SITE NARRATIVE - SAUGET AREA 2 / Site P

Sample Locations	Sampling Entity	Date Sampled	Data Source
DC-P1 thru DC-P5	E & E	2/87	"Expanded Site Investigation Dead Creek Project Sites" prepared for IEPA by Ecology and Environment, Inc., May 1988

Nature and Extent of Contamination:

VOCs were detected at a concentration of 1.3 mg/kg in 1 of the 4 subsurface soil samplescollected at Site P. BNAs were detected at 16.4 mg/kg in 1 of the 4 samples, and pesticides and PCBs were not detected in any of the four samples collected. Metals, particularly Pb and Hg were elevated in a few of the samples collected. The organic contaminants were all detected in a the sample collected from boring P-1 at the south end of the site from a depth of 0 to 10 feet BGS.

The extent of contamination is not very well defined for Site P given that onl four subsurface soil samples were collected from three boring locations across the site. Although, the contaminantion detected does appear to be present at low levels.

Containment and Integrity (if known):

There is no known containment for Site P other than the landfill cover materials which may be in place. The surface of the site is covered primarily with cinders and slag, and erosion is evident along the site perimeter. A business and parking lot is located on the southern portion of Site P and access to this site is unrestricted.

Other Comments: See the attached "Site Description" for more site details.

ecology and environment

SITE DESCRIPTION - Sauget Area 2/Site P

Site P is an inactive, IEPA-permitted landfill encompassing approximately 20 acres in the northern portion of the Sauget Area 2 sites. The site is bordered on the west by the Illinois Central Gulf Railroad, on the south by Monsanto Ave., and on the east by the Terminal Railroad. The two railroads converge to form the north end of the site. The site has steep slopes along the sides of the landfill, and access to the site is unrestricted. The following is a chronology of events for site P as discovered in the file information search:

1972

Sauget and Company entered into a lease agreement with Union Electric Company of St. Louis to operate a waste disposal facility.

January 1973

IEPA issues a permit to Sauget and Company to operate a landfill at Site P. The permitonly allowed non-chemical waste from Monsanto.

1974

Sauget and Company applied for and were granted a supplement permit for Site P. Thesupplement permit allowed the landfill to accept general waste and diatomaceous earth filter cake from Edwin Cooper (AKA the Ethyl Corporation). Routine IEPA inspections began at the facility.

October 1975

An IEPA inspector observed a small amount of yellowish tar-like liquid in an area next to drums labeled "Monsanto ACL-85, Chlorine Composition". Both Monsanto and Sauget and Company were notified of the violation and the issue wasthen "dropped".

December 1977

An IEPA inspection indicated the disposal of 25 barrels of phosphorus pentasulfide. Monsanto was required to remove this waste from the site.

1978-1979

IEPA inspections revealed unpermitted disposal of Monsanto ACL filter residues and packaging.

December 1981

IEPA issued a supplemental permit to Sauget and Company after a water line was discovered in the middle of the southern portion of the site.

February 1987

Four subsurface soil samples were taken at five boring locations onsite.

(Note: All information above was excerpted from a document with the heading of "Background" which was taken off microfiche from the IEPA file records)

Nature and Extent of Contamination:

The following description of the nature and extent of contamination refers to samples collected in and adjacent to the closed lagoons at Site O. Samples 1 thru 16, collected adjacent to Clayton Chemical property, are presented on the Site O figure and in summary table format, but are not included in this discussion of the lagoon area samples.

VOC concentrations in soil samples collected at Site O ranged from 0.001 to 889.9 mg/kg for 10 of the 12 samples collected. BNAs were detected at concentrations ranging from 0.28 to 1916 mg/kg in 9 of the 12 samples collected. Pesticides were not detected in any of the 12 samples collected. PCB concentrations ranged from 11.4 to 1,871 mg/kg for 9 of the 12 samples collected. Metals, particlaurly Cu, Hg, and Zn, were elevated in a few samples collected. The greatest contaminant concentrations in subsurface soils were detected at depths between 0 to 10 feet BGS.

The extent of soil contamination at Site O is fairly well defined through the 12 samples collected at various depths, both within and adjacent to the lagoons. The lagoons are unlined, and were excavated into the Henry Formation sands. The lateral boundary of the lagoons is well-defined, and is readily evident in historical aerial photos.

Containment and Integrity (if known):

The lagoons at Site O are closed, covered, and vegetated. Therefore, there is some containment of the wastes within the lagoons, but the quality and amount of cover is unknown. The lagoons are unlined, and were excavated into the Henry Formation sands. Access to Site O is somewhat restricted, only by the fact that the entrance road to the lagoon area is posted as a private drive; otherwise the site access is unrestricted.

Other Comments: See the attached "Site Description" for more site details.

SITE DESCRIPTION - Sauget Area 2/Site O

Site O consists of four inactive sludge dewatering lagoons associated with the Sauget Wastewater Treatment Plant (WWTP). The site is located on Mobile Avenue in Sauget. The site covers approximately 20 acres to the northeast of the American Bottoms WWTP. The lagoons have been covered with clay and vegetated, and no waste material is present at the surface. An access road to the American Bottoms WWTP runs through the middle of the site. The history of Site O includes activities at the Sauget WWTP. The Sauget WWTP began operation in approximately 1952. The plant treated waste from area industries and residents. Approximately 10 million gallon per day of wastewater was treated, more than 95% was from area industries. Industries which contributed wastewater to the plant include Monsanto, Cerro Copper, Sterling Steel Foundry, Amax Zinc, Rogers Cartage, Edwin Cooper, and Midwest Rubber. Effluent from the plant was discharged to the Mississippi River under NPDES permit. The Sauget WWTP had many past violations of the NPDES permit, mainly due to chemical quality of the plant effluent. Mercury, PCBs and organic solvents had been detected at levels which violated the set permit levels on several occasions. A 1982 USEPA study concluded that the effluent from the Sauget WWTP contributed a substantial volume of priority pollutants annually to the river. The lagoons which comprise Site O were usedas sludge drying beds for the original Sauget WWTP. It is not known if sludge was removed from the lagoons prior to closure and capping.

