E	Result exceeded calibration range.

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F2	MS/MSD RPD exceeds control limits
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
V	Serial Dilution exceeds the control limits
W	PS: Post-digestion spike was outside control limits

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)

CASE NARRATIVE

Client: EA Engineering, Science, and Technology

Project: CBBT Thimble Shoal Parallel Tunnel

Report Number: 180-43250-1 REVISED

NOTE: This report has been revised to include Manganese per EA Engineering's request.

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 04/20/2015; the samples arrived in good condition, properly preserved and on ice. The temperatures of the 12 coolers at receipt time were 5.0º C, 5.1º C, 5.2º C, 5.3º C, 5.3º C, 5.4º C, 5.6º C, 5.6º C, 5.7º C, 5.7º C, 5.8º C and 5.8º C.

Several samples (180-43250 samples 23 thru 27) were received outside cooler temperature at our Burlington lab. The samples were logged in and analyzed.

SEMIVOLATILES
Benzidine failed the recovery criteria low for the MS/MSD of sample TS-2NB-SET (180-43250-21) in batch 180-141122. Di-n-octyl phthalate failed the recovery criteria high.

PESTICIDES
Several samples had surrogates recover outside QC limits. At least one surrogate recovered within QC limits. All data was reported.

PCB CONGENERS
Several samples had surrogates recover outside QC limits. At least one surrogate recovered within QC limits. All data was reported.

PCB-28, PCB-66, PCB-77 and PCB-8 failed the recovery criteria high for the MS of sample TS-2NB-SET (180-43250-21) in batch 180-140217. PCB-66 failed the recovery criteria high for the MSD of sample TS-2NB-SET (180-43250-21) in batch 180-140217. PCB-8 exceeded the RPD limit.

The continuing calibration verification (CCV) associated with batch 140217 recovered above the upper control limit for BZ-8, 126, 28, 66, and 77. The samples associated with this CCV were non-detects or had estimated values for the affected analytes; therefore, the data have been reported.

ORGANOPHOSPHORUS PESTICIDES
Instrument stopped just before the closing CCV was analyzed. All QC and surrogate recovery were within limits and samples were non-detect for the target compounds. After starting the instrument back up, the closing CCV passed all compounds. All data was reported with this narrative. TS-3SB-SET (180-43250-23), TS-3NT-SET (180-43250-24), TS-3NB-SET (180-43250-25), TS-4ST-SET (180-43250-26), TS-4SB-SET (180-43250-27), TS-4MT-SET (180-43250-28), TS-4NT-SET (180-43250-29), TS-4NB-SET (180-43250-30), (LCS 180-140316/2-A), (LCSD 180-140316/3-A) and (MB 180-140316/1-A)

Azinphos-methyl failed slightly low on primary column so all results were reported from the confirmation column which were non-detect. TS-1-SET (180-43250-16), TS-2ST-SET (180-43250-17), TS-2SB-SET (180-43250-18), TS-2MT-SET (180-43250-19), TS-2NT-SET (180-43250-20), TS-2NB-SET (180-43250-21), TS-2NB-SET (180-43250-21[MS]), TS-2NB-SET (180-43250-21[MSD]), TS-3ST-SET (180-43250-22), (LCS 180-140074/2-A) and (MB 180-140074/1-A)

ORGANOTINS
The samples in this delivery group were analyzed for alkyltins. The samples were analyzed using an internal standard method of analysis with tetra-n-propyltin as the internal standard. Peak areas were used to measure the instrument response in performing calibration and quantification. The analytical report forms correctly list the alkyltin analytes as unsubstituted alkyltin compounds. The analysis of three of the compounds employed the use of alkyltin chlorides. The results from the alkyltin chlorides required conversion factors to reflect the concentrations of the unsubstituted forms. For instance, tributyltin chloride was converted to tributyltin using a conversion factor of 0.89. Dibutyltin dichloride was converted to dibutyltin using a factor of 0.77. Monobutyltin trichloride was converted to monobutyltin using a factor of 0.62 and the surrogate, tripentyltin chloride was converted to tripentyltin using a factor of 0.90.

Monobutyltin has poor extraction efficiency exhibiting a mean recovery of typically less than 5%. The low mean recovery is typical of routine implementation of this method. Although the laboratory has reported control limits of 10-48% for this analyte these control limits are not based on historical performance and do not indicate expected performance of this analyte by this method. The laboratory does not use the recovery or performance of this compound as a basis for acceptance of the analytical batch. All analytical results, both positive and non-detects are considered qualitative values and are flagged with a cn qualifier.

Monobutyltin failed the recovery criteria low for LCS 200-87725/2-A and for LCS 200-88087/2-A.

Monobutyltin failed the recovery criteria low for the MS/MSD of sample TS-2NB-SET (180-43250-21) in batch 200-87867.

METALS

Several samples were diluted due to the nature of the sample matrix. Elevated reporting limits (RLs) are provided.

The following samples were further diluted to bring the concentration of sodium within the linear range: TS-4MT-SET (180-43250-28), TS-4NT-SET (180-43250-29), TS-4NB-SET (180-43250-30), (180-43250-G-28-B MS), (180-43250-G-28-C MSD), (180-43250-G-28-A PDS) and (180-43250-G-28-A SD). Elevated reporting limits (RLs) are provided.

Aluminum, Calcium and Lead were detected in method blank MB 180-140278/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Sodium was detected in method blank MB 180-140485/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Selenium failed the recovery criteria low for the MS of sample TS-2NB-SET (180-43250-21) in batch 180-140681. Calcium and Sodium failed the recovery criteria high. Calcium, Magnesium, Selenium and Sodium failed the recovery criteria high for the MSD of sample TS-2NB-SET (180-43250-21) in batch 180-140681. Selenium exceeded the RPD limit. The presence of the '4' qualifier indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Sodium failed the recovery criteria low for the MS/MSD of sample TS-4MT-SET (180-43250-28) in batch 180-141088. Calcium failed the recovery criteria high in the MSD. The presence of the '4' qualifier indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

The serial dilution performed for the following samples associated with batch 140485 was outside of the control limits for calcium and potassium.: TS-4MT-SET (180-43250-28)

The post digestion spike percent recovery for zinc associated with batch 140485 was outside of control limits.

GENERAL CHEMISTRY

Ammonia, distilled failed the recovery criteria high for the MSD of sample TS-2NB-SET (180-43250-21) in batch 180-142003.

Ammonia, distilled failed the recovery criteria high for the MS of sample TS-4ST-SET (180-43250-26) in batch 180-142003.

Dissolved Organic Carbon - Duplicate failed the recovery criteria low for the MS/MSD of sample TS-2NB-SET (180-43250-21) in batch 180-140817.

ELUTRIATE GENERATION

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SUBCONTRACT WORK

Quality Control and Data Interpretation

Unless otherwise noted, all holding times and QC criteria were met and the test results shown in this report meet all applicable NELAC requirements.

All 2378-TCDF results which met all qualitative requirements and were reported from the Rtx-5 column are qualified with an "X". This was done to indicate that the Rtx-5 column is not isomer specific for 2378-TCDF.

The following flags are used to qualify results for chlorinated dioxin and furan results:

J – The reported result is an estimate. The amount reported is below the Minimum Level (ML). The qualitative definition of the ML is "the lowest level at which the analytical system must give a reliable signal and an acceptable calibration point". The ML was introduced in EPA Methods 1624 and 1625 in 1980 and was promulgated in these methods in 1984 at 40 CFR Part 136, Appendix A. For the purposes of this report, the ML is qualitatively defined as described above, and quantitatively defined as follows:

Minimum Level: The concentration or mass of analyte in the sample that corresponds to the lowest calibration level in the initial calibration. It represents a concentration (in the sample extract) equivalent to that of the lowest calibration standard, after corrections for method-specified sample weights, volumes and cleanup procedures has been employed.

Example: The lowest calibration level for TCDD in the initial calibration is 0.5 pg/uL. A mass of 10 pg of 2,3,7,8-TCDD in the sample would result in a concentration of 0.5 pg/uL in the sample extract (at a final volume of 20 uL). Since the concentration in the sample extract corresponds to the concentration in the lowest calibration standard, the 10 pg mass in the sample components is the ML. If the sample extract is further diluted, the ML will increase by the dilution factor.

Example: A 1/10 dilution is performed on the sample extract described above. The ML for 2,3,7,8-TCDD becomes 100 pg rather than the default of 10 pg.

E – The reported result is an estimate. The amount reported is above the Upper Calibration Level (UCL) described below. The quantitative definition of the UCL is listed below:

PROJECT NARRATIVE
H5D300408

Upper Calibration Level: The concentration or mass of analyte in the sample that corresponds to the highest calibration level in the initial calibration. It is equivalent to the concentration of the highest calibration standard, assuming that all method-specified sample weights, volumes, and cleanup procedures have been employed.

Example: The maximum calibration level for TCDD in the initial calibration is 200 pg/uL. A mass of 4000 pg of 2,3,7,8-TCDD in the sampling components would result in a concentration of 200 pg/uL in the sample extract (at a final volume of 20 uL). Since the concentration in the sample extract corresponds to the concentration in the highest calibration standard, the 4000 pg mass in the sample components is the UCL. If the sample extract is further diluted, the ML will increase by the dilution factor.

