DATA VALIDATION REPORT
METALS AND SELECTED ANALYTES
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the groundwater samples collected on January 11, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number WL-0048 which contained 5 groundwater samples and 1 field duplicate sample. All samples in this report were analyzed by Pace, Incorporated Environmental Laboratories (Pace, Inc.), Westbrook, Maine, following United States Environmental Protection Agency (EPA) Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846), Methods for Chemical Analysis of Water and Wastes (MCAWW), and Standard Methods for the Examination of Water and Wastewater, 16th Edition, 1985 (SM), American Public Health Association (APHA). The individual analyses were performed using the following methods:

Analytes	Methods
aluminum, barium, calcium, chromium, iron, magnesium, manganese, potassium, silicon, and sodium	200.7
hexavalent chromium	7195/6010
arsenic	206.2
lead	239.2
bicarbonate as HCO3 and carbonate as CO3	SM406C
bromide	320.1
nitrate as N and nitrite as N	353.2
dissolved organic carbon (DOC)	415.1
phosphorus as P	365.4
solids - filterable residue (TDS)	160.1

Because the analyses were not performed according to the EPA Contract Laboratory Program (CLP) methods, the findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis, June 1988, where applicable.

SMITH

The support documentation in Appendix A of this report summarizes the specifics of this review. Appendix A also provides the sample results as reported by the laboratory. The data summary lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers section. Other issues which arose which did not warrant qualification are detailed in the Notes Section.

FINDINGS/QUALIFIERS

This data validation report addresses Pace, Inc. work order number WL-0048 which contained 3 groundwater samples and 1 field duplicate sample. The data were evaluated for the following parameters:

* data completeness
holding times
* data calibration verification
* laboratory blank analysis
\+ field blank analysis
* interference check sample results
matrix spike recoveries
laboratory duplicates
field duplicates
* laboratory control sample results
furnace atomic absorption results
\+ serial dilution results
\+ detection limit results
sample results

* All criteria were met for this parameter.
\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

- Hexavalent chromium results are estimated because holding times were not met.

- All positive results for potassium are estimated because the matrix spike percent recovery (%R) was below 30%. All positive results and detection limits for nitrite and dissolved organic carbon (DOC) are estimated because the matrix spike %Rs were below criteria. (Matrix spike results are also discussed in the Notes Section.)

- The graphite furnace post-digestion analytical spike %Rs for arsenic and lead for samples GW-42-D (S000006/WL-0048-1), GW-50-S (S000007/WL-0048-4), and GW-42-S (S000002/WL-0048-6) and arsenic for field duplicate sample GW-42-D (S000005/WL-0048-8) were below criteria. These results are estimated. The detection limits for these results were elevated to reflect the dilution factor as indicated on the Report of Analysis Forms included in Appendix A.

- All positive phosphorus as P and solids-filterable residue (TDS) results are estimated because laboratory duplicate precision was not met.

- All positive nitrite, phosphorus as P, and TDS results are estimated because field duplicate precision was not met. Details are presented on the Field Duplicate Precision Worksheet provided in Appendix A.

- The reported 200 mg/L hexavalent chromium result for field duplicate sample GW-42-D (S000005/WL-0048-16) is rejected because the various dilutions performed on the sample did not result in consistent values. The logic for choosing the hexavalent chromium results of record was explained by the Pace Inc. analyst on the bottom of notebook page 25 which is included in Appendix A of this report. The original result reported on the Report of Analysis Form was changed by the laboratory from 110 mg/L (which was reported from the preparation dilution of 5) to 200 mg/L (which was reported from the preparation dilution factor of 20). However, this sample was the blind field duplicate sample of sample GW-42-D (S000006/WL-0048-9). Sample WL-0048-9 had consistent results at the 5 and 20 preparation dilution factors which agree with the result originally reported for WL-0048-16 of 110 mg/L (see the Field Duplicate Precision Worksheet in Appendix A). The 94 mg/L result for sample WL-0048-9 is considered the appropriate result of record for the sampling location.