The following is a chronology of events for site O as discovered in the file information search:

Circa 1952

Sauget Water Treatment Plant has been in operation in some form.

1965 to approx. 1978

The former lagoons were used for disposal of clarified sludges.

1981

The Village of Sauget submitted a Notification of Hazardous Waste Site Form to USEPA in June. The form stated that the lagoons were used for disposal of clarified sludges. The lagoons were designed to drain liquids from the sludge. The lagoons were not lined and were excavated into the Henry Formation Sand. In March, following a long history of effluent problems, the Sauget WWTP submitted specifications for a pretreatment program to increase the treatment efficiency in their waste streams.

December 1982

IEPA collected soils around the Bliss Waste Oil tanks at Clayton Chemical. This area is near site O. High levels of PCBs and pentachlorophenol were detected. Dioxin, especially 2,3,7,8-TCDD was suspected since Russel Bliss had been connected to dioxin-contaminated waste oil in the past.

January 1983

Construction began on the new American Bottoms WWTP which will replace the old Sauget WWTP. The Illinois Attorney General filed suit against Russel Bliss and Clayton Chemical for an alleged water pollution hazard.

February 1983

IEPA and Envirodyne Engineers soil samples reveal PCBs and 2,3,7,8,-TCDD contamination in an area northwest of Site O.

April 1983

Clean-up plan submitted for dioxin contaminated soils. USEPA and IEPA approve the plan.

June 1983

IEPA ordered the excavation of an underground storage tank owned by Russel Bliss on Clayton Chemical property. The tank was found to be ruptured - soil and waste samples were collected by IEPA.

August 1983

IEPA ordered the excavation of additional soil from the Bliss underground storage tank. This was done based on the results of previous IEPA samples.

May 1984

A trench was dug in the area of the lagoons to bury a water pipe. Wastes were encountered during trenching, and the trench was covered and the water line laid above ground.

July 1984

A hydrogeologic investigation was initiated by Geraghty & Miller.

August 1984

Excavation for the construction of a transfer sewer at Site O uncovered contaminated soils.

December 1986

Geraghty & Miller completed their report on investigations at Site O. The report outlined the extent of groundwater contamination from the former sludge lagoons.

December 1986 - March 1987

Nine subsurface soil samples were taken at Site O. An additional two subsurface samples were taken in areas just off-site.

July 1987

Two groundwater monitoring wells were sampled on site. Three monitoring wells located just off-site were sampled by E & E.

March 1994

Surface and subsurface soil samples are expected to be taken by IEPA.

(Note: All information above was excerpted from a document with the heading of "Background" which was taken off microfiche from the IEPA file records)

SITE NARRATIVE - SAUGET AREA 2 / Site Q

Nature and Extent of Contamination:

Southern Portion of Site Q (samples X101-X111 and Q203-Q208):
VOC concentrations in soils ranged from 0.008 to 0.29 mg/kg for 5 of the 11 samples analyzed for these parameters. BNA concentrations ranged from 0.38 to 1.9 mg/kg for 5 of the 11 samples collected. Pesticides were not detected in any of the 11 samples analyzed for these parameters. PCB concentrations ranged from 0.06 to 223 mg/kg for 14 of 17 samples collected.

The samples collected from the southern portion of Site Q are collected from depressional areas. These depressional areas have been identified by IEPA as apparent disposal areas and not all of the property south of the Alton & Southern Railroad has been sampled or characterized. The extent of surficial contamination in the southern portion of Site Q (south of the Alton & Southern Railroad) is fairly well defined laterally. However, there are no subsurface soils to help delineate the extent of vertical contamination.

Northern Portion of Site Q (all samples north of the Alton & Southern Railroad):
Waste samples (QD1 to QD3) collected in drums adjacent to the river at Site Q revealed a BNA concentration of 534 mg/kg in one sample, and PCB concentrations ranged from 180,000 to 260,000 mg/kg for the drum samples collected.

Surface water samples (P1 and P2) collected on Site Q did not contain appreciably high concentrations of metals. These samples were not analyzed for organic parameters. Pond sediments (Q201 and Q202) collected in the center of Site Q had PCB concentrations which ranged from 1.8 to 4.6 mg/kg for the two samples.

BNA concentrations in leachate samples (from samples L-1, L-2, L101, L102, and L103) were 5 μg/L for 2 of the 5 samples collected. The leachate samples were not analyzed for VOCs, and pesticides were not detected in any of the 5 samples. PCB concentrations ranged from 0.1 to 1.0 μg/L for 4 of the 5 samples collected. Metals, particularly As, Cr, Cu, Pb, and Zn, were elevated in a few of these samples.

VOC concentrations in the subsurface soils (from borings B-1 to B-18 and Pits 1 & 2) ranged from 0.02 to 5,855 mg/kg for 28 of the 36 samples collected BNA concentrations ranged from 3.8 to 15,190 mg/kg for 34 of the 36 samples collected. Pesticide concentrations were 0.1 and 3.3 mg/kg for 2 of the 35 samples collected. PCB concentrations ranged from 0.002 to 16,000 mg/kg for 32 of the 36 samples collected. Dioxin (2,3,7,8-TCDD) concentrations in subsurface soil samples ranged from 0.0001 to 0.0033 mg/kg in two of the 35 samples analyzed for this parameter.

The extent of contamination in the southern portion of Site Q (south of the Alton & Southern Railroad) is fairly well defined laterally in and around the depressional areas identified by IEPA. However, there are no subsurface soils to help delineate the extent of vertical contamination. The extent of contamination in the central portion of Site Q is poorly defined. Wastes have been initially identified through sampling of drum samples and leachate but surface and subsurface soil samples are lacking in this area. The extent of contamination in the northern portion of Site Q, adjacent to Site R is well defined through multiple soil borings and subsurface soil samples.