Example: A 1/10 dilution is performed on the sample extract described above. The UCL for 2,3,7,8-TCDD becomes 40,000 pg rather than the default of 4000 pg. In this example, all positive 2,3,7,8-TCDD results above 40,000 pg are flagged with an E.

B – The analyte is present in the associated method blank at a detectable level. For this analysis, there is no method specified reporting level other than the qualitative criterion that peaks must exhibit a signal-to-noise ratio of $\geq$2.5 to 1. Therefore, the presence of any reportable amount of the analyte in the blank will result in a B qualifier on all associated samples.

Q – Estimated maximum possible concentration. This qualifier is used when the result is generated from chromatographic data that does not meet all the qualitative criteria for a positive identification given in the method. These may include one or more of the following:

- Ion abundance ratios must be within specified limits (+/-15% of theoretical ion abundance ratio).
- Retention time criteria (relative to the method-specified isotope labeled retention time standard).
- Co-maximization criterion. The two quantitation ion peaks must reach their maxima within 2 seconds of each other.
- 2,3,7,8-TCDF result is reported from the non-isomer specific Rtx-5 column.
- Polychlorinated dibenzofuran purity. An interference may be present on the indicated polychlorinated dibenzofuran when a polychlorinated diphenyl ether peak is present and maximizes within +/- 3 seconds of the dibenzofuran candidate.

S – Ion suppression evident. The trace indicating the signal from the lock mass of the calibration compound shows a deflection at the retention time of the analyte. This may indicate a temporary suppression of the instrument sensitivity due to a matrix-borne interference.

C – Coeluting Isomer. The isomer is known to coelute with another member of its homologue group, or the peak shape is shouldered, indicating the likelihood of a coeluting isomer.

X – Other. See explanation in narrative.

PROJECT NARRATIVE
H5D300408

Laboratory studies supporting risk assessment and Total Maximum Daily Load (TMDL) evaluations, frequently use qualified data reported as low as the Method Detection Limit (MDL), or the Estimated Detection Limit (EDL). Several of EPA's isotope dilution methods employ the EDL.[1,2,3] The EDL is based on a direct measurement of the signal-to-noise (S/N) ratio acquired during sample analysis. This S/N measurement is used to calculate the concentration in the sample corresponding to the minimum intensity of the smallest quantifiable peak. The EDL reflects the amount of the particular analyte which would be required to cause a positive result for the particular analysis. Because the S/N obtained covaries with recovery, instrument sensitivity and sample-specific cleanup efficacy, the EDL is a more valid measure of the sensitivity of the entire analytical process for the specific sample than is an MDL run periodically on a reference matrix.

The EDL is typically calculated according to the following equation:

$$\text{Estimated Detection Limit} = \frac{N \times 2.5 \times Qis}{His \times RRF \times W \times S}$$

Where:

N	=	peak to peak noise of quantitation ion signal in the region of the ion chromatogram where the compound of interest is expected to elute
His	=	peak height of quantitation ion for appropriate internal standard
Qis	=	ng of internal standard added to sample
RRF	=	mean relative response factor of compound obtained during initial calibration
W	=	amount of sample extracted (grams or liters)
S	=	percent solids (optional, if results are requested to be reported on dry weight basis)

(The area of the internal standard is sometimes used instead of height, along with an area-to-height conversion factor.)

This method of estimating the detection limit differs from the MDL in that it does not carry the requirement that the sample be statistically distinguished as being from a contaminated population. As results approach the EDL, the risk of false positives and the analytical uncertainty increase significantly. However, a low false positive well below the ML or MDL is often closer to the true value than an assumption that the target analyte is present at the detection or reporting limits. For relatively clean samples, MDL studies may give an elevated estimate of the detection limit. Additionally, on contaminated samples, the MDL may give a falsely low estimate of the detection limit.

$$\text{Analyte Concentration} = \frac{As \times Qis}{Ais \times RRF \times W \times S}$$

Where:

As	=	Sum of areas of the target peaks
Qis	=	ng of internal standard added to sample
Ais	=	Sum of areas of the internal standard peaks
RRF	=	mean relative response factor of compound obtained during initial calibration

PROJECT NARRATIVE
H5D300408

W = amount of sample extracted (grams or liters)
S = percent solids (optional, if results are requested to be reported on dry weight basis)

In sample data, peaks must have an intensity of ≥2.5 times the height of the background noise in order to be considered. Careful examination of the two equations above reveals that for the concentration of the smallest peak detectable (per the EDL equation) to exactly equal the smallest peaks that are calculated, requires that the average height to area ratio obtained during the calibration must equal the area to height ratio for every peak obtained near 2.5 times the noise. When the area to height ratio on a peak in a sample is less than the average obtained during calibration, the calculated result will correspond to a peak that would have been less than 2.5 times the noise on the calibration. This is the result of normal variability. Because the source methods for the EDL (SW-846 8290 and 8280A) do not provide for censoring of results by any other magnitude standard than being 2.5 times the noise, the laboratory does not censor at the calculated EDL. Hence, detections may be reported below the estimated detection limits.

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.
H	Sample was prepped or analyzed beyond the specified holding time
X	Surrogate is outside control limits
*	LCS or LCSD is outside acceptance limits.
cn	Refer to Case Narrative for further detail

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.

General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

CASE NARRATIVE

Client: EA Engineering, Science, and Technology

Project: CBBT Thimble Shoal Parallel Tunnel

Report Number: 180-43799-1 REVISED

NOTE: This report has been revised to include Manganese per EA Engineering's request.

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 05/06/2015; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 4.2 C.

SEMIVOLATILES
Naphthalene was detected in method blank MB 180-141164/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

PESTICIDES
The following sample was prepared outside of preparation holding time due to and extraction error. The sample was extracted 1 day out of holding time: EQB-GRAB (180-43799-1). This sample had several surrogates recover outside QC limits. One surrogate recovered within QC limits. All data was reported.

PCB CONGENERS
The following sample was diluted to bring the concentration of target analytes within the calibration range: EQB-GRAB (180-43799-1). Elevated reporting limits (RLs) are provided.

The continuing calibration verification (CCV) associated with batch 141926 recovered above the upper control limit for several congener compounds. The samples associated with this CCV were non-detects or at estimated levels for the affected analytes; therefore, the data have been reported. The following samples are impacted: EQB-GRAB (180-43799-1), (LCS 180-140931/2-A), (LCSD 180-140931/3-A) and (MB 180-140931/1-A).

ORGANOPHOSPHORUS PESTICIDES
Sample EQB-GRAB (180-43799-1) was analyzed multiple times; each time Fensulfothion failed slightly low. The results were reported as is with this narration.

BUTYLTINS
The samples in this delivery group were analyzed for alkyltins. The samples were analyzed using an internal standard method of analysis with tetra-n-propyltin as the internal standard. Peak areas were used to measure the instrument response in performing calibration and quantification. The analytical report forms correctly list the alkyltin analytes as unsubstituted alkyltin compounds. The analysis of three of the compounds employed the use of alkyltin chlorides. The results from the alkyltin chlorides required conversion factors to reflect the concentrations of the unsubstituted forms. For instance, tributyltin chloride was converted to tributyltin using a conversion factor of 0.89. Dibutyltin dichloride was converted to dibutyltin using a factor of 0.77. Monobutyltin trichloride was converted to monobutyltin using a factor of 0.62 and the surrogate, tripentyltin chloride was converted to tripentyltin using a factor of 0.90.

Monobutyltin has poor extraction efficiency exhibiting a mean recovery of typically less than 5%. The low mean recovery is typical of routine implementation of this method. Although the laboratory has reported control limits of 10-48% for this analyte these control limits are not based on historical performance and do not indicate expected performance of this analyte by this method. The laboratory does not use the recovery or performance of this compound as a basis for acceptance of the analytical batch. All analytical results, both positive and non-detects are considered qualitative values and are flagged with a cn qualifier. EQB-GRAB (180-43799-1) and (LCS 200-88087/2-A)

Monobutyltin failed the recovery criteria low for LCS 200-88087/2-A.

METALS
Sodium was detected in method blank MB 180-140872/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

GENERAL CHEMISTRY
No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

SUBCONTRACT WORK
Method 1613 B Dioxins/Furans + TEQs (EA criteria): This method was subcontracted to TestAmerica Knoxville. The subcontract laboratory certification is different from that of the facility issuing the final report.

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

PROJECT NARRATIVE
H5E080406

The results reported herein are applicable to the samples submitted for analysis only. If you have any questions about this report, please call (865) 291-3000 to speak with the TestAmerica project manager listed on the cover page.

This report shall not be reproduced except in full, without the written approval of the laboratory.

The original chain of custody documentation is included with this report.

Sample Receipt

There were no problems with the condition of the samples received.

Quality Control and Data Interpretation

Unless otherwise noted, all holding times and QC criteria were met and the test results shown in this report meet all applicable NELAC requirements.

