Appendix B

NJDEP March 2007 Sampling Results

April 2007 Site Investigation Report (NJDEP)

SITE INVESTIGATION REPORT
FOR
OLD BRIDGE TOWNSHIP – MARGARETS CREEK PROPERTY
OLD BRIDGE TOWNSHIP, MIDDLESEX COUNTY
April 20, 2007

1. Preliminary assessment. Review of available environmental records was completed. The property, Block 1, lot 54.11, located on Route 35, is not listed in the State's Known Contaminated Sites or Solid Waste Disposal Area databases. The local health department, Middlesex County Department of Public Health, had no records on the property. Old Bridge Township – the site's owner- has no knowledge of the nature of the fill material.

Fig. 1 Site Location

1.1 Review of historic aerial photography revealed the subject to be, in 1930, tidal marsh – with a road traversing southwest –northeast from Route 35 to a cluster of structures on Raritan Bay. In 1974 the filling of a ± 20 acre portion of the site is apparent.

Fig. 2 1930

R2-0001990

Fig. 3 1974 (Showing land filling)

1.2 On December 13, 2006, a limited site investigation was completed to visually characterize fill material via excavation of test pits. Using a skid steer backhoe, representatives of the New Jersey Geological Survey completed 11 test pits biased (using historic aerial photography) to the thickest deposits of fill or based upon evidence of surficial waste materials. Test pits were excavated to native material. Only minor amounts of non-soil materials were encountered and in only one of 11 locations.

Waste materials were evident in numerous locations across the surface of the filled area, several of which included large quantities of what appeared to be shredded automotive battery casings, brick – including apparent refractory brick – and slag, suggesting possible disposal of industrial wastes (see Figures 4 & 5).

Fig. 4 Main access road, showing crushed car battery casings.

Fig. 5 Area of slag, refractory brick & miscellaneous solid waste.

2. Site Investigation.

2.1 Field work. On March 4, 2007, representatives of the Bureau of Environmental Measurements & Site Assessment collected 16 soil samples, biased to areas with accumulations of shredded battery casings and in areas devoid of vegetation in which refractory brick, slag and other waste materials were evident. Samples L-1 through L-13 were collected in areas of accumulated battery casings, for lead analyses. Samples S-1 through S-4 were collected in areas devoid of vegetation in which refractory brick, slag and other waste materials were evident, for the complete Target Analyte List/Target Compound List analyses. The lead and TAL samples were collected in the 0-6" interval beneath waste materials. The TCL samples were collected at 6-12" bgs. Samples for volatile organic compound analyses were collected using Encore coring devices from within the boring.

2.2 Results. Lead was detected in all lead-only sample locations (L-1 though L-13) and at one TCL/TAL location (S-1) at concentrations above the non-restricted future use and restricted future use Soil Cleanup Criteria (400 ppm/600 ppm) with a concentration range of 701 ppm to 146,000 ppm, with an average concentration of 50,482 ppm (See Figure 6.)

Fig. 6 Sample location map.

2.3 Discussion: The detected concentrations of lead significantly exceed the Department's human health-based Soil Cleanup Criteria. Ample visual evidence of human use of the site was observed during the site investigation, including footprints, bike/ATV tracks, campsites and promiscuous dumping.

In addition, the site is situated adjacent to sensitive environmental receptors – the wetlands and open water of the Margarets Creek and Raritan Bay. The site is mapped in the Department's Geographic Information System as "Critical Emergent Wetland" and as foraging habitat for a State-threatened species: the Black-Crowned Night Heron. The proximity of the contaminated areas to wetlands and open water suggests the possibility that contamination may be or may have migrated to these receptors via overland flow in surface runoff or via groundwater.

Given the sample results and potential receptors/exposures, this information was reported to the Department's Environmental Hotline and was assigned case # 07-04-18-1110-28.

3. Recommendation. It is recommended that Green Acres not purchase this property. Old Bridge Township should be advised of the results of the site investigation and be urged to enter a Memorandum of Agreement with the Site Remediation & Waste Management Program to address the contamination. Green Acres may reconsider acquisition of the site upon receipt by the Township of a No Further Action determination by the Site Remediation & Waste Management Program.

Subject: Laurence Harbor Seawall Soil Sampling
Field Sampling Summary Report

At the request of Assistant Director Putnam, a soil sampling event was conducted at the Laurence Harbor Seawall, Old Bridge Township, Middlesex County. For this event a total of 34 soil samples were collected for metals on March 14, 2007. After collection of each sample its location was plotted using a Trimble GPS logger. All samples were collected in accordance with the latest NJDEP Field Sampling Procedures Manual.

These samples were collected at the 0-6" interval after homogenizing the soil using a dedicated stainless steel trowel. An enclosed map is provided to indicate soil sampling locations.

Any questions regarding this sampling event may be directed to me at (609) 584-4280.

The Office of Data Quality, Hazardous Site Science Element, Division of Remediation Management and Response has reviewed the above listed nonaqueous samples according to Full CLP Deliverable Requirements as specified in the Technical Requirements for Site

Remediation, N.J.A.C. 7:26E. A Target Analyte Summary List is provided for your convenience. Specific comments are provided below:

Metals

Samples S1A (711236), S3B (711242), S3C (711243) and S12 (711254) were analyzed undiluted and at 100 fold dilutions because lead, sodium and zinc were present at levels above the linear range of the instrument. The dilution analyses were sufficient to bring the concentrations of lead and zinc within the linear range. The dilutions were too extensive for sodium in the above listed samples and the detection limits were elevated above the Contract Required Quantitation Limits (CRQLs). A 50-fold dilution would have been more appropriate for sodium. The nondetected results and detection levels for sodium in the above mentioned samples are suspect.

The remaining metals data are acceptable with the qualifications resulting from QA/QC outliers in the following analyses: sample spike, sample duplicate, serial dilution, preparation blank and negative drifting.

Should you have any questions regarding this review, please contact this office at 633-0752.

Zinc	7440-66-6	422		422			

FOOTNOTES

1. The reported concentration is quantitatively qualified because it is above the Method Detection Level (MDL) but below the Contract Required Quantitation Limit (CRQL).

2. The reported concentration is quantitatively qualified and may be biased low or the detection limit for the nondetected result may be estimated because the %recovery for the sample spike analysis was below the QA/QC limits of 75-125%.

3. The reported concentration is quantitatively qualified and may be biased high because the %recovery for the sample spike analysis was above the QA/QC limits of 75-125%.

4. The reported concentration is quantitatively qualified because the Relative %Difference between the sample and sample duplicate results was greater than 20%.

5. The reported concentration is quantitatively qualified because the %Difference between the sample result and the Sample Serial Dilution result for this analyte was greater than 10%.

6. The reported concentration in the sample is less than 3 X the value in the method/preparation blank. It is the policy of ODQ to negate the reported value due to probable contamination unrelated to the actual sample.

7. The reported concentration in the sample is greater than 3X the value in the method/preparation blank and is considered "real". However, the reported value must be quantitatively qualified "J" due to method/preparation blank contamination. The "B" qualifier alerts the end-user to the presence of this analyte in the method/preparation blank.

8. The positive result is qualified "J" and may be biased low, the nondetected results are qualified "UJ" and the detection limits may be estimated due to negative drifting of this analyte in the preparation blank.

9. The reported concentration of this analyte is taken from a dilution analysis. The concentration is above the MDL but below the elevated CRQL.

10. The non detected result for this analyte is suspect because the sample was diluted too extensively.

SUBJECT: Quality Assurance Review –**Laurence Harbor Petroleum (SDG 120128)** Site. STL Burlington, Colchester, VT analyzed seventeen nonaqueous samples for TAL Metals according to USEPA CLP SOW ILM05.3.

Field ID	Laboratory ID	Sample Date	Matrix
S13	711256	05/23/2007	NONAQUEOUS
S5A	711257	05/23/2007	NONAQUEOUS

DUP3	711272	05/23/2007	NONAQUEOUS

The Office of Data Quality, Hazardous Site Science Element, Division of Remediation Management and Response has reviewed the above listed nonaqueous samples according to Full CLP Deliverable Requirements as specified in the Technical Requirements for Site Remediation, N.J.A.C. 7:26E. A Target Analyte Summary List is provided for your convenience. Specific comments are provided below:

Metals

Samples S6B (711260), S7B (711263), S8B (711265), S9B (711268), S9C (711269), DUP1 (711270) and DUP2 (711271) were analyzed undiluted and at 100 fold dilutions because lead, sodium and zinc were present at levels above the linear range of the instrument. The dilution analyses were sufficient to bring the concentrations of lead and zinc within the linear range. The dilutions were too extensive for sodium in the above listed samples and the detection limits were elevated above the Contract Required Quantitation Limits (CRQLs). A 50-fold dilution would have been more appropriate for sodium. The nondetected results and detection levels for sodium in the above mentioned samples are suspect.

The remaining metals data are acceptable with the qualifications resulting from QA/QC outliers in the following analyses: sample spike, sample duplicate, serial dilution and preparation blank.

Should you have any questions regarding this review, please contact this office at 633-0752.

C. Dave Diblee, SAS

FOOTNOTES

1. The reported concentration is quantitatively qualified because it is above the Method Detection Level (MDL) but below the Contract Required Quantitation Limit (CRQL).

2. The reported concentration is quantitatively qualified and may be biased low or the detection limit for the nondetected result may be estimated because the %recovery for the sample spike analysis was below the QA/QC limits of 75-125%.

3. The reported concentration is quantitatively qualified because the Relative %Difference between the sample and sample duplicate results was greater than 20%.

4. The reported concentration is quantitatively qualified because the %Difference between the sample result and the Sample Serial Dilution result for this analyte was greater than 10%.

5. The reported concentration in the sample is greater than 3X the value in the method/preparation blank and is considered "real". However, the reported value must be quantitatively qualified "J" due to method/preparation blank contamination. The "B" qualifier alerts the end-user to the presence of this analyte in the method/preparation blank.

6. The reported concentration in the sample is less than 3 X the value in the method/preparation blank. It is the policy of ODQ to negate the reported value due to probable contamination unrelated to the actual sample.

7. The reported concentration is quantitatively qualified and may be biased high because the %recovery for the sample spike analysis was above the QA/QC limits of 75-125%.

8. The reported concentration of this analyte is taken from a dilution analysis. The concentration is above the MDL but below the elevated CRQL.

9. The non detected result for this analyte is suspect because the sample was diluted too extensively.

Memorandum

To: Fred Mumford, Case Manager
Remedial Response Element

AUG 6 2007

From: Jerry R. Schoenleber, Section Chief JRS
Environmental Measurements Section

Subject: Margaret's Creek Lead Contamination – A4639300
Soil Sampling – July 24, 2007

At your request the Environmental Measurements Section conducted surface soil sampling at the Old Bridge Waterfront Walkway at Laurence Harbor on July 24th, 2007. This event constitutes the second round of sampling, the first being conducted in May of this year. Soil associated with the seawall analyzed during the first event revealed elevated levels of lead, antimony and arsenic. This prompted a second round of surface soil sampling to further investigate the expanse associated with the park where exposure to walkway users would most likely occur. Thirty-one locations were chosen over the park area including an expanse of beach east of the footbridge over Margaret's Creek. The attached maps depict sample locations that were fixed using global positioning satellites. All samples were collected from the 0-6 inch depth interval using dedicated decontaminated stainless steel trowels.

As a precautionary measure, a radiation meter (Micro R/Model 19 w/ Gamma probe) was used to scan the crucible slag waste material along the seawall between S29 and S30 and again at locations S34 and S35. Reading never went above the background measurement of 5-6 mR/hr. Based on these observations, it may be assumed that the crucible slag presents no immediate radiological concerns.

Samples were shipped to Test America in Burlington, Vermont for trace metals analysis per state contract A57425 line item #50. Results should be available on or about August 26th. If you have any questions regarding sample collection or the status of samples analysis please contact the writer @ 588-3104.

The Office of Data Quality, Hazardous Site Science Element, Division of Remediation Management and Response has reviewed the above listed nonaqueous samples according to Full CLP Deliverable Requirements as specified in the Technical Requirements for Site Remediation, N.J.A.C. 7:26E. A Target Analyte Summary List is provided for your convenience. Specific comments are provided below:

R2-0002027

Metals

The metals data are acceptable with the qualifications resulting from QA/QC outliers in the following analyses: sample spike, sample duplicate, serial dilution, negative drifting and preparation blank.

Should you have any questions regarding this review, please contact this office at 633-0752.

C. Ed Putnam, RPDE

FOOTNOTES

1. The reported concentration is quantitatively qualified because it is above the Method Detection Level (MDL) but below the Contract Required Quantitation Limit (CRQL).

2. The positive result is qualified "J" and may be biased low, the nondetected results are qualified "UJ" and the detection limits may be estimated due to negative drifting of this analyte in the preparation blank.

3. The reported concentration in the sample is greater than 3X the value in the method/preparation blank and is considered "real". However, the reported value must be quantitatively qualified "J" due to method/preparation blank contamination. The "B" qualifier alerts the end-user to the presence of this analyte in the method/preparation blank.

4. The reported concentration is quantitatively qualified and may be biased low or the detection limit for the nondetected result may be estimated because the %recovery for the sample spike analysis was below the QA/QC limits of 75-125%.

5. The reported concentration is quantitatively qualified because the Relative %Difference between the sample and sample duplicate results was greater than 20%.

6. The reported concentration is quantitatively qualified because the %Difference between the sample result and the Sample Serial Dilution result for this analyte was greater than 10%.

The Office of Data Quality, Hazardous Site Science Element, Division of Remediation Management and Response has reviewed the above listed nonaqueous samples according to Full CLP Deliverable Requirements as specified in the Technical Requirements for Site Remediation, N.J.A.C. 7:26E. A Target Analyte Summary List is provided for your convenience. Specific comments are provided below:

Metals

The metals data are acceptable with the qualifications resulting from QA/QC outliers in the following analyses: sample spike, sample duplicate, serial dilution, negative drifting and preparation blank.

Should you have any questions regarding this review, please contact this office at 633-0752.

FOOTNOTES

1. The reported concentration is quantitatively qualified because it is above the Method Detection Level (MDL) but below the Contract Required Quantitation Limit (CRQL).

2. The positive result is qualified "J" and may be biased low, the nondetected results are qualified "UJ" and the detection limits may be estimated due to negative drifting of this analyte in the preparation blank.

3. The reported concentration is quantitatively qualified and may be biased low or the detection limit for the nondetected result may be estimated because the %recovery for the sample spike analysis was below the QA/QC limits of 75-125%.

4. The reported concentration is quantitatively qualified because the Relative %Difference between the sample and sample duplicate results was greater than 20%.

5. The reported concentration is quantitatively qualified because the %Difference between the sample result and the Sample Serial Dilution result for this analyte was greater than 10%.

NOTES

1. Base Map and proposed sewer layout from R3M Engineering, Inc. "Plan and Profile" drawings dated February 24, 2005.
2. All soil borings were performed using Geoprobe direct-push boring equipment.
3. Deep fill samples (>1' bgs) collected from soil borings SB-1A,B,C through SB-6A,B,C were laboratory analyzed for full TCL and TAL. The surficial soils at these locations were field screened for metals using X-ray fluorescence (XRF), with minimum 20% laboratory analysis for TAL metals and base-neutral semivolatile compounds.
4. Surficial soil samples B-1 (A, B, C) through B-7 (A, B, C) were field screened for metals using XRF, with minimum 20% laboratory analysis for TAL metals.
5. Results shown exceed the NJDEP Residential Direct Contact Soil Cleanup Criteria (RDCSCC).
6. Laboratory results are shown in gold. XRF Results are shown in silver.

EXECUTIVE SUMMARY

Icon Engineering, the Environmental and Geotechnical Division of CME Associates (ICON/CME), has conducted a limited site investigation in the Laurence Harbor Interceptor Sewer construction easement located on Lots 54.11 and 54.12 in Block 1 of the Township of Old Bridge, Middlesex County, New Jersey (NJDEP Case No. 07-04-18-1110-28). This work was performed on behalf of the Old Bridge Municipal Utilities Authority (OBMUA) and R3M Engineering Inc. pursuant to a Memorandum of Agreement (MOA) between the OBMUA and the New Jersey Department of Environmental Protection (NJDEP), and in accordance with the Bias for Action condition of the Technical Requirements of Site Remediation (NJAC 7:26E-1.11). The site investigation activities were limited to an investigation of fill materials located within a 40-foot wide sanitary sewer construction easement that traverses an approximately 60-acre open space parcel. The OBMUA plans to abandon a failing gravity sewer line that extends from State Highway Route 35 to a Pump Station near Raritan Bay and install a new 30-inch diameter ductile iron pipeline on the site.

The main objective of this site investigation was to characterize the extent and environmental quality of fill materials within the construction easement and specify an appropriate workplan for the remediation of any contaminated soils. The field investigation included twenty-three (23) soil borings and seven (7) test pits. Surficial soils were screened for metal contaminants using an XRF analyzer. A total of eighteen (18) surficial and eight (8) deep discrete fill samples were collected for laboratory analysis. Three (3) existing shallow monitoring wells were sampled to evaluate groundwater quality.

The fill layer in the area of investigation consists of sandy to clayey soil that varies from 7.5 to 15 feet thick. Elevated lead levels were observed in surficial soil samples from 0 to 1-foot bgs along a 400-foot section of the easement between station 6+00 and station 10+00. Lead levels ranged up to 24,000 mg/kg, compared to the most stringent soil cleanup criterion of 400 mg/kg. The lead contaminated soil is typically gravelly sand that comprises the surface of existing dirt roadways and contains varying amounts of battery casing chips. Antimony was also detected at levels exceeding the cleanup criteria. No correlation is evident between the groundwater quality at the site and the surficial soil contamination; lead was below the Class IIA standard in each of the three groundwater samples.

A remedial action workplan is proposed that includes excavation and offsite disposal of the contaminated soil. Post-excavation XRF sampling with laboratory confirmation will be performed to document the effectiveness of the remediation.

1.0 INTRODUCTION

Icon Engineering, the Environmental and Geotechnical Division of CME Associates (ICON/CME), has conducted a limited site investigation in the Laurence Harbor Interceptor Sewer construction easement located on Lots 54.11 and 54.12 in Block 1 of the Township of Old Bridge, Middlesex County, New Jersey (NJDEP Case No. 07-04-18-1110-28). This work was performed on behalf of the Old Bridge Municipal Utilities Authority (OBMUA) and R3M Engineering Inc. pursuant to a Memorandum of Agreement (MOA) between the OBMUA and the New Jersey Department of Environmental Protection (NJDEP), and in accordance with the Bias for Action condition of the Technical Requirements of Site Remediation (NJAC 7:26E-1.11). Pursuant to the Bias for Action, contaminated media should be contained and/or stabilized to prevent exposure to receptors and prevent movement of contaminants through any pathway. In accordance with the MOA the site investigation was limited to an investigation of fill materials located in the sewer construction easement. Additional areas of concern on the site, if any, were not investigated and are not the responsibility of OBMUA.

The site investigation activities were limited to an investigation of fill materials located within a 40-foot wide sanitary sewer construction easement that traverses an approximately 60-acre open space parcel (**Figure 1** and **Figure 2**). The OBMUA plans to abandon a failing gravity sewer line that extends from State Highway Route 35 to a Pump Station near Raritan Bay. A new 30-inch diameter ductile iron pipeline will be installed along a different route.

In April 2007, the New Jersey Department of Environmental Protection (NJDEP) conducted limited soil sampling in order to characterize the fill material on portions of the property (**Appendix A**). Fill soils that locally included accumulations of shredded battery casings, slag, refractory brick, and other waste materials were locally encountered. Elevated concentrations of lead were detected in fill samples at several locations. The NJDEP issued a Notice of Violation (April 18, 2007) to the Township of Old Bridge, citing violations of the Solid Waste Management Act (NJSA 13:1E-1 et seq.) and the Solid Waste Utility Control Act (NJSA 48:13A-1 et seq.) related to the disposal of solid waste on the property as a fill material in the area of Margaret's Creek.

The main objective of this site investigation was to characterize the extent and environmental quality of fill materials within the construction easement. Based on this information, an appropriate workplan for the remediation of contaminated soils in the sewer line construction easement was prepared.

R2-0002059

2.0 PROPERTY DESCRIPTION AND PHYSICAL SETTING

2.1 Location

The 40-foot wide sewer construction easement is located on portions of Lots 54.11 and 54.12 in Block 1 of the Township of Old Bridge ('the site'). The site is located in the Laurence Harbor section of Old Bridge Township, and fronts on Route 35 North (**Figure 1** and **Figure 2**). An existing dirt road extends from a gate on Route 35 northeast toward Raritan Bay. Access is also available through the OBMUA sewage pump station facility located on Boulevard West.

2.2 Topography and Drainage

Based on the Topographic Survey of the Township of Old Bridge (Sheet No. N-3), existing surface elevations along the proposed pipeline route range from approximately 5 to 15 feet msl (NGVD 1988). Elevations in fill areas on the site are locally as high as 28 feet msl. Marquis Creek (a.k.a. Margaret's Creek) is located in the northern portion of the site. Slopes across the easement are generally gentle and oriented to the northwest, north, or northeast. Coastal and freshwater wetlands are present in substantial portions of the site. The Raritan Bay borders the northeast side of the site.

2.3 Geology and Hydrogeology

Surface materials mapped in the project area include estuarine deposits, beach deposits, and artificial fill (Surficial Geology of the Keyport Quadrangle; NJGS OFM 46, 2002; **Figure 3**). Estuarine deposits are mapped over a majority of the site and are typically comprised of salt marsh sediments including silt and clay, fine sand, and peat. Beach deposits are comprised of sand and pebble gravel, and are mapped along Raritan Bay. Artificial fill is mapped above the marsh deposits in the central western portion of the site, as well as along the dirt road that leads to the beach at Raritan Bay.

Surficial geologic deposits in the project area are underlain by the upper Magothy Formation (Bedrock Geologic Map of Central New Jersey, USGS Map I-2540-B, 1998). The Magothy generally consists of sand interbedded with dark gray clays or silts, and is often characterized by rapid lateral and vertical changes in composition.

R2-0002060

3.0 PREVIOUS INVESTIGATIONS

3.1 Site History and Operations

The NJDEP Site Investigation Report (April 18, 2007; **Appendix A**) includes a review of historical aerial photography of the project site. In a 1930 photograph, the property is dominantly tidal marsh. A dirt road traversed the property from Route 35 northeast to Raritan Bay. Several buildings of unidentified use were located along the beach on Raritan Bay. In a 1974 photograph, fill is evident in an approximately 20 acre area of former marshland in the southwestern portion of the site. Residential developments of single family homes are located to the northwest and southeast of the site. The site is currently vacant and is generally comprised of woodland, marshland, and beachfront. A portion of former marsh area in the northwestern part of the site is now open water. The existing Laurence Harbor interceptor sewer located on the property is maintained by the OBMUA.

3.2 Environmental Sampling

Three previous investigations have been conducted at the site. In July 2004, a geotechnical investigation was performed by Icon Engineering to characterize the subsurface conditions along the proposed pipeline route. Eight (8) soil borings were performed in the sewer easement. In addition, three (3) monitoring wells were installed to measure shallow groundwater levels. The geotechnical investigation included limited environmental testing of soil and groundwater to provide a preliminary characterization of waste material that might be generated during construction. Two surficial soil samples (0 to 2 feet bgs) were collected and analyzed for priority pollutants (PP+40). All targeted parameter concentrations were below the most stringent soil cleanup criteria (**Appendix B**). One groundwater sample was collected from each of the three wells, and a single composite sample was analyzed for PP+40. The targeted parameters were either not detected or were detected at concentrations below the New Jersey Class IIA Groundwater Quality Standards (**Appendix B**).