Containment and Integrity (if known):

There is no known containment for site Q. Wastes are present at the surface in the southern portion of Site Q. The northern portion is covered primarily with cinders. Access to this site is unrestricted.

Other Comments: See the attached "Site Description" for more site details.

ecology and environment

SITE DESCRIPTION - Sauget Area 2/Site Q

Site Q is an inactive waste disposal facility in Sauget and Cahokia. The facility, which was operated by Sauget & Company between 1966 and 1973, covers approximately 90 acres. The site is located on the east bank of the Mississippi River and is on the river side of the flood control levee. Most of Site Q is occupied by the Pillsbury Company, which operates a coal and grain unloading and transfer facility. The northern half of the site contains coal and cinders while the southern portion is unoccupied. A railroad spur divides the site and several ponds exist on site. Site Q was operated without a permit. The north side was registered with the IDPH in 1967, prior to formation of IEPA. The site is presently covered with black cinders which makes it highly permeable. Site Q is presently being leased to the Pillsbury Co. by its owners the Riverport Terminal and Fleeting Co.

The following is a chronology of events for site Q as discovered in the file information search:

1966

Disposal operations began in the northern most portion of site Q. A flyash pond operated by Union Electric existed at the area immediately south of the Monsanto Chemical dump (Site R).

1968 - 1972

Septic tank pumping and general municipal refuse were accepted at the site.

Early 1970s

IEPA inspections documented several violations of the Illinois Environmental Protection Act, including open burning, using unsuitable cover materials (cinders and flyash), and disposal of liquid chemical wastes.

April 1971

IEPA filed a complaint against Sauget & Co.. The company was ordered to cease open burning, using flyash and cinders for cover materials, and accepting liquid chemical wastes.

May 1971

The Illinois Pollution Control Board issued an order to Sauget & Company to discontinue the use of cinders and flyash for final cover.

September 1971 - August 1971

IEPA conducted monthly inspections at the site. During this time they cited inadequate daily and final cover, and the disposal of liquid wastes.

July 1972

An IEPA inspection revealed a smoldering underground fire.

August 1972

Leach tests of the cinder cover was performed by IEPA. The material was found to be inadequate in terms of permeability of material and its high metal content.

October 1972

The fire which began in July 1972, finally went out. The fire smouldered continuously from July to October despite repeated attempts to extinguish it.

1972

Sauget & Company applied for a permit to extend the existing landfill to an area south ofthe Alton & Southern Railroad. IEPA denied all permit applications to the southern site extension. Approval was never issued by IEPA, however Sauget & Company used this area for disposal.

October 1972

IEPA collected two soil samples from Site Q. One was from ponded water, the other was a leachate sample. Results indicated the presence of metals including lead andmercury.

January 1973

Groundwater samples were collected from two monitoring wells.

March 1973

Mississippi River flood waters inundated Site Q. The flood conditions lasted until May 1973.

April 1973

Samples of ponded water collected by IEPA on two separate occasions.

November 1973

The Illinois Secretary of State revoked the authority of Sauget & Co. to transact business in the State of Illinois.

January 1975

Disposal activities were completed at Site Q by this time.

September 1976

An IEPA inspection of Site Q revealed and underground fire at the site. The fire smoldered for approximately 1 month.

May 1977

The Illinois Pollution Control Board filed suit #77-84 against Sauget & Co. and Paul Sauget. A monetary penalty was invoked and Sauget & Co. was ordered to put a two foot layer of suitable cover material to cap the entire site by February 1981.

May 1980

IEPA was notified that drums and chemical wastes were uncovered during excavation along a railroad spur.

May 1981

In response to Sauget's failure to comply with order #77-84 and alleging several violations of the Illinois Environmental Protection Act, the Illinois Attorney General filed suit against Sauget & Co.

October 1981

IEPA sampled leachate seeps from the banks of the river. Results indicated high levels of organic contaminants.

June 1983

A subsurface investigation at Site Q was initiated by a USEPA FIT Contractor. Over half of the organics analyzed for in the samples were detected including 2,3,7,8-TCDD in two samples. A geophysical investigation was completed by Technos of Miami, Florida.

September 1983

IEPA took more leachate seep samples from the bank of the river. The results weresimilar to the results in October 1981.

March 1985

The Illinois Attorney Generals' office reentered a suit against Sauget & Company. TheIAG's office ordered final cover to be applied at the site and also requested a civil penalty.

March 1987

E & E took nine samples from eight monitoring wells at site Q. Monitoring wells were also sampled in area adjacent to site Q.

Subsequent to 1987, several investigative and significant environmental events have taken place. In 1992, Monsanto conducted sampling at the south end of Site R, on the Site Q property. In 1994, most of site Q was innundated by the Mississippi River flood waters. IEPA and USEPA conducted sampling in the depressional areas at the southern portion of Site Q in 1994 and 1997, respectively. In addition to sampling activities, construction of offices and storeage areas for a landscaping firm has taken place in the northern and central portions of Site Q.

SITE NARRATIVE - SAUGET AREA 2 / Site R

Nature and Extent of Contamination: The Site R landfill and adjacent areas have been studied extensively by the USEPA, IEPA, and Monsanto since the early 1980's. Below is a brief synopsis of the nature and extent of soil/sediment contamination identified at Site R.

RI Report Data - Geraghty & Miller, 1994.

Eight sediment samples (SS-1 through SS-8) were collected from storm water drainage ditches surrounding the Site R landfill. VOC concentrations in sediment samples collected from the drainage ditches ranged from 0.002 to 0.035 mg/kg. Constituents detected in these sediment samples were similar to those detected in the landfill soil samples, although the detected concentrations were orders of magnitude lower. SVOC concentrations in sediments ranged from 0.045 to 3.99 mg/kg. Pesticides were only detected in one of the sediment samples at a concentration of 0.096 mg/kg. PCBs were detected at concentrations ranging from 0.08 to 1.5 mg/kg. Metals, particularly Al, Fe, Ca,and Mg were elevated in some samples.