The following flags are used to qualify results for chlorinated dioxin and furan results:

J – The reported result is an estimate. The amount reported is below the Minimum Level (ML). The qualitative definition of the ML is "the lowest level at which the analytical system must give a reliable signal and an acceptable calibration point". The ML was introduced in EPA Methods 1624 and 1625 in 1980 and was promulgated in these methods in 1984 at 40 CFR Part 136, Appendix A. For the purposes of this report, the ML is qualitatively defined as described above, and quantitatively defined as follows:

Minimum Level: The concentration or mass of analyte in the sample that corresponds to the lowest calibration level in the initial calibration. It represents a concentration (in the sample extract) equivalent to that of the lowest calibration standard, after corrections for method-specified sample weights, volumes and cleanup procedures has been employed.

Example: The lowest calibration level for TCDD in the initial calibration is 0.5 pg/uL. A mass of 10 pg of 2,3,7,8-TCDD in the sample would result in a concentration of 0.5 pg/uL in the sample extract (at a final volume of 20 uL). Since the concentration in the sample extract corresponds to the concentration in the lowest calibration standard, the 10 pg mass in the sample components is the ML. If the sample extract is further diluted, the ML will increase by the dilution factor.

Example: A 1/10 dilution is performed on the sample extract described above. The ML for 2,3,7,8-TCDD becomes 100 pg rather than the default of 10 pg.

E – The reported result is an estimate. The amount reported is above the Upper Calibration Level (UCL) described below. The quantitative definition of the UCL is listed below:

Upper Calibration Level: The concentration or mass of analyte in the sample that corresponds to the highest calibration level in the initial calibration. It is equivalent to the

PROJECT NARRATIVE
H5E080406

concentration of the highest calibration standard, assuming that all method-specified sample weights, volumes, and cleanup procedures have been employed.

Example: The maximum calibration level for TCDD in the initial calibration is 200 pg/uL. A mass of 4000 pg of 2,3,7,8-TCDD in the sampling components would result in a concentration of 200 pg/uL in the sample extract (at a final volume of 20 uL). Since the concentration in the sample extract corresponds to the concentration in the highest calibration standard, the 4000 pg mass in the sample components is the UCL. If the sample extract is further diluted, the ML will increase by the dilution factor.

Example: A 1/10 dilution is performed on the sample extract described above. The UCL for 2,3,7,8-TCDD becomes 40,000 pg rather than the default of 4000 pg. In this example, all positive 2,3,7,8-TCDD results above 40,000 pg are flagged with an E.

B – The analyte is present in the associated method blank at a detectable level. For this analysis, there is no method specified reporting level other than the qualitative criterion that peaks must exhibit a signal-to-noise ratio of $\geq$2.5 to 1. Therefore, the presence of any reportable amount of the analyte in the blank will result in a B qualifier on all associated samples.

Q – Estimated maximum possible concentration. This qualifier is used when the result is generated from chromatographic data that does not meet all the qualitative criteria for a positive identification given in the method. These may include one or more of the following:

- Ion abundance ratios must be within specified limits (+/-15% of theoretical ion abundance ratio).
- Retention time criteria (relative to the method-specified isotope labeled retention time standard).
- Co-maximization criterion. The two quantitation ion peaks must reach their maxima within 2 seconds of each other.
- 2,3,7,8-TCDF result is reported from the non-isomer specific Rtx-5 column.
- Polychlorinated dibenzofuran purity. An interference may be present on the indicated polychlorinated dibenzofuran when a polychlorinated diphenyl ether peak is present and maximizes within +/- 3 seconds of the dibenzofuran candidate.

S – Ion suppression evident. The trace indicating the signal from the lock mass of the calibration compound shows a deflection at the retention time of the analyte. This may indicate a temporary suppression of the instrument sensitivity due to a matrix-borne interference.

C – Coeluting Isomer. The isomer is known to coelute with another member of its homologue group, or the peak shape is shouldered, indicating the likelihood of a coeluting isomer.

X – Other. See explanation in narrative.

Laboratory studies supporting risk assessment and Total Maximum Daily Load (TMDL) evaluations, frequently use qualified data reported as low as the Method Detection Limit (MDL), or the Estimated Detection Limit (EDL). Several of EPA's isotope dilution methods employ the EDL.[1,2,3] The EDL is based on a direct measurement of the signal-to-noise (S/N) ratio acquired during sample analysis. This S/N measurement is used to calculate the concentration in the sample corresponding to the minimum intensity of the smallest quantifiable peak. The EDL reflects the amount of the particular analyte which would be required to cause a positive result for the particular analysis. Because the S/N obtained covaries with recovery, instrument sensitivity and sample-specific cleanup efficacy, the EDL is a more valid measure of the sensitivity of the entire analytical process for the specific sample than is an MDL run periodically on a reference matrix.

The EDL is typically calculated according to the following equation:

$$\text{Estimated Detection Limit} = \frac{N \times 2.5 \times Qis}{His \times RRF \times W \times S}$$

Where:

N	=	peak to peak noise of quantitation ion signal in the region of the ion chromatogram where the compound of interest is expected to elute
His	=	peak height of quantitation ion for appropriate internal standard
Qis	=	ng of internal standard added to sample
RRF	=	mean relative response factor of compound obtained during initial calibration
W	=	amount of sample extracted (grams or liters)
S	=	percent solids (optional, if results are requested to be reported on dry weight basis)

(The area of the internal standard is sometimes used instead of height, along with an area-to-height conversion factor.)

This method of estimating the detection limit differs from the MDL in that it does not carry the requirement that the sample be statistically distinguished as being from a contaminated population. As results approach the EDL, the risk of false positives and the analytical uncertainty increase significantly. However, a low false positive well below the ML or MDL is often closer to the true value than an assumption that the target analyte is present at the detection or reporting limits. For relatively clean samples, MDL studies may give an elevated estimate of the detection limit. Additionally, on contaminated samples, the MDL may give a falsely low estimate of the detection limit.

$$\text{Analyte Concentration} = \frac{As \times Qis}{Ais \times RRF \times W \times S}$$

Where:

As	=	Sum of areas of the target peaks
Qis	=	ng of internal standard added to sample
Ais	=	Sum of areas of the internal standard peaks
RRF	=	mean relative response factor of compound obtained during initial calibration

PROJECT NARRATIVE
H5E080406

W = amount of sample extracted (grams or liters)
S = percent solids (optional, if results are requested to be reported on dry weight basis)

In sample data, peaks must have an intensity of ≥2.5 times the height of the background noise in order to be considered. Careful examination of the two equations above reveals that for the concentration of the smallest peak detectable (per the EDL equation) to exactly equal the smallest peaks that are calculated, requires that the average height to area ratio obtained during the calibration must equal the area to height ratio for every peak obtained near 2.5 times the noise. When the area to height ratio on a peak in a sample is less than the average obtained during calibration, the calculated result will correspond to a peak that would have been less than 2.5 times the noise on the calibration. This is the result of normal variability. Because the source methods for the EDL (SW-846 8290 and 8280A) do not provide for censoring of results by any other magnitude standard than being 2.5 times the noise, the laboratory does not censor at the calculated EDL. Hence, detections may be reported below the estimated detection limits.

TIER 2 STFATE MODEL RESULTS SUMMARY: NODS - Thimble Shoal Parallel Tunnel TS-2ST

PARALLEL THIMBLE SHOAL TUNNEL, VIRGINIA (APRIL 2015)

Scenario: **NODS - Thimble Shoal Parallel Tun** **Placement Volume: 48,000**

Tier II - Water Quality Criteria

Analyte: Cyanide

Water Quality Criterion: 0.001

Elutriate Concentration (C_s): 0.01

Background concentration (C_{ds}): 0

Dilution Required: 9.0

Dilution Factor Achieved: 99

WQC Initial Mixing Computation Results: 4-Hour Criterion

Time (hours)	Depth (ft)	Maximum Contaminant Concentration (C_{max}) on Grid	Dilution on Grid (D_{a-wq})

65	3.83	1.31E-05	7.62E+02
52.9	3.83	9.68E-05	1.02E+02

D_{a-wq} = $(C_s - C_{max}) / (C_{max} - C_{ds})$; where C_s = elutriate concentration and C_{ds} = background concentration

Shaded row = depth of maximum concentration

1. Concentration above backgrond ($C_{max} - C_{ds}$) = 0.

NODS - Thimble Shoal Parallel Tunnel TS-2ST

MODEL: SHORT-TERM FATE OF DREDGED MATERIAL FROM SPLIT HULL BARGE OR HOPPER DREDGE
(PC Version 5.01 MAY, 1993)
(Extended Memory Modification: December, 1997)
This Version Supports Grid Sizes up to 96 x 96 Points

TITLE: NODS - Thimble Shoal Parallel Tunnel TS-2ST

FILE: TmpFile .DUE

AREA: THE PROJECT AREA IS DESCRIBED BY A 96 X 96 GRID.

THERE ARE 96 GRID POINTS (NMAX) IN THE Z-DIRECTION (FROM LEFT TO RIGHT)
AND 96 GRID POINTS (MMAX) IN THE X-DIRECTION (FROM TOP TO BOTTOM).