  Additionally, because trivalent chromium is calculated using the hexavalent chromium result, the trivalent chromium result for sample GW-42-D (S000005/WL-0048-16) is also rejected. The trivalent chromium result for sample GW-42-D (S000006/WL-0048-9) is considered the appropriate result of record for the sampling location.

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. All bromide data were attempted to be analyzed by Method 320.1. The laboratory was unable to analyzed all data associated with sampling location GW-42-D for bromide by Method 320.1. This data includes the field duplicate sample, laboratory duplicate sample, and the matrix spike sample The samples were very dark in color and could not be colormetrically

analyzed according to the Pace Inc. analyst. These samples were reanalyzed for bromide by Method 300.0 and are reported as non-detect. The associated detection limits were elevated by the laboratory to reflect the sample dilutions necessary because of the levels of chloride and sulfate present in the samples.

2. Arsenic and lead for sample WL-0048-2 (matrix spike), WL-0048-3 (laboratory duplicate), and field duplicate sample GW-42-D (S000005/WL-0048-8) were analyzed at dilutions. The detection limits of these results were elevated by the laboratory to reflect the dilution factors as indicated on the Report of Analysis Forms included in Appendix A.

3. Matrix spike %Rs for aluminum, calcium, chromium, hexavalent chromium, iron, magnesium, manganese, sodium, and silicon were out of the associated acceptance ranges. Because the spike concentrations significantly below the sample concentrations (i.e., less than four times), no data are qualified.

4. The matrix spike %Rs for arsenic and lead were zero; however, both the sample results and the spike sample results were non-detect and were analyzed with elevated detection limits due to interferences. The spike concentrations were below these elevated detection limits, no data are qualified.

5. A serial dilution sample was not provided by the laboratory as recommended by the MCAWW Method 200.7. Since performance of a serial dilution is not required by the method, no data are qualified.

6. There are no field blank samples associated with this order.

SUMMARY

This review has identified holding times, matrix spike %Rs, graphite furnace post-digestion analytical spike %Rs, laboratory and field duplicate precision, and a sample result for hexavalent chromium as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix A.

SMITH

QUALIFIER CODES

R - The data are unusable.

J - The associated value is an estimated quantity.

UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

DATA VALIDATION REPORT
CHLORIDE, SULFATE, ORTHOPHOSPHATE, SULFIDE, AND AMMONIA-N
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on additional data from the groundwater samples collected on January 11, 1995 (5 groundwater samples and 1 field duplicate sample) at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of Pace Inc.'s Hampton, New Hampshire laboratory work order number 42773 which contained the same 5 groundwater samples and 1 field duplicate sample that were analyzed in work order number WL-0048 by Pace Inc. of Westbrook, Maine. The individual analyses were performed using the following from Methods for Chemical Analysis of Water and Wastes (MCAWW):

Analytes	Methods
chloride and sulfate	300.0
orthophosphate	365.2
sulfide	376.1
ammonia-N	350.2

The findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis, June 1988, where applicable.

The support documentation in Appendix B of this report summarizes the specifics of this review. Appendix B also provides the samples results as reported by the laboratory. The data summary lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers section. Other issues which arose which did not warrant qualification are detailed in the Notes Section.

SMITH

FINDINGS/QUALIFIERS

This data validation report addresses Pace, Inc. work order number 42773 which contained 5 groundwater samples and 1 field duplicate sample. The data were evaluated for the following parameters:

* data completeness
* holding times
* data calibration verification
* laboratory blank analysis
+ field blank analysis
* matrix spike recoveries
* laboratory duplicates
* field duplicates
* laboratory control sample results
* detection limit results
sample results

* All criteria were met for this parameter.

\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report. Issues discussed in the Notes Section do not require qualification based on the associated methods performed.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

- The chloride result for GW-42-S (S000003/42773-009) is estimated because the reported concentration of 53 mg/L exceeded the maximum standard concentration, and the sample was not reanalyzed at a dilution.

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. The reported sulfide result for sample GW-42-D (S000006/42773-017) was analyzed at a dilution due to matrix interferences. The detection limit was elevated to reflect the dilution factor as indicated on the laboratory-reported sample results included in Appendix B.