Soil samples were collected from 16 borings (SB-1 through SB-16) within the landfill during the RI conducted by Geraghty & Miller. In addition, Dynamac completed an investigation in 1989 which included 8 borings (D-1 through D-8) around the perimeter onf the landfill, 8 surface samples (C-1 through C-8) collected from the landfill cap, and 10 surface samples collected from the perimeter (P-1 through P-10). VOC concentrations in subsurface soil samples collected from the RI borings ranged from 0.15 to 4,100 mg/kg. VOC concentrations in subsurface soil samples collected by Dynamac ranged from 0.51 to 5,800 mg/kg. SVOC concentrations in subsurface soil samples collected from borings SB-1 through SB-16 ranged from 0.017 to 11,000 mg/kg. SVOC concentrations in subsurface soil samples collected by Dynamac ranged from 0.37 to 19,000 mg/kg. Pesticide concentrations in subsurface soil samples collected from the borings SB-1 through SB-16 ranged from 0.011 to 99 mg/kg. Pesticides were not detected in any borings conducted by Dynamac. PCB concentrations in subsurface soil samples collected from borings SB-1 through SB-16 ranged from 0.075 to 4,800 mg/kg. PCBs were only detected in three of the borings conducted by Dynamac. Some metals, including As, Cr, Pb, Ni and Hg, were slightly elevated in most samples.

Expanded Study Area RI Report Data - Geraghty & Miller, 1994.

Soil samples were collected from 3 borings (SB-17 through SB-19) drilled along the southern portion of the landfill. This area is actually part of Site Q but was investigated as part of the Site R RI by Geraghty & Miller. VOC concentrations in subsurface soil samples collected from these borings ranged from 0.002 to 1,640 mg/kg. SVOC concentrations in subsurface soil samples collected from borings SB-17 through SB-19 ranged from 0.041 to 185 mg/kg. Pesticide concentrations in subsurface soil samples collected from the borings SB-17 through SB-19 ranged from 0.016 to 0.18 mg/kg. PCB concentrations in subsurface soil samples collected from borings SB-17through SB-19 ranged from 0.36 to 6.6 mg/kg.

recycled paper

SITE NARRATIVE - SAUGET AREA 2 / Site R

IEPA and USEPA File Information - Pre-1992

Information presented here pertains to the sample locations presented on the figure for Sites O, Q, R, and S. These sample locations are situated adjacent to the river on the west side of Site R. Nine sediment samples (A, B, C, S02, S04, S06, M02, M04, M06) were collected from 6 locations adjacent to the river to the west of Site R. VOCs were not detected in any of the three sediment samples analyzed for this parameter group. SVOC concentrations in sediments to the west of Site R ranged from 0.001 to 7.7 mg/kg for 9 of the 9 sample collected. Pesticides were not analyzed in these sediment samples. PCB concentrations in the sediments ranged from 0.00001 to 0.23 mg/kg for 6 of the 9 samples collected. Metals were not elevated in most of the samples collected. However, cyanide was detected at concentrations ranging from 6.8 to 90 mg/kg for all three samples analyzed for this parameter.

Nine leachate samples (X101D, X103D, X104D, S01, S03, S05, M01, M03, M05) were collected from 6 locations adjacent to the river to the west of Site R. VOCs were not analyzed in any of the leachate samples. SVOC concentrations in leachate to the west of Site R ranged from 0.6 to 12.3 μg/L for the 3 samples analyzed for this parameter group. Pesticide concentrations ranged from 0.5 to 3.0 μg/L for the three samples analyzed for this parameter. PCBs were only detected in one leachate sample at a concentration of 0.08 μg/L. Sample X101D, X103D, and X104D were analyzed for dioxins/furans only.

Total dioxin/furan concentrations ranged from 0.0001 to 0.0014 ppm. Metals were slightly elevated in some samples collected. Cyanide was detected in one leachate sample at a concentration of 71 μg/L.

Surface water samples (S101D, S103D, and S104D) were collected from the Mississippi River and analyzed for dioxins/furans. The total dioxin/furan concentrations ranged from 0.0001 to 0.0007 ppm in the three samples collected.

Containment and Integrity (if known):

Site R is surrounded by a security fence and monitored by 24-hour surveillence. In addition to site security, the landfill has been capped and the riverbank to the west of the site has been stabilized.

Installation of Landfill Cap: In 1979, Monsanto installed a clay cap on the Site R landfill. The purpose of the cap was to cover waste, limit infiltration through the landfill, and prevent direct contact with fill material. The clay for the cover was obtained locally from several site in Cahokia and the cap thickness varies from 2 feet to approximately 8 feet. The permeability of the clay was determined to range from 3.9×10^{-7} cm/sec to 2.4×10^{-6} cm/sec based on laboratory analysis of undisturbed samples.

Riverbank Stabilization Project: In 1985, a 2,250 foot long rock revetment was installed by Monsanto along the east bank of the Mississippi River adjacent to Site R. The purpose of the stabilization project was to prevent further erosion of the riverbank and thereby minimize potential for release of waste material from the landfill. The riverbank was graded using rock and sand, covered with a geotextile fabric, and a fine, crushed rock filter blanket (1-foot thick) was placed over the fabric. A second geotextile fabric layer was placed over the crushed rock blanket. Finally, 2-foot of class C rip-rap was placed over the upper fabric layer. The rip-rap was placed from the top of the riverbank to 374 feet MSL, producing a revetment that extends from 150 to 290 feet into the river.

Other Comments: See the attached "Site Description" for more site detail

SITE DESCRIPTION - Sauget Area 2/Site R

Site R is a former industrial waste landfill situated adjacent to the Mississippi River in Sauget, Illinois. Early IEPA files list the site name as the Sauget Toxic Dump (aka: Krummerich Landfill). More recent reports and files list the site name as Monsanto Landfill or River's Edge Landfill. The site is owner by Monsanto Chemical Co. and was used by Monsanto for landfilling between 1957 and 1977. The site is located north and west of Site Q on the river side of a flood control levee. Site R is covered with a clay cap and is vegetated. Access to Site R is restricted by fencing and under 24-hour camera surveillance.