SITE: THE DISPOSAL SITE IS REPRESENTED AS A RECTANGLE ON THE SITE GRID.

THE TOPMOST BOUNDARY IS LOCATED AT POINT # 6 (MDS1) FROM THE TOP OF THE GRID.

THE BOTTOMMOST BOUNDARY IS LOCATED AT POINT #87 (MDS2) FROM THE TOP OF THE GRID.

THE LEFTMOST BOUNDARY IS LOCATED AT POINT # 6 (NDS1) FROM THE LEFT OF THE GRID.

THE RIGHTMOST BOUNDARY IS LOCATED AT POINT #87 (NDS2) FROM THE LEFT OF THE GRID.

EXECUTION PARAMETERS:

MODEL COEFFICIENTS SPECIFIED IN INPUT DATA (KEY1 = 1).

VERTICAL DIFFUSION COEFFICIENT (AKY0) COMPUTED FROM PRITCHARD EQUATION (IPRIT = 1).

PERFORM COMPLETE ANALYSIS INCLUDING DESCENT, COLLAPSE, AND TRANSPORT-DIFFUSION (KEY2 = 0).

PERFORM TIER II OCEAN DUMPING INITIAL MIXING EVALUATION
TO COMPARE WATER QUALITY WITH CRITERIA (KEY3 = 2).

PRINTING OF CONVECTIVE DESCENT RESULTS NOT REQUESTED (IPCN = 0).

PRINTING OF CONVECTIVE DESCENT RESULTS NOT REQUESTED (IPCN = 0).

PRINTING OF DYNAMIC COLLAPSE RESULTS NOT REQUESTED (IPCL = 0).

QUARTERLY PRINTING OF LONG-TERM TRANSPORT DIFFUSION RESULTS REQUESTED (IPLT = 0).

LONG-TERM TRANSPORT DIFFUSION RESULTS REQUESTED AT THE FOLLOWING 5 DEPTH(S):
0.00 FT
15.00 FT
30.00 FT
45.00 FT
65.00 FT

GRID: NUMBER OF LONG TERM GRID POINTS IN Z-DIRECTION (NMAX) = 96

NUMBER OF LONG TERM GRID POINTS IN X-DIRECTION (MMAX) = 96

GRID SPACING IN Z-DIRECTION (DZ) = 100.00000 FT

GRID SPACING IN X-DIRECTION (DX) = 100.00000 FT

CONSTANT DEPTH GRID SPECIFIED HAVING A DEPTH (DEPC) OF 65.00000 FT.

MODEL: SHORT-TERM FATE OF DREDGED MATERIAL FROM SPLIT HULL BARGE OR HOPPER DREDGE
(PC Version 5.01 MAY, 1993)
(Extended Memory Modification: December, 1997)
This Version Supports Grid Sizes up to 96 x 96 Points

TITLE: NODS - Thimble Shoal Parallel Tunnel TS-2NB

FILE: TmpFile .DUE

AREA: THE PROJECT AREA IS DESCRIBED BY A 96 X 96 GRID.

THERE ARE 96 GRID POINTS (NMAX) IN THE Z-DIRECTION (FROM LEFT TO RIGHT)
AND 96 GRID POINTS (MMAX) IN THE X-DIRECTION (FROM TOP TO BOTTOM).

SITE: THE DISPOSAL SITE IS REPRESENTED AS A RECTANGLE ON THE SITE GRID.

THE TOPMOST BOUNDARY IS LOCATED AT POINT # 6 (MDS1) FROM THE TOP OF THE GRID.

THE BOTTOMMOST BOUNDARY IS LOCATED AT POINT #87 (MDS2) FROM THE TOP OF THE GRID.

THE LEFTMOST BOUNDARY IS LOCATED AT POINT # 6 (NDS1) FROM THE LEFT OF THE GRID.

THE RIGHTMOST BOUNDARY IS LOCATED AT POINT #87 (NDS2) FROM THE LEFT OF THE GRID.

TIER 2 STFATE MODEL RESULTS SUMMARY: NODS - Thimble Shoal Parallel Tunnel TS-3SB

PARALLEL THIMBLE SHOAL TUNNEL, VIRGINIA (APRIL 2015)

Scenario: **NODS - Thimble Shoal Parallel Tun** **Placement Volume: 31,000**

Tier II - Water Quality Criteria

Analyte: Cyanide

Water Quality Criterion: 0.001

Elutriate Concentration (C_s): 0.01

Background concentration (C_{ds}): 0

Dilution Required: 9.0

Dilution Factor Achieved: 99

WQC Initial Mixing Computation Results: 4-Hour Criterion

Time (hours)	Depth (ft)	Maximum Contaminant Concentration (C_{max}) on Grid	Dilution on Grid (D_{a-wq})

65	3.83	1.29E-05	7.74E+02
53.7	3.83	9.56E-05	1.04E+02

D_{a-wq} = $(C_s - C_{max}) / (C_{max} - C_{ds})$; where C_s = elutriate concentration and C_{ds} = background concentration

Shaded row = depth of maximum concentration

1. Concentration above backgrond ($C_{max} - C_{ds}$) = 0.

NODS - Thimble Shoal Parallel Tunnel TS-3SB

MODEL: SHORT-TERM FATE OF DREDGED MATERIAL FROM SPLIT HULL BARGE OR HOPPER DREDGE
(PC Version 5.01 MAY, 1993)
(Extended Memory Modification: December, 1997)
This Version Supports Grid Sizes up to 96 x 96 Points

TITLE: NODS - Thimble Shoal Parallel Tunnel TS-3SB

FILE: TmpFile .DUE

AREA: THE PROJECT AREA IS DESCRIBED BY A 96 X 96 GRID.

THERE ARE 96 GRID POINTS (NMAX) IN THE Z-DIRECTION (FROM LEFT TO RIGHT)
AND 96 GRID POINTS (MMAX) IN THE X-DIRECTION (FROM TOP TO BOTTOM).

SITE: THE DISPOSAL SITE IS REPRESENTED AS A RECTANGLE ON THE SITE GRID.

THE TOPMOST BOUNDARY IS LOCATED AT POINT # 6 (MDS1) FROM THE TOP OF THE GRID.

THE BOTTOMMOST BOUNDARY IS LOCATED AT POINT #87 (MDS2) FROM THE TOP OF THE GRID.

THE LEFTMOST BOUNDARY IS LOCATED AT POINT # 6 (NDS1) FROM THE LEFT OF THE GRID.

THE RIGHTMOST BOUNDARY IS LOCATED AT POINT #87 (NDS2) FROM THE LEFT OF THE GRID.

EXECUTION PARAMETERS:

MODEL COEFFICIENTS SPECIFIED IN INPUT DATA (KEY1 = 1).

VERTICAL DIFFUSION COEFFICIENT (AKY0) COMPUTED FROM PRITCHARD EQUATION (IPRIT = 1).

PERFORM COMPLETE ANALYSIS INCLUDING DESCENT, COLLAPSE, AND TRANSPORT-DIFFUSION (KEY2 = 0).

PERFORM TIER II OCEAN DUMPING INITIAL MIXING EVALUATION
TO COMPARE WATER QUALITY WITH CRITERIA (KEY3 = 2).

PRINTING OF CONVECTIVE DESCENT RESULTS NOT REQUESTED (IPCN = 0).

PRINTING OF CONVECTIVE DESCENT RESULTS NOT REQUESTED (IPCN = 0).

PRINTING OF DYNAMIC COLLAPSE RESULTS NOT REQUESTED (IPCL = 0).

QUARTERLY PRINTING OF LONG-TERM TRANSPORT DIFFUSION RESULTS REQUESTED (IPLT = 0).

LONG-TERM TRANSPORT DIFFUSION RESULTS REQUESTED AT THE FOLLOWING 5 DEPTH(S):
0.00 FT
15.00 FT
30.00 FT
45.00 FT
65.00 FT

GRID: NUMBER OF LONG TERM GRID POINTS IN Z-DIRECTION (NMAX) = 96

NUMBER OF LONG TERM GRID POINTS IN X-DIRECTION (MMAX) = 96

GRID SPACING IN Z-DIRECTION (DZ) = 100.00000 FT

GRID SPACING IN X-DIRECTION (DX) = 100.00000 FT

CONSTANT DEPTH GRID SPECIFIED HAVING A DEPTH (DEPC) OF 65.00000 FT.