2. There are no field blank samples associated with this order.

SMITH

SUMMARY

This review has identified a saturated chloride peak as an area of concern. The reported sulfide result is usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix B.

RPD = Relative percent difference, which is the absolute value of the difference between two duplicate results divided by the mean concentration then multiplied by 100%.

NA = Not applicable.

NC = Relative percent difference cannot be calculated for sample results less than the POL.

Potassium is estimated. The remaining criteria outlined are described in the Notes Section of the report. M Dungi 1/19/96

DATA QUALITY COMMENTS:

Results of all quality control measurements are within the laboratory or contract specified acceptance range except as noted. The laboratory does not use the sample duplicate and matrix spike acceptance ranges as acceptance criteria for a specific analysis. Sample duplicate and matrix spike data are used to evaluate method performance in the environmental sample matrix only. Please refer to LCS data for assessment

RPD = Relative percent difference, which is the absolute value of the difference between two replicate results divided by the mean concentration then multiplied by 100%.

→ out of range

→ below criteria

NC = Relative percent difference cannot be calculated for sample results less than the PQL.

NA = Not applicable.

MOusey 1/16/96

DATA QUALITY COMMENTS:

Results of all quality control measurements are within the laboratory or contract specified acceptance range except as noted. The laboratory does not use the sample duplicate and matrix spike acceptance ranges as acceptance criteria for a specific analysis. Sample duplicate and matrix spike data are used to evaluate method performance in the environmental sample matrix only. Please refer to LCS data for assessment of quality control for each parameter.

* Matrix spike recovery is outside the laboratory's specified acceptance range indicating potential sample matrix interference and potential bias of reported value for this parameter.

& Precision of replicate analysis as measured by RPD is outside the laboratory's acceptance range for this parameter. Sample homogeneity may be a factor.

NR = Initial sample pH was <4.5 Alkalinity could not be analyzed.

RE: Hexavalent Chromium

At your request, we have reviewed the raw data for PACE Work Order Number WL0048. We have determined that a calculation error resulted in the reporting of erroneous hexavalent chromium and trivalent chromium results for Sample Number S000005 (PACE Sample Number WL0048-16). The correct results for this sample are 2[illegible] mg/L for hexavalent chromium and 3300 mg/L for trivalent chromium. We regret this error and will issue a corrected report of analysis.

PROJECT Bromide EPA 320.1 (titrimetric) Notebook No. 3

Continued From Page 10

Spike + CCV:

Because I had virtually no recovery of these during my last set of bromides (12-27-94), I used a different solution to make the CCVs and Spike. I used the Br^- Stock Std which yielded high recoveries for the standards (A+B) during the previous run. I use the following volumes:

Spike: (1.0 ml × 1.0 mg/ml)/.10 L = 10.0 mg/l

CCV: (1.0 ml × 1.0 mg/ml)/.10 L = 10.0 mg/l

$$[I^-] = \frac{N(\Delta ml - Blank)}{Sample\ Vol} \qquad N = .0075$$

I^- Determination

Client	Sample ID	Site ID	Sample Vol (ml)	Δml STS	$[I^-]$
Olin-Conroe	WL0069-3		100.0	0.38	6.00×10^{-6}
↓	WL0069-4		100.0	0.41	8.25×10^{-6}
	WL0069-5		100.0	0.33 0.52	1.65×10^{-5}
	WL0069-6		100.0	~~1.52~~ 1.98	1.26×10^{-4}
	CCV		100.0	0.33	$2.25 \times 10^{-}$
	CCV *		100.0	0.47	$1.275 \times 10^{-}$
	WL0059-1		100.0	2.87	1.9275×10

* CCV was titrated (read) after WL0069-4 (20TH sample). Remaining CCV was titrated after sample WL0059-1.

Samples WL0048-1-3, WL0048-8, WL0062-1, WL0062-3 were a very dark "inky" color and could not be colorimetrically (titrated) analyzed. I attempted to titrate all 6 in case something could be detected - but I could not see a color change.