The following is a chronology of events for site R through 1987 as discovered in the file information search:

1957
The Sauget Toxic Dump began being used by Monsanto.

August 1968
IEPA begins making routine inspections at Site R.

April 1971
IEPA inspection of Site R revealed disposal of bulk chemical wastes and drums.

May 1971
The Illinois Pollution Control Board order #71-29 issued to Sauget & Co. to respond to a request for information.

June 1971
Monsanto responded to the Illinois Pollution Control Board order number 71-29. They indicated that 18,400 cubic yards of chemical wastes were disposed of at Site R for 1971.

December 1972
IEPA sampled monitoring wells at Site R. Phenols found in all samples.

January 1973
High concentrations of phenols were identified by IEPA in a limited analysis of samples taken from waste ponds.

February 1973
IEPA sampled monitoring wells at Site R and found high levels of phenol and COD in all samples.

March 1973
The Mississippi River flood waters inundated Sites R and Q.

November 1973

The Illinois Secretary of State revoked the authority of Sauget & Co. to transact business in the State of Illinois.

1973

IEPA sent notices to Sauget & Co. and Monsanto, which outlined violations of the Environmental Protection Act at Site R. The violations included inadequate segregation of wastes, and a lack of the necessary permits to operate a disposal facility. These violations were reiterated several times in 1973 and again in 1974.

1973 - 1976

IEPA sampled the monitoring wells at Site R anually. Also a Monsanto Ranney well located in the northwest corner of the site was sampled.

1975

Records indicate a significant reduction in the amounts of chemicals disposed of on-site.

1976

Ranney well sample indicated PCB contamination.

October 1977

D'Appolonia Engineers, a consultant for Monsanto, conducted a subsurface investigation of Site R and proposed appropriate closure alternatives.

1977

Monsanto voluntarily ceases operations at Site R.

May 1978

Monsanto filed closure documents and plans with IEPA.

September 1978

Monsanto began closure operations which consisted of covering, grading, capping, and securing Site R.

October 1979

IEPA samples from monitoring wells indicated the presence of chlorophenols, chlorobenzenes, and analine derivatives. Closure of Site R was completed.

February 1980

Monsanto filed an affidavit of closure for Site R.

March 1981

Monitoring well samples indicated the presence of a variety of organic compounds.

May 1981

Monsanto filed a CERCLA notification for Site R.

October 1981

IEPA collected leachate and sediment samples from Site R. The samples were collected from an area adjacent to the Mississippi River. Leachate was noted flowing into the river in at least three locations.

October 1981

The U.S Food and Drug Administration (USFDA) collected fish samples from both upstream and downstream river locations. The downstream fish contained several organic contaminants.

December 1981

A USEPA TAT contractor sampled the Site R seeps adjacent to the river. Analyses of these samples included higher chlorinated (hexa-through octa-) dioxins.

July 1982

The USEPA FIT contractor submitted an HRS score for Site R. The site scored 7.23 and did not qualify for the National Priorities List (NPL). This score was low because of a lack of a target population. Surface and groundwater contamination was observed, however there was not a target population for these releases. No air releases were observed.

1982

The IAG's office filed suit against Monsanto outlining several apparent violations of the Illinois Environmental Protection Act. Most of the complaint was regarding water pollution and the relief being sought included civil penalties and the issuance of an injunction to Monsanto to immediately prevent seepage from Site R from entering the river. The injunction also directed the defendant to remove all waste from the site.

October 1983

Geraghty and Miller, a contractor for Monsanto, conducted a hydrogeologic investigation on Monsanto property including Site R.

July 1984

Monsanto applied for a permit to construct a revetment along the bank of the Mississippi River.

1985

Revetment constructed along the bank of the Mississippi River.

September 1986

The initial Geraghty & Miller hydrogeologic investigation report estimated 77 pounds of organic compounds were leaching into the Mississippi River per day.

March 1987

E & & took one groundwater sample from an on-site location with an additional nine groundwater samples taken from seven wells located in areas adjacent to the site.

Subsequent to 1987, Monsanto has continued groundwater monitoring and site characterization activities at the site. In 1989, Dynamac Corporation (Dynamac) conducted sediment, surface soil, and subsurface soil sampling to obtain information to be used in preparation of a site-specific risk assessment. In compliance with a consent order signed by Monsanto and IEPA in 1992, a remedial investigation was initiated by Monsanto in 1992, with oversight from IEPA. An RI report was submitted to IEPA in August 1994.

(Note: All information above was excerpted from a document with the heading of "Background" which was taken off microfiche from the IEPA file records)

SITE NARRATIVE

SITE S

recycled paper

SITE NARRATIVE - SAUGET AREA 2 / Site S

Sample Locations	Sampling Entity	Date Sampled	Data Source
X102 thru X106	IEPA	3/22/95	Handwritten notes with sample map and data sheets.

Nature and Extent of Contamination:

VOC concentrations in soil samples collected from Site S ranged from 0.007 to 2,181 mg/kg in all 6 of the samples collected. BNAs were detected at concentrations ranging from 0.8 to 250 mg/kg for 5 of the 6 samples. Pesticides ranged from 0.005 to 0.2 mg/kg for 5 of the 6 samples. PCBs were detected in all 6 samples at concentrations ranging from 0.04 to 195 mg/kg. Metals, particularly Cr, Cu, Pb, and Hg, were found at elevated concentrations in a few of the samples collected. At the time of sampling, surface leachate seeps were present at the southern portion of the site.

The extent of contamination at Site S is poorly defined due to the limited number of sampling locations and associated analytical data. Samples were collected from locations X102 thru X106 using a hand auger, and the sample depths ranged from 0 to 5 feet BGS. High VOC, BNA and PCB contamination present in samples X105 and X106 indicate that the extent of contamination at Site S has not been completely defined, either laterally or vertically.