In April 2005, a limited investigation was performed by Icon Engineering to characterize approximately 200 cubic yards (CY) of soil stockpiled in roughly 40 individual piles in the central portion of the site, to the north of the construction easement. The stockpiled soil was being considered as potential backfill material for the sewer installation project. Six (6) soil samples were collected and analyzed for PP+40. No contaminant concentrations exceeded the most stringent NJDEP soil cleanup criteria (**Appendix B**).

In December 2006 and March 2007, the NJDEP conducted a limited site investigation of fill materials on the property. Eleven (11) test pits were excavated to visually characterize the fill material; the test pits were biased to the thickest deposits of fill or to areas with evidence of surficial waste materials. Waste materials observed at several locations in the fill included shredded automotive battery casings, refractory brick, and slag. In March 2007, sixteen (16) soil samples were collected from the fill layer. Samples L-1 through L-13 were collected in areas of accumulated battery casings and analyzed for lead. Samples S-1 through S-4 were collected in areas where refractory brick, slag, and other waste materials were evident, and analyzed for the complete Target Analyte List/Target Compound List (TAL/TCL). Lead exceeded the non-restricted future use soil cleanup criteria (400 ppm) and the restricted use soil cleanup criteria (600 ppm) in fourteen (14) samples (L-1 through L-13 and S-1). In the samples that exceeded the remedial standards the lead level ranged from 701 ppm to 146,000 ppm, with an average concentration of 50,482 ppm. A copy of the NJDEP Site Investigation Report is provided in **Appendix A**.

4.0 TECHNICAL OVERVIEW

The scope of work for the site investigation was based on a Limited Site Investigation Workplan (May 2007) approved by the NJDEP. The main objective of the investigation was to characterize the composition and environmental quality of fill materials within the 40-foot wide construction easement. This information would then be used to evaluate the need for any remediation that might be required in order to implement the sewer construction project. Sample locations are shown on **Figure 4**, and a sampling summary for the site investigation is presented in **Table 1**. Photographs of sample locations are included in **Appendix C**. Sampling was performed in general accordance with the NJDEP Field Sampling Procedures Manual (August 2005).

4.1 Fill Investigation

For the purpose of the investigation, the construction easement is divided into two areas: (1) the main fill area (Station 0+00 to 13+00) and (2) the road/beach area (Station 13+00 to 27+00). The investigation activities were concentrated in the main fill area where historic aerial photos indicate most fill materials on the property were placed. In order to facilitate the field activities, the centerline of the proposed pipeline was survey located with stations marked at 100-foot intervals.

a. Surficial Soil Sampling: XRF Analysis

Metals concentrations in surficial soil samples were screened in the field using a portable X-Ray Fluorescence (XRF) analyzer in general conformance with EPA Method 6200 (Field Portable XRF Spectrometry for the Determination of Elemental Concentrations in Soil and Sediment). The XRF equipment employed in this investigation was manufactured by Innov-X Systems, Inc. (Alpha Series). The equipment uses an energy dispersive x-ray fluorescence method to measure elemental concentrations of thirteen (13) different metals (Hg, Sb, As, Cd, Cr, Co, Cu, Fe, Pb, Mn, Ni, Se, and Zn).

Samples from 0 to 6-inches bgs were collected with a decontaminated stainless steel trowel and placed in individual one-quart plastic bags. Larger gravel and organic fragments were removed and the sample was homogenized (soil clumps were broken and the sample was mixed by kneading the plastic bag). The bagged samples were then analyzed, with the sample thickness typically at least one inch. Replicate measurements of selected samples were performed to qualitatively evaluate the precision of the method and to confirm certain readings.

R2-0002063

In the main fill area, the surficial soils were screened at stations typically spaced at 100-foot intervals (sample stations B-1 through B-7 and SB-1 through SB-6; **Figure 4**). At each station, three (3) samples were typically collected: one sample approximately 10-feet to the left of the centerline (sample A), one sample on the centerline (sample B), and one sample 10-feet to the right of the centerline (sample C). Three (3) additional surficial samples were collected in a suspect fill area in an existing dirt roadway (B-4D, B-4E, and B-5D). Additionally, one (1) sample was collected from 6 to 12-inches bgs (B-4E 0.5-1.0').

A total of forty-three (43) surficial soil samples in the main fill area were therefore screened with the XRF analyzer (**Table 6**). Fifteen (15) of these soil samples (35%) were also analyzed in a laboratory. The samples for laboratory analysis were transferred directly from the XRF bag to laboratory bottles. Six (6) surficial samples were analyzed for TAL metals and TCL base-neutral semi-volatile compounds (SB-1B, SB-2C, SB-3B, SB-4B, SB-5B, and SB-6C; **Table 2**). Nine (9) samples were only analyzed for TAL metals in order to provide additional confirmation on the XRF results (**Table 3**).

In the road/beach area, the surficial soils were screened with the XRF analyzer at approximately 250-foot intervals (samples S-1 through S-3 and S-1A through S-3A; **Figure 4**; **Table 6**). At each location, one sample collected along the pipe centerline was screened. Three (3) of the samples were also analyzed in a laboratory for TAL metals (S-1 through S-3; **Table 4**).

b. Test Pits

Test pits were excavated at seven (7) locations in the main fill area (TP-1 through TP-7; **Figure 4**). The purpose of the test pits was to evaluate the fill composition, including any larger debris or rubble that may potentially be present in the fill layer. Hill Remediation and Construction Services (Pennington, New Jersey) performed the test pit excavations on May 14, 2007, as directed in the field by ICON/CME. A rubber-tire backhoe was utilized. The depth of the test pits varied between 6 and 12 feet bgs. Test pit logs are included in **Appendix D**.

c. Soil Borings

Geoprobe direct-push soil borings were performed to evaluate the fill composition and thickness and to collect samples for laboratory analysis (SB-1 through SB-6, GB-1 through GB-5; **Figure 4**). In the main fill area, sets of soil borings were performed at stations typically spaced at 200-foot intervals (SB-1 through SB-6). At each station,

R2-0002064

three (3) borings were performed: boring A was located approximately 10-feet to the left of the centerline, boring B was located on the centerline, and boring C was located approximately 10-feet to the right of the centerline. Additional borings were performed to evaluate the fill thickness at selected intermediate locations along the centerline (GB-1 through GB-5). A total of twenty-three (23) soil borings were performed. The borings were advanced until the natural soil profile was encountered, and the depth of the borings ranged from 10 to 20 feet bgs. Boring logs are included in **Appendix D**.

Hill Remediation and Construction Services (Pennington, New Jersey) performed the soil borings on May 11 and 14, 2007, as directed in the field by ICON/CME. Geoprobe 66DT boring equipment was utilized, with approximately 2-inch diameter soil cores retrieved in 5-foot long dedicated disposable acetate sleeves. All soils were screened for any volatile emissions with a photo-ionization detector (MiniRAE 2000 PID). Boreholes were backfilled with the soil cuttings.

d. Soil Sampling and Laboratory Analysis

Surficial Soil Sample Collection

Surficial soil samples were collected from the 0 to 6-inch depth interval using a decontaminated stainless steel trowel. All surficial soil samples were initially placed in individual one-quart plastic bags and screened in the field using a portable XRF analyzer (see Section 4.1a above). Larger gravel and organic fragments were removed and the sample was homogenized. Upon completion of the XRF screening, samples for laboratory analysis were transferred directly from the XRF bag to laboratory bottles.

The purpose of the laboratory analysis of surficial soil samples was to:

(1) Characterize typical historic fill contaminants in the upper portion of the fill layer (this may include contaminants associated with specific fill materials as in roadways, as well as contaminants that may have migrated down-gradient from known contaminated areas as a result of erosion and sediment transport); and

(2) Provide confirmation of the XRF results.

In the main fill area, a total of fifteen (15) surficial samples were collected for laboratory analysis. Six (6) surficial samples were analyzed for TAL metals and TCL base-neutral semi-volatile compounds (SB-1B, SB-2C, SB-3B, SB-4B, SB-5B, and SB-6C; **Table 2**). Nine (9) surficial samples were only analyzed for TAL metals (**Table 3**).

R2-0002065

In the road/beach area, three (3) surficial soil samples were collected for laboratory analysis of TAL metals (S-1 through S-3; **Figure 4**). Where present, surficial soil samples were biased to areas of suspected contamination (e.g. soil containing battery casing chips).

Deep Soil Sample Collection

Deeper samples in the main fill area were collected from the Geoprobe soil borings (see Section 4.1c above). A total of eight (8) soil samples were collected from the fill layer at depths that varied between 1.5 and 9-feet bgs. Discrete samples were collected from 6-inch intervals and transferred directly from the boring sleeves to laboratory bottles. Samples were biased to possible indications of contamination, if any. Where distinctly different types of fill soils were present, discrete samples of each type were collected.

The purpose of the laboratory analysis of the deeper samples was to characterize potential contamination in the different fill types placed on the site. Each sample was analyzed for the full Target Compound List (TCL) and Target Analyte List (TAL) contaminants (**Table 2**).

4.2 Groundwater Sampling

a. Monitoring Wells

In July 2004, three (3) groundwater monitoring wells were installed in or immediately adjacent to the sewer construction easement (MW1, MW2, MW3; **Figure 4**). The purpose of the wells was to measure shallow water levels and collect information needed to evaluate dewatering requirements for the proposed pipeline installation. Each well consists of 4-inch diameter PVC casing installed in an approximately 10-inch diameter auger borehole. The nominal well depths are 20 feet (MW1) and 15 feet (MW2 and MW3). The lower 10 feet of each well was screened with prefabricated 10-slot (0.010-inch) PVC screen. The wells were generally screened in the silty marsh deposits in which much of the pipeline excavation is expected to occur. A filter pack of No. 1 quartz sand was placed between the PVC screen and the borehole wall, from the bottom of the borehole to approximately 1 foot above the top of the screen. An approximately 1-foot thick bentonite seal was installed above the filter pack, and the portion of the borehole above the seal was backfilled with drill cuttings. A stick-up steel outer casing and concrete cap was installed at the top of each well. As-built well construction details are presented in **Appendix E**. The wells were initially developed at the time of installation as well as during pump tests conducted in July 2004. On May 3, 2007, the wells were re-developed using a submersible pump.

R2-0002066

b. Sample Collection and Laboratory Analysis

In order to obtain an assessment of groundwater quality along the construction easement, the existing wells MW-1, MW-2, and MW-3 were sampled on May 17 and 18, 2007. Static water levels were measured with an electronic water probe. A peristaltic pump and dedicated disposable polyethylene tubing was used to purge the wells, with the pump intake set approximately midway in the pre-purge static water column. Water quality indicator parameters including temperature, pH, conductivity, turbidity, and salinity were monitored during purging using a multi-parameter water quality meter (Horiba U22). Monitoring well field sampling forms are included in **Appendix F**. After a sufficient water volume was removed, the pump rate was reduced to a low flow condition (~0.5 l/min). Samples were collected after the water quality parameters had stabilized at low flow. Samples for metals analysis were collected first by transferring the pump outflow directly into laboratory bottles. Samples for volatile organics analysis were then collected using dedicated disposable Teflon bailers. Samples were transferred in the field to laboratory bottles with appropriate preservative as required. Samples from each well were analyzed for TCL volatile organic compounds (TCL VO+10) and for TAL metals.

4.3 Quality Assurance

The data quality objective for the limited site investigation was to provide an initial characterization of the historic fill materials present in the sewer construction easement. The investigation included the collection and laboratory analysis of soil and groundwater samples as described in previous sections. Quality assurance protocol included the following:

- All sample bottles were stored in a cooler with ice packs and delivered to a New Jersey certified laboratory with proper chain-of-custody (Hampton-Clarke, Inc. Veritech Laboratories; NJEP Certification No. 14622).
- Sample containers of sufficient volume for the specified target parameters were provided by the laboratory, including appropriate sample preservatives where required. Samples were submitted to the laboratory within 48 hours of collection. All sample holding times for the specified analyses were in conformance with the NJDEP Field Sampling Procedures Manual (August 2005).
- Non-aqueous laboratory samples were analyzed using EPA specified methods (Test Methods for Evaluating Solid Waste, SW-846, Third Edition); aqueous samples were analyzed using appropriate methods, including EPA SW-846, 40 CFR Part 136, and the Method for the Chemical Analysis of Water and Wastes (EPA 600/4-79-020).

R2-0002067

- Laboratory results are in a Reduced Laboratory Data Deliverable format that complies with NJAC 7:26E-2.1. Laboratory non-conformance summaries are included in the reduced deliverable reports.
- Reporting Limits (RL) for target analytes for EPA SW846 methods are reported to the Practical Quantitation Limit (PQL).
- The applicable remediation standards used to evaluate the soil analytical results are the NJDEP Soil Cleanup Criteria (last revised May 12, 1999). RL that exceed the unrestricted use SCC for individual target contaminants are indicated in the analytical result summary tables.
- The applicable remediation standards used to evaluate the surface water analytical results are the Ground Water Quality Standards (NJAC 7:9C). RL that exceed the applicable groundwater quality standards for individual target contaminants are indicated in the analytical result summary tables.
- Dedicated disposable sampling equipment was used where possible (e.g., Geoprobe acetate sleeves, polyethylene and silicon pump tubing).
- Soil samples for volatile organics analysis were collected in individual 25-gram EnCore type samplers.
- Reusable sampling equipment (e.g., stainless steel trowels) were decontaminated in the field using the following procedure: (1) removal of heavy soil; (2) scrub with Alconox detergent solution; (3) rinse with distilled water and air dry; and (4) rinse with 5% acetic acid solution and air dry.
- One field blank sample was collected to confirm the decontamination procedure. In the field during the sampling activities, laboratory provided de-ionized water was run over decontaminated sampling equipment (e.g. stainless steel trowel) directly into lab bottles. The field blank sample was analyzed for the same parameters as the soil samples (TCL VO+10, BNA+25, and TAL metals).
- Trip blanks accompanied the laboratory bottle shipments for each aqueous sampling event (Trip Blank 5-11-07 and Trip Blank 5-18-07). The trip blanks were analyzed for volatile organic compounds (VO+10).

R2-0002068

5.0 SITE INVESTIGATION FINDINGS

Sample analytical results with comparison to the applicable remediation standards are summarized in **Table 2** through **Table 5**. XRF results are summarized in **Table 6**. Soil boring and test pit logs are included in **Appendix D**. Laboratory summary reports are included as **Appendix G**, and the Reduced Data Delivery Reports are included as **Attachment A**.

5.1 Extent and Composition of Fill Layer

The approximate vertical limit of the fill layer is shown in a cross-section along the proposed pipeline (**Figure 5**). The thickness of the fill layer within the area of investigation varies from about 7.5 to 15 feet. The elevation of the base of the fill layer varies from +5 to -5 feet msl.

The following observations regarding the fill composition are noted:

- The fill material encountered in the investigation consists of soils varying from brownish yellow sand to dark gray clay.
- The surficial fill in and adjacent to the roadway area from station 7+00 to station 9+00 is typically fine to medium sand with little gravel and little silt; the gravel fraction includes quartz pebbles, brick fragments, and black plastic battery casing chips. The battery casing chips are most abundant in the upper 6-inches and are consistent with the material present in other areas of the site that were previously investigated by the NJDEP (**Appendix A**).
- Buried rubble and debris consisting of concrete, wood, and a rubber tire was encountered at one location in the fill layer (TP-6).
- No elevated PID readings or odors indicative of contamination were observed in the fill layer.
- The undisturbed natural soil profile directly beneath the fill layer is variable, and includes mottled gray and yellowish brown silt with little sand, soft dark gray organic silt with little peat, and stiff dark gray clay and silt.

R2-0002069

5.2 Environmental Quality of Fill Materials

The analytical results for both the XRF field screening and laboratory soil testing are compared to the New Jersey Soil Cleanup Criteria (SCC; last revised May 12, 1999). The laboratory results for soil analyses are summarized in **Table 2** through **Table 4**. XRF results are summarized in **Table 6**. Samples with detected contaminants that exceed the SCC are indicated in **Figure 6**.

Based on both the XRF and the laboratory analyses, the following observations regarding contamination in the fill soils are noted:

- Elevated lead levels were observed in surficial soil samples from station 7+00 to station 9+00. Lead levels ranged up to 24,000 mg/kg (Sample B-4E), compared to the direct contact soil cleanup criterion of 400 mg/kg for residential use and 600 mg/kg for non-residential use. The samples with high lead levels corresponded to the sandy soils that contained trace amounts of battery casing chips.
- The antimony level was elevated in the surficial soil sample at location B-4E. Antimony was detected at 110 mg/kg, compared to the most stringent SCC of 14 mg/kg.
- The metals contamination appears to be limited to surficial soils. The highest laboratory confirmed lead concentration in the easement was 24,000 mg/kg at sample location B-4E from 0 to 6-inches bgs. The lead concentration was 610 mg/kg in a sample from 6 to 12-inches bgs at the same location. Antimony and arsenic levels were below the SCC in this sample. The targeted metal levels in deeper fill soils throughout the area of investigation were generally below the most stringent SCC; a slightly elevated arsenic level in one sample may reflect a naturally occurring condition.
- Arsenic was detected at 23 mg/kg in a sample from 8.5 to 9.0 feet bgs at location SB-4C. The most stringent SCC for arsenic is 20 mg/kg. The slightly elevated arsenic concentration in this sample is likely naturally occurring due to the presence of regraded silty marsh soils in the fill layer.
- The XRF results for lead, the main contaminant of concern at the site, were generally consistent with the analytical laboratory confirmation results (**Table 7**). The XRF results compared less favorably for other potential metal contaminants, including mercury, cadmium, and arsenic. Based on the laboratory results, these metals are not contaminants of concern at the site.
- No surficial or deep contamination in the fill layer is indicated from pipeline station 0+00 through station 6+00.

R2-0002070

- No surficial or deep contamination in the fill area is indicated from pipeline station 10+00 through station 13+00.
- No surficial contamination is indicated in the road/beach area from pipeline station 13+00 through station 27+00.

The lead and antimony contamination appears to be restricted to surficial soils in a limited area of the construction easement. The contaminated area extends from some point prior to pipeline station 7+00 to some point after station 9+00, and is near the intersection of two existing dirt roads. The lead contaminated soil is typically gravelly sand that comprises the road surface and contains varying amounts of battery casing chips. Elevated lead levels are commonly associated with soils containing crushed battery debris. The battery chips may have been placed as a type of gravel to stabilize portions of the roadway, or may have been tracked along the roadway from a source area. More abundant battery chips are evident at the surface along the main site roadway near the Route 35 site entrance, in one of the areas previously investigated by the NJDEP. In that area of the site, lead levels as high as 106,000 mg/kg were reported in surface soils. Regardless of how the contamination originated, the lead contamination in the pipeline easement appears to be a surficial problem and does not significantly extend below a depth of about 1-foot bgs. In the area of investigation, no battery casing debris was observed below the upper one foot of soil.

5.3 Groundwater Quality

Groundwater sampling results are summarized in **Table 5** with comparison to the Class IIA Groundwater Quality Standards (GWQS; NJAC 7:9C). Contaminants that exceed the Class IIA are indicated in **Figure 7**. The following observations regarding groundwater quality at the site:

- In the MW-1 sample, iron and manganese exceeded the GWQS. Additionally, the field measured pH was low.
- In the MW-2 sample, aluminum, arsenic, beryllium, iron, manganese, and sodium exceeded the GWQS. Additionally, the field measured pH was low.
- In the MW-3 sample, iron and manganese exceeded the GWQS. Additionally, the field measured pH was low.

No correlation is evident between the groundwater quality and the surficial soil contamination that is locally present in the easement or in other areas of the site. The primary contaminant of concern at the site is lead, and lead was below the Class IIA standard in each of the three wells. The groundwater quality at the site, particularly in the MW-2 area, likely reflects the marsh conditions. The MW-2 well is screened in

R2-0002071

naturally acid-producing organic silt marsh deposits that were locally disturbed and aerated by the well installation. Regardless, due to the site location adjacent to the saline waters of Raritan Bay, the shallow groundwater at the site is likely not suitable for potable use. The actual classification for the site groundwater would likely be Class III.

R2-0002072

6.0 REMEDIAL ACTION WORKPLAN

6.1 Remedial Action Selection

Contaminated fill material is present within limited portions of the sewer construction easement. Upon excavation the contaminated soil would become a regulated waste material and must be appropriately managed as such. The remediation of the contaminated fill material within the construction easement will thus be coordinated with the sewer construction activities. Due to the apparent limited extent of contamination in the easement, excavation and offsite disposal of the contaminated fill is a feasible remedial approach. The remedial activities should be completed prior to the initiation of pipeline construction in this area of the easement. Any contaminated areas outside the construction easement are not the responsibility of the OBMUA and are not addressed in this workplan.

6.2 Contaminants of Concern and Remedial Standards

The site investigation findings indicate that contaminated soil is only present in a limited section of the construction easement and appears to be surficial. Based on the laboratory analytical results, the contaminants of concern are metals including lead, antimony, arsenic, and chromium. Each of these metals was detected at concentrations that exceed the most restrictive soil remediation standards. The applicable remediation standards for this project are the New Jersey Residential Direct Contact Soil Cleanup Criteria (RDCSCC; last revised May 12, 1999) as follows:

Parameter	RDCSCC (mg/kg)
lead	400
antimony	14
arsenic	20
hexavalent chromium	240*

*Non-Residential SCC for hexavalent chromium is 20 mg/kg

6.3 Excavation Limits

Based on the verified clean locations as indicated by the available laboratory analytical data, the maximum longitudinal extent of soil contamination extends from station 6+00 to station 10+00 (**Figure 8**). A full delineation was not performed, so the contamination is assumed to extend laterally through the full 40-foot width of the easement. Based on the limited vertical delineation sampling within this area of the easement, the vertical extent of contamination is assumed to extend to 1-foot bgs. Thus, the maximum estimated

R2-0002073

volume of contaminated soil is approximately 600 cubic yards (CY). Based on the XRF field screening, the limits of the excavation may be modified (increased or decreased) at the time of remediation.

6.4 Restricted Access Areas

The lateral extent of contamination outside the 40-foot wide construction easement has not been delineated. Site access during remedial and construction activities will therefore be restricted in order to avoid the disturbance of potentially contaminated soils outside the immediate remediation area. The remediation area, staging area, and construction access road are indicated on the soil remediation plan (**Figure 8**). Appropriate safety fencing will be installed at the limit of the remediation area in order to provide a visual and physical barrier that will prevent disturbance outside the remediation area.

Additionally, access to known contaminated areas sampled by the NJDEP will be restricted in order prevent the spreading of contaminated soils. In particular, access along the main site road that extends from the existing gate at Route 35 will be prohibited during the remediation and subsequent pipeline construction activities.

6.5 Post-Excavation Sampling

Post-excavation sampling is required to confirm the effectiveness of the remedial action. The post-excavation sampling may be performed in the field using XRF equipment, with limited laboratory confirmation analyses. Laboratory confirmation of the contaminants of concern will be performed on at least 10 percent of the post-excavation samples with a minimum of two laboratory samples. The laboratory samples will be biased to the soil with the highest XRF contaminant concentrations.