~~These samples were~~ were run by Method 300.0 on 1/16/95 Nancy Smith

THE ASSURANCE OF QUALITY

REPORT OF LABORATORY ANALYSIS

TECHNICAL NARRATIVE

Laboratory Number: 42773

Samples were received in acceptable condition, with the exceptions noted on the sample receipt condition report.

All samples were prepared and analyzed within the holding times specified in the referenced methods.

Instrumentation used for analysis was calibrated and/or tuned with the appropriate frequency and to the appropriate specifications required by the referenced methods.

Blank contamination was not observed at levels affecting the analytical results.

Matrix effects, as monitored by matrix spike recovery, unusual physical properties and/or surrogate analyte recovery, were not apparent with the following exception:

> The detection limit for the analysis of sulfide was raised for laboratory number 42773-17 due to matrix interference.

Accuracy and precision as monitored by laboratory control sample analyses were within laboratory acceptance limits.

DATA VALIDATION REPORT
OLIN CORPORATION
GROUNDWATER CONFIRMATION SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the groundwater samples collected on January 11 and 17, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number S000004, case number 50184 which contained 2 groundwater samples. All samples in this report were analyzed by Columbia Analytical Services (CAS), Boulder, Colorado, following modified United States Environmental Protection Agency (EPA) Contract Laboratory Program (CLP) Statement of Work (SOW) for Inorganics Analysis, March 1990 (ILM03.0), EPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846), Methods for Chemical Analysis of Water and Wastes (MCAWW), and Standard Methods for the Examination of Water and Wastewater, 17th Ed., 1989 (SM), American Public Health Association (APHA). The individual analyses were performed using the following methods:

Analytes	Methods
aluminum, arsenic, barium, calcium, chromium, iron, magnesium, manganese, potassium, silicon, and sodium	CLP modified
hexavalent chromium	7195/6010
alkalinity as CaCO3	310.1
bicarbonate as HCO3 and carbonate as CO3	SM 2320B
ammonia as nitrogen (for sample S000004)	350.3
ammonia as nitrogen (for sample S000017)	350.1
bromide, chloride, sulfate	300.0
total and dissolved organic carbon (TOC and DOC)	415.1
nitrate as N and nitrite as N (for sample S000004)	353.2
nitrate as N and nitrite as N (for sample S000017)	300.0
orthophosphate as phosphorus and total phosphorus	365.3
solids, filterable residue (TDS)	160.1
sulfide	9030 (modified)

Because not all of the analyses were performed according to the EPA Contract Laboratory Program (CLP) methods, the findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA

SMITH

Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis, June 1988, where applicable.

The support documentation in Appendix A of this report summarizes the specifics of this review. Appendix A also provides the sample results as reported by the laboratory. The data summary lists all compounds that were analyzed. All results on the data summary table are reported in mg/L. Analytical problems are outlined in the following Findings/Qualifiers section. Other issues which arose which did not warrant qualification are detailed in the Notes Section.

FINDINGS/QUALIFIERS

This data validation report addresses Pace, Inc. work order number S000004 which contained 2 groundwater samples. The data were evaluated for the following parameters:

* data completeness
holding times
* data calibration verification
* laboratory blank analysis
\+ field blank analysis
interference check sample results
matrix spike recoveries
laboratory duplicates
\+ field duplicates
* laboratory control sample results
\+ furnace atomic absorption results
serial dilution results
\+ detection limit results
* sample results

* All criteria were met for this parameter.
\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

- Hexavalent chromium and total dissolved solids (TDS) results for both samples and nitrate and nitrite results for sample GW-42-D (S000004/K950184-001) are estimated because method-specific holding times were not met.

- Manganese and silicon results are estimated for sample GW-42-D (S000004/K950184-001) because false positives may exist as indicated by positive

manganese and silicon results in the ICP interference check samples (ICS). These analytes are not present in the EPA-provided solutions, and the interferent analytes that may contribute to the presence of these compounds (aluminum, chromium, iron, and magnesium) are present at concentrations which may be effecting the reported sample results for manganese and silicon.

- The non-detect sulfide result for sample GW-42-D (S000004/K950184-001) is rejected because the matrix spike percent recovery (%R) was below 30%. (Matrix spike results are also discussed in the Notes Section.)