Containment and Integrity (if known):

The containment for Site S is in the form of topsoil and vegetation on the northernmost portion of the site area, and gravel cover for the southern portions of the site area. The southern portion of the site, which is covered with gravel, is also fenced.

Other Comments: See the attached "Site Description" for more site details.

ecology and environment

SITE DESCRIPTION - Sauget Area 2/Site S

Site S is depicted up on the USGS topographic map as a low-lying feature located to the west of the American Bottoms WWTP. This location appeared to be a drum disposal area based upon a review of historical aerial photographs. The site is currently part of the American Bottoms WWTP property which is situated to the west-southwest of the Site O lagoons. The northern portion of Site S is grassed with no apparent features of waste disposal, and the southern portion is covered with gravel and fenced. Disposal boundaries have not been delineated. Slag material was encountered in every boring attempted at Site S. Access to the northern, grassed portion of Site S is partially restricted in that the Site is located on private property, and access to the southern portion of Site S is restricted by fencing.

Organic (mg/kg)
Collected by Russell and Axon (July 20, 1984)

Sample Number	1	2	BLANK	Maximum
Organics				Concentration
2,4-Dichlorophenol	50.1	ND	ND	50.1
Pentachlorophenol	3600	159	ND	3600
2,4,6-Trichlorophenol	39.3	ND	ND	39.3
Crysene	123	2.2	ND	123
Benzo-k-Fluoranthene	15.9	0.45	ND	15.9
Bis(2-Ethylhexyl) Phthalate	10.9	ND	0.098	10.9
1,2-Chlorobenzene	ND	12.2	ND	12.2
1,4-Dichlorobenzene	ND	8.01	ND	8.01
Di-Butyl Phthalate	ND	5.06	0.1	5.06
Phenanthrene	100	1.6	ND	100
Pyrene	102	2.1	ND	102
1,2,4-Trichlorobenzene	65.3	1.6	ND	65.3
PCBs	*	*	ND	ND
Benzo(a)Pyrene	4.2	1	ND	4.2

mg/kg - Milligrams per kilogram
ND - Not detected
* - Identified, but values cannot be verified

mg/kg - Milligrams per kilogram

B - Estimated value. The value is less than the CRDL, but greater than the instrument detection limit

N - Laboratory spike recoveries were outside QC protocols

ND - Not detected.

S - Analysis performed using the method of standard additions

W - Laboratory post-digestion spike for furnace AA analysis exceeds QC limits

* - Laboratory duplicate analysis not within control limits

2200 Churchill Road, Springfield, IL 62794-9276

MEMORANDUM

Date: December 30, 1994

From: Paul E. Takács, IEPA/BOL/NPL

To: Monica Rebbe, IDPH

Subject: L1630200005 -- St. Clair County
Sauget Sites (Area 1, Area 2) -- Sauget
Superfund/Technical Reports

The primary purpose of this memorandum is to present and interpret the results from a sampling event that IEPA was tasked to perform on November 9 and 10, 1994 at the Sauget Area 1 and Area 2 Sites. This sampling entailed the collection of sixteen surface soil samples within Site Q and near Site G (see Attachment A).

As outlined in the September 6 proposal to the Illinois Department of Public Health (IDPH) (see Attachment B), the objective of the sampling event was to gather data on areas in the Sauget and Cahokia area that were impacted by last year's flooding. This project represents a cooperative effort between IEPA and IDPH. All analytical costs were paid for by IDPH.

Actual field sampling was performed by Tom Miller and Doug Hayward of IEPA's Collinsville office with Monica Rebbe (IDPH) and Paul Takacs (IEPA) providing general oversight and assistance. The sixteen soil samples were sent to Applied Research and Development Laboratory (ARDL) in Mt. Vernon for analysis. ARDL was picked because of its proximity to the site.

Each sample was collected with a stainless steel spoon, sealed in a glass jar and packed with blue ice before shipping as per normal IEPA guidelines. One trip blank was sent to ARDL along with each group of samples that were taken on both days. All samples arrived at ARDL on the same day they were taken. Analyses were then run for volatile and semivolatile organic compounds, pesticides, PCBs and inorganics. As per the Health and Safety Plan (Attachment C), the sampling was performed in Level C protection.

Inorganics

In general, the samples ranged from very low to high levels of contamination. The first group of samples were taken in the east borrow pit of Site Q. Previous site visits have noted two large mounded areas near the west-central portion of this pit. Two soil samples each were taken around the edges of both mounds where drums and waste piles were exposed. Sample X101 was a grayish waste

recycled paper

ecology and environment

Printed on Recycled Paper

SCREENED BF

material that had fairly high levels of antimony (157ppm), cadmium (2,260ppm), chromium (3,650ppm), lead (7,690ppm), mercury (4.9ppm), nickel (153ppm), selenium (59.9ppm) and cyanide (3.3ppm). Sample X102 was a white crumbly waste. It had only low levels of inorganic contamination with magnesium (4,259ppm) being most significant. The next sample, X103 was a bluish-grey waste that had high levels of antimony (17,900ppm), arsenic (216ppm), copper (1,630ppm), lead (195,000ppm) and silver (30.2ppm). Sample X104, similar to X102, contained the white crumbly substance that had similar contaminants (magnesium @ 4,600ppm). Samples X105 and X106 were both located in waste piles near the northern portion of the borrow pit along the west boundary. X105 was a grayish crystalline substance, which did not appear to have inorganic contamination (although the sample did have a pH of 2.6). X106 was a light blue flaky material that also did not appear to have significant inorganic contamination. Samples X107 and X108 were also taken at the northern portion of the pit. X107 was taken on a ridge of what appeared to be waste material, although the reddish material resembling clay in this sample did not appear to have significant inorganic contamination. X108 was the northernmost sample taken in the east borrow pit. It was dark grey in color and had rather significant concentrations of lead (571ppm).