TIER 3 STFATE MODEL RESULTS SUMMARY: NODS - Thimble Shoal Parallel Tunnel TS-4NT

PARALLEL THIMBLE SHOAL TUNNEL, VIRGINIA (APRIL 2015)

Scenario: NODS - Thimble Shoal Parallel Tunnel TS-4NT

Placement Volume (cy): 26,000

Tier III - Water Column Toxicity

Species: *Mytilis*

LPC: 1

Dilution Required: 99

Dilution Achieved: 100

Toxicity Initial Mixing Computation Results: 4-Hour Criterion

Time (hours)	Depth (ft)	Maximum Contaminant Concentration (C_{tox}) on Grid	Dilution on Grid ($D_{a\text{-}tox}$)
4.0	0	1.52E-21	6.58E+22
4.0	15	9.43E-12	1.06E+13

Toxicity Initial Mixing Computation Results: Disposal Site Boundary Criterion

Depth (ft)	Time Corresponding to C_{tox} Outside Disposal Site (hours)	Maximum Contaminant Concentration (C_{tox}) Outside Disposal Site (percent)	Dilution Outside Disposal Site ($D_{a\text{-}tox}$)
0	NA	NA	NA
15	NA	NA	NA
30	NA	NA	NA
45	NA	NA	NA
65	3.83	1.27E-01	7.86E+02
54	3.83	9.38E-01	1.06E+02

$D_{a\text{-}tox}$ = $(100 - C_{tox}) / C_{tox}$

Shaded row = depth of maximum concentration

1. Concentration outside disposal site (Ctox - C_{ds}) = 0.

NODS - Thimble Shoal Parallel Tunnel TS-4NT

MODEL: SHORT-TERM FATE OF DREDGED MATERIAL FROM SPLIT HULL BARGE OR HOPPER DREDGE
(PC Version 5.01 MAY, 1993)
(Extended Memory Modification: December, 1997)
This Version Supports Grid Sizes up to 96 x 96 Points

TITLE: NODS - Thimble Shoal Parallel Tunnel TS-4NT

FILE: TmpFile .DUE

AREA: THE PROJECT AREA IS DESCRIBED BY A 96 X 96 GRID.

THERE ARE 96 GRID POINTS (NMAX) IN THE Z-DIRECTION (FROM LEFT TO RIGHT)
AND 96 GRID POINTS (MMAX) IN THE X-DIRECTION (FROM TOP TO BOTTOM).

SITE: THE DISPOSAL SITE IS REPRESENTED AS A RECTANGLE ON THE SITE GRID.

THE TOPMOST BOUNDARY IS LOCATED AT POINT # 6 (MDS1) FROM THE TOP OF THE GRID.

THE BOTTOMMOST BOUNDARY IS LOCATED AT POINT #87 (MDS2) FROM THE TOP OF THE GRID.

THE LEFTMOST BOUNDARY IS LOCATED AT POINT # 6 (NDS1) FROM THE LEFT OF THE GRID.

THE RIGHTMOST BOUNDARY IS LOCATED AT POINT #87 (NDS2) FROM THE LEFT OF THE GRID.

EXECUTION PARAMETERS:

MODEL COEFFICIENTS SPECIFIED IN INPUT DATA (KEY1 = 1).

VERTICAL DIFFUSION COEFFICIENT (AKY0) COMPUTED FROM PRITCHARD EQUATION (IPRIT = 1).

PERFORM COMPLETE ANALYSIS INCLUDING DESCENT, COLLAPSE, AND TRANSPORT-DIFFUSION (KEY2 = 0).

PERFORM TIER III OCEAN DUMPING INITIAL MIXING EVALUATION
TO COMPARE WITH TOXICITY CRITERIA (KEY3 = 3).

PRINTING OF CONVECTIVE DESCENT RESULTS NOT REQUESTED (IPCN = 0).

PRINTING OF CONVECTIVE DESCENT RESULTS NOT REQUESTED (IPCN = 0).

PRINTING OF DYNAMIC COLLAPSE RESULTS NOT REQUESTED (IPCL = 0).

QUARTERLY PRINTING OF LONG-TERM TRANSPORT DIFFUSION RESULTS REQUESTED (IPLT = 0).

LONG-TERM TRANSPORT DIFFUSION RESULTS REQUESTED AT THE FOLLOWING 5 DEPTH(S):
0.00 FT
15.00 FT
30.00 FT
45.00 FT
65.00 FT

GRID: NUMBER OF LONG TERM GRID POINTS IN Z-DIRECTION (NMAX) = 96

NUMBER OF LONG TERM GRID POINTS IN X-DIRECTION (MMAX) = 96

GRID SPACING IN Z-DIRECTION (DZ) = 100.00000 FT

GRID SPACING IN X-DIRECTION (DX) = 100.00000 FT

CONSTANT DEPTH GRID SPECIFIED HAVING A DEPTH (DEPC) OF 65.00000 FT.

MODEL: SHORT-TERM FATE OF DREDGED MATERIAL FROM SPLIT HULL BARGE OR HOPPER DREDGE
(PC Version 5.01 MAY, 1993)
(Extended Memory Modification: December, 1997)
This Version Supports Grid Sizes up to 96 x 96 Points

TITLE: NODS - Thimble Shoal Parallel Tunnel TS-4NB

FILE: TmpFile .DUE

AREA: THE PROJECT AREA IS DESCRIBED BY A 96 X 96 GRID.

THERE ARE 96 GRID POINTS (NMAX) IN THE Z-DIRECTION (FROM LEFT TO RIGHT)
AND 96 GRID POINTS (MMAX) IN THE X-DIRECTION (FROM TOP TO BOTTOM).

SITE: THE DISPOSAL SITE IS REPRESENTED AS A RECTANGLE ON THE SITE GRID.

THE TOPMOST BOUNDARY IS LOCATED AT POINT # 6 (MDS1) FROM THE TOP OF THE GRID.

THE BOTTOMMOST BOUNDARY IS LOCATED AT POINT #87 (MDS2) FROM THE TOP OF THE GRID.

THE LEFTMOST BOUNDARY IS LOCATED AT POINT # 6 (NDS1) FROM THE LEFT OF THE GRID.

THE RIGHTMOST BOUNDARY IS LOCATED AT POINT #87 (NDS2) FROM THE LEFT OF THE GRID.

1. INTRODUCTION

At the request of the Jacobs Engineering Group, Norfolk District, EA Engineering, Science, and Technology performed water column toxicity testing on sediment samples collected from the Parallel Thimble Shoal Tunnel project footprint, which extends from Wise Point on the eastern shore of Virginia to the Virginia Beach area. The purpose of this study was to evaluate the toxicity of standard elutriates prepared from the sediment samples.

The toxicity testing program consisted of acute water column bioassays with *Mytilus galloprovincialis* (west coast blue mussel), *Americamysis bahia* (opossum shrimp), and *Menidia beryllina* (inland silverside). The acute water column bioassays evaluated the effects of exposure to the sediment elutriates on survival or normal embryo development (*Mytilus*) of the test organisms.

2. MATERIALS AND METHODS

2.1 SAMPLE RECEIPT AND PREPARATION

Fifteen sediment samples from the location of the Parallel Thimble Shoal Tunnel project were collected and composited by EA personnel. In addition, one sample of site water was collected from the sediment sample locations. The composited Parallel Thimble Shoal Tunnel sediment samples were placed into 5-gallon pails. The samples were held at ≤4°C and were hand delivered to EA's Ecotoxicology Laboratory in Hunt Valley, Maryland. Upon receipt at EA, the sediment samples were logged in and assigned EA laboratory accession numbers, and were stored in the dark in a secured walk-in cooler at ≤4°C until used for testing. Table 1 summarizes the sample identification, accession numbers, and collection/receipt information for the sediment samples and site water. Chain-of-custody records are included in Attachment I.

2.2 TOXICITY TEST METHODS

All toxicity testing was conducted following EA's standard operating procedures (EA 2013) which are in accordance with USEPA/USACE guidance (1991, 1998) and USEPA guidance (2000, 2002).

2.2.1 Water Column Toxicity Testing

Elutriates were prepared from the sediment composite samples using the site water. A subsample of homogenized sediment was combined with site water in a 1:4 sediment to water ratio, on a volume/volume basis. The sediment/water combination was vigorously mixed by aeration and manual stirring for 30 minutes, and was then allowed to settle for a minimum of one hour. After settling, the supernatant was siphoned off and adjusted, if necessary, to 30 ppt salinity using Crystal Sea Bioassay Grade synthetic sea salts. The elutriates were used for the water column acute toxicity testing within 24 hours of preparation. Elutriate ammonia concentrations were measured on samples for each testing event and are included in Table 2.

Static, non-renewal bioassays were conducted on the prepared elutriates using *Americamysis bahia* (opossum shrimp) and *Menidia beryllina* (inland silverside). The west coast blue mussel (*Mytilus galloprovincialis)* was used as the test species for the bivalve embryo development tests. The test organisms were acquired from outside vendors. Acquired lots of organisms were gradually acclimated to test temperature and salinity prior to use in testing.

Test concentrations of 100, 50, 10, and 1 percent elutriate were prepared by measuring aliquots of elutriate in a graduated cylinder and bringing to final volume with 30 ppt artificial sea water. A dilution water control of artificial seawater and a secondary control of undiluted site water were also prepared. The artificial seawater was prepared by mixing Crystal Sea synthetic sea salts with laboratory water to a final salinity of 30 ppt. The source of the laboratory water was the City of Baltimore municipal tap water that was passed through a high-capacity, activated carbon filtration system. This synthetic seawater formulation has proven acceptable for aquatic toxicological studies, and has been used successfully at EA for maintaining multigeneration cultures of *Americamysis bahia*, and for holding healthy populations of estuarine and marine species. Batches of artificial seawater were aerated and aged at least 24 hours prior to use in testing.