Post-excavation bottom samples with the XRF will be performed at a minimum frequency of one (1) sample per nine-hundred (900) square feet of excavation area. Based on the assumed remedial area of 16,000 square feet, approximately eighteen (18) post-excavation bottom samples will be analyzed with XRF; at least two (2) samples will be delivered to a State certified laboratory for analytical confirmation of the lead, antimony, arsenic, and hexavalent chromium concentration. Additionally, three (3) post-excavation samples will be collected along each longitudinal edge of the excavation (i.e., at station 6+00 and station 10+00). One (1) sample from each edge will be delivered to a State certified laboratory for analytical confirmation of the lead, antimony, arsenic, and hexavalent chromium concentration. Thus, for the assumed excavation area, a total of twenty-four (24) post-excavation XRF samples are proposed, of which four (4) will also be laboratory

R2-0002074

analyzed. Post-excavation samples will be biased to any areas containing battery casing chips.

6.6 Stockpile and Waste Classification Testing

Excavated contaminated soils will be placed in a temporary stockpile area pending waste classification testing (**Figure 8**). Stockpiled soil will be placed on, and covered with, 10-mil plastic sheeting (or equivalent tarpaulin) that will be secured to prevent wind displacement. Silt fence will be installed around the perimeter of the stockpile area for soil erosion control. An appropriate number of waste classification samples shall be collected for analysis of RCRA characteristics including a full Toxicity Characteristic Leachate Procedure (TCLP). At the completion of the remediation, all plastic sheeting will be properly disposed as contaminated material.

6.7 Dust Control

Due to the locally high lead levels in the soil, airborne dust monitoring shall be performed during remedial activities. Dust monitoring will be performed using a particulate meter (TSI DustTrak Aerosol Monitor; MIE pDR-4000 Data Ram; or equivalent) to ensure that dust concentrations are acceptable. Dust monitoring will be performed at least hourly in work area locations and at the downwind site boundary. The monitoring frequency may be increased based on conditions in the work areas. Site specific action levels for the dust monitoring are defined in the Health and Safety Plan (**Attachment B**). Dust suppression procedures will include wetting the ground surface or source of dust. A water truck or equivalent source will be maintained onsite for this purpose.

6.8 Construction Staging, Storage, and Access Areas

Construction storage and staging areas, and haul roads have been situated outside of known contaminated zones (**Figure 8**). The construction entrance and tracking pad will be located at the northern site entrance from Route 35 (use of the existing main site road to the south is prohibited due to surficial soil contamination).

6.9 Decontamination

A vehicle tracking pad and equipment decontamination zone will be setup at the boundary of the remediation area (**Figure 8**). The tracking pad will be comprised of clean stone placed over a suitable geotextile. Equipment will be steam cleaned upon leaving the remediation area. A temporary decontamination water collection system will be installed, including an impermeable base. Decontamination water will be collected and disposed

R2-0002075

offsite at an appropriate facility. At the end of the remediation, the tracking pad material will be collected and disposed as contaminated material. A personnel decontamination zone will also be setup at the boundary of the remediation area, including a wash station and drums for disposable personal protective equipment.

6.10 Post-Remedial Construction Monitoring

Following completion of the soil remedial action, installation of the pipeline throughout its length will be monitored for any indication of contamination or buried debris, including but not limited to battery casing debris. Dust monitoring should also be performed during the main pipeline installation.

6.11 Restoration

The remediation area will be fully restored following installation of the pipeline. The remedial excavation will be backfilled with certified clean soil; grass seed will be planted to stabilize the disturbed areas.

6.12 Permitting

The Soil Erosion and Sediment Control Plan will be revised and submitted to the Freehold Soil Conservation District for certification. The soil remedial action will be performed under the existing Waterfront Development Permit and approval for the pipeline project. Because some parameters exceed the groundwater quality standards, a Permit-by-Rule will be acquired for the return of any groundwater removed during dewatering of the pipeline construction trenches.

6.13 Groundwater Management

Groundwater is not expected to be encountered during the remedial activities, in which the excavation will only extend to approximately 1-foot bgs. Groundwater dewatering is expected to be required during installation of the pipeline. Water should be disposed outside of known contaminated areas. A Permit by Rule should be obtained for dewatering disposal.

6.14 Health and Safety

A site specific Health and Safety Plan (HASP) for remedial activities associated with the sewer construction has been prepared in accordance with applicable standards (NJAC 7:26E-1.9; 29 CFR 1910 & 29 CFR 1926; **Attachment B**). The HASP addresses potential job

R2-0002076

hazards specifically related to the handling of contaminated soils, and specifies minimum safety training requirements, safety responsibilities, control measures, monitoring requirements, appropriate personnel protective equipment, decontamination procedures, and emergency procedures. The HASP will be applicable to all personnel working at the site, and will supplement individual contractor's health and safety plans for specific activities as well as industry safety standards. Prior to mobilization, copies of the HASP will be provided to all construction contractors, consultants, and any other field personnel.

6.15 Schedule

The remediation will be performed prior to the main pipeline construction, and is expected to begin by October 1, 2007. The remediation, including setup, excavation, and soil disposal, is expected to be completed in approximately four (4) weeks, and should thus be completed by November 1, 2007.

R2-0002077

Appendix G

EPA September 2008 Sampling Results (Phase I)

SAMPLING TRIP REPORT

SITE NAME: Raritan Bay Slag Site
DCN No.: RST 2 – 02 – F – 0708
W.O. No.: 20401.032.010.2064
Case No.: 37836

EPA I.D. NO.: NJN000206276

SAMPLING DATES: September 10, 2008 through September 16, 2008 (excluding September 13 and 14)

1. Site Location: Refer to Figure 1

2. Sample Locations: Refer to Figure 2

3. Sample Descriptions: Refer to Table 1

4. Laboratory Receiving Samples:

Analysis	Name and Address of Laboratory
Target Analyte List (TAL) metals and dissolved metals (excluding mercury, including tin), and Toxicity Characteristic Leaching Procedure (TCLP) metals	Bonner Analytical Testing Company 2703 Oak Grove Road Hattiesburg, MS 39402
Grain-size distribution	Test America Laboratories 30 Community Drive, Suite ll South Burlington, VT 05403

5. Sample Dispatch Data:

Twelve aqueous samples for low concentration TAL metals analysis, 12 aqueous samples for low concentration dissolved TAL metals analysis, and 23 soil/sediment samples for low concentration TAL metals analysis were shipped to Bonner Analytical Testing Company (Bonner Analytical) on 9/10/2008 at 1730 hours via Federal Express Airbill No. 8541 0029 6945. Thirteen sediment samples for grain-size distribution analysis were shipped to Test America Laboratories (Test America) on 9/10/2008 at 1730 hours via Federal Express Airbill No. 8541 0029 6577.

Four aqueous samples for low concentration TAL metals analysis, three aqueous samples for low concentration dissolved TAL metal analysis, 57 soil/sediment samples for low concentration TAL metals analysis, and 13 soil samples for medium concentration TAL metals analysis (six of which also included TCLP metals analysis) were shipped to Bonner Analytical on 9/11/2008 at 1730 hours via Federal Express Airbill No. 8541 0029 6912. Twelve sediment samples for grain-size

distribution analysis were shipped to Test America on 9/11/2008 at 1730 hours via Federal Express Airbill No. 8541 0029 6923.

Sixty-five soil/sediment samples for low concentration TAL metals analysis were shipped to Bonner Analytical on 9/12/2008 at 1630 hours via Federal Express Airbill No. 8541 0029 6901. Thirty-four sediment samples for grain-size distribution analysis were shipped to Test America on 9/12/2008 at 1630 hours via Federal Express Airbill No. 8541 0029 6897.

Ten aqueous samples for low concentration TAL metals analysis, nine aqueous samples for low concentration dissolved TAL metals analysis, and 13 soil/sediment samples for low concentration TAL metals analysis, and seven soil samples for medium concentration TAL metals analysis (five of which also included TCLP metals analysis) were shipped to Bonner Analytical on 9/15/2008 at 1730 hours via Federal Express Airbill No. 8541 0029 6522. Nine sediment samples for grain-size distribution analysis were shipped to Test America on 9/15/2008 at 1730 hours via Federal Express Airbill No. 8541 0029 6533.

One aqueous sample for low concentration TAL metals analysis and 11 soil/sediment samples for low concentration TAL metals analysis were shipped to Bonner Analytical on 9/16/2008 at 1645 hours via Federal Express Airbill No. 8541 0029 6496. Eleven sediment samples for grain-size distribution analysis were shipped to Test America on 9/16/2008 at 1645 hours via Federal Express Airbill No. 8541 0029 6441.

6. On-Site Personnel:

Name	Company	Duties on Site
Dan Gaughan	WESTON	Project Manager, Site Health and Safety Officer, Sampler
Scott Snyder	WESTON	Sample Management Officer (SMO)
Kelli Lucarino	WESTON	Sampler, Global Positioning System (GPS) Data Collection
Julissa Morales	WESTON	Sampler, GPS Data Collection
Matt Foster	WESTON	Sampler
Kristen Sharp	WESTON	Sampler
Nick Magriples	EPA	EPA Oversight

7. Additional Comments:

From September 10 through September 16, 2008, Weston Solutions, Inc. (WESTON®) personnel collected surface soil, sediment, and surface water samples from the Raritan Bay Slag Site to determine the priority for further action under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). A total of 105 surface soil samples (including six environmental duplicate samples), 84 sediment samples (including four environmental duplicate samples), and 48 surface water samples (including four environmental duplicate samples) were collected from the site and a nearby background location.

All surface soil samples were collected at depth of 0 to 2 inches. Soil samples collected in areas adjacent to the slag were proposed to be collected at additional depth intervals of 6 to 12 inches and

12 to 18 inches. However, obstructions such as slag and rock were encountered during collection of the samples at depth. Therefore, of the 11 proposed samples at each depth, only six samples were collected from the 6 to 12 inch interval and only three samples were collected at the 12 to 18 inch interval. Surface soil samples were collected using a dedicated plastic scoop to scrape away surficial organic material (grass, leaves, etc.) and to remove the top layer of vegetation/soil/fill material. Soil samples collected at a depth of 6 to 18 inches were obtained using decontaminated, stainless-steel augers and dedicated, disposable plastic scoops: The soil sample was obtained by augering soil from the location of the previously collected 0 to 2 inch sample to the required depth below the surface. Once the soil from the appropriate depth was obtained, it was transferred into a dedicated plastic container using the dedicated plastic scoop and homogenized. The homogenized soil was then transferred into the required sample containers using the dedicated plastic scoop. All remaining soil, not used for laboratory analysis, was discarded at the sampling location.

Sediment samples were collected at a depth of 0 to 3 inches. Sediment samples were collected using a dedicated, disposable plastic scoop, allowing any excess surface water to drain from the sampling device. A petite ponar dredge was used to collect sediment samples from locations under several feet of water adjacent to the Cheesequake Creek inlet western jetty. The petite ponar dredge was decontaminated prior to each sample location. After collection, the sediment was transferred into a dedicated plastic container using the dedicated plastic scoop and homogenized. The homogenized sediment was then transferred into the required sample containers using the dedicated plastic scoop. All remaining sediment, not used for laboratory analysis, was discarded at the sampling location.

Surface water samples were collected moving in an upstream direction when appropriate, and collected prior to sediment samples if co-located. In a deviation from the Sampling and Quality Assurance Project Plan (SAQAPP), surface water sample RBS-SW17 was collected prior to and upstream of sample RBS-SW18. WESTON began collection of the samples at a location midway between the footbridge over Margaret's Creek and Raritan Bay and planned to collect an upgradient sample near the footbridge. The EPA On-Scene Coordinator directed WESTON to collect the second sample at the intersection of Margaret's Creek and Raritan Bay. Surface water samples were collected directly into the sample container by partially submerging the sample bottle and collecting the sample. Three rinsate blanks (two for plastic scoop, plastic container, and decontaminated stainless-steel augers and one for the petite ponar dredge) were collected for quality assurance/quality control (QA/QC) purposes. Surface water sample numbers containing a 'D' indicates that the samples were analyzed for Dissolved Metals.

All sample locations were recorded electronically using GPS technology. Post-processing differential correction of the GPS data was conducted in accordance with the EPA Region 2 GPS Standard Operating Procedures (SOP). The processed GPS data were then transferred to the Sample Location Map (Figure 2) using Geographic Information Systems (GIS).

All samples were collected as part of the Integrated Assessment (IA) evaluation conducted on site. Samples collected by WESTON were designated for analysis of TAL metals (including tin) (soil, sediment, and surface water), dissolved metals (surface water), and TCLP metals (select surface soil samples) through the EPA Contract Laboratory Program (CLP). Sediment samples were sent for grain size distribution analysis through a non-CLP laboratory. Inorganic Traffic Reports and non-CLP chains of custody are presented in Attachment 1.

RBS-RIN03	MB53L6	9/16/08	0940	Rinsate blank (decontaminated stainless-steel petite ponar dredge and dedicated, disposable plastic scoop and tray) for QA/QC purposes.

Notes:
Surface water sample numbers containing a 'D' (RBS-SW01D) indicates that the samples were analyzed for Dissolved Metals.
Select soil samples were analyzed for TCLP Metals including: RBS-S01A, -S02A, -S03A, -S04A, -S05A, -S06A, -S07A, -S09A, -S10A, -S59A, -S60A, -S97, and –S98.

All results in milligrams per kilogram (mg/kg)
U - Analyte not detected
J - Estimated concentration
UJ - The analyte was not quantifiable at or above the Contract Required Quantitation Limit (CRQL), or QA/QC requirements were not met
R - Unusable value

All results in milligrams per kilogram (mg/kg)
U - Analyte not detected
J - Estimated concentration
UJ - The analyte was not quantifiable at or above the Contract Required Quantitation Limit (CRQL), or QA/QC requirements were not met
R - Unusable value

All results in milligrams per kilogram (mg/kg)
U - Analyte not detected
J - Estimated concentration
UJ - The analyte was not quantifiable at or above the Contract Required Quantitation Limit (CRQL), or QA/QC requirements were not met
R - Unusable value

R2-0002103

All results in milligrams per kilogram (mg/kg)
U - Analyte not detected
J - Estimated concentration
UJ - The analyte was not quantifiable at or above the Contract Required Quantitation Limit (CRQL), or QA/QC requirements were not met
R - Unusable value

R2-0002106

All results in micrograms per liter (µg/L)
U - Analyte not detected
J - Estimated concentration
UJ - The analyte was not quantifiable at or above the Contract Required Quantitation Limit (CRQL), or QA/QC requirements were not met
R - Unusable value
Surface water sample numbers containing a 'D' (RBS-SW01D) indicates that the samples were analyzed for Dissolved Metals.

All results in micrograms per liter (µg/L)
U - Analyte not detected
J - Estimated concentration
UJ - The analyte was not quantifiable at or above the Contract Required Quantitation Limit (CRQL), or QA/QC requirements were not met
R - Unusable value
Surface water sample numbers containing a 'D' (RBS-SW01D) indicates that the samples were analyzed for Dissolved Metals.

EXECUTIVE SUMMARY

The Raritan Bay Slag site, located in Old Bridge and Sayreville, New Jersey (NJ), extends approximately 1.5 miles from Margaret's Creek Wetlands Area along the seawall adjacent to the Old Bridge Waterfront Park to the waterfront area just west of the Cheesequake Creek Inlet western jetty. In the late 1960s and early 1970s, lead-bearing slag and other demolition material were used as fill and stabilizing material for the construction of the seawall. In addition, slag and associated materials were used to build-up the western jetty at the Cheesequake Creek Inlet.

The objectives of this work assignment (WA) were to characterize the metallurgical waste material at the site; evaluate the potential for release and transport of contaminants associated with the waste material; collect data in support of human and ecological risk assessment; and conduct an initial ecological risk assessment. Final results are presented in two separate documents. This document presents the data collected and an assessment of the data relative to the chemical nature, fate and transport of the contaminants. A second document utilizes the same data in an initial ecological risk assessment (EPA/ERT/REAC 2009).

The results of this evaluation are as follows:

• Slag from the seawall, Cheesequake Creek Inlet western jetty and along the beachfront west of the jetty was highly heterogenous with a wide range of concentrations. Particularly high concentrations were found for arsenic (As), copper (Cu), lead (Pb), antimony (Sb), tin (Sn) and zinc (Zn). Lead concentrations exceeded 10,000 mg/kg for 15 of the 17 samples analyzed and exceeded 100,000 mg/kg for 5 of the 17 samples analyzed

• Metal speciation analysis of the slag reinforced the conclusion of heterogeneity of the material present, and confirmed that it was metallurgical waste material. The analyses identified various Pb, Cu, As and Sn compounds as dominant species. Five different Pb species were identified as dominant species in the slag. Of particular importance was the finding that interior and exterior layers of the slag contained different Pb species, with the interior layers containing Pb species with greater affinity to mobilize from the potential weathering and erosion of the slag. This finding is consistent with a conclusion that the slag is weathering.

• The leachability and/or mobility of the metals from the slag were evaluated under acidic conditions following Toxicity Characteristic Leaching Procedure (TCLP) methods. All 17 slag samples exceeded the Resource Conservation and Recovery Act (RCRA) regulatory limit for Pb of 5.0 mg/L based on TCLP, designating the slag as hazardous waste. Leachable metal determinations were also presented as concentration leached based on dry weight. Lead concentrations leached from the slag exceeded 1,000 mg/kg for 15 of the 17 slag samples, with 10 samples having leachable Pb concentrations exceeding 10,000 mg/kg.

• The leachability and/or mobility of the metals from the slag were also evaluated using neutral salt solutions. Particularly high levels of Pb were determined to be leachable and/or mobilized from neutral salt solutions with higher levels of leachable Pb in the interior (non-weathered) samples compared with the exterior layer of the slag boulders. This finding is consistent with a conclusion that contaminants within the slag are leachable and therefore able to be released into the environment under normal conditions at the site.

• Soil (*i.e.,* beach sediments) and pore water collected along the intertidal zone adjacent to the seawall had high metal concentrations consistent with the release of metals from the slag. Soils along the entire length of the intertidal zone adjacent to the seawall are characterized as having a

R2-0002121

high spatial variability, with a wide range of concentrations, particularly for Pb, Sb, As and Cu. Pore water was analyzed for dissolved metals and total metals. High concentrations of total Pb, manganese (Mn), As and Sb were measured in the unfiltered samples. In addition, high concentrations of dissolved Mn, Pb As, and Sb were measured for several of the filtered samples. The wide variation of contaminant concentrations in the soils and pore water is consistent with the influence of Site characteristics. The finding of elevated pore water metal concentrations is of particular importance as this supports a conclusion that Site contaminants are being released into the environment.

• Biomonitoring techniques were utilized to assessing contaminant release and transport. These techniques are particularly useful in locations with periodic or sporadic contaminant releases. Utilizing the principles of biomonitoring, biota sampling focused on the predominant organisms that were residing or utilizing the intertidal and subtidal zones at this site to determine which organisms would accumulate contaminants released from the seawall. The organisms collected from the intertidal zone included two mollusks (ribbed mussels [*Geukensia demissa*] and long neck or steamer clams [*Mya arenaria*]), macroalgae (*Ulva*), and foraging fish (killifish). In addition, hard shell clams (*Mercenaria mercenaria*) were collected in the subtidal zone. *Ulva* had the highest metal accumulations for Pb, Mn, As, chromium (Cr) and nickel (Ni). Of the three mollusks, juvenile *Mya* clams accumulated the highest concentrations of Pb and Cu. All three mollusks accumulated comparable concentrations of As and silver (Ag). The biomonitoring data are consistent with a conclusion that Site contaminants are being released into the environment and are being biologically accumulated. The biota data also support a conclusion that the contaminants are being transported away from the source material; this conclusion is supported by the accumulation of contaminants in biota not residing immediately adjacent to the slag material.

R2-0002122

1.0 INTRODUCTION

The Raritan Bay Slag site (the Site), located in Old Bridge Township and the Borough of Sayreville, New Jersey (NJ), is approximately 1.5 miles in length and consists of the waterfront area between Margaret's Creek and the area just beyond the western jetty at the Cheesequake Creek Inlet. The Site consists of a sea wall that extends for approximately 2,500 feet along the Old Bridge Waterfront Park adjacent to Bayview Drive in Laurence Harbor, public beach areas, three jetties, the Cheesequake Creek Inlet western jetty that extends for about 800 feet from the mouth of the Cheesequake Creek into Raritan Bay and the waterfront area west of the jetty (Figure 1).

In September 1972, the New Jersey Department of Environmental Protection (NJDEP) was advised by a local environmental commission member that lead-bearing waste material was being deposited along the Laurence Harbor beachfront. The material was reported to be non-recoverable, low-yield metallic waste from a blast furnace and blast furnace rubble. The slag was deposited at the beachfront in the late 1960s and early 1970s, mostly in the form of blast furnace pot bottoms, in an area that had sustained significant beach erosion and damage due to a series of storms in the 1960s. Demolition debris in the form of concrete and a variety of bricks, including fire bricks, was also placed along the beachfront. A portion of the seawall also contains large riprap believed to have been placed over the slag when the grassed and paved portion of the park was developed.

The western jetty at Cheesequake Creek Inlet has been in existence since the United States (U.S.) Army Corps of Engineers constructed it in the late nineteenth century. The slag was reportedly placed on the jetty during the same general time period as the construction of the seawall. The entire jetty is covered with slag that is similar in appearance to that which is present on the seawall. The waste material and slag was used to supplement the jetty and was used as a fill and stabilizing material for the seawall. Metal contaminants associated with the slag and associated waste material include antimony (Sb), arsenic (As), copper (Cu), lead (Pb), manganese (Mn), nickel (Ni), zinc (Zn), and tin (Sn).

Under this work assignment (WA), the U.S. Environmental Protection Agency (EPA)/Emergency Response Team (ERT) requested Response Engineering and Analytical Contract (REAC) personnel to perform both chemical and biological assessments that are presented as separate reports. The biological assessment evaluates the risk/impact of the metals being released from the slag on the biological communities associated with the intertidal zone adjacent to the sea wall (EPA/ERT/REAC 2009). The objectives of this chemical assessment report include:

- Characterization of the metal contaminants associated with the slag and waste material used for the construction of the sea wall and Cheesequake Creek Inlet Western Jetty;
- Evaluation of the leachability and mobility of metals from the slag and associated waste material;
- Assessment of contaminant release through biomonitoring techniques;
- Evaluation of the fate and transport of the metals in environmental media including soils (*i.e.*, beach sediments), pore water and biota of the intertidal zone adjacent to the sea wall;
- Collection of data relevant to human health and ecological risk assessments.

R2-0002123

2.0 SITE SETTING AND DESCRIPTION

The Site is bordered to the south, east, and west by residential properties and State Highway 35, and to the north by Raritan Bay. The Site extends for approximately 1.5 miles and includes the Old Bridge Waterfront Park, public beaches, three jetties, the Cheesequake Creek Inlet western jetty and the waterfront area west of the jetty (Figures 1, 2 and 3). The Old Bridge Waterfront Park, consisting of walking paths, gazebo and public parking area, is protected by a seawall, which is constructed with layers of slag and fill. Slag and fragments of slag are scattered along the entire length of the beach area between the seawall and cordgrass (*Spartina alterniflora*) beds (Figure 4). Figure 5 depicts the slag at the top of the seawall during high tide. Figures 6 and 7 depict the Cheesequake Creek Inlet western jetty at high tide when the water has risen to close to the top of the jetty and Figures 8 and 9 depict an assortment of slag used for constructing the jetty. Figure 10 shows the waterfront area just west of the jetty with slag and fragments of slag scattered along the waterfront.