Samples X109, X110 and X111 were collected along the east bank of the west borrow pit with X109 and X110 taken from one waste pile that resembled the one X105 and X106 came from in the other borrow pit. X109 was a reddish grey waste that did not contain high levels of organics, while X110 contained antimony (47.6ppm), arsenic (19.3ppm), copper (226ppm), lead (5,320ppm), nickel (371ppm), and silver (28.9ppm). Both samples also had pH's (3.6 and 3.7, respectively). Sample X111 was a grayish-white material collected south of the above-mentioned samples and contained nickel (25.9ppm) and vanadium (23.1ppm).

Samples X112 and X113 were taken along the river bank, just south of Site R. Both samples contained a hard blackish substance that appeared to have been disposed of in drums. X112 contained notable levels of cadmium (56.2ppm) and zinc (10,300ppm), while X113 was found to contain magnesium (4,710ppm).

The remaining samples (X114, X115 and X116) were collected around Site G. Both X114 and X115 were soil samples collected in lower elevation areas to the south of the southern Site G fence that could have received runoff from Site G. These samples showed rather high levels of copper (675ppm in X114 and 1,150ppm in X115), lead (172ppm in X114), nickel (32.7ppm in X114 and 38.5ppm in X115) and vanadium (23.3ppm in X114 and 22.7ppm in X115). The last sample (X116) was located in a ridge off of the southwest corner of Site G. X116 which was a brownish waste material containing significant levels of copper (515ppm), mercury (4.7ppm) and high levels of zinc (38,200ppm).

Volatile Organic Contaminants

Only X101, X106, X115 and X116 showed any significant measurable

ecology and environment

SITE NARRATIVE - SAUGET AREA 2 / Groundwater

Nature and Extent of Contamination:

Monitoring wells throughout the Sauget Area 2 sites are installed to monitor three separate zones (shallow, intermediate, and deep) within the unconsolidated aquifer system beneath the sites. Monitoring wells used to evaluate the shallow zone are set between approximately 28 feet and 50 feet BGS. Monitoring wells used to evaluate the intermediate zone are set between approximately 80 feet and 90 feet BGS. Monitoring wells used to evaluate the deep zone are set between approximately 100 feet and 115 feet BGS at the base of the sand aquifer. The brief discussion presented below breaks down the nature of contamination by groundwater zone.

Shallow Zone:
Total VOC concentrations detected in samples collected from Area 2 monitoring wells set in the shallow aquifer zone range from 8 µg/L to 557,900 µg/L. The highest total VOC concentration was detected at Site O. Total BNA concentrations in the shallow zone ranged from 7 µg/L to 1,906,170 µg/L. The highest total BNA concentration was detected at Site R. PCBs were not detected in any of the groundwater samples collected from wells set in the shallow zone. Contamination (from the late 1980's sampling presented on the figure) is primarily limited to areas directly beneath and between Sites O and R. There are isolated pockets of shallow contamination in the central and southern portion of Site Q but the contaminant concentrations in these areas are several orders of magnitude less than the concentrations detected near Sites O and R. The concentration ranges presented in this summary reflect only the monitoring well and private well data presented on the Area 2 Groundwater Figure. Additional data provided in the data summary tables section will reveal different concentration ranges, depending upon the wells sampled and the date.

Intermediate/Deep Zone:
Total VOC concentrations detected in samples collected from Area 2 monitoring wells set in the intermediate or deep aquifer zones range from 117 µg/L to 31,138 µg/L. The highest total VOC concentration was detected at Site R. Total BNA concentrations in the intermediate/deep zone ranged from 5.6 µg/L to 333,669 µg/L. The highest total BNA concentration was detected at Site R. PCBs were detected in one intemediate zone groundwater sample at a concentration of 0.9 µg/L at Site R. Contamination (from the late 1980's sampling presented on the figure) is primarily limited to areas directly beneath and between Sites O and R, although somewhat more spread out than the contamination noted in the shallow zone. Contaminants in the intermediate/deep zone, although more spread out, were also detected at concentrations significantly less than in the shallow zone. The isolated pockets of contamination detected in the central and southern portion of Site Q in the shallow zone was not detected in the intermediate/deep zones in these areas. The concentration ranges presented in this summary reflect only the monitoring well and private well data presented on the Area 2 Groundwater Figure. Additional data provided in the data summary tables section will reveal different concentration ranges, depending upon the wells sampled and the date.

ecology and environment

SITE NARRATIVE - SAUGET AREA 2 / Groundwater

Nature and Extent of Contamination: Cont'

The greatest volume of data exists for Sites O and R, where most of the monitoring wells for both sites have been sampled on numerous occassions. Aside from the VOC concentration detected in one shallow well at Site O, contaminants were generally higher in both the shallow and the intermediate/deep zones at Site R.

The extent of shallow groundwater contamination in Area 2 is very well defined in areas immediately adjacent to Sites O and R, including the northern portion of Q which extends between these two sites. However, because there are no wells located north and south of Site R, there is little control on contaminant concentrations or migration to these areas. The extent of shallow groundwater contamination for site Q is poorly defined due to the absence of wells in this area, and there are no wells to assess potential contamination from either Site P or Site S.

The extent of intermediate/deep groundwater contamination in Area 2 is fairly well defined in areas immediately adjacent to Sites O and R, including the northern portion of Q which extends between these two sites. However, because there are no wells located north and south of Site R, there is little control on contaminant concentrations or migration to these areas. The extent of intermediate/deep groundwater contamination for site Q is poorly defined due to a lack of wells to characterize these zones. However, intermediate or deep zone contamination associated with the central and southern portions of Site Q would be assumed to be minor due to the low levels of contaminants detected in the shallow zone in these areas.

Groundwater modeling was performed by E & E in 1988 to assess the groundwater flow regime and contaminant transport. Simulations were used to predict the future movement of groundwater contaminants and to estimate contaminant loading to the Mississippi River. Average and maximum total loading values from the shallow and intermediate zones were estimated at 47.93 lb/day and 89.3 lb/day, respectively. Including the deep zone, the average and maximum total loading values were estimated at 69.93 lb/day and 219.3 lb/day, respectively.