2.2.1.1 *Mytilus galloprovincialis* Water Column Toxicity Testing

Larval development tests were conducted with the west coast blue mussel (*Mytilus* galloprovincialis). Adult mussels were acquired from Carlsbad Aquafarm (Carlsbad, California). The supplier divided Lot ME-051 in two batches and shipped each batch separately. Lot ME-051a was received at EA on 5 May 2015. Lot ME-051b was received on 6 May 2015. Upon receipt at EA, the adult mussels were visually inspected, were scrubbed clean (e.g., barnacles removed) and were placed in 30 ppt artificial seawater at <12ºC overnight (Lot ME-051a) or for several hours (Lot ME-051b). The collection of mussel eggs and sperm, and preparation of gamete suspension were performed according to EA's standard operating procedures (EA 2013) which follow guidelines in USEPA/USACE (1998). Spawning was temperature induced by placing the mussels into individual 200 ml cups containing 30 ppt artificial seawater and slowly raising and lowering the temperature of the water between 12ºC and 20ºC. Care was taken to keep male and female gametes completely separate, to avoid

accidental fertilization during gamete preparation. Gametes were microscopically inspected to determine normality of eggs and motility of sperm. Gametes that were determined to be acceptable for testing were pooled from a minimum of three males and three females, and were used to prepare the sperm and egg suspensions for the fertilization procedures. Only combined gamete preparations that had achieved a minimum of 90 percent fertilization were used in testing. Toxicity tests were initiated within 4 hours of egg fertilization.

Test chambers were 30-ml scintillation vials with screw caps. Each test concentration and control had five replicate test chambers containing 10 ml of test solution. At test initiation, on 6 May, 100 µl of fertilized gamete preparation (approximately 2,400 embryos per ml) was delivered into each test chamber containing test dilution. Extra replicates of controls were prepared to monitor embryo counts at test initiation and termination. The tests were maintained at a target temperature of 16±1°C with a 16-hour light/8-hour dark photoperiod. Water quality parameters (temperature, pH, dissolved oxygen, and salinity) were measured in separate water quality cups at test initiation and daily during the 48-hour exposure period. Summaries of water quality parameters can be found in Table 3.

The toxicity tests were terminated at 48 hours by adding 250 µl of 37 percent buffered formalin to each test chamber. The preserved samples were subsequently observed microscopically to determine the percent survival of control organisms, and the percentage of embryos in each test treatment and control that had normally developed (C-shaped, hinged, prodissoconch larvae) shells.

In order to evaluate the toxicity of ammonia to *Mytilus*, a separate toxicity test was conducted in which the *Mytilus* embryos were exposed to a graded concentration of ammonia, administered as ammonium chloride (NH_4Cl). Copies of the data sheets from all mussel toxicity tests are included in Attachment II.

2.2.1.2 ***Americamysis bahia*** **and** ***Menidia beryllina*** **Water Column Toxicity Testing**

The *A. bahia* and *M. beryllina* were acquired from Aquatic BioSystems (Fort Collins, Colorado).

A. bahia lot AB-863 was received at EA on 28 April 2015 and was used to initiate toxicity tests on the same day. *M. beryllina* lot MS-193 was received at EA on 2 May 2015 and was used to initiate toxicity tests on the same day. The opossum shrimp and silversides were fed *Artemia* sp. nauplii (<24 hours old) during holding, prior to use in testing.

The *A. bahia* and *M. beryllina* testing was conducted in 1-L beakers. Each beaker contained 200 ml of test solution, with five replicate beakers per test concentration. Ten organisms were randomly introduced into each replicate for a total of 50 organisms per concentration. The test chambers were maintained at 20±1°C with a 16-hour light/8-hour dark photoperiod. The *A. bahia* and *M. beryllina* were fed a small ration of brine shrimp nauplii (*Artemia* sp.) daily to prevent starvation and cannibalism (*A. bahia*). Temperature, pH, dissolved oxygen, and salinity were measured daily in one replicate of each concentration of the *A. bahia* and *M. beryllina* toxicity tests during the 96-hour exposure period. Summaries of water quality parameters measured during the toxicity tests are presented in Tables 4 (*A. bahia*) and 5 (*M. beryllina*). The number of live organisms in each test chamber were counted daily and recorded on the test data sheets. Copies of the *A. bahia* and *M. beryllina* acute toxicity test data sheets are included in Attachments III and IV, respectively.

2.2.2 Data Analysis

Statistical analyses were performed on the water column test data according to USEPA/USACE (1998) guidance and using the ToxCalc statistical software package (Version 5.0, Tidepool Scientific Software). For the elutriate testing, an EC50 (median effective concentration) or LC50 (median lethal concentration) was calculated for each test species using the linear interpolation, Spearman-Karber, Trimmed Spearman-Karber, or probit method. Additionally, if normal development or survival in the 100 percent elutriate concentration was at least 10 percent lower than the dilution water control, then a statistical comparison (t-Test) was performed between the 100 percent elutriate concentration and the control. The t-test was based on the assumptions that the observations were independent and normally distributed as determined by the Shapiro-Wilk's test. The F-Test was used to test for homogeneity of variance. When the data did not meet the normality assumption, the nonparametric test, Wilcoxon's Two- Sample Test, was used to

analyze the data. An arc sine (square root [Y]) transformation was performed on the survival percentages.

The results of the water column testing are summarized in Tables 6 through 9.

2.2.3 Reference Toxicant Testing

In conformance with EA's quality assurance/quality control program requirements, reference toxicant testing was performed by EA on the acquired lot of *Mytilus*. Reference toxicant data for the *A. bahia* and *M. beryllina*, acquired from Aquatic BioSystems, were obtained from the organism supplier. The reference toxicant tests consisted of a graded concentration series of a specific toxicant. The results of the reference toxicant tests were compared to established control chart limits. Table 10 presents the results of the reference toxicant testing.

2.3 ARCHIVES

Original data sheets, records, memoranda, notes, and computer printouts are archived at EA's Office in Hunt Valley, Maryland. These data will be retained for a period of 5 years unless a longer period of time is requested by Jacobs Engineering Group.

3. RESULTS AND DISCUSSION

This bioassay study with elutriates prepared from the composited sediments from the Parallel Thimble Shoal Tunnel project was designed and conducted to meet the requirements of the USEPA/USACE dredged material testing program. The results of these toxicity tests met the current NELAC standards, where applicable.

3.1 WATER COLUMN TOXICITY TESTING

3.1.1 *Mytilus galloprovincialis* Water Column Testing

In order to evaluate the toxicity of ammonia to *Mytilus*, a separate toxicity test was conducted in which the test organisms were exposed to a graded concentration of ammonia, administered as ammonium chloride (NH_4Cl). The results of this ammonia study are summarized in Table 6. The 48-hour EC50 value for *Mytilus* was 9.6 mg/L NH_3-N.

The combined controls from the *Mytilus* water column tests initiated on the Parallel Thimble Shoal Tunnel elutriates had a mean survival of 78 percent and a mean percent normal embryo development of 75 percent, which met the minimum acceptable control criteria of 70 percent survival and 70 percent normal embryo development (US EPA/USACE, 1998).

The results of the *Mytilus* toxicity tests conducted on the elutriate samples are presented in Table 7. All of the Parallel Thimble Shoal Tunnel elutriates had 48-hour EC50 values >100 percent elutriate for *Mytilus.* Two of the elutriates, TS-3ST-SED and TS-3NT-SED, had statistically significant (p=0.05) differences in percent normal embryo development in the 100 percent test concentrations when compared to the combined laboratory controls. The site water used to prepare the Parallel Thimble Shoal Tunnel elutriates had 68 to 75 percent normal embryo development.

3.1.2 *Americamysis bahia* Water Column Testing

Table 8 summarizes the results of the elutriate testing with *A. bahia.* The laboratory controls had 90 to 100 percent survival after 96 hours of exposure. All of the Parallel Thimble Shoal Tunnel

elutriates had 96-hour LC50 values >100 percent elutriate for *A. bahia*, and all had 90 to 100 percent survival in the 100 percent test concentrations. The site water had 98 to 100 percent survival.

3.1.3 *Menidia beryllina* Water Column Testing

The *M. beryllina* water column test results are presented in Table 9. Survival in the laboratory controls ranged from 94 to 100 percent. All of the tests had 96-hour LC50 values >100 percent elutriate, and all had 97 to 100 percent survival in the 100 percent test concentrations. The site water had 98 to 100 percent survival.

3.2 REFERENCE TOXICANT TESTS

The results of the reference toxicant tests are summarized in Table 10. All of the reference toxicant test results fell within the established laboratory control chart limits.

1. INTRODUCTION

At the request of the Jacobs Engineering Group, EA Engineering, Science, and Technology performed whole sediment toxicity testing on sediment samples collected from the Parallel Thimble Shoals Tunnel project footprint, which extends from Wise Point on the Eastern shore of Virginia to the Virginia Beach area. The purpose of this study was to evaluate the toxicity of the sediment samples.