Intertidal Zone Along Seawall

The intertidal zone adjacent to the seawall (Figures 1 and 2) consists of an open stretch of beach with slag and slag debris that extends for 20 to 30 feet before reaching the *Spartina* beds. Figure 4 depicts the area along the seawall within the intertidal zone at low tide with the *Spartina* beds situated adjacent to the seawall. The *Spartina* beds (Figure 11) extend for 10 to 15 feet within the mid to high tide range of the intertidal zone along the entire length of the seawall. The intertidal zone immediately beyond the *Spartina* beds primarily consists of open sand beach, cobble stones to medium sized rocks and randomly scattered slag. The green macroalgae (*Ulva* sp) was attached to the bottom substrate or to the cobble stones or rocks within this area that extended from the mid tidal level to beyond the low tidal level. It was noted that the *Ulva* did not colonize or attach to the slag that was scattered in this area. The *Ulva* was prominent but was not growing profusely within this intertidal zone.

Invertebrates that were prevalent in the intertidal zone either within or in proximity of the *Spartina* beds were limited to two species of mollusks: ribbed mussel (*Geukensia demissa*) (Figure 12) and long neck or steamer clam (*Mya arenaria*) (Figure 13). A dense colony of ribbed mussels was situated within the *Spartina* beds buried just below the surface of the sediments with a portion of the bivalve shell slightly extending above the surface of the sediments, allowing for the siphon to be extended into the water column for filtering. Most of the *Mya* clams were completely buried in the sediments from just below the surface to depths of six to eight inches. The hard shell clam (*Mercenaria mercenaria*) was found inhabiting the subtidal zone just beyond the intertidal zone. The hard shell clams were buried in the sediment at just below the surface. The biological assessment report for this WA provides an evaluation of the exposure of the organisms to metals associated with the slag boulders in this intertidal zone (EPA/ERT/REAC 2009).

3.0 SAMPLING DESIGN AND METHODS

The sampling design focused upon two primary objectives. One objective was to collect a representative assortment of waste rock/slag samples to characterize the metals associated with and leaching from the slag. Slag samples were collected along the sea wall, along the Cheesquake Creek Inlet western jetty and along the waterfront area west of the jetty. The slag samples were analyzed for total metals and for identification of the dominant metal species. In addition, the mobility and/or leaching potential of the metals associated with the slag were assessed based on Toxicity Characteristic Leaching Procedure (TCLP) methods and use of neutral salt solution to

simulate seawater. This evaluation also included a characterization of exterior and interior slag samples.

The second objective of the sampling design was to document the release of contaminants from source areas and assess the fate and transport of the metals leaching from the slag and associated waste material. This second objective was met by a biomonitoring approach, utilizing both chemical analyses of abiotic media (soil and pore water) and evaluation of the contaminant uptake by the biota inhabiting or utilizing the intertidal and subtidal zones along the seawall. The criteria for the selection of target biomonitoring species were taken from Boening 1999; Butler 1971; Phillips 1977; and Phillips 1978, and are as follows:

- The organisms can integrate exposure over time;
- The organisms feeding strategy and/or other behavior characteristics establish an exposure pathway consistent with environmental chemistry of the contaminant of interest;
- The organism can concentrate contaminants and, therefore allow the evaluation of contaminants that are present in the environment at or below the analytical detection limit;
- The organism accumulates the pollutant without being adversely affected, if possible;
- The organism is an important foraging food source for higher level biota;
- The organism is sedentary (sessile) in order to be representative of the area of collection;
- The organism is abundant in the study area;
- The organism is sufficiently long lived to allow the sampling of more than one year class, if possible;
- The organism is of reasonable size to provide adequate tissue for analyses and accurate weight measurement; and
- The organism is easy to collect/sample and hardy enough to survive in the laboratory, allowing depuration (clearing) before chemical analyses.

The organisms chosen for the biomonitoring sampling were selected in an attempt to meet as many of the above criteria as possible given the species that are actually present at the Raritan Bay Slag Site. One of the primary considerations was the ability to bioaccumulate metals being released from the slag. In addition, there was consideration as to whether animals and plants at the site could potentially be consumed by human or ecological receptors (to increase the utility of the data generated). Based on the field reconnaissance of the sampling area and the organism selection criteria above, several target species were identified for sampling, including mollusks (ribbed mussels, long neck clam and hard shell clam), polychaetes, macroalge (*Ulva*) and foraging fish (killifish).

Mollusks or bivalves are known to be effective biomonitors of metal contaminants meeting many of the criteria for an ideal biomonitoring organism; however, no one particular species is universally suitable. When possible and practical it is advisable to initiate a biomonitoring assessment using several species representing different exposure pathways (Boening 1999). The three prominent bivalves (ribbed mussel, long neck clam and hard shell clam) at this Site represent different feeding and/or habitat characteristics.

Ulva species have demonstrated their capability as biomonitors of metal contamination including Cu, Pb, Mn, Ni and Zn (Besada *etal*. 2009, Villares *etal*. 2005, 2001, 2002, Ho 1990). Both the laminar structure of this macroalgae, providing a high surface area to volume ratio, and its

R2-0002125

capacity to grow in contaminated areas increases its potential as a useful biomonitor.

Killifish (*Fundulus* sp.) were the predominant foraging fish utilizing the intertidal zone at the Site. In addition, killifish are known to have a limited seasonal home range (Lotrich 1975). The killifish continuously move in and out of this intertidal zone with the tide and could potentially be exposed to the metals associated with the slag via surface water and foraging.

Polychaetes, residing within the interstitial sediments of this intertidal zone, would be in direct contact with the sediments and pore water that could be contaminated with metals associated with the slag. However, the population density of the polycheate community within this intertidal zone was too small for effective sampling during the site investigation. Local residents were observed collecting worms to be used for bait along the beach area just east of the sea wall. Numerous worms were easily collected by the local residents with the use of a trowel, with the largest worms ranging in size up to several inches in length. No evidence of these same type of worms were found along the seawall.

Soil and pore water sampling was co-located with the biota sampling, particularly for the ribbed mussels and Mya clams, to integrate exposure from the environmental media at the same locations.

The site investigation activities occurred over four sampling days on September 10, 11, 19 and 22, 2008. Sampling and analytical methods are provided in the following sections.

3.1 Slag Sampling and Analytical Methods

Sampling of the slag was performed by identifying and selecting individual pieces of slag along the seawall, the Cheesequake Creek Inlet western jetty and at the waterfront area west of the jetty. A total of 17 pieces of slag was collected by chiseling off fragments from the slag using a cole chisel and hammer.

Appendix C provides the photographs of the slag and samples. Figures C-1 to C-8 show the five slag samples originating from the seawall, identified as samples SW-1 through SW-5. Figures C-9 to C-20 show the 10 slag originating from the jetty from which samples were chiseled. These samples are designated as Jetty 1, 2A, 2B, 3A, 3B, 4, 5, 6, 7A and 7B. Figures C-21 and C-22 show the slag along the waterfront just west of the jetty from which samples were collected, designated as West Jetty 1 and 2.

Six slag samples from the jetty were collected by chiseling off just the exterior crust from the slag (Jetty 2A, 3A and 7A) and then chiseling off an interior sample below the crust (Jetty 2B, 3B and 7B). All of the remaining slag samples are whole samples that consist of exterior and interior layers of the slag.

All slag samples were pulverized and homogenized to a powder in the laboratory using a puck mill. The pulverized slag samples were analyzed for total metal concentrations of As, Cu, Pb, Sb, Sn and Zn by Inductively Coupled Plasma – Atomic Emission Spectrometry (ICP-AES) following acid digestion. X-ray diffraction (XRD) was used for metal speciation determinations. In addition, the potential leachability or mobility of the metals from the 17 slag samples was evaluated based on exposure to acidic conditions as defined by the Toxicity Characteristic Leaching Procedure (TCLP) and by exposure to a neutral (weak) salt solution (0.01 molar [M] calcium chloride solution). Appendix A provides the analytical report and the standard operating procedures (SOPs).

R2-0002126

Ten soil samples (*i.e.,* beach sediments) collected by Weston Solutions, Inc. adjacent to slag were analyzed for total metals by ICP-AES and for metal speciation by XRD. Five samples were collected along the intertidal zone adjacent to the seawall and five samples were collected along or near the Cheesequake Creek Inlet western jetty (Weston Solutions 2009).

3.2 Soil Sampling and Analytical Methods

A total of 11 co-located soil (*i.e*., beach sediment) samples were collected at the ribbed mussel and *Mya* clam collection points (Figure 2). The soil samples were collected after the ribbed mussels and *Mya* clams were collected to avoid disturbing the biota. Soil samples were collected with a trowel and placed into 8-ounce (oz) glass jars. Samples were shipped to the subcontract laboratory and were analyzed for target analyte list (TAL) metals and Sn.

3.3 Pore Water Sampling and Analytical Methods

Pore water samples were collected by inserting a glass pipette into the soil at a depth of 1.5 to 2 inches below the surface. The end of the pipette that was inserted into the soil was covered with nylon screen to prevent the entrainment of soil. The pore water was siphoned through the pipette using a portable peristaltic pump. Individual decontaminated pipettes and tubing were used for collecting each sample. Five pore water samples were collected. Each of the samples was collected within proximity of the *Mya* clam collection points (Figure 2). The pore water was collected when the tide water had receded to avoid collection of surface water. One half of each sample volume was filtered by passing the water through a 0.45 micron (µm) filter and preserved to a pH of less than (<) 2.0 standard units with nitric acid. The other half of each sample was not filtered and preserved to pH < 2.0. Pore water samples were shipped to the subcontract laboratory and were analyzed for TAL metals and Sn as total metals and filtered dissolved metals.

3.4 Killifish (*Fundulus* sp.) Sampling and Analytical Methods

Five composite samples of killifish each consisting of eight individual fish were collected along the seawall during mid-tide using a seine net. Figure 2 presents the sampling area where the seining occurred. The killifish were placed into 2.5-gallon pails containing aerated seawater and transported back to the ERT/REAC Biological Laboratory for a depuration period of 24 hours. Following the depuration period, each composite sample was weighed, placed into glass jars and frozen. Samples were shipped to the subcontract laboratory, homogenized and analyzed for target analyte list (TAL) metals, Sn and percent (%) solids.

3.5 Ribbed Mussel (*Geukensia demissa*) Sampling and Analytical Methods

Ribbed mussels were collected at six areas along the seawall at mid-tide. Figure 2 presents the six sampling locations designated as RM-1 to RM-6. The ribbed mussels were found to be prevalent amongst the *Spartina* (marsh grass) beds that are approximately 40 to 60 feet from the seawall. The ribbed mussels, most of which were seen projecting from the sediment, were collected by hand and ranged in size from 3.8 to 8.0 centimeters (cm). Eight to twelve ribbed mussels were collected at each sampling location to produce six composite samples, placed into large glass jars containing Rartian

R2-0002127

Bay water, aerated and brought back to the ERT/REAC Biological Laboratory for a depuration period of 24 hours. Following the depuration period, each composite sample was weighed, placed into a 16 ounce (oz). glass jar and frozen. The tissue was removed from each bivalve shell while frozen and the composite sample of the tissue was weighed. Tissue samples were shipped frozen to the subcontract laboratory, homogenized and analyzed for TAL metals, Sn and % solids.

3.6 Long Neck Clam (*Mya arenaria*) Sampling and Analytical Methods

Mya clams were collected at five areas along the seawall at mid-tide within or near the *Spartina* beds. Figure 2 presents the five sampling locations (*Mya* 1 to *Mya* 5). The *Mya* clams were either observed partially buried in the sediment and collected by hand or were collected using a clam rake. The clams ranged in size from 1 to 4 cm with the number of individual clams in each composite sample ranging from 5 clams for *Mya*-3 to 106 clams for *Mya*-2. The clams were transported back to the ERT/REAC Biological Laboratory alive, placed into large glass flasks with Raritan Bay water and aerated for a depuration period of 24 hours. Following the depuration period, each composite sample was weighed, placed into a 16 oz. glass jar and frozen. The tissue from each clam was removed while frozen and the composite sample of tissue was weighed. Samples were shipped frozen to the subcontract laboratory, homogenized and analyzed for TAL metals, Sn and % solids.

3.7 Hard Shell Clam (*Mercenaria mercenaria*) Sampling and Analytical Methods

Mercenaria were collected using a clam rake at a water depth of 3.5 to 4 feet at mid-level tide just offshore of the sea wall. Figure 2 presents the approximate area from which the clams were collected. After numerous hauls with the clam rake, a total of 10 clams were collected at three different size ranges (2.0 inches, 2.5 inches and 3.5 inches). The clams were subdivided into three composite samples based on the three size ranges. The clams were transported back to the ERT/REAC Biological Laboratory alive, placed into large glass flasks with Raritan Bay water and aerated for a depuration period of 24 hours. Following the depuration period, each composite sample was weighed, placed into a glass jar and frozen. The tissue from each clam was removed while frozen and the composite sample of the tissue was weighed. Tissue samples were shipped frozen to the subcontract laboratory, homogenized and analyzed for TAL metals, Sn and % solids.

3.8 Polychaete Sampling

Sampling for polychaete worms was performed by collecting sediment at the low to mid-tide level with a clam rake, transferring the sediment onto a sieve and washing the sediment through the sieve to separate the polychaetes from the sediment. Collections were attempted at depths from just below the surface to a depth of approximately 10 inches. However, only a few small polychaetes (<1 to 2 inches in size) were collected after sieving numerous sediment samples. This amounted to no more than 2.1 grams (g) wet weight, providing an insufficient volume of biomass to meet the data quality objectives

3.9 Sea Lettuce (*Ulva*) Sampling and Analytical Methods

Ulva was prevalent attached to bottom substrate (mostly attached to large stones and rocks) just beyond the *Spartina* beds at the mid-tide level. It was noted that attached *Ulva*

R2-0002128

was missing or sparse on the waste rock that was lying in these areas. Figure 2 presents the five sampling locations where the *Ulva* was collected and composited. Each of the composite samples was collected by hand, placed into a ziplock bag and brought back to the ERT/REAC Biological Laboratory. The *Ulva* was transferred to a sieve to be washed with distilled water, then blotted dry, transferred to sampling jars and frozen. Samples were shipped to the subcontract laboratory, homogenized and analyzed for TAL metals, Sn and % solids.

4.0 ANALYTICAL RESULTS

Appendix A provides the analytical report for the characterization of the slag. Section 4.1 provides an overview of the results. Appendix B provides the analytical report for the soil, pore water and biota. Sections 4.1 to 4.6 summarize the results.

4.1 Characterization of Slag and Soil Samples

A total of 17 slag samples were collected from the seawall, Cheesequake Creek Inlet western jetty and the waterfront area west of the jetty. Appendix C provides the photographs of the slag samples and Section 3.1 describes the samples collected.

Each of these 17 slag samples was analyzed for total elemental concentration for the primary metals of interest (As, Cu, Pb, Sb, Sn and Zn) along with the identification of the dominant mineral or chemical species using XRD procedures. In addition, two leachability tests assessing the mobility of the metals from the slag were performed. One test, TCLP, evaluated leachability under acidic conditions. The other test evaluated the leachability of metals from the slag when exposed to a neutral salt solution. Appendix A provides the analytical report. A summary of the results are provided below.

Ten soil samples collected by Weston Solutions, Inc. were also analyzed for total metal concentrations along with the identification of the dominant mineral or chemical species. Five of these samples were collected along the seawall within the intertidal zone and five samples were collected along or near the Cheesequake Creek Inlet western jetty (Weston Solutions 2009).

Total Metal Concentrations

The slag samples are characterized as highly heterogenous with a wide variation in elevated metal concentrations among the samples (Table 1a). Arsenic ranged from 8 mg/kg for Jetty 1 to 15,200 mg/kg for West Jetty-1. One particularly high concentration (445,000 mg/kg or 44.5%) of Cu was found in sample SW-2. Copper concentrations ranged from 101 mg/kg (Jetty 1) to 18,200 mg/kg (SW-3) for the remaining slag samples. With the exception of two samples (SW-2 and Jetty-1), the slag samples had Pb concentrations greater than 10,000 mg/kg, ranging from 12,900 mg/kg for West Jetty-2 to 131,000 mg/kg for Jetty-5. Antimony concentrations ranged from 31 mg/kg for Jetty-1 to 71,300 mg/kg for SW-1 and Sn ranged from 25 mg/kg for SW-2 to 11,400 mg/kg for Jetty-7A. Zinc concentrations ranged from 49 mg/kg for SW-2 to 13,400 mg/kg for SW-3 (Table 1a).

Table 2a presents the results for the ten soil samples collected adjacent to slag. Three of the five soil samples along the seawall had Pb concentrations above 1,000 mg/kg, ranging from 1,130 mg/kg to 2,580 mg/kg. The highest Pb concentrations (maximum

R2-0002129

concentration of 173,000 mg/kg) were from samples collected along or near the Cheesequake Creek Inlet western jetty. Additionally, the five soil samples collected along or near the Cheesequake Creek Inlet western jetty had elevated concentrations of As, Cu, Pb, Sb, Sn and Zn that exceeded 1,000 mg/kg (Table 2a).

Compound Speciation of Metals (XRD Analyses)

The XRD analyses performed on the slag and soil samples identified the crystal form of the dominant compound or species based on an initial phase identification.

Table 1b presents the dominant species identified for the slag samples. In many of the slag samples, there is a strong correlation between the total metal concentrations (Table 1a) and the dominant compounds identified by XRD (Table 1b). Iron (Fe) species and silicate (SiO_2) species were identified as dominant species for most of the samples and also various Pb, Cu, As and Sn species were also identified as dominant species. The dominant Pb species identified for a number of the slag samples included elemental Pb, lead carbonate ($PbCO_3$), lead zirconium oxide ($PbZrO_3$), lead sulfate ($PbSO_4$), and lead oxide (PbO). Different Pb species were identified in exterior versus interior layers of three slag boulders (*i.e.*, samples Jetty 2A, 2B, 3A, 3B, 7A and 7B). The interior samples contained lead carbonate ($PbCO_3$) as the dominant species, whereas the dominant species identified for the exterior samples included elemental Pb and $PbZrO_3$.

In Sample SW-2 (Cu concentration of 445,000 mg/kg) cuprite (Cu_2O) was the dominant species. Sample West Jetty 1 (As concentration of 15,200 mg/kg) contained arsenic copper sulfide (AsCuS) as a dominant species (Tables 1a and 1b)

Table 2b presents the dominant species identified for the soil samples. The four samples collected near the Cheesequake Creek Inlet western jetty with the highest Pb concentrations (*i.e.*, samples 48, 50, 51 and 52 collected by Weston Solutions, Inc.) contained several Pb species including $PbCO_3$, lead sulfide (PbS), lead hydroxide chloride (Pb(OH)Cl), lanarkite (Pb_2OSO_4), laurionite (PbOHCl) and lead sulfate ($PbSO_4$).

Toxicity Characteristic Leaching Procedure (TCLP)

The TCLP procedure was employed to determine the mobility of the metal contaminants from the slag under acidic conditions. The primary objective of the TCLP analysis is to simulate landfill conditions to assess if, over time, water or other liquids will react with the waste material or slag to mobilize contaminants and thus pose public health or environmental risk. The TCLP results are reported as the concentration in the aqueous phase as milligrams per liter (mg/L) (Table 3a) and as total elemental solids leaching from the slag as mg/kg dry weight (Table 3b).

Regulatory limits established under the Resource Conservation and Recovery Act (RCRA) (under Code of Federal Regulations [CFR] 40 CFR 261.24) are defined for both As and Pb as 5.0 mg/L. All of the 17 slag samples far exceed the 5.0 mg/L level for Pb with leachable Pb levels ranging from 17 mg/L to 3,140 mg/L (Table 3a). RCRA does not establish regulatory limits for the other metals analyzed. Arsenic levels in the leachate did not exceed the regulatory limit.

The TCLP analyses demonstrated that each of the 17 waste rock/slag samples leached Pb at concentrations ranging from 349 mg/kg to 62,700 mg/kg. Only two of the waste rock

R2-0002130

samples (SW-2 and Jetty-1) had concentrations of leachable Pb below 1,000 mg/kg; five waste rock samples exceeded 1,000 mg/kg and the remaining 10 samples exceeded 10,000 mg/kg (Table 3b). Slag sample SW-2 which contained the highest Cu concentration (445,000 mg/kg) had a leachable Cu concentration of 16,900 mg/kg (Table 3a). The slag samples did not leach appreciable quantities of the other metals with the exception of sample SW-5 which leached 1,005 mg/kg of Zn.

Leachability of Metals from Neutral Salt Exposure

Neutral salt extraction procedure was used to simulate the potential leachability and/or mobility of the metal contaminants from the slag from exposure to seawater.

Lead was determined to be leachable under these conditions (Table 3c). It was also demonstrated that the interior slag samples (samples Jetty 2B, 3B and 7B) had considerably higher levels of leachable Pb when compared with the leachable Pb levels from the exterior slag samples (samples Jetty 2A, 3A, and 7A). The exterior samples, essentially the outer crust of the slag, yielded leachable Pb levels of 8.3 mg/kg, 1.3 mg/kg and 10.1 mg/kg for samples Jetty 2A, 3A, and 7A, respectively. In comparison, the interior samples, that have not been previously exposed to Raritan Bay water, leached Pb at significantly higher levels (610 mg/kg, 870 mg/kg and 70.9 mg/kg for samples Jetty 2B, 3B and 7B, respectively) (Table 3c). As discussed above, the XRD characterization demonstrated differences in Pb species between the interior and exterior samples. The dominant Pb species for two of the three interior samples was identified as $PbCO_3$, which would have a greater affinity for leaching than the dominant Pb species for the exterior samples (elemental Pb and $PbZrO_3$).

Two other slag samples (samples Jetty 5 and Jetty 6) that are composite samples containing both interior and exterior layers also had high levels of leachable Pb with concentrations of 505 mg/kg and 72.2 mg/kg, respectively. Arsenic, Cu, Sb and Sn did not leach under the neutral salt water extraction. Zinc was leachable for a few of the slag samples with the highest leachable Zn level (126 mg/kg) for the Jetty-5 slag sample.

4.2 Pore Water Results

Five pore water samples were collected in the intertidal zone within proximity of the collection sites for the *Mya* (long neck shell) clams. Table 4 summarizes the results (as ug/L) for both the total metals in unfiltered and filtered samples.

Lead levels in the filtered and unfiltered pore water samples differed. Two particularly high Pb values (1,500 ug/L and 2,400 ug/L) were determined for the unfiltered pore water samples. Correspondingly, dissolved Pb values ranged from < 2.0 ug/L to a maximum value of 170 ug/L. The maximum Sb concentrations in the two unfiltered pore water samples were 56 ug/L and 270 ug/L and the maximum dissolved Sb concentrations were 19 ug/L and 130 ug/L, respectively. Dissolved As levels ranged from 11 ug/L to 86 ug/L and total As levels ranged from 19 ug/L to 230 ug/L.

Total and dissolved Mn levels were quite similar, ranging from 530 ug/L to 2,300 ug/L, indicating that Mn in the pore water was essentially available as dissolved metal. Copper and Zn concentrations were mostly below detection limits for both the total and dissolved metals.