Containment and Integrity (if known):

There is no known containment for groundwater contamination beneath the Sauget Area 2 sites. All of the disposal sites in this area are unlined, and waste material was observed at depths below the water table in some borings conducted at Site Q. Water levels are generally below the refuse located at Site R, however, groundwater has risen to encounter the fill materials when river levels have exceeded the flood stage elevation of 410 feet MSL (the base of the fill is approximately 406 feet MSL). Sites O and R contain clay caps, which will reduce infiltration at these sites. In contrast, Sites P and Q are covered primarily with cinders and flyash which will not inhibit surface infiltration.

* - Replicate Analyses

** - Prior to analysis, this sample was held by Envirodyne Engineers, Inc. longer than the maximum allowable USEPA holding time.

*** - Envirodyne Engineers, Inc. (St. Louis, MO.) provided the laboratory services for the September 1984 sampling round. ETC (Edison, New Jersey) performed the analyses for the November 1984 through February 1986 sampling programs.

(- Indicates that the compound was not detected at the detection limit which is the value shown next to the symbol.

Sub Total 2	0	0
Total VOCs Analyzed	40,900	61,600

NA Not analyzed.
* Replicate analyses.
** Prior to analysis, this sample was held by Envirodyne Engineers, Inc. longer than the maximum allowable USEPA holding time.
ETC Environmental Testing and Certification, Edison, New Jersey.
EEI Envirodyne Engineers Inc., St. Louis, Missouri.
SL Savannah Laboratories and Environmental Testing, Savannah, Georgia.
SLES Savannah Laboratories and Environmental Services, Inc., Savannah Georgia (formerly Savannah Laboratories and Environmental Testing, Savannah, Georgia).
+ Concentration includes both the cis and trans isomers.
# Concentration includes ortho, para, and meta isomers.
J Estimated value.
b) Envirodyne Engineers, Inc. reported 4 ug/L, 18 ug/L and 10 ug/L for wells GM-25B, GM-27B and GM27C, respectively. Their results did not differentiate between the xylene compounds.
c) Envirodyne Engineers, Inc. reported 66 ug/L, greater than 119 ug/L and 1 ug/L for wells GM-28B, GM-28C and GM-30, respectively. Their results did not differentiate between the xylene compounds.

Base/Neutral Extractable Organic Compounds (concentrations are in ug/L)		
Acenaphthene		<2.1
Acenapthylene		<3.9
Anthracene		<2.1
Benzidine		<49
Benzo(a)anthracene		<8.7
Benzo(a)pyrene		<2.8
Benzo(b)fluoroanthene		<11
Benzo(ghi)perylene		<4.6
Benzo(k)fluoranthene		<3.9
bis(2-Chloroethoxy)methane		<5.9
bis(2-Chloroethyl)ether		<6.3
bis(2-Chloroisopropyl)ether		<6.3
bis(2-Ethylhexyl)phthalate		<11
4-Bromophenyl phenyl ether		<2.1
Butyl benzyl phthalate		<11
2-Chloronaphthalene		<2.1
4-Chlorophenyl phenyl ether		<4.7
Chrysene		<2.8
Dibenzo(a,h)anthracene		<11
1,2-Dichlorobenzene		<2.1
1,3-Dichlorobenzene		<2.1
1,4-Dichlorobenzene		<4.9
3,3-Dichlorobenzidine		<18
Diethylphthalate		<11
Dimethylphthalate		<11
Di-n-butylphthalate		<11
2,4-Dinitrotoluene		<6.3
2,6-Dinitrotoluene		<2.1
Di-n-octylphthalate		<11
1,2-Diphenylhydrazine		<11
Fluoranthene		<2.4
Fluorene		<2.1
Hexachlorobenzene		<2.1
Hexachlorobutadiene		<1.0
Hexachlorocyclopentadiene		<11
Hexachloroethane		<1.8
Indeno(1,2,3-c,d)pyrene		<5.2
Isophorone		<2.4
Naphthalene		<1.8
Nitrobenzene		<2.1
N-Nitrosodimethylamine		<11
N-Nitrosodi-n-propylamine		<11
N-Nitrosodiphenylamine		<2.1
Phenanthrene		<6.0
Pyrene		<2.1
1,2,4-Trichlorobenzene		<2.1
Sub Total 1		0

Table 5-15. Summary of Target Compound List Semivolatile Organic Compound Parameters Detected in Groundwater Samples, Sauget Site R, Monsanto Company, Sauget, Illinois.

Parameters	Sample Identification:	Equipment Blank	Equipment Blank	Equipment Blank
	Sample Date:	6/8/92	6/9/92	6/10/92
	Units:	ug/L	ug/L	ug/L
Aniline		21 J	--	--
Phenol		--	--	--
2-Chlorophenol		--	--	--
1,3-Dichlorobenzene		--	--	--
1,4-Dichlorobenzene		--	--	--
1,2-Dichlorobenzene		--	--	--
2-Methylphenol		--	--	--
4-Methylphenol		--	--	--
Nitrobenzene		--	--	--
2-Chloroaniline		--	--	--
2,4-Dimethylphenol		--	--	--
2,4-Dichlorophenol		--	--	--
1,2,4-Trichlorobenzene		--	--	--
Naphthalene		--	--	--
3-Chloroaniline		--	--	--
4-Chloroaniline		--	--	--
2,4,6-Trichlorophenol		--	--	--
Acenaphthene		--	--	--
4-Nitrophenol		--	--	--
Phenanthrene		--	--	--
Di-n-butylphthalate		--	--	--
Fluoranthene		--	--	--
Pyrene		--	--	--
Butylbenzylphthalate		--	--	--
bis(2-Ethylhexyl)phthalate		13 J	--	3 J
Di-n-octylphthalate		--	--	--
Total SVOCs		34	--	3

ug/L	Micrograms per liter.
J	Estimated value.
E	Compound exceeded the calibration range.
D	Compound determined at a secondary dilution factor.
--	Not detected.
SVOCs	Semivolatile organic compounds.

Only those compounds detected are listed.