The toxicity testing program consisted of 10-day whole sediment toxicity tests with *Ampelisca abdita* (marine amphipod) and *Leptocheirus plumulosus* (estuarine amphipod). The whole sediment toxicity tests evaluated the effects of exposure to the sediment samples on survival of the test organisms.

2. MATERIALS AND METHODS

2.1 SAMPLE RECEIPT AND PREPARATION

Fifteen sediment samples from the location of the Parallel Thimble Shoals Tunnel project were collected and composited by EA personnel. Three sediment samples were also collected as references for the Parallel Thimble Shoals Tunnel sediment samples, along with a Chesapeake Bay control sediment (CBCON-SED). The reference samples, CBCON sediment, and the composited Parallel Thimble Shoals Tunnel sediment samples were placed into 5-gallon pails. The samples were held at ≤4°C and were hand delivered to EA's Ecotoxicology Laboratory in Hunt Valley, Maryland. Upon receipt at EA, the sediment samples were logged in and assigned EA laboratory accession numbers, and were stored in the dark in a secured walk-in cooler at ≤4°C until used for testing. Table 1 summarizes the sample identification, accession numbers, and collection/receipt information for the sediment samples. Chain-of-custody records are included in Attachment I.

2.2 TOXICITY TEST METHODS

All toxicity testing was conducted following EA's standard operating procedures (EA 2013) which are in accordance with USEPA/USACE guidance (1991, 1998) and USEPA guidance (2000, 2002).

2.2.1 Whole Sediment Toxicity Testing

Whole sediment toxicity testing was conducted with two saltwater amphipods, *A. abdita* and *L. plumulosus. A. abdita* Lot AA-023 was acquired from Aquatic Research Organisms, (Hampton, New Hampshire) on 1 May 2015. The amphipods were 3-5 mm when used for testing on the same day. The *L. plumulosus* were acquired from Chesapeake Cultures, (Hayes, Virginia). The organisms in Lot LP-074 were received at EA on 18 May, and were 2-4 mm when used to initiate the toxicity test on the same day. During the holding period, the organisms were gradually acclimated to laboratory water at 20°C and to the appropriate test salinity.

For solid phase testing, U.S. EPA guidance (Davies, et. al. 1993) specifies the reduction of pore water ammonia concentrations to ≤20 mg/L NH_3-N prior to testing. Initial interstitial total ammonia concentrations in the fifteen samples could not be determined due to lack of adequate pore water in the samples, however purging activities were continued to ensure all samples were less than 20 mg/L NH_3-N (Table 2). The sediments were loaded into the test beakers and overlying sea water was added. The five replicate beakers per sediment were loaded, and additional beakers were set up for each sediment to monitor the progress of the ammonia reduction. The overlying water was replaced two times per day. Pore water for analysis was extracted from each of the purged sediment samples by centrifugation. The interstitial ammonia values for all of the ammonia purged Parallel Thimble Shoals Tunnel sediments are presented in Table 2.

The whole sediment toxicity tests were conducted as static, non-renewal tests with ten days of exposure to the sediments and overlying water. Artificial seawater (Crystal Sea artificial sea salts) at 20 ppt salinity (*L. plumulosus*) or 30 ppt salinity (*A. abdita*) was used as the overlying water.

The *A. abdita* and *L. plumulosus* tests utilized 1-L beakers as the exposure chambers, with each beaker containing 200 ml of sediment and 700 ml of overlying water. There were five replicate chambers for each sediment sample and control. Test organisms were randomly assigned to the test chambers, 20 per replicate, for a total of 100 organisms exposed per sample.

The tests were maintained at a target of 20±1°C, with a 24-hour light photoperiod. The test chambers were visually inspected daily for abnormal organism behavior or lack of burrowing. The test organisms were not fed during the 10-day exposure period.

The overlying water in each test chamber was gently aerated (100 bubbles per minute) for the duration of the tests. Water quality measurements of temperature, pH, dissolved oxygen, and salinity were recorded daily on one replicate of each sample and control. The water quality parameters measured during the *A. abdita* and *L. plumulosus* toxicity tests are summarized in Tables 3 and 4, respectively.

After ten days of exposure, the test organisms were retrieved from the samples and the number of live organisms per replicate was recorded. Copies of the original data sheets for the *A. abdita* and *L. plumulosus* toxicity testing are included as Attachments II and III, respectively.

2.2.2 Data Analysis

Statistical analyses were performed on the whole sediment test data according to USEPA/USACE (1998) guidance, using the ToxCalc statistical software package (Version 5.0, Tidepool Scientific Software). If survival in a Parallel Thimble Shoals Tunnel sediment was greater than the allowable percent difference (20 percent) from a reference, then a t-test or Wilcoxon's Two-Sample Test (depending on normal or non-normal data distribution) was performed on that sediment sample. The statistical analyses were performed to determine if exposure to any of the Parallel Thimble Shoals Tunnel sediment samples resulted in significantly lower survival ($p=0.05$) as compared to the organisms exposed to the corresponding reference sediment. The results of the *A. abdita* and *L. plumulosus* whole sediment bioassays are summarized in Tables 5 and 6, respectively.

2.2.3 Reference Toxicant Testing

In conformance with EA's quality assurance/quality control program requirements, reference toxicant testing was performed by EA on the acquired lots of *A. abdita* and *L. plumulosus* utilized in the testing program. The reference toxicant tests consisted of a graded concentration series of a specific toxicant in water only tests, with no sediment present in the test chambers. The results of the reference toxicant tests were compared to established control chart limits. Table 7 presents the results of the reference toxicant testing.

2.3 ARCHIVES

Original data sheets, records, memoranda, notes, and computer printouts are archived at EA's Office in Hunt Valley, Maryland. These data will be retained for a period of 5 years unless a longer period of time is requested by Jacobs Engineering Group.

3. RESULTS AND DISCUSSION

This bioassay study with the sediments from Parallel Thimble Shoals Tunnel was designed and conducted to meet the requirements of the USEPA/USACE dredged material testing program. The results of these toxicity tests met the current NELAC standards, where applicable.

3.1 WHOLE SEDIMENT TOXICITY TESTING

Statistical analyses were conducted on the sediment samples if the percent difference in survival between the sample and a reference was at least 20 percent.

Table 5 summarizes the results of the 10-day whole sediment toxicity testing with *A. abdita.* Survival in the Parallel Thimble Shoals Tunnel sediments ranged from 95 to 100 percent. The reference samples had 97 to 98 percent survival. Survival in all sediment samples was within the allowable percent difference (20 percent) of the corresponding reference samples. Survival in the CBCON was 96 percent, while the laboratory control had 98 percent survival.

The results of the *L. plumulosus* whole sediment toxicity test are presented in Table 6. Survival in the Parallel Thimble Shoals Tunnel sediments ranged from 88 to 99 percent. The reference samples had 93 to 99 percent survival. Survival in all sediment samples was within the allowable percent difference (20 percent) of the corresponding reference samples. Survival in the CBCON was 95 percent, while the laboratory control had 98 percent survival.

3.2 REFERENCE TOXICANT TESTS

The results of the reference toxicant tests are summarized in Table 7. All of the reference toxicant test results fell within the established laboratory control chart limits.

1. INTRODUCTION

At the request of the Jacobs Engineering Group, EA Engineering, Science, and Technology performed solid phase bioaccumulation testing on sediment samples collected from the Parallel Thimble Shoals Tunnel project footprint, which extends from Wise Point on the Eastern shore of Virginia to the Virginia Beach area. The purpose of this study was to evaluate the toxicity and bioaccumulation potential of the sediment samples.

The toxicity testing program consisted of 28-day bioaccumulation tests with *Nereis virens* (sand worm) and *Macoma nasuta* (blunt-nose clam). The bioaccumulation tests evaluated percent recovery of the test organisms and bioaccumulative effects as a result of exposure to the sediment samples. At the completion of the bioaccumulation testing, the organism tissues were submitted for selected chemical analyses, the results of which are not included in this report.

2. MATERIALS AND METHODS

2.1 SAMPLE RECEIPT AND PREPARATION

Fifteen sediment samples from the location of the Parallel Thimble Shoals Tunnel project were collected and composited by EA personnel. Three sediment samples were also collected as references for the Parallel Thimble Shoals Tunnel sediment samples. The reference samples and the composited Parallel Thimble Shoals Tunnel sediment samples were placed into 5-gallon pails. The samples were held at ≤4°C and were hand delivered to EA's Ecotoxicology Laboratory in Hunt Valley, Maryland. Upon receipt at EA, the sediment samples were logged in and assigned EA laboratory accession numbers, and were stored in the dark in a secured walk-in cooler at ≤4°C until used for testing. Table 1 summarizes the sample identification, accession numbers, and collection/receipt information for the sediment samples. Chain-of-custody records are included in Attachment I.

2.2 TOXICITY TEST METHODS

All toxicity testing was conducted following EA's standard operating procedures (EA 2013) which are in accordance with USEPA/USACE guidance (1991, 1998) and USEPA guidance (2000, 2002).