R2-0002131

A comparison of the metal concentrations in the surface water collected along the intertidal zone adjacent to the seawall by Weston Solutions, Inc (Weston Solutions 2009) during the same time period as this study reveals that certain metals were more concentrated in the pore water than surface water. For example, Mn levels in the surface water ranged between 100 ug/L to 200 ug/L and As ranged between < 10 ug/L to 11 ug/L as dissolved metal. Dissolved Pb levels in the pore water were comparable to the surface water levels along the seawall, ranging from 11.9 ug/L to 152 ug/L (Figure 5 in Weston Solutions 2009).

4.3 Soil Results

Eleven soil (*i.e.,* beach sediment) samples were collected within proximity of the collection sites for the ribbed mussels and the *Mya* clams (Table 4). In addition, 18 soil samples were collected along the seawall during the same time period as this study (September 2008) by Weston Solutions, Inc. (2009) (Table 5). The sampling locations of these 18 samples are shown in Figure 3.

The metal concentrations (Tables 4 and 5) in the soil samples along the seawall were highly heterogenous, analogous to what would be expected within a contaminated landfill site. Lead levels particularly stand out with concentrations ranging from 12 mg/kg to 5,860 mg/kg (Tables 4 and 5). Likewise, Sb ranges from 0.2 mg/kg to 232 mg/kg, As ranges from 2 mg/kg to 29 mg/kg and Cu ranges from 4.4 mg/kg to 248 mg/kg.

4.4 Mollusk Bioaccumulation Results

Five composite samples of the long neck clams (*Mya*), six composite samples of the ribbed mussels and three composite samples of the hard shell clams were analyzed for metals. Analyses were only performed on the soft tissue. The bivalve shells of the mollusks were discarded. Only juvenile *Mya* clams, less than one year old, were collected from the intertidal zone along the seawall. No adult *Mya* clams were found. Both the ribbed mussel and the hard shell clam composite samples were composed entirely of adult clams that were greater than two to four years old.

Tissue concentrations of Pb and Cu were highest in the juvenile *Mya* clams compared with either the adult ribbed mussels or the adult hard shell clams (Table 4). Lead levels for the *Mya* clams ranged from 3.4 mg/kg to 17 mg/kg (mean of 13.1 mg/kg) whereas ribbed mussels had Pb levels ranging from 3.0 mg/kg to 8.6 mg/kg (mean of 5.0 mg/kg) and the hard shell clam had Pb ranging from 1.7 mg/kg to 3.1 mg/kg (mean of 2.6 mg/kg). Copper levels for the *Mya* clams ranged from 8.5 mg/kg to 31 mg/kg (mean of 21.3 mg/kg) whereas Cu levels in ribbed mussels ranged from 10.4 mg/kg to 16 mg/kg (mean of 13.5 mg/kg) and the Cu levels in the hard shell clams ranged from 11 mg/kg to 14.3 mg/g (mean of 13.1 mg/kg).

Manganese levels were significantly higher in the *Mya* clams (4.3 mg/kg to 130 mg/kg) compared with the ribbed mussels (4.4 mg/kg to 7.1 mg/kg), but were lower than Mn levels in the hard shell clams (52 mg/kg to 200 mg/kg). Arsenic and Ag levels were comparable among all three mollusks with levels ranging from 1.4 mg/kg to 9.8 mg/kg for As and 0.15 mg/kg to 2.1 mg/kg for Ag. Zinc levels were higher in the *Mya* clams and hard shell clams than the ribbed mussels, but within the same range for the hard shell clams (Table 4).

R2-0002132

4.5 *Ulva* Bioaccumulation Results

Five composite samples of *Ulva* collected within the intertidal zone were analyzed for metal concentrations. The *Ulva* bioconcentrated As, Cr, Pb, Mn and Ni at higher levels than the other biota (Table 4). Lead, Mn and Ni concentrations in the *Ulva* are of particular note with concentrations of 24 mg/kg to 80 mg/kg for Pb, 120 mg/kg to 280 mg/kg for Mn and 2.6 mg/kg to 4.7 mg/kg for Ni. Arsenic concentrations in the *Ulva* ranged from 4.7 mg/kg to 15 mg/kg and Cr ranged from 2.6 mg/kg to 5.0 mg/kg.

4.6 Foraging Fish (*Fundulus* sp.) Bioaccumulation Results

Five composite samples of killifish (*Fundulus* sp.) were analyzed for metals. Killifish exposure to the metal contaminants within the intertidal zone would primarily be the result of surface water exposure and foraging as the fish move in and out of the area with the tide. Data was collected for only one sampling area. Arsenic, Cu, Cr, Pb and Ni tissue concentrations in the killifish tissue were lower than measured for the other biota (Table 4).

5.0 SUMMARY AND CONCLUSIONS

The objectives of the chemical assessment are:

- Characterization of the metal contaminants associated with the slag and waste material used for the construction of the sea wall and Cheesequake Creek Inlet western jetty;
- Evaluation of the leachability and mobility of metals from the slag and associated waste material under acidic and simulated salt water conditions;
- Assessment of contaminant release through biomonitoring techniques;
- Evaluation of the fate and transport of the metals to environmental media including the soil, pore water and biota of the intertidal zone adjacent to the seawall;
- Collection of data relevant to human health and ecological risk assessments.

The slag originating from the seawall, the Cheesequake Creek Inlet western jetty and the waterfront area west of the jetty was characterized as being quite heterogeneous with a wide range of metal concentrations. Particularly high concentrations were measured for As, Cu, Pb, Sb, Sn and Zn (Table 1a). Lead concentrations exceeded 10,000 mg/kg for 15 of the 17 samples analyzed and exceeded 100,000 mg/kg for 5 of the 17 samples analyzed. Arsenic exceeded 1,000 mg/kg for 13 of the 17 samples analyzed with two of those samples exceeding 10,000 mg/kg. Copper exceeded 1,000 mg/kg for 14 of the 17 slag samples with five samples exceeding 10,000 mg/kg. The highest Cu concentration in the slag was determined at 445,000 mg/kg. Antimony exceeded 1,000 mg/kg for 12 of the 17 slag samples with seven samples exceeding 10,000 mg/kg. Tin exceeded 1,000 mg/kg for 14 of the 17 samples and Zn exceeded 1,000 mg/kg for 13 of the 17 samples (Table 1a). The total metal concentrations found within the slag material support a conclusion that the slag material present, at the Site, constitutes a contaminant source to the surrounding environment.

Compound speciation of the metals associated with the slag identified various Pb, Cu, As and Sn compounds as dominant species (Table 1b). Five different Pb species were identified as dominant species in the slag. Differences in Pb species between exterior and interior slag samples were identified. Analysis of the interior samples, slag that had not been previously exposed to weathering, identified lead carbonate ($PbCO_3$) as the dominant species for two of the three samples. The dominant species identified for the exterior samples were elemental Pb and $PbZrO_3$.

R2-0002133

The results of the speciation investigation of the slag material are consistent with a conclusion that the slag is weathering, which would release contamination from the source material.

Leachability and/or mobility of the metal contaminants from the slag were evaluated based on acidic (TCLP) procedures and neutral salt solution extraction. The TCLP protocol provides an assessment of metals potentially being released under exposure to acidic groundwater and/or rainwater conditions, and evaluates the acceptability of the slag for landfill disposal. The TCLP results are given as metal concentrations leached in mg/L to compare results with regulatory limits defined by RCRA and as metals leached in mg/kg dry weight. All 17 slag samples exceeded the 5.0 mg/L RCRA regulatory limit for Pb, with leachable Pb levels ranging from 17 mg/L to 3,140 mg/L. None of the samples exceeded the As regulatory level (Table 3a). The results of the TCLP procedures demonstrate that the slag material fails TCLP and is therefore a hazardous waste.

The TCLP analysis determined that all 17 slag samples leached and/or mobilized Pb at concentrations ranging from 349 mg/kg to 62,700 mg/kg (Table 3b). Leachable Pb exceeded 1,000 mg/kg for 15 of the 17 samples with 10 samples having leachable Pb concentrations exceeding 10,000 mg/kg. The TCLP evaluation also determined that Cu had leached at a concentration of 16,900 mg/kg for the slag that contained the maximum Cu concentration (445,000 mg/kg).

A simulation of the leachability of metals from the slag was also evaluated by exposing the slag to neutral salt solutions. Lead was determined to be leachable and/or mobile from the neutral salt solution exposures with higher levels of leachable Pb determined for the interior (non-weathered) samples compared with the exterior (outer crust) of the slag (Table 3c). The exterior samples had leachable Pb values ranging from 8.3 mg/kg to 10.1 mg/kg, compared to the interior samples with leachable Pb values ranging from 70.9 mg/kg to 870 mg/kg. Weathering of the slag would result in exposing the interior layers of the slag containing more soluble lead species like lead carbonate ($PbCO_3$). The results of the neutral salt extraction tests demonstrated that contaminants can be released from the slag material under environmental conditions which exist at the Site. In addition the results of these tests are consistent with a conclusion that there is continued weathering of the slag and contaminant release to the surrounding environment.

Soils (*i.e.,* beach sediments) along the entire length of the intertidal zone adjacent to the seawall were characterized by a wide range of concentrations, particularly for Pb, Sb, As and Cu. The wide variations of concentrations are not unexpected since wave action mixes sediments along the shoreline and the physical characteristics of the shoreline create microenvironments. The highest concentrations were 5,860 mg/kg for Pb, 232 mg/kg for Sb, 29 mg/kg for As and 248 mg/kg for Cu (Tables 4 and 5). These results are consistent with a physical and chemical release (weathering) of contaminants from the slag material.

Pore water was analyzed for dissolved metals and total metals. High concentrations of total and dissolved Pb, Mn, As and Sb were measured for the unfiltered and filtered samples (Table 4). The results of the pore water analyses are consistent with a conclusion of release of contaminants from the slag material.

Biomonitoring focused on those organisms residing or utilizing the intertidal zone at this Site that would best assess contaminant release from the seawall. The predominant organisms collected from the intertidal zone included two mollusks (ribbed mussels and juvenile *Mya* clams), the macroalgae (*Ulva*), and the foraging fish (killifish). One mollusk, the hard shell clam, collected within the subtidal zone just beyond the intertidal zone, was also evaluated for its potential to

R2-0002134

accumulate metals associated with the Site. In addition, the site investigation revealed that certain organisms that were expected to be present, such as the polychaetes, were essentially absent along the intertidal zone of the seawall. Adult *Mya* clams also were absent during the site investigation along the seawall. The risk to the intertidal fauna and flora at this Site is evaluated in the separate biological assessment report for this project (EPA/ERT/REAC 2009).

Ulva, the sea lettuce, demonstrated the greatest bioaccumulation of metals, particularly for Mn, Pb, As, Cr and Ni (Table 4). Lead had accumulated up to 80 mg/kg in the *Ulva*. The bioaccumulation of metals by Ulva would be predominately from exposure to metals in the surface water. The elevated Pb concentrations in the surface water collected from the intertidal zone (See Weston Solutions, Inc 2009) are consistent with the elevated levels of Pb found in the *Ulva*. In addition, the contaminants found with the *Ulva* are consistent with a conclusion of release of contaminants from the slag material.

The juvenile *Mya* clams (less than one year old) had the highest Pb and Cu accumulations compared with the adult ribbed mussels and the adult hard shell clams. Arsenic and Ag were accumulated at comparable concentrations among the three mollusks. Manganese and Zn levels were at the highest levels in the hard shell clam (Table 4). The contaminants found within the bivalves collected at the Site are consistent with a conclusion of release of contaminants from the slag material.

The overall conclusions drawn from the data presented in this report are that the slag and associated debris used for constructing the seawall and building up of the Cheesequake Creek Inlet western jetty provide a significant source of metals to the environment including As, Cu, Pb, Sb, Sn and Zn. Lead is the predominant metal being released. The speciation chemistry performed in conjunction with the leachability testing clearly show that metals, particularly Pb, are in forms that can be released into the environment under conditions which can exist at the Site. The actual release of metals at the site is supported by the findings of metals within the pore water, surface water and soil at the site and is also supported by the bioaccumulation of the Site-related metals by biota residing at the Site.

ANALYTICAL REPORT: CHARACTERIZATION OF SLAG

OHIO STATE UNIIVERSITY

Raritan Bay Slag and Soil Characterizations

E.A. Dayton, S.D. Whitacre
School of Environment and Natural Resources
The Ohio State University
March, 2009

R2-0002149

Project Summary:

Seventeen waste rock samples and ten sediment samples were characterized for As, Pb, Cu, Sn, Zn, and Sb. Elemental content was determined for all twenty-seven samples, while solubility and leachability were determined on only the seventeen waste rock samples. Additional spectroscopic investigation was performed on all twenty-seven samples in order to identify possible mineral phases in the waste rock and sediment.

The twenty-seven samples varied widely in elemental content (Table 1), indicating that the Raritan Bay waste rock and sediment contaminant concentrations are very heterogeneous.

Table 1. Minimum (min), maximum (max), and median elemental content of Raritan Bay waste rock and sediment (US EPA 3051A).

Element	Unit	min	max	median
As	g/kg	0.00313	15.2	1.62
Cu	g/kg	0.00477	445	3.27
Pb	g/kg	0.0358	173	60.2
Sb	g/kg	0.00976	71.3	3.19
Sn	g/kg	0.00416	11.4	4.54
Zn	g/kg	0.00917	13.5	2.02

Methods:

The samples were oven dried at 60°C followed by pulverization to powder in a puck mill and homogenization. Elemental content was determined by US EPA method 3051A (SOP attached); solubility was determined with a neutral salt (0.01M $CaCl_2$) extraction (SOP attached); and leachability by the toxicity characteristic leaching procedure (SOP attached). Particle size of the powdered samples was further reduced using an agate mortar and pestle prior to X-ray diffraction (XRD). The XRD analysis was carried out using a Scintag XDS2000 diffractometer equipped with a θ-θ goniometer, a 2kW sealed-beam tube with Cu anode and Si-Ge solid-state detector. Samples were pressed into Plexiglas specimen mounts and scanned according to the instrumental settings given in Table 2. The raw scans were collected using the Scintag DMS2000 Diffraction Management Software (Sunnyvale, CA).

Table 2. X-ray diffractometer settings

Scan range	2-80°2θ
Tube voltage	45kV
Filament current	20mA
Source collimating slits	2 & 4mm
Detector receiving slits	0.5 & 0.3mm
Scan mode	continuous
Scan rate	1°min^{-1}
Scan interval	0.03°2θ

Pattern processing and phase identification were carried out using MDI (Materials Data Inc., Livermore, CA) Jade ver. 6.1 (preferences given in Table 3 below). A background function was fitted and subtracted from each of the raw scans. Phase identification by search/match routine was launched on the reduced pattern.

Table 3. Peak Search and Background Fitting Preferences

Peak Search Filter Points	15
Peak Search Filter Type	Parabolic
Peak Location	by summit
$K_{\square 2}$ peaks	screened out
Threshold sigma	3.0
Intensity cutoff %	0.10
Background fitting function	cubic spline
Background fitting point sampling	dense
Background fitting vertical offset	0.4

The Powder Diffraction File (PDF) maintained by the International Center for Diffraction Data (ICDD) & the Inorganic Crystal Structure Database (ICSD) which include NBS and common phases were accessed during the search/match routine. A preferred orientation filter was invoked to compensate for particle orientations acquired during packing of the specimen holder. A 2θ error window of 0.06 and 2θ position and intensity matching sensitivities of 4 and 6 respectively were used. Phases were sorted by figure of merit and selected/rejected based on visual match to the pattern. Phase selections were further guided by results from the dissolution chemistry.

Tables 1 to 4 provide the results.

Standard Operating Procedure
3051a Microwave Assisted Acid Digestion of Sediments, Sludges, and Soils Followed by Inductively Coupled Plasma (ICP) Spectrometry analysis
Soil Environmental Chemistry Program, The Ohio State University
Version 2

1.0 Scope of Method

1.1 This method is a microwave-assisted extraction using aqua regia and HNO_3. This method is more aggressive in dissolving the sample matrix than methods using conventional heating with nitric acid (HNO_3), or alternatively, nitric acid and hydrochloric acid (HCl), according to EPA Methods 200.2 and 3050. However, because Method 3051a does not accomplish total decomposition of the sample, the extracted analyte concentrations may not reflect the total content in samples where the analytes are occluded in recalcitrant mineral phases. This method is applicable to the microwave-assisted acid extraction/dissolution‡ of sediments, sludges, and soils, for the following elements: Aluminum (Al)*, Antimony (Sb)*, Arsenic (As), Barium (Ba)*, Beryllium (Be)*, Boron (B), Cadmium (Cd), Calcium (Ca), Chromium (Cr)*, Cobalt (Co), Copper (Cu), Iron (Fe)*, Lead (Pb), Magnesium (Mg)*, Manganese (Mn), Molybdenum (Mo), Nickel (Ni), Potassium (K), Selenium (Se), Silver (Ag)*, Sodium (Na), Strontium (Sr), Thallium (Tl), Vanadium (V)*, Zinc (Zn).
*Indicates elements which typically require the addition of HCl to achieve equivalent results with EPA Method 3050, as noted in reference 3.
This method is intended to provide a rapid multi-element acid extraction or dissolution prior to analysis. Many types of samples will be dissolved by this method. A few refractory sample matrix compounds, such as quartz, silicates, titanium dioxide, alumina, and other oxides may not be dissolved and in some cases may sequester target analyte elements. These bound elements are considered non-mobile in the environment and are excluded from most aqueous transport mechanisms of pollution.

2.0 Definitions

2.1 Laboratory Control Sample: The laboratory control used for the microwave digestion is a standard reference material (SRM) or certified reference material (CRM) that goes through the same extraction/preparation procedure as the samples. The analyte composition of the laboratory control sample is certified by acid dissolution method 3051a, 3050, or equivalent.

2.2 Duplicate Samples: A duplicate test involves splitting a sample two sub-samples and processing each through the same sample preparation procedure in order to determine the precision of the method.

2.3 Pre-digestion Spike: A duplicate sample is spiked prior to digestion in order to provide information about the effect of the sample matrix on the digestion and/or measurement methodology.

2.4 Preparation Blank: The Preparation Blank is a sample that contains only the reagents used in the extraction procedure. The preparation blanks is processed

through the same preparation procedures as the samples and therefore gives an indication of any contamination picked up during the sample preparation process.

2.5 Serial Dilution: A serial dilution consists of a comparison of the results of a sample and another aliquot diluted by a known factor.

2.6 ICP-AES: Inductively Coupled Plasma-Atomic Emission Spectrometry.

2.7 ICP-HG-AES: ICP-AES with sample introduction using automated hydride generation

2.8 ICP-MS: Inductively Coupled Plasma-Mass Spectrometry.

3.0 Equipment and Supplies

3.1 MARS 1600 watt microwave (CEM corporation, Mathews, NC).
Note: The microwave power output test, power calibration, and temperature probe calibration should be performed according to manufactures specifications every six months.

3.2 Trace metal grade nitric acid.

3.3 Trace metal grade hydrochloric acid.

3.4 ≥18 MΩ deionized water (DI).

3.5 50ml volumetric flasks

3.6 Parafilm

4.0 Procedure

Review SOP for handling acids (attached) prior to beginning the procedure.

4.1 Weigh a well-mixed sample to the nearest 0.001 g into an acid washed Teflon vessel equipped with a controlled pressure relief mechanism.

4.2 Add 9.0 ± 0.1 mL concentrated nitric acid and 3.0 ± 0.1 mL concentrated hydrochloric acid to the vessel in a fume hood.

4.2a The addition of concentrated hydrochloric acid to the nitric acid is appropriate for the stabilization of certain analytes, such as Ag, Ba, and Sb and high concentrations of Fe and Al in solution.

4.3 Seal the vessel according to the manufacturer's directions. Properly place the vessel in the microwave system according to the manufacturer's recommended specifications.

4.4 Enable the appropriate 3051 method in the MARS unit software as determined by the number of samples and project requirements. Note: The 3051_40 express method does not adhere to the 4 minute ramp requirement of the USEPA 3051 method.

4.5 Once the digests have cooled, remove from the microwave and wholly transfer into labeled 50ml volumetrics that have been acid washed following the *Dish Washing SOP* and triple rinsed with ≥18 MΩ DI water immediately prior to transfer.

4.6 Bring samples to volume, cover with parafilm and mix thoroughly by inversion. Bring to volume and mix thoroughly again after samples have cooled.

4.7 Syringe filter samples into labeled falcon tubes using dry acid washed syringes and nylon 0.45um nylon syringe filters.

5.0 Quality Control

5.1 Laboratory Control Sample: The laboratory control sample must fall within ± 20% of the known value or within the 95% prediction interval of the certified value. The laboratory control sample must be run with each batch of microwave digestions.

5.2 Sample Duplicates: The relative percent difference (RPD) must be no more than 20%. One sample duplicate must be run with every microwave batch.

$$RPD = 100 \times \frac{|S - D|}{\text{Avg. } (S,D)}$$

5.3 Pre-digestion Spike: Spike recoveries must fall within the limits of 75-125%. At least one spike analyses (matrix spikes) shall be performed on each group of samples of a similar matrix type. Pre-digestion spikes are to be done at the following levels for elements of interest.

Final Spike concentration	mg/L spike solution	uL spike prior to digest
As - 400 mg/kg	1000	200
Ba - 400 mg/kg	1000	200
Se 400 mg/kg	1000	200
Tl - 400 mg/kg	1000	200
Sb - 100 mg/kg	1000	50
Co 100 mg/kg	1000	50

Pb - 100 mg/kg	1000	50
Mn - 100 mg/kg	1000	50
Ni - 100mg/kg	1000	50
V - 100 mg/kg	1000	50
Zn - 100 mg/kg	1000	50
Cu 50 mg/kg	1000	25
Cr 40 mg/kg	1000	20
Ag - 10 mg/kg	100	50
Be - 10 mg/kg	100	50
Cd 10 mg/kg	100	50

5.4 Preparation Blank: If any analyte concentration is above the detection limit, in the preparation blank, the lowest concentration of the analyte reported in associated samples must be ≥ 10 times the preparation blank concentration. A preparation blank must be performed with each batch of microwave digests.

5.5 Serial Dilution: The % difference for the serial dilution tests must be no more than 10%. At least one serial dilutions should be performed on each group of samples with similar matrix.

$$\%\text{Difference} = 100 * \frac{[\text{initial}] - ([\text{diluted}] * \text{DilutionFactor})}{[\text{initial}]}$$

6.0 Instrumental Analysis

6.1 Instrumentation: ICP-AES and ICP-HG-AES analysis are carried out on a Varian Vista-MPX ICP-OES (Varian Inc., Walnut Creek, CA). Determination by ICP-MS is done on a Perkin-Elmer Sciex ELAN 6000 (Perkin-Elmer Inc., Waltham, MA)

6.2 Detection Limits

6.2a Method detection limits (MDL) are calculated for specific methods and consequent conditions of that method developed for analysis on ICP. The method detection limit is determined by multiplying by 3.143 the standard deviation of seven replicate analyses of standard solutions at 2-5x the IDL limit.

6.3 Stock standards are prepared using ICP grade standards (SPEX CertiPrep Group, Metuchen, NJ, Assurance ICP Standards). Calibration standards are prepared daily by serial dilution from at least two independent stock standards. The dilutions should be done into a matrix comparable to the samples.

6.4 Nebulizer optimization should be performed before each calibration. Nebulizer optimization should be carried out according to manufacturer specifications.