- The chromium results for both samples and the hexavalent chromium result for sample GW-64-S (S000017/K950265-001) are estimated because laboratory duplicate precision was not met.

- The barium and potassium results for sample GW-42-D (S000004/K950184-001) and the iron result for sample GW-64-S (S000017/K950265-001) are estimated because the associated serial dilution results were out of criteria .

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. Transcription errors exist on the Analysis Run Log (Form 14) for arsenic. The reviewer-corrected form is included in Appendix A. Also, because several dilutions were performed for sample GW-42-D (S000004/K950184-001), the Form 14 (page 27) is included in Appendix A to clarify which results were reported as sample results and which were reported as serial dilution results.

2. Nitrite for sample GW-42-D (S000004/K950184-001) was analyzed at a dilution because of matrix interferences. The detection limit was elevated by the laboratory to reflect the dilution factors as indicated on the Report of Analysis Forms included in Appendix A. Also, the matrix spike level and spiked sample result associated with this nitrite result were reported at a level below the method reporting limit (MRL). No data are qualified.

3. Several transcription errors exist in the Laboratory QC Results reported for all methods except modified CLP. The reviewer-corrected forms are included in Appendix A.

4. Matrix spike %Rs for total phosphorus and hexavalent chromium associated with sample GW-42-D (S000004/K950184-001) were out of the associated

acceptance ranges. Because the spike concentrations were significantly below the sample concentrations (i.e., less than four times), no data are qualified.

5. There are no field blank or field duplicate samples associated with this order.

SUMMARY

This review has identified holding times, ICP ICS results, matrix spike %Rs, laboratory duplicate precision, and serial dilution results as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix A.

SMITH

QUALIFIER CODES

R - The data are unusable.

J - The associated value is an estimated quantity.

UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

DATA VALIDATION REPORT
METALS AND SELECTED ANALYTES
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the groundwater samples collected on January 16, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number WL-0069 which contained 3 groundwater samples and 1 field duplicate sample. All samples in this report were analyzed by Pace, Incorporated Environmental Laboratories (Pace, Inc.), Westbrook, Maine, following United States Environmental Protection Agency (EPA) Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846), Methods for Chemical Analysis of Water and Wastes (MCAWW), and Standard Methods for the Examination of Water and Wastewater, 16th Edition, 1985 (SM), American Public Health Association (APHA). The individual analyses were performed using the following methods:

Analytes	Methods
aluminum, barium, calcium, chromium, iron, magnesium, manganese, potassium, silicon, and sodium	200.7
hexavalent chromium	7195/6010
arsenic	206.2
lead	239.2
bicarbonate as HCO3 and carbonate as CO3	SM406C
bromide	320.1
nitrate as N and nitrite as N	353.2
dissolved organic carbon (DOC)	415.1
phosphorus as P	365.4
solids - filterable residue (TDS)	160.1

Because the analyses were not performed according to the EPA Contract Laboratory Program (CLP) methods, the findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis, June 1988, where applicable.

The support documentation in Appendix A of this report summarizes the specifics of this review. Appendix A also provides the sample data as reported by the laboratory. The data summary lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers Section. Other issues which arose which did not warrant qualification are detailed in the Notes Section.

FINDINGS/QUALIFIERS

This data validation report addresses Pace, Inc. work order number WL-0069 which contained 3 groundwater samples and 1 field duplicate sample. The data were evaluated for the following parameters:

*	data completeness
	holding times
*	data calibration verification
*	laboratory blank analysis
+	field blank analysis
*	interference check sample results
	matrix spike recoveries
	laboratory duplicates
	field duplicates
*	laboratory control sample results
	furnace atomic absorption results
+	serial dilution results
*	detection limit results
+	sample results

* All criteria were met for this parameter.

\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

- Hexavalent chromium results were analyzed 40 minutes outside the 24 hour holding time. All hexavalent chromium results are estimated. Since all results were non-detect and trivalent chromium results were also non-detect and were acceptable, the impact is considered minor.