2.2.1 Bioaccumulation Testing

Bioaccumulation testing was conducted using the blunt-nose clam (*Macoma nasuta*) and the sand worm (*Nereis virens*). The adult clams (lot number MA-046) and the adult worms (NV-054) were received from Aquatic Research Organisms (Hampton, New Hampshire) on 22 April 2015. The clams were placed in clean seawater and allowed to depurate accumulated waste products, prior to use in testing. The *N. virens* were loaded into the test immediately to minimize cannibalism/holding stress.

The sediment samples and overlying water were added to the test chambers a minimum of one day prior to test initiation to allow time for the suspended sediments to settle. The overlying

water was 30 ppt artificial seawater (Crystal Sea artificial sea salts). Natural sediments from the organism collection sites were used as laboratory controls in the bioaccumulation testing. Control sediment used in the *N. virens* test was collected from the Damariscotta River, Booth Bay Harbor, Maine. The sediment used in the clam bioaccumulation test was collected from Tomales Bay, California. The bioaccumulation tests were 28 days in duration and were conducted as static renewal assays. The overlying water was replaced three times a week by siphoning approximately 80 percent of the overlying water from the aquaria and replacing with new overlying water taking care not to disturb the sediment surface.

The bioaccumulation tests were conducted in 10-gallon aquaria with 5 L of sediment and 22 L of overlying water per aquarium. There were five replicates per reference and test sediment, and three replicates per control sediment. Based on the analytical tissue biomass requirements, 19 organisms were randomly introduced into each replicate chamber for the *N. virens* testing, while the *M. nasuta* testing utilized 50 organisms per chamber.

During the 28-day exposure period, the test chambers were maintained at a target temperature of 20±1°C for *N. virens* and 12±1°C for *M. nasuta* with a 16-hour light/8-hour dark photoperiod. Gentle aeration was provided to each aquarium throughout the test period. Observations of mortality and abnormal organism behavior were recorded daily, and dead organisms were removed, as observed, from the test chambers. Measurements of temperature, pH, dissolved oxygen, and salinity of the overlying water were recorded on one replicate of each sample and control at test initiation, termination, and three times a week prior to replacement of the overlying water. The water quality measurements are summarized in Table 2 *(N. virens*) and Table 3 (*M. nasuta*). The organisms were not fed during the exposure period.

The bioaccumulation tests were initiated on 22 April (*N. virens*) and 23 April (*M. nasuta*) and completed on 20 April and 21 April 2015, respectively. After 28 days of exposure, the organisms were recovered from the samples and placed into clean artificial sea water for 24 hours to purge their digestive tracts. After the depuration period, the organism tissues were collected and submitted for chemical analyses. Copies of the original data sheets from the *N. virens* and *M. nasuta* testing are included in Attachments II and III, respectively.

2.2.2 Data Analysis

Statistical analyses were performed on the percent recovery data from the bioaccumulation tests according to USEPA/USACE (1998) guidance, using the ToxCalc statistical software package (Version 5.0, Tidepool Scientific Software). If the percent recovery in a sediment sample was at least 10 percent less than the reference samples, then a t-test or Wilcoxon's Two-Sample Test (depending on normal or non-normal data distribution) was performed on that sediment sample. The statistical analyses were performed to determine if exposure to any of the Parallel Thimble Shoals Tunnel sediment samples resulted in significantly lower percent recovery ($p=0.05$) as compared to the organisms exposed to the reference sediments. The percent recovery data from the *N. virens* and *M. nasuta* bioaccumulation testing are summarized in Tables 4 and 5, respectively.

2.2.3 Reference Toxicant Testing

In conformance with EA's quality assurance/quality control program requirements, reference toxicant testing was performed by EA on the acquired lots of *N. virens* and *M. nasuta* utilized in the testing program. The reference toxicant tests consisted of a graded concentration series of a specific toxicant in water only tests, with no sediment present in the test chambers. The results of the reference toxicant tests were compared to established control chart limits. Table 6 presents the results of the reference toxicant testing.

2.3 ARCHIVES

Original data sheets, records, memoranda, notes, and computer printouts are archived at EA's Office in Hunt Valley, Maryland. These data will be retained for a period of 5 years unless a longer period of time is requested by Jacobs Engineering Group.

3. RESULTS AND DISCUSSION

This bioaccumulation study with the sediments from Parallel Thimble Shoals Tunnel was designed and conducted to meet the requirements of the USEPA/USACE dredged material testing program. The results of these toxicity tests met the current NELAC standards, where applicable.

3.1 BIOACCUMULATION TESTING

Statistical analyses were conducted on the sediment samples if the difference in percent recovery between a sediment sample and a reference was at least 10 percent.

Tables 4 and 5 summarize the percent recovery of *N. virens* and *M. nasuta*, respectively, following 28 days of exposure to the sediment samples. Percent recovery of *N. virens* exposed to the Parallel Thimble Shoals Tunnel sediments ranged from 95 to 100 percent. Reference sediments had 97 to 98 percent recovery. The difference in percent recovery between all of the Parallel Thimble Shoals Tunnel sediment samples and the reference samples was less than 10 percent. Therefore, statistical analyses were not conducted on *N. virens* percent recovery data.

Percent recovery of *M. nasuta* exposed to the Parallel Thimble Shoals Tunnel sediments ranged from 88 to 98 percent. Reference sediments had 84 to 96 percent recovery. The difference in percent recovery between all of the Parallel Thimble Shoals Tunnel sediment samples and the reference samples was less than 10 percent. Therefore, statistical analyses were not conducted on *M. nasuta* percent recovery data.

3.2 REFERENCE TOXICANT TESTS

The results of the reference toxicant tests are summarized in Table 6. All of the reference toxicant test results fell within the established laboratory control chart limits.

LAB CONTROL	AT5-073	125 / 150	83

(a) Total for five replicates of fifty organisms for all test sediments except for control, which had three replicates.
(b) Statistically compared to reference, if percent recovery is ≥10 percent difference from reference.

TABLE 6 RESULTS OF REFERENCE TOXICANT TESTING ON ACQUIRED LOTS OF TEST ORGANISMS – PARALLEL THIMBLE SHOAL TUNNEL, VIRGINIA

Test Species	Organism Lot Number	Reference Toxicant	Test Endpoint	Acceptable Control Chart Limits
Nereis virens	NV-054	Potassium chloride (KCl)	48-Hour LC50: 1,208 mg/L KCl	566 – 1,588 mg/L KCl
Macoma nasuta	MA-046	Potassium chloride (KCl)	48-Hour LC50: 1,439 mg/L KCl	817 – 2,203 mg/L KCl

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits
F2	MS/MSD RPD exceeds control limits

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits

Metals

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.
F1	MS and/or MSD Recovery is outside acceptance limits.
V	Serial Dilution exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

CASE NARRATIVE

Client: EA Engineering, Science, and Technology

Project: CBBT Thimble Shoal Parallel Tunnel

Report Number: 180-44597-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT
The samples were received on 05/29/2015; the samples arrived in good condition, properly preserved and on ice. The temperatures of the 7 coolers at receipt time were 1.3º C, 1.6º C, 1.7º C, 2.0º C, 2.1º C, 2.3º C and 2.7º C.

SEMIVOLATILES
Several samples were diluted due to the nature of the sample matrix. Elevated Reporting Limits (RLs) are provided.

Nitrobenzene-d5 (Surr) failed the surrogate recovery criteria low for AT5-078 B-C (180-44597-24). 2-Fluorobiphenyl and Nitrobenzene-d5 (Surr) failed the surrogate recovery criteria low for AT5-075 B-C (180-44597-8). Evidence of matrix interference is present and sample was analyzed at a dilution; therefore, re-extraction and/or re-analysis was not performed.

Several analytes exceeded the RPD limit for the MSD of sample AT5-073 C-C (180-44597-3) in batch 180-146014.

Internal standard response for Perylene-d12 was outside of acceptance limits for the following samples: AT5-078 D-C (180-44597-26) and AT5-078 E-C (180-44597-27). The samples show evidence of matrix interference. The data has been qualified and reported.

PESTICIDES
One surrogate for sample AT5-075 B-C (180-44597-8) recovered outside QC limits. At least one surrogate recovered within QC limits. All data was rpeorted.

METALS
The holding time for mercury on tissues is 28 days from the date sampled. These smaples were released from hold after the 28 day holding time for mercury. All results are flagged with the H qualifer and reported with this narration.

Several samples were diluted due to the nature of the sample matrix for mercury. Elevated reporting limits (RLs) are provided.

Chromium and Iron were detected in method blank MB 180-145319/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Antimony, Iron and Magnesium were detected in method blank MB 180-145442/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Chromium was detected in method blank MB 180-145448/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Several analytes were detected in method blank MB 180-145552/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Aluminum and Sodium failed the recovery criteria high for the MS of sample AT5-073 B-C (180-44597-2) in batch 180-146445. Aluminum, Iron, Magnesium and Sodium failed the recovery criteria high for the MSD of sample AT5-073 B-C (180-44597-2) in batch 180-146445.

The serial dilution performed for the following sample associated with batch 145319 was outside of the control limits for several analytes.:

MOISTURE
No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

PERCENT LIPIDS
No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.