6.5 Instruments shall be calibrated daily and each time the instrument is set up. Calibrate the instrument according to instrument manufacturer's recommended procedures. At least four standards shall be used for ICP calibration. One of the standards shall be a blank. Linear calibration must meet the criteria of: $r^2 = 0.995$, and calculated concentrations from the regression within 10% for each standard in the calibration.

6.6 Initial calibration verification (ICV) is an independent certified mixed QC standard (SPEX CertiPrep Group LPC standard 1, Fisher Cat. No. LPC-1-100N) run immediately after instrument calibration. Standards must fall within ± 10% of certified value. An independent standard is defined as a standard composed of the analytes from a different source than those used in the standards for the instrument calibration.

6.7 Continuing calibration verification (CCV) is a dilution of the ICV QC standard and is run after every ten samples. Standards must fall within ± 10% of certified value.

6.8 Initial calibration blank (ICB) is a calibration blank run just prior to the first sample. The calibration blank must fall below the method detection limit (MDL) detection limit. If the calibration blank is above the MDL, the problem should be fixed and instrument re-calibrated.

6.9 Continuing calibration blank (CCB) is a calibration blank run after every ten samples with the CCV. The calibration blank must fall below the MDL. If a calibration blank is above the detection limit, the instrument must be recalibrated and the previous samples to the last CCB re-run.

6.10 Limit of quantitation (LOQ) is a check standard used to verify linearity at the MDL for ICP analysis. The LOQ standards at a concentration equal to the MDL are analyzed at the beginning and end of each sample analysis and at a frequency of not greater than 20 analytical samples.

6.11 A linear range verification check standard shall be analyzed for each wavelength concentrations that exceed the highest calibration standard by more than 20%. The standard shall be analyzed during the analytical run. The analytically determined concentration of this standard shall be within 10% of the true value. This concentration is the upper limit of the ICP linear range beyond which results cannot be reported without dilution of the analytical sample.

6.12 Potential interferences are determined by calibration of all potential lines used for analysis followed by the analysis of single element standards as samples containing 10 to 500mg/L. Interferences were identified as a signal greater than the IDL on any line other than the element in the standard. The single element standards

investigated included; Al, As, B, Ba, Be, Ca, Cd, Co, Cr, Cu, Fe, K, Mg, Mn, Mo, Na, Ni, P, Pb, Sb, Se, Tl, V, Zn.

6.13 To verify interelement and background correction factors for the ICP, an Interference Check Samples (ICS) shall be analyzed at the beginning and end of each analysis run and not greater than 20 analytical samples per analysis run. The Interference Check Samples consist of two solutions: Solution A and Solution AB. Solution A consists of the interferents, and Solution AB consists of the analytes mixed with the interferents. An ICS analysis consists of analyzing both solutions consecutively (starting with Solution A) for all wavelengths used for each analyte reported by ICP. The analytical results for those target analytes with MDLs < 10 ug/L shall fall within + 2x MDL of the analyte's true value (the true value shall be zero unless otherwise stated) in the ICS Solution A (ICSA). For example, if the analysis result(s) for Arsenic (MDL = 10 ug/L, ICSA true value = 0 ug/L) in the ICSA analysis during the run is + 19 ug/L, then the analytical result for Arsenic falls within the + 2x MDL window for Arsenic in the ICSA. Results for the ICP analyses of Solution AB during the analytical runs shall fall within the control limit of +20% of the true value for the analytes included in the Interference Check Samples. If not, terminate the analysis, correct the problem, recalibrate the instrument, and reanalyze the analytical samples analyzed since the last good ICS. This + 20% window does not apply when the IDL exceeds the MDL for the analytes As, Pb, Se, Tl.

INTERFERENT AND ANALYTE ELEMENTAL CONCENTRATIONS USED FOR ICP INTERFERENCE CHECK SAMPLE

Analytes (mg/L)		Interferents (mg/L)

Standard Operating Procedure
Neutral Salt Extraction
Soil and Environmental Chemistry Group, The Ohio State University, Version 2

1.0 Scope of Method

1.1 A neutral salt extraction is used to screen for elemental solubility.

1.2 This method is applicable for testing soil, sediments, and municipal/industrial byproducts

3.0 Definitions

2.1 Duplicate Samples: A duplicate test involves splitting a sample into two or more sub-samples and processing each through the same sample preparation procedure in order to determine the precision of the method.

2.2 Preparation Blank: A a sample that contains only the reagents used in the extraction procedure. The preparation blanks is processed through the same procedures as samples and therefore gives an indication of potential contamination in the sample preparation process.

2.3 ICP-AES: Inductively Coupled Plasma-Atomic Emission Spectrometry.

3.0 Equipment and Supplies

3.1 Shaker

3.2 Neutral salt solution

3.4 ≥18 MΩ deionized water.

4.0 Procedure

4.1 Samples should be oven dried 70 ºC, dried and crushed to <2mm

4.2 Weigh 5 g of well-mixed sample to the nearest 0.001 g into a 50 mL centrifuge tube

4.3 Add 25 mL of 0.01 *M* $CaCl_2$ solution and cap vessel

4.4 Equilibrate sample by shaking for 4h

4.5 Filter (0.45µm) using nylon syringe filters, into ICP falcon tubes

4.6 Refrigerate filtered extracts and analyze within 2 days or add 1drop concentrated HCl to preserve samples.

5.0 Quality Control

5.1Sample Duplicates: The % relative standard deviation (%RPD) must be no more than 20%. One sample duplicate must be run for every twenty samples.

$$RPD = 100 \times \frac{|S - D|}{Avg.\ (S,D)}$$

5.2 Preparation Blank: If any analyte concentration is above the detection limit, the lowest concentration of the analyte in the associated samples must be 10 times the preparation blank concentration. A preparation blank must run every 10 samples

6.0 Instrumental Analysis by ICP-OES

6.1 Instrumentation: ICP-AES and ICP-HG-AES analysis are carried out on a Varian Vista-MPX ICP-OES (Varian Inc., Walnut Creek, CA).

6.2 Stock standards are prepared using ICP grade standards (SPEX CertiPrep Group, Metuchen, NJ, Assurance ICP Standards). Calibration standards are prepared daily by serial dilution from at least two independent stock standards. The dilutions should be done into a matrix comparable to the samples.

6.3 Nebulizer optimization should be performed before each calibration. Nebulizer optimization should be carried out according to manufacturer specifications.

6.4 Instruments shall be calibrated daily and each time the instrument is set up. Calibrate the instrument according to instrument manufacturer's recommended procedures. At least four standards shall be used for ICP calibration. One of the standards shall be a blank. Linear calibration must meet the criteria of: $r^2 = 0.995$, and calculated concentrations from the regression within 10% for each standard in the calibration.

6.5 Initial calibration verification (ICV) is an independent certified mixed QC standard (SPEX CertiPrep Group LPC standard 1, Fisher Cat. No. LPC-1-100N) run immediately after instrument calibration. Standards must fall within ± 10% of certified value. An independent standard is defined as a standard composed of the analytes from a different source than those used in the standards for the instrument calibration.

6.6 Continuing calibration verification (CCV) is a dilution of the ICV QC standard and is run after every ten samples. Standards must fall within ± 10% of certified value.

6.7 Initial calibration blank (ICB) is a calibration blank run just prior to the first sample. The calibration blank must fall below the method detection limit (MDL) detection limit. If the calibration blank is above the MDL, the problem should be fixed and instrument re-calibrated.

6.8 Continuing calibration blank (CCB) is a calibration blank run after every ten samples with the CCV. The calibration blank must fall below the MDL. If a calibration blank is above

the detection limit, the instrument must be recalibrated and the previous samples to the last CCB re-run.

6.9 Limit of quantitation (LOQ) is a check standard used to verify linearity at the MDL for ICP analysis. The LOQ standards at a concentration equal to the MDL are analyzed at the beginning of each sample analysis.

6.10 A linear range verification check standard shall be analyzed for each wavelength concentrations that exceed the highest calibration standard by more than 20%. The standard shall be analyzed during the analytical run. The analytically determined concentration of this standard shall be within 10% of the true value. This concentration is the upper limit of the ICP linear range beyond which results cannot be reported without dilution of the analytical sample

6.11 Potential interferences are determined by calibration of all potential lines used for analysis followed by the analysis of single element standards as samples containing 10 to 500mg/L. Interferences were identified as a signal greater than the IDL on any line other than the element in the standard. The single element standards investigated included; Al, As, B, Ba, Be, Ca, Cd, Co, Cr, Cu, Fe, K, Mg, Mn, Mo, Na, Ni, P, Pb, Sb, Se, Tl, V, Zn.

7.0 Reporting

7.1 If the QC limits are not met for any element or sample, the effect on the data set will be evaluated by the project manager and analyst.

Toxicity Characteristic Leaching Procedure (TCLP) for Inorganics
Standard Operating Procedure

Soil Environmental Chemistry Program, The Ohio State University

Version 1

1.0 Scope of Method

1.1 The TCLP is designed to determine the mobility of both organic and inorganic analytes present in liquid, solid, and multiphasic wastes.

2.0 Definitions

2.1 Duplicate Samples: A duplicate test involves splitting a sample two sub-samples and processing each through the same sample preparation procedure in order to determine the precision of the method.

2.2 Preparation Blank: The Preparation Blank is a sample that contains only the reagents used in the extraction procedure. The preparation blanks is processed through the same preparation procedures as the samples and therefore gives an indication of any contamination picked up during the sample preparation process.

2.3 Matrix Spike: A duplicate sample is spiked after to the extraction procedure in order to provide information about the effect of the sample matrix on the measurement methodology.

2.4 ICP-AES: Inductively Coupled Plasma-Atomic Emission Spectrometry.

3.0 Equipment and Supplies

3.1 Agitation apparatus

3.2 high density polyethylene (HDPE), polypropylene (PP), or polyvinyl chloride(PVC) extraction vessels

3.3 pH Meter accurate to 0.05 units

3.4 Laboratory Balance: Any laboratory balance accurate to within + 0.01 grams may be used (all weight measurements are to be within + 0.1 grams).

3.5 Hydrochloric acid (1N), HCl, made from ACS reagent grade.

3.6 Nitric acid (1N), HNO3, made from ACS reagent grade.

3.7 Sodium hydroxide (1N), NaOH, made from ACS reagent grade.

3.8 Glacial acetic acid, CH3CH2OOH, ACS reagent grade.

3.9 ≥18 MΩ deionized water (DI).

3.10 Parafilm

4.0 Procedure

Review SOP for handling acids (attached) prior to beginning the procedure.

4.1 Oven dry sample at 60°C.

4.2 Grind solid sample until it is capable of passing through a 9.5 mm sieve.

4.3 Determine the correct extraction solution for the sample.

4.3.1 Weigh 5g of sample into a 500 mL beaker or Erlenmeyer flask. Add 96.5 mL of reagent water to the beaker, cover with a watchglass, and stir vigorously for 5 minutes using a magnetic stirrer. Measure and record the pH. If the pH is <5.0, use extraction fluid #1. If the pH from Section 7.1.4.2 is >5.0, add 3.5 mL 1N HCl, slurry briefly, cover with a watchglass, heat to 50 °C, and hold at 50 EC for 10 minutes. Let the solution cool to room temperature and record the pH. If the pH is <5.0, use extraction fluid #1. If the pH is >5.0, use extraction fluid #2.

4.4 Prepare appropriate extraction solution.

Extraction fluid # 1: Add 5.7 mL glacial CH_3CH_2OOH to 500 mL of reagent water (See Section 5.2), add 64.3 mL of 1N NaOH, and dilute to a volume of 1 liter. When correctly prepared, the pH of this fluid will be 4.93 + 0.05.

Extraction fluid # 2: Dilute 5.7 mL glacial CH_3CH_2OOH with reagent water (See Section 5.2) to a volume of 1 liter. When correctly prepared, the pH of this fluid will be 2.88 + 0.05

4.5 Weigh 1.5g of sample into extraction vessel.

4.6 Add 30ml of extraction fluid

4.7 Close the extractor bottle tightly, secure in agitation device, and agitate for 18 ± 2 hours.

4.8 Remove from rotary agitation device and 0.45um nylon syringe filter (aprox. 12ml) into falcon tubes for ICP analysis. Samples should be preserved <pH 2 by the addition of 1 drop of concentrated HNO_3.

5.0 Instrumental Analysis by ICP-OES

5.1 Instrumentation: ICP-AES and ICP-HG-AES analysis are carried out on a Varian Vista-MPX ICP-OES (Varian Inc., Walnut Creek, CA). Determination by ICP-MS is done on a Perkin-Elmer Sciex ELAN 6000 (Perkin-Elmer Inc., Waltham, MA)

5.2 Stock standards are prepared using ICP grade standards (SPEX CertiPrep Group, Metuchen, NJ, Assurance ICP Standards). Calibration standards are prepared daily by serial dilution from at least two independent stock standards. The dilutions should be done into a matrix comparable to the samples.

5.3 Nebulizer optimization should be performed before each calibration. Nebulizer optimization should be carried out according to manufacturer specifications.

5.4 Instruments shall be calibrated daily and each time the instrument is set up. Calibrate the instrument according to instrument manufacturer's recommended procedures. At least four standards shall be used for ICP calibration. One of the standards shall be a blank. Linear calibration must meet the criteria of: $r^2 = 0.995$, and calculated concentrations from the regression within 10% for each standard in the calibration.

5.5 Initial calibration verification (ICV) is an independent certified mixed QC standard (SPEX CertiPrep Group LPC standard 1, Fisher Cat. No. LPC-1-100N) run immediately after instrument calibration. Standards must fall within ± 10% of certified value. An independent standard is defined as a standard composed of the analytes from a different source than those used in the standards for the instrument calibration.

5.6 Continuing calibration verification (CCV) is a dilution of the ICV QC standard and is run after every ten samples. Standards must fall within ± 10% of certified value.

5.7 Initial calibration blank (ICB) is a calibration blank run just prior to the first sample. The calibration blank must fall below the method detection limit (MDL) detection limit. If the calibration blank is above the MDL, the problem should be fixed and instrument re-calibrated.

5.8 Continuing calibration blank (CCB) is a calibration blank run after every ten samples with the CCV. The calibration blank must fall below the MDL. If a calibration blank is above the detection limit, the instrument must be recalibrated and the previous samples to the last CCB re-run.

5.9 Limit of quantitation (LOQ) is a check standard used to verify linearity at the MDL for ICP analysis. The LOQ standards at a concentration equal to the MDL are analyzed at the beginning of each sample analysis.

5.10 A linear range verification check standard shall be analyzed for each wavelength concentrations that exceed the highest calibration standard by more than 20%. The standard shall be analyzed during the analytical run. The analytically determined concentration of this standard shall be within 10% of the true value. This concentration is the upper limit of the ICP linear range beyond which results cannot be reported without dilution of the analytical sample

5.11 Potential interferences are determined by calibration of all potential lines used for analysis followed by the analysis of single element standards as samples containing 10 to 500mg/L. Interferences were identified as a signal greater than the IDL on any line other than the element in the standard. The single element standards investigated included; Al, As, B, Ba, Be, Ca, Cd, Co, Cr, Cu, Fe, K, Mg, Mn, Mo, Na, Ni, P, Pb, Sb, Se, Tl, V, Zn.

6.0 Quality Control

6.1 Sample Duplicates: The relative percent difference (RPD) must be no more than 20%. One sample duplicate must be run every 20 samples.

$$RPD = 100 \times \frac{|S - D|}{\text{Avg. } (S,D)}$$

6.2 Matrix Spike: Spikes should be performed such that the end concentration is within the linear range for the instrument. Spike recoveries for analytes of interest must fall within the limits of 75-125%. At least one spike analyses (matrix spikes) shall be performed on each group of samples of a similar matrix type.

6.3 Preparation Blank: If any analyte concentration is above the LOQ, in the preparation blank, the lowest concentration of the analyte reported in associated samples must be ≥ 10 times the preparation blank concentration. A preparation blank must be performed with each batch of microwave digests.

7.0 Reporting

7.1 If the QC limits are not met for any element or sample, the effect on the data set will be evaluated by the project manager and analyst.

Introduction

REAC, in response to WA# 0-356, provided analytical support for environmental samples collected from the Laurence Harbor Site in Laurence Harbor, New Jersey, as described in the following table. The support also included QA/QC, data review, and preparation of an analytical report containing the results and the QA/QC results.

Chain of Custody #	Number of Samples	Sampling Date	Date Received	Matrix	Analysis / Method	Lab	Data Package
356-09/15/08-0003	6	09/10/08	9/19/08	Tissue	TAL Metals/ SW-846 6020	Katahdin	T 304

	10	09/22/08		Pore Water			

[1] Katahdin is NELAC certified for Metals analysis.

Case Narrative

The metals data are reported to two significant figures and reported as received from the laboratory. Any other representation of the data is the responsibility of the user. All data validation flags have been inserted into the results tables.

Due to the high levels of acid used during the digestion procedure for ICP-MS metals, all samples underwent a five-fold dilution before analysis. All RLs have been adjusted for dilution.

Metals in Tissue Package T 304

Manganese and copper were detected in the continuing calibration blank (CCB) of 10/2/08-23:44 above the RL. Manganese and copper are qualified estimated high (J+) for the method blank of 10/2/08 and the CO_2 blank.

Copper and lead were detected in the method blank 10/1/08 above the RL. Copper and lead are qualified estimated high (J+) for samples 356-0037 through -0041.

Barium, copper, manganese and nickel were detected in the CO_2 blank above the RL. Barium, copper, manganese and nickel are qualified estimated high (J+) for samples 356-0023, -0024, -0026, -0027, -0028 and -0029. Barium, manganese and nickel are qualified estimated high (J+) for sample 356-0025. Barium and nickel are qualified estimated high (J+) for samples 356-0030, -0031, -0032, -0033, -0034, -0035, and -0036. Barium, copper and nickel are qualified estimated high (J+) for samples 356-0037, -0038, -0039, -0040, -0041, -0042, -0043, -0044, -0045 and -0046.

Aluminum did not meet the %D criterion for the serial dilution analysis of sample 356-0023. Aluminum is qualified estimated (J) for samples 356-0023 through -0041.

Aluminum and manganese did not meet the % recovery criterion for the MS/MSD of sample 356-0043.

R2-0002178

Aluminum is qualified estimated high (J+) and manganese estimated low (J-) for samples 356-0042 through -0046.

Metals in Sediment and Water Package T 308

The sediment blank (356-0022) contained aluminum, barium, chromium, copper, lead, manganese and nickel above the reporting limit. Barium is qualified estimated high (J+) for samples 356-0011, -0012, -0013, -0017, -0018 and -0021. Copper is qualified estimated high (J+) for samples 356-0011, -0012, -0020 and -0021. Manganese is qualified estimated high (J+) for samples 356-0011, -0014, -0017, -0019 and -0021. Nickel is qualified estimated high (J+) for samples 356-0011 and -0014.

Manganese and tin did not meet the %RPD criterion for the MS/MSD analysis of sample 356-0011. Manganese did not meet the % recovery criterion for the MS and tin did not meet the % recovery criterion for the MSD of sample 356-0011. Manganese and tin are qualified estimated (J) for samples 356-0011 through -0022.

Arsenic did not meet the %D criterion for the serial dilution analysis of sample 356-0011. Arsenic is qualified estimated (J) for sample 356-0011 through 356-0022.

Andrea,

The 10 samples that were marked for TCLP analyses have been cancelled. Would you please ship those samples back to us next week. The samples are identified as follows:

356-0006
356-0007
356-0008
356-0009
356- 0010
356-0048
356-0049
356-0050
356-0051
356-0052

Thank you,

Larry A. Lyons

To: Johnson, John M
Subject: RE: Project 0356 TCLP Metals

Hi John,
The COC is marked for TAL metals plus tin. Please confirm we are only doing the 18 metals in the bid request.
Thanks,
Andrea

From: Johnson, John M [mailto:john.m.johnson@lmco.com]

Subject: Project 0356 TCLP Metals

Andrea please do not analyze the samples marked for TCLP analysis that you should receive today on COC 356-09/24/08-0009. Please just hold for further instructions.

Work Assignment No.: 20401.032.011.2206, Raritan Bay Slag Site
Contract No.: EP-W-06-072; Task Order No.: 0011-00

Dear Mr. Magriples:

Weston Solutions, Inc. (WESTON®) is pleased to submit the Sampling Trip Report for the second phase of sampling at the Raritan Bay Slag Site (RBS) (CERCLIS ID No. NJN000206276) located in Old Bridge and Sayreville, New Jersey. If you have any questions, please contact me at (732) 417-5869.

Very truly yours,

WESTON SOLUTIONS, INC.

Daniel J. Gaughan
Project Manager

SAMPLING TRIP REPORT

SITE NAME: Raritan Bay Slag Site
DCN No.: RST2-02-F-0933
W.O. No.: 20401.032.011.2206
Case No.: 38476

EPA I.D. NO.: NJN000206276

SAMPLING DATES: April 20 through 23, 2009

1. Site Location: Refer to Figure 1

2. Sample Locations: Refer to Figure 2

3. Sample Descriptions: Refer to Table 1

4. Laboratory Receiving Samples:

Analysis	Name and Address of Laboratory
Target Analyte List (TAL) metals	Bonner Analytical Testing Company 2703 Oak Grove Road Hattiesburg, MS 39402
	Liberty Analytical Corporation 501 Madison Avenue Cary, NC 27513

5. Sample Dispatch Data:

One aqueous sample for low concentration TAL metals analysis and 47 soil samples for low concentration TAL metals analysis were shipped to Bonner Analytical Testing Company (Bonner Analytical) on 4/20/2009 at 1415 hours via Federal Express Airbill No. 8627 4314 8293.

Eight aqueous samples for low concentration TAL metals analysis, seven aqueous samples for low concentration dissolved TAL metals analysis, and 59 soil/sediment samples for low concentration TAL metals analysis were shipped to Liberty Analytical on 4/21/2009 at 1640 hours via Federal Express Airbill No. 8627 4314 8308.

Six aqueous samples for low concentration TAL metals analysis, five aqueous samples for low concentration dissolved TAL metals analysis, and 83 soil/sediment samples for low concentration TAL metals analysis were shipped to Bonner Analytical on 4/22/2009 at 1740 hours via Federal Express Airbill No. 8627 4314 8319.

R2-0002210

Six aqueous samples for low concentration TAL metals analysis, five aqueous samples for low concentration dissolved TAL metals analysis, and 61 soil/sediment samples for low concentration TAL metals analysis were shipped to Liberty Analytical on 4/23/2009 at 1830 hours via Federal Express Airbill No. 8627 4314 8320.

6. On-Site Personnel:

Name	Company	Duties on Site
Dan Gaughan	WESTON	Project Manager, Site Health and Safety Officer, Sampler
Scott Snyder	WESTON	Sample Management Officer (SMO)
Kelli Lucarino	WESTON	Sampler
Julissa Morales	WESTON	Sampler, Global Positioning System (GPS) Data Collection
Laura Holloway	WESTON	Sampler
Eric Hazard	WESTON	Sampler
Shawna Rigby	EPA	EPA Oversight

7. Additional Comments:

From April 20 through 23, 2009, Weston Solutions, Inc. (WESTON®) personnel collected soil, sediment, and surface water samples from the Raritan Bay Slag Site to determine the priority for further action under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). A total of 134 surface and near-surface soil samples (including eight environmental duplicate samples), 116 sediment samples (including five environmental duplicate samples), and 34 surface water samples (including two environmental duplicate samples) were collected from the site and a nearby background location. This sampling event was conducted as a follow-up to the October 2008 sampling event at the site.

WESTON collected surface soil samples from the depth interval of 0 to 2 inches and near-surface soil samples from the depth intervals of 6 to 12 inches, 12 to 18 inches, and 18 to 24 inches. Surface soil samples were collected using a dedicated plastic scoop to scrape away surficial material (grass, leaves, rocks etc.) and to remove the top layer of vegetation/soil/fill material. The soil was collected, transferred into a dedicated plastic tray, homogenized, and transferred into the required sample container using a dedicated plastic scoop. Near-surface soil samples were collected using a steel shovel and dedicated, disposable plastic scoops. Near-surface depths were achieved by shoveling soil from the location of the previously collected 0-to-2 inch sample to the required depth below the surface (i.e., top of the sampling interval). Once the appropriate depth was achieved, a layer of soil was scraped away using a disposable scoop. A second scoop was utilized to collect soil, place it into a dedicated plastic tray, and homogenize it. The homogenized soil was then transferred into the required sample container using the second dedicated plastic scoop. All remaining soil, not used for laboratory analysis, was discarded at the sampling location.

Sediment samples were collected at a depth of 0 to 3 inches. Sediment samples were collected using a dedicated, disposable plastic scoop, allowing any excess surface water to drain from the sampling

R2-0002211

device. After collection, the sediment was transferred into a dedicated plastic tray, homogenized, and transferred into the required sample container using the dedicated plastic scoop. All remaining sediment, not used for laboratory analysis, was discarded at the sampling location.

Surface water samples were collected directly into the sample container by partially submerging the sample bottle and collecting the sample. Surface water samples for TAL metals and TAL dissolved metals analysis were co-located, with the sample numbers containing a 'D' indicating requested analysis for dissolved metals (i.e., RBS-SW25 and RBS-SW25D). The dissolved metals sample was collected into a clean container and filtered through a 0.45-micron filter into another clean container using a peristaltic pump and dedicated tubing to avoid cross-contamination, at which point the first container was discarded.

Four rinsate blanks (plastic scoop and plastic tray) were collected for quality assurance/quality control (QA/QC) purposes.

All sample locations were recorded electronically using GPS technology. Post-processing differential correction of the GPS data was conducted in accordance with the EPA Region 2 GPS Standard Operating Procedures (SOP). The processed GPS data were then transferred to the Sample Location Map (Figure 2) using Geographic Information Systems (GIS).

All samples were collected as part of the Integrated Assessment (IA) evaluation conducted on site. Samples collected by WESTON were designated for analysis of TAL metals (soil, sediment, and surface water) and TAL dissolved metals (surface water) through the EPA Contract Laboratory Program (CLP). Inorganic Traffic Reports are presented in Attachment 1.

EPA June to July 2009 Sampling Results (Sediment Cores)

LOCKHEED MARTIN

DATE: August 14, 2009

TO: Mark Sprenger, U.S. EPA/ERT Work Assignment Manager

FROM: Cindy Kleiman, REAC Biology Group Leader/Acting Task Leader
Larry Lyons, REAC Task Leader

THROUGH: Dennis Miller, REAC Program Manager

SUBJECT: TRIP REPORT: Raritan Bay Sediment Sampling, Laurence Harbor, NJ
Work Assignment No. 0-356

Background. The Raritan Bay Slag Site, located in the Laurence Harbor section of Old Bridge Township, New Jersey (NJ), is approximately 1.3 miles in length and encompasses the waterfront area on the Raritan Bay from Margaret's Creek to the area just beyond the western jetty at the Cheesequake Creek Inlet. The Site includes a sea wall that extends for approximately 3,000 feet along the Old Bridge Waterfront Park adjacent to Bayview Drive; a public beach area located at the outlet of the Cheesequake Creek; the Cheesequake Creek outlet jetty that extends for about 1,000 feet from the mouth of the Cheesequake Creek into Raritan Bay; and the waterfront area west of the jetty. Contaminants of concern are primarily metals including lead, arsenic, copper, zinc, antimony and tin originating from foundry bottoms and battery waste, and potentially other materials. The waste material was used to construct the jetties and was used as a fill and stabilizing material for the seawall.

This Work Assignment (WA) focuses on assessing the bioaccumulation of metals within the forage (food) items of the ecological receptors at this site, and on investigating the distribution of waste material in the environment. Previous site work performed by Response, Engineering and Analytical Contract (REAC) personnel at the request of the Environmental Protection Agency (EPA) Environmental Response Team (ERT) included the collection of biota (i.e., ribbed mussels, clams, foraging fish and algae), which were evaluated for the accumulation of contaminants of concern. Biota, sediment, pore water and waste material were collected from various locations at and within proximity of the sea wall and the jetties. Biota, sediment and pore water samples were analyzed for metals. Samples of waste material from the exterior and interior of the sea wall and jetties were subjected to extraction procedures, metals analysis and analytical procedures to differentiate among metal species.

Other previous site work included a geophysical survey of the playground within the Old Bridge Waterfront Park area of the site and a waterborne survey using side-scan sonar techniques conducted from the EPA vessel, Biglane, performed in April 2009. These surveys were conducted to assess the distribution of submerged site materials that may be present in the Raritan Bay adjacent to the Cheesequake Creek inlet jetties and the seawall and may extend out into the coastal subtidal zone.

Summary of Sediment Sampling Activities. This trip report covers offshore and onshore sediment core sampling conducted in June and July 2009 to evaluate the extent of contamination in offshore sediments in the Raritan Bay adjacent to the Cheesequake Creek Inlet jetties and the seawall and the coastal subtidal zone. A statistically-based phased sampling approach was developed using Visual Sampling Plan (VSP)

R2-0002251

(REAC 2009). The site was divided into three areas (Area A, B and C) based on professional judgment, historical information, and the following considerations: the large area of concern; possible dispersal of contaminants, presence in "hot spots", or as chunks of slag; and the complexity of collecting sediment in an intertidal zone. The three phases, and the proposed sampling locations were discussed in detail in the Quality Assurance Project Plan (QAPP), Amendment 1, and in the *Phased Sampling Design for the Raritan Bay Slag Site* (REAC 2009). Figures 1 through 3 show the locations at which samples were obtained in Areas A, B and C, respectively.

Determinations were made in the field as to whether any of the planned sampling grid locations would be inconsistent with the WA's data quality objectives – for example, samples were not collected from the beach or from solid rock. Samples could not be collected at some locations due to refusal, i.e., encountering hard substrate. At these locations, samplers would relocate the sleeve within five feet of the original location and make another attempt. After two unsuccessful attempts, the location would be abandoned. Of the 362 planned sampling locations, a total of 354, or 98 percent (%) of the planned locations, were actually sampled (listed in Table 1). The following locations were not sampled, as shown by black X's on Figures 1 through 3: A-105, A-109, B-48, C-4, C-5, C-6, C-11 and C-12. In addition, at some locations the full targeted depth could not be collected due to refusal. This was noted on the chain of custody, and is included under "Remarks" on Table 2. Due to the nature of the material, some samples compacted in the sleeves, resulting in the appearance of a smaller sample than was actually collected. Material other than sediment would sometimes be captured in the sleeve, e.g., seaweed, small rocks, snails and shrimp.

Activities of June 29-July 28, 2009. REAC personnel arrived on-site on June 29, 2009 to mobilize equipment and supplies needed for sampling and for sample processing by EPA Region II. All materials were stored in the Old Bridge Township recreational building, which served as the Command Center. EPA Region II reviewed the QAPP provided by REAC and provided comments. The Coast Guard reviewed REAC's Health and Safety Plan (HASP); REAC made some minor modifications at their request.

Sampling by on-shore teams was performed on June 30, July 1 and July 7- 9. Arrival times were selected to take advantage of low tide. Sampling was not performed on July 2, July 3, July 6 or July 10 at the request of the EPA. REAC divers performed off-shore sampling on July 7-10, July 13-17, July 20, July 22, July 23 and July 27, dictated by weather conditions. On July 7, on-shore and off-shore work was stopped early due to lightning. On certain days, REAC personnel were joined by ERT personnel during collection efforts. REAC staffing was arranged to provide a total of one to three on-shore sampling teams, and one or two dive teams on each sampling day. Sampling dates and locations are shown in Table 1 and Table 2. Table 2 also provides sample depth, chain of custody numbers, times of collection and remarks, as compiled from chains of custody and field logbooks.

At the beginning of each day, REAC personnel signed the Command Center site entry log; the HASP was also signed and remained at the Command Center throughout operations. Prior to sampling on each day, REAC and ERT noted the Global Positioning System (GPS) coordinates for each location with a Trimble differential GPS (dGPS) unit, and marked the spot with a wooden stake. The stakes were marked to indicate the sample location number and the number of cores to be collected at that spot (as described below). All GPS data were processed using Pathfinder Office software, and transferred into a project database. GPS coordinates for all sampling locations are provided in Attachment 1.

Cores were obtained by driving rigid, transparent polycarbonate sleeves (two inch outer diameter, one-eighth inch wall thickness, purchased from Scandia Plastics, Inc.) into the sediment using a sledge hammer and a metal strike-plate that fit over the upper end of the sleeve. Two depths were targeted: 0-6 inches (using a one-foot sleeve), and 0-24 inches (using a three-foot sleeve). In some locations, a 0-36

R2-0002252

inch or 0-48 inch depth was sampled using five-foot sleeves. When the desired depth was reached, the upper end of the sleeve was closed with a plastic end cap, carefully removed from the sediment to prevent loss of sample and capped at the bottom end. Both end caps were secured by duct tape and labeled in the field with the sample location identification number and time of collection. Locations, dates and times of collection, and problems encountered were recorded in field log books (shown in Attachment 3). In cases where water was present in the sleeve in addition to the sediment, a small breach was made in the upper end cap with a razor knife, and the sleeve was sliced open on one side with a hacksaw at the liquid/sediment interface, in order to drain off seawater. REAC manually prepared chains of custody in the field, denoting the date, sample location, depth and any problems encountered. After the first day of sampling, EPA Region II asked REAC to record the times of collection on the chains of custody as well. Copies of these chains are included in Attachment 2. All collected samples remained under direct line-of-sight of a REAC staff member until transfer to EPA Region II.

Depending on distance and location, the cores collected by the onshore teams, and associated chains of custody, were either driven back to the Command Center in an all-terrain vehicle or sport utility vehicle, or hand-carried back. They were then turned over to EPA Region II. Chain of custody numbers 01823 and 01824 and associated samples were signed over to the ERT Quality Assurance (QA) Coordinator in the field, to be brought back to the Region II personnel in the Command Center. For samples collected by the dive team, EPA Region II personnel met the boat to take possession of the samples and associated chains of custody. Region II was responsible for sample management, processing and shipment to a EPA designated Contract Laboratory Program (CLP) laboratory for analysis. Sample processing by EPA Region II included using a chop saw to divide the 0-24 inch cores into two separate samples, 0-12 inches and 12-24 inches. Thus, three samples were potentially obtained at each location: 0-6 inches, and two 12-inch segments. Region II processed, homogenized and placed the samples into appropriate containers (as described in the QAPP), then sent the samples to the lab to be analyzed for metals. At 10 % of the sampling locations, selected at random using VSP, REAC collected additional 0-6 inch cores, along with the 0-24 inch core. Initially, four 0-6 inch cores were collected at these locations; subsequently, REAC was asked to take five 0-6 inch cores. These additional 0-6 inch cores were processed by Region II and shipped to the CLP lab for analysis for the full suite of contaminants: volatile organic analytes (VOAs), semi-volatile organic analytes (SVOAs), pesticides/polychlorinated biphenyls (Pest/PCBs), metals and total organic carbon (TOC). At these same locations, the 12-24 inch sample was also analyzed for TOC. Samples were collected for the full suite analysis at the following 34 locations: A-8, A-17, A-22, A-32, A-41, A-50, A-56 (and duplicate), A-60, A-61, A-68, A-80, A-92, A-110, A-116, A-122, A-133, A-136, A-146, B-4, B-11, B-14, B-31, B-34, C-23, C-28, C-37, C-55, C-68, C-71, C-91, C-94, C-104, C-112 and C-121 (and duplicate).

Sediment cores are typically obtained using acetate sleeves. Because acetate sleeves could not be obtained with the necessary length and wall thickness for the Raritan Bay sampling, polycarbonate sleeves were used. To ensure that the polycarbonate plastic sleeve material would not result in phthalate contamination of the samples, REAC placed “certified clean” sand into five one-foot sleeves, to a depth of 6 inches. These were capped and secured with duct tape as for regular samples, labeled as “equipment blanks” and turned over to Region II to be sent to the CLP laboratory for full analysis. Since dedicated sleeves were used to collect samples, no rinsate blanks were collected by REAC. No field or trip blanks were submitted with the sediment samples. The targeted frequency for field duplicates was 5% of all field samples, in accordance with the *CLP Field Sampler’s Guide* (USEPA 2007). Duplicates were obtained at two of the 34 full-suite analysis locations. For metals-only samples, duplicates were obtained at six of 320 locations. EPA Region II personnel or their contractors were responsible for selection of samples to fulfill the laboratory QC requirements (i.e., matrix spike/matrix spike duplicate [MS/MSD] or duplicates). It is assumed that EPA Region II followed decontamination procedures appropriate for sample homogenization.

R2-0002253

Collection of samples at locations too deep for the onshore teams was initially performed by EPA-certified divers equipped with contaminated water dive gear (VikingPRO® dry suit, AGA MKII ® positive pressure face mask). As the sampling proceeded, the divers received permission from REAC's Health and Safety Officer to switch from dry suits to wet suits. Dive operations consisted of a single diver equipped with self-contained underwater breathing apparatus (SCUBA) or surface supplied air. All dive operations were conducted from suitable vessel(s). Core collection was as described above. At least one member of the dive team was certified as an EPA Divemaster and was responsible, as per the EPA Diving Safety Manual, for ensuring that all diving operations were conducted safely and in accordance with prescribed EPA diving safety rules and regulations. All diving tasks were conducted in accordance with the guidelines, procedures, and regulations of the EPA Dive Safety Board, OSHA, United States Coast Guard (USCG) and the site-specific Dive Plan and HASP. A record of all dive activities was maintained in dive operation logs. Float plans were also prepared on a daily basis during boat operations.

Support operations continuing throughout this effort included monitoring supplies and purchasing/transporting additional supplies to the Command Center or marina as needed, and ensuring adequate staffing. On July 28, with the conclusion of sampling, REAC personnel reported to the Command Center to demobilize and remove all equipment and excess supplies.

Summary of Samples Collected. Table 2 lists all samples collected during this effort. Excluding the five equipment blank cores, a total of 867 cores were collected from 354 sampling locations.

Future Activities. No additional intertidal zone sediment sampling is planned at this time.

Note: Data compiled from chains of custody and field logbooks.
*Samples with less than the full targeted depth reflect refusal.
**Discrepancy on chain of custody #05799: indicates five total cores were collected, but lists five 0-6" cores and one 24" core; total number of samples received for location A-116 could not be confirmed with ERT or EPA Region II.
NR = not recorded

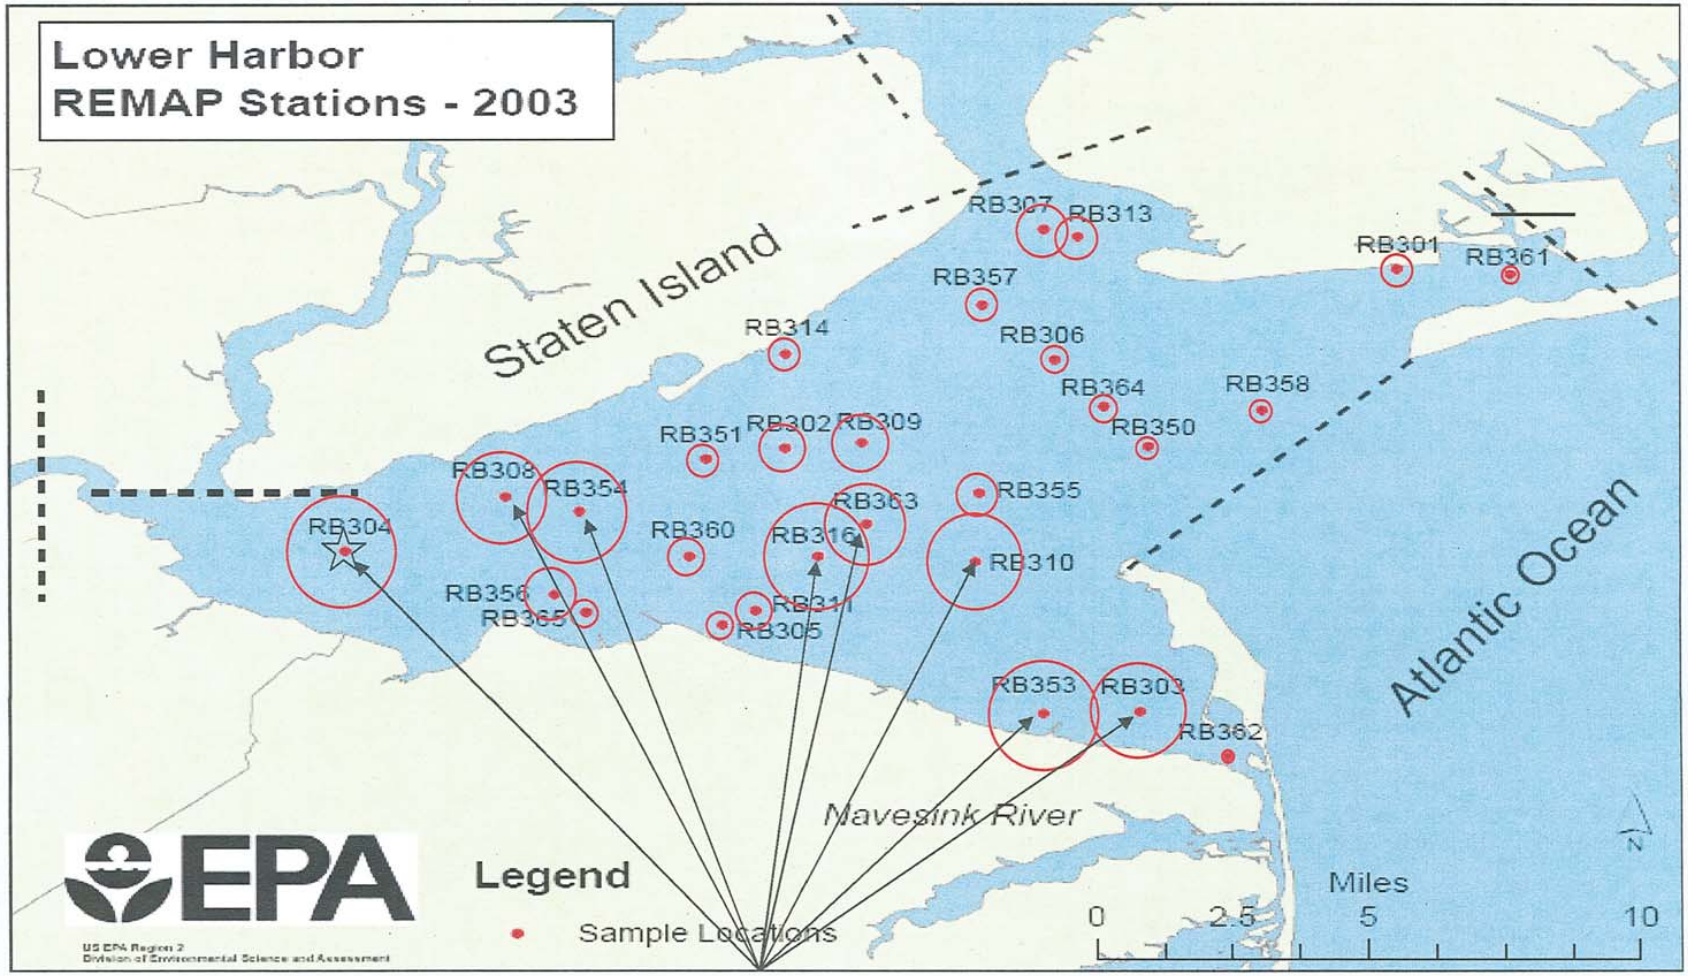
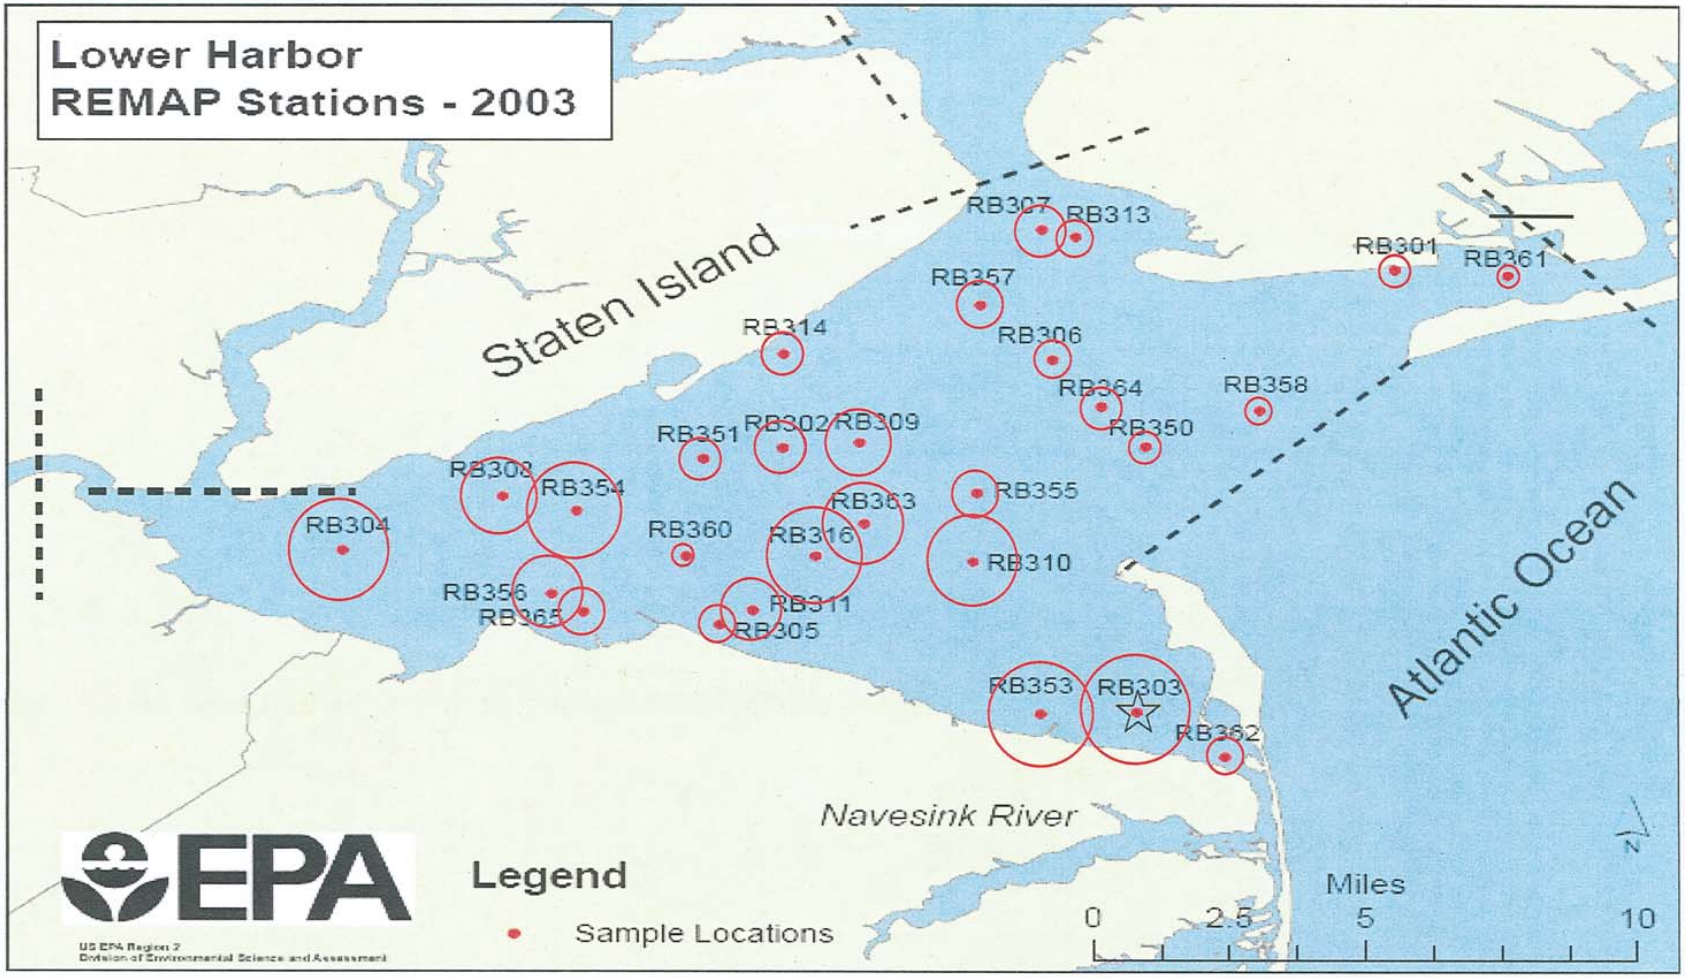
Relative Lead Levels in Raritan Bay



Lead shows high concentrations at these 8 sites, typical of most metals.

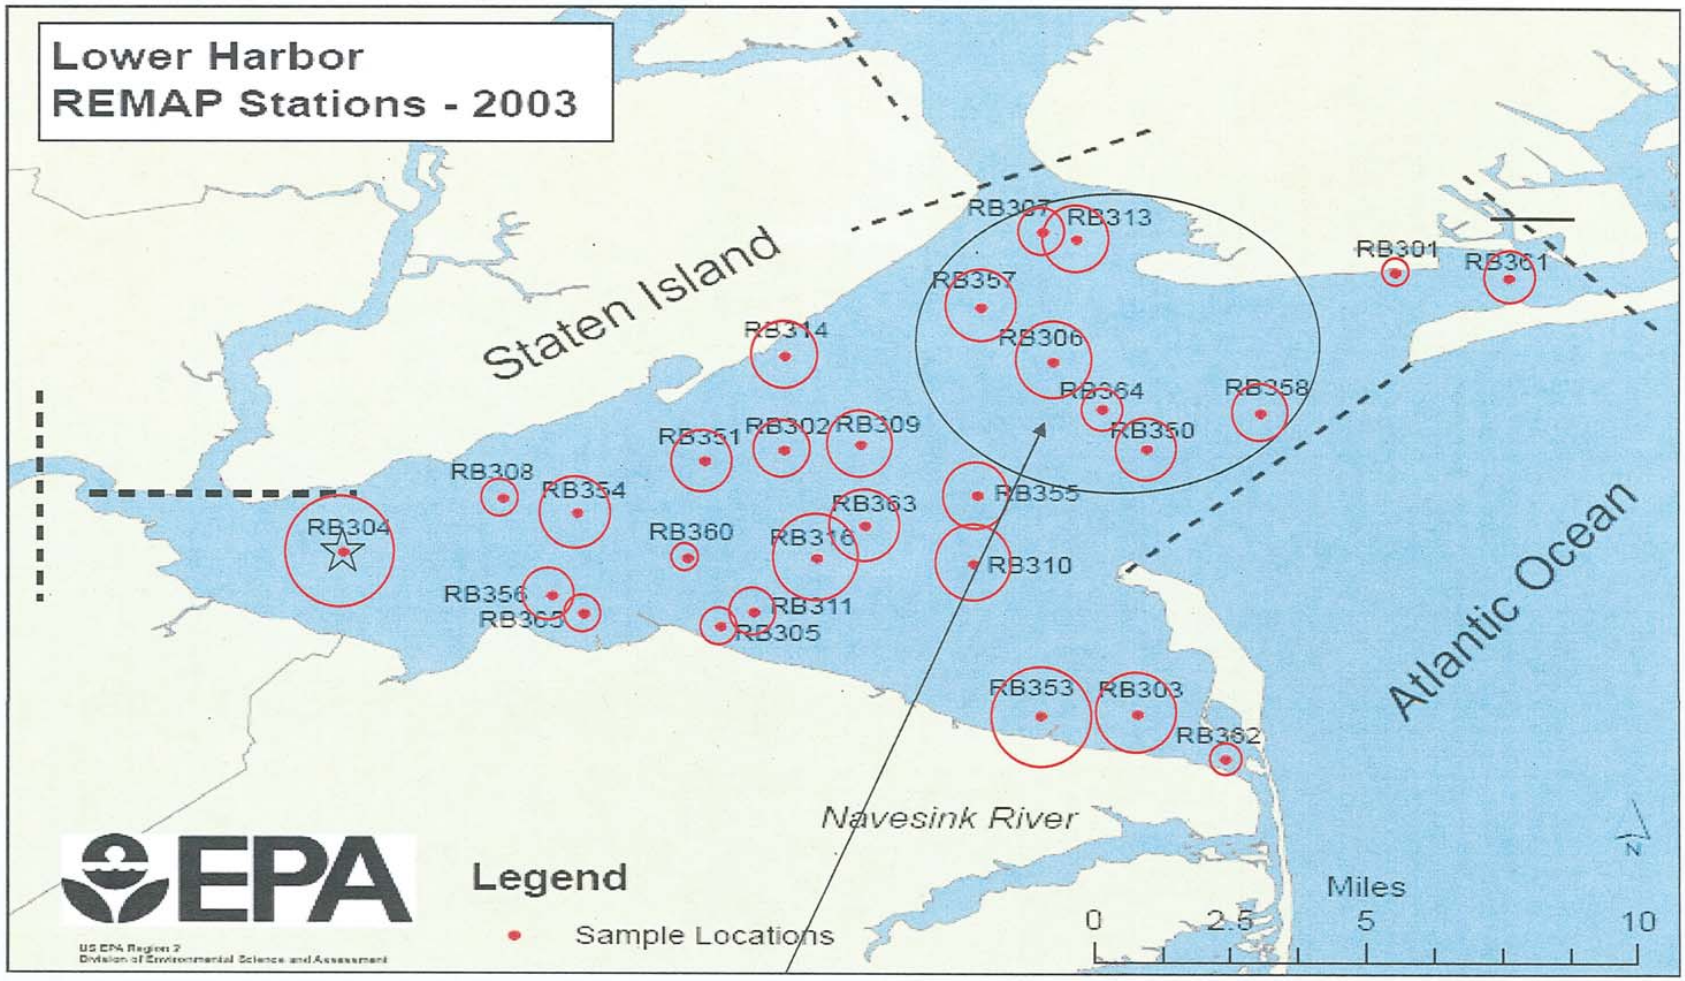
☆ - Indicates highest recorded value.

Relative Iron Levels in Raritan Bay



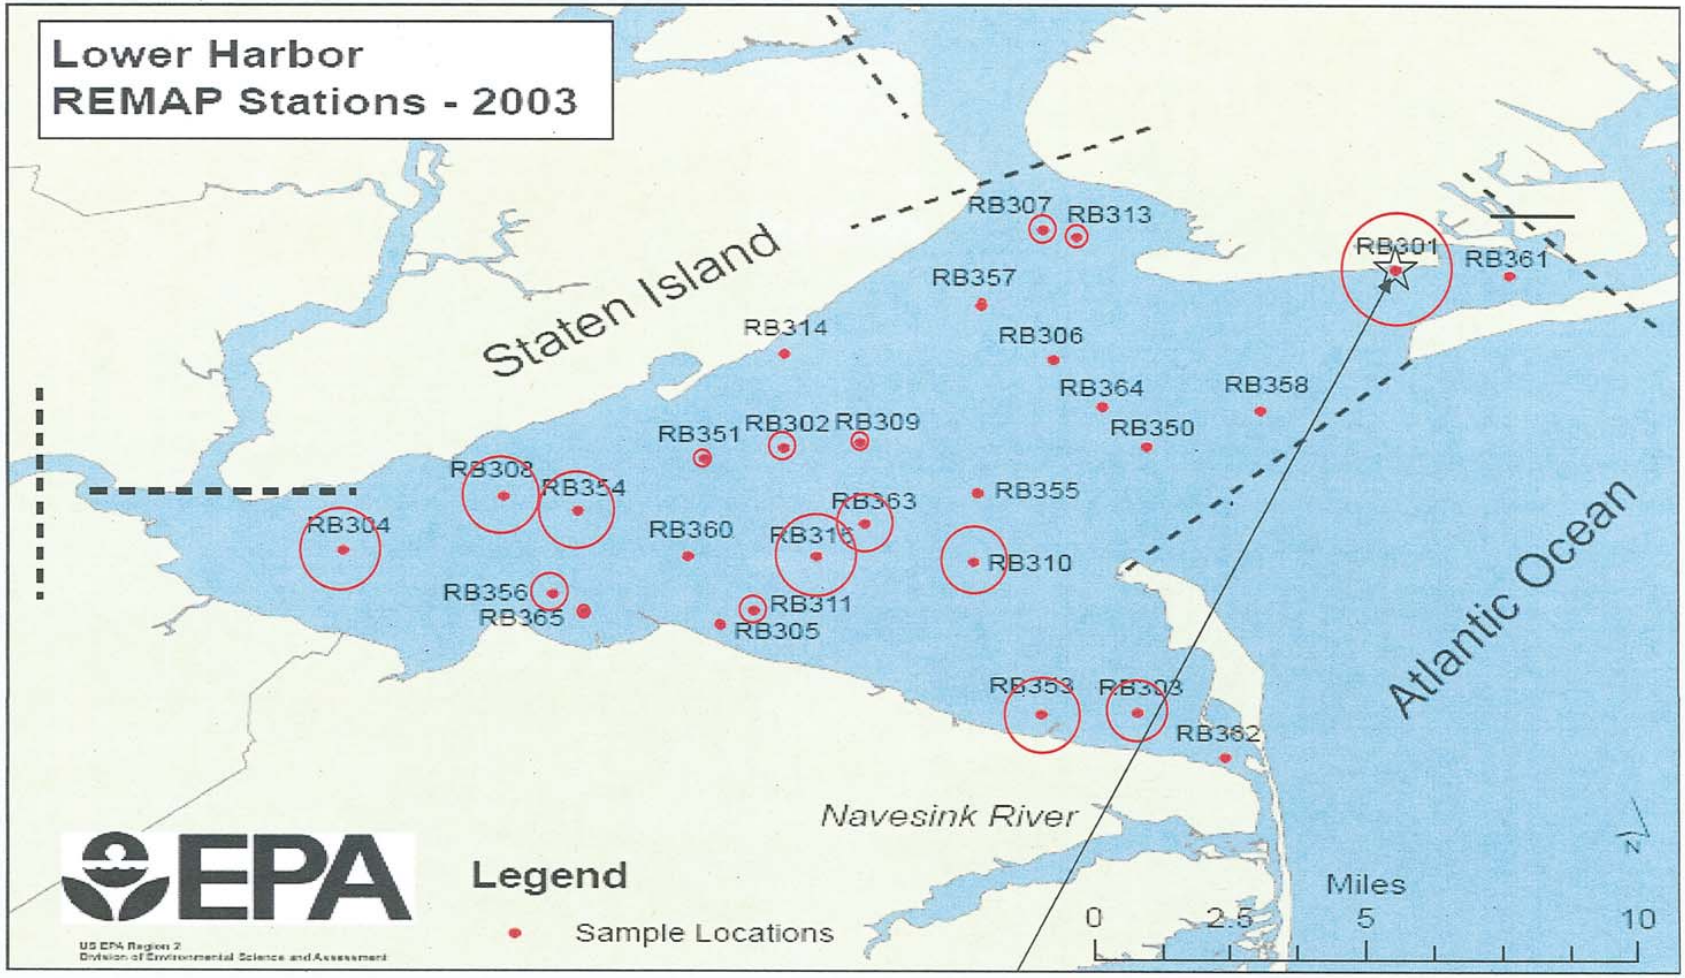
Relative iron levels are comparable to those of lead (0.96).

Relative Aluminum Levels in Raritan Bay



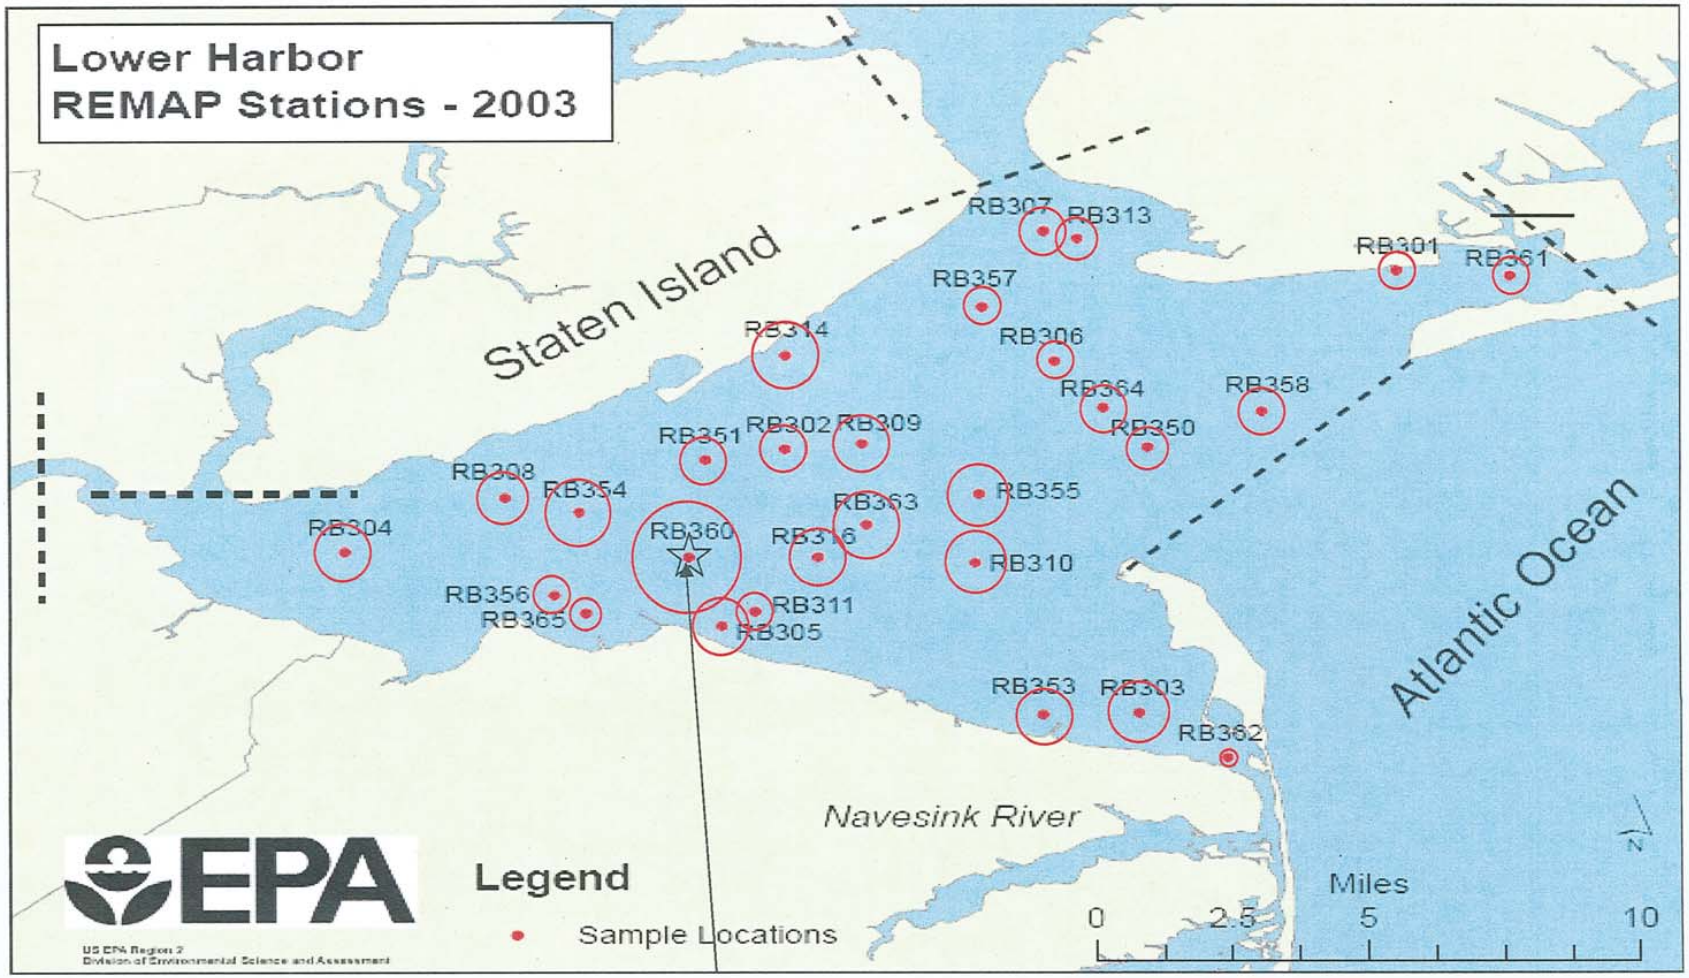
Aluminum is somewhat unique (0.66-0.77) because of slightly higher concentrations in this area and slightly lower concentrations at some of the usual 8 sites.

Relative Mercury Levels in Raritan Bay

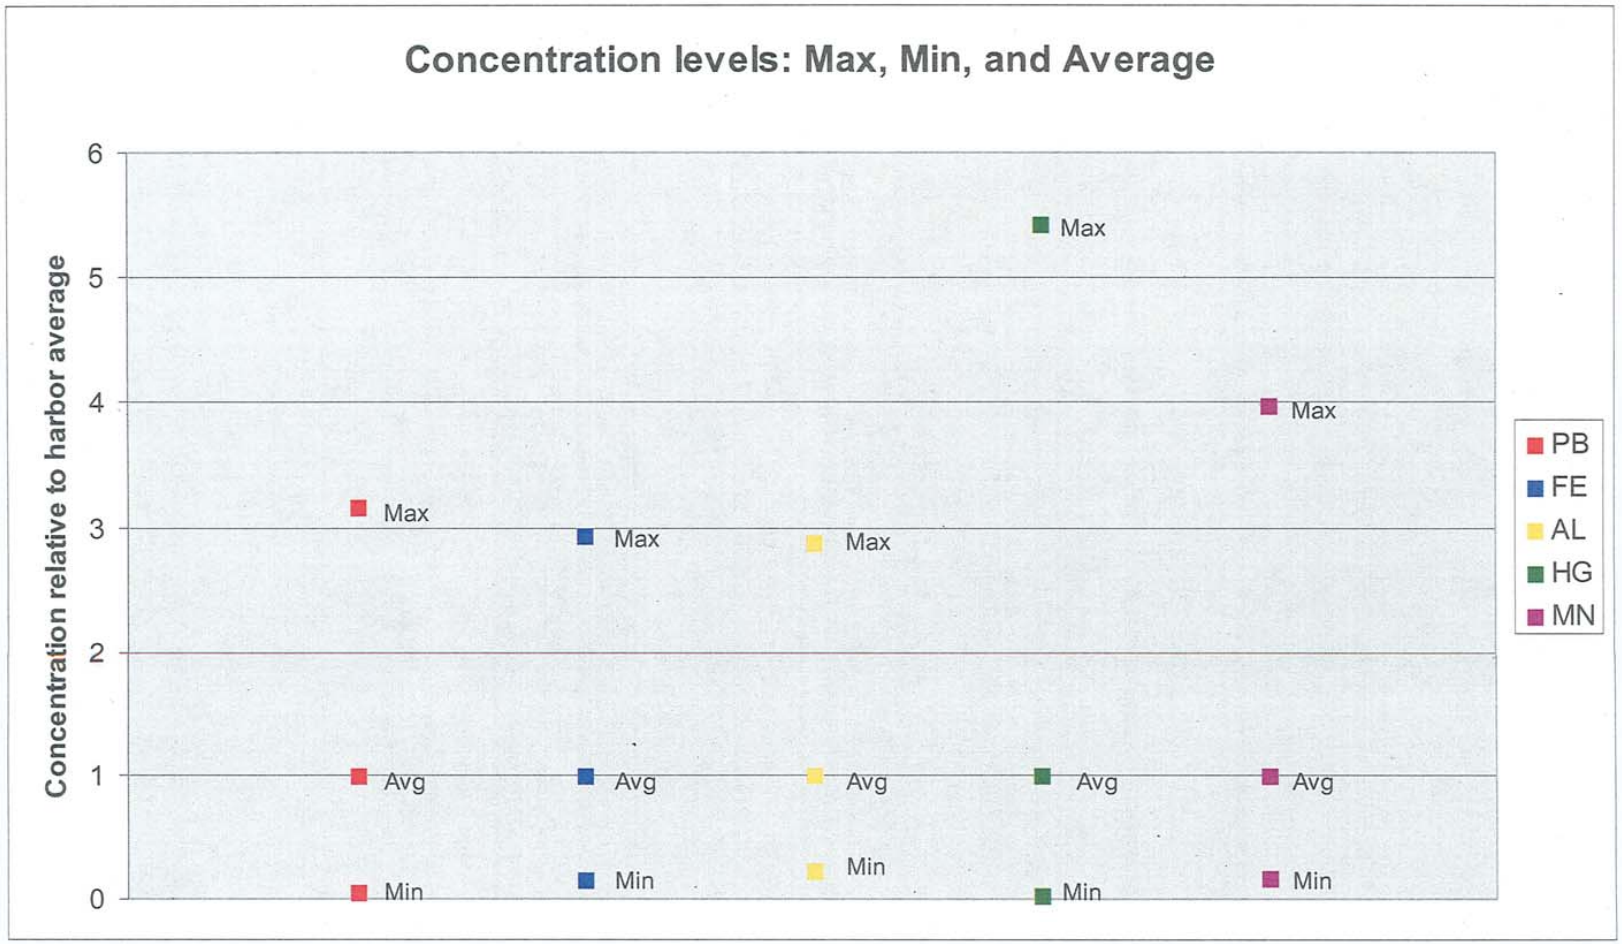


For mercury, the 8 typical sites are present, but overshadowed by this site, which has ~5.5 times the mean concentration (as compared to the typical max of ~3x avg.).

Relative Manganese Levels in Raritan Bay



Manganese levels are fairly constant throughout the harbor with the exception of this site, which has ~4 times the average concentration.



Mercury and Manganese maximum values are proportionally higher than most other metals.