- The bromide results are rejected for sample GW-64-S (S000018/WL-0069-1) and estimated for samples GW-64-S (S000019/WL-0069-4) (field duplicate), GW-64-D (S000020/WL-0069-5), and GW-62-BR (S000011/WL-0069-6) because the matrix spike percent recovery (%R) was less than 30 %. All positive results and detection

limits for phosphorus as P are estimated because the matrix spike %Rs were below criteria. (Matrix spike results are also discussed in the Notes Section.)

- All positive results for iron and manganese except sample GW-62-BR (S000011/WL-0069-6) and all positive phosphorus as P results are estimated because the laboratory duplicate precision was not met.

- The graphite furnace post-digestion analytical spike %Rs for arsenic and lead for sample GW-62-BR (S000011/WL-0069-6) were below criteria. These results are considered estimated. The detection limits for these results were elevated to reflect the dilution factor as indicated on the Report of Analysis Forms included in Appendix A.

- All positive results for iron, manganese, potassium, silicon, nitrate, and bromide are estimated because field duplicate precision was not met. Details are presented on the Field Duplicate Precision Worksheet provided in Appendix A.

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. Matrix spike %Rs for calcium, iron, magnesium, manganese, and sodium were out of the associated acceptance ranges. Because the spike concentrations were significantly below the sample concentrations (i.e., less than four times), no data are qualified.

2. A serial dilution sample was not provided by the laboratory as recommended by the MCAWW Method 200.7. Since performance of a serial dilution is not required by the method, no data are qualified.

3. The laboratory duplicate results and the matrix spike results for magnesium and manganese results were reported incorrectly on the laboratory-supplied Quality Control Reports. The reviewer-corrected forms are included in Appendix A.

4. The incorrect sample result was reported on the Quality Control Report for dissolved organic carbon (DOC) for sample WL-0069-1. The reviewer-corrected form is included in Appendix A.

5. Transcription errors for DOC are present on the Quality Control Report Form. The reviewer-corrected form is included in Appendix A.

6. There are no field blank samples associated with this order.

SUMMARY

This review has identified holding times, matrix spike %Rs, graphite furnace post-digestion analytical spike recoveries, and laboratory and field duplicate precision as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix A.

DATA VALIDATION REPORT
CHLORIDE, SULFATE, ORTHOPHOSPHATE, SULFIDE, AND AMMONIA-N
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on additional data from the groundwater samples collected on January 16, 1995 (3 groundwater samples and 1 field duplicate sample) at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of Pace Inc.'s Hampton, New Hampshire laboratory work order number 42817 which contained the same 3 groundwater samples and 1 field duplicate sample that were analyzed in work order WL-0069 by Pace Inc. of Westbrook, Maine. The individual analyses were performed using the following from Methods for Chemical Analysis of Water and Wastes (MCAWW):

Analytes	Methods
chloride and sulfate	300.0
orthophosphate	365.2
sulfide	376.1
ammonia-N	350.2

The findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis, June 1988, where applicable.

The support documentation in Appendix B of this report summarizes the specifics of this review. Appendix B also provides the sample results as reported by the laboratory. The data summary lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers section. Other issues which arose which did not warrant qualification are detailed in the Notes Section.

SMITH

FINDINGS/QUALIFIERS

This data validation report addresses Pace, Inc. work order number 42817 which contained 4 groundwater samples and 1 field duplicate sample. The data were evaluated for the following parameters:

+ data completeness
* holding times
* data calibration verification
* laboratory blank analysis
+ field blank analysis
matrix spike recoveries
* laboratory duplicates
field duplicates
* laboratory control sample results
* detection limit results
+ sample results

* All criteria were met for this parameter.

\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

- All sulfate results are estimated because the matrix spike percent recovery (%R) was below criteria. (Matrix spike results are also discussed in the Notes Section.)

- All sulfate results are estimated because field duplicate precision was not met. Details are presented on the Field Duplicate Precision Worksheet provided in Appendix B.

SMITH

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. The chloride results for samples GW-64-S (S000018/42817-005) and GW-64-S (S000019/42817-006) were each reported incorrectly as 60 mg/L. The correct result for each is 61 mg/L. The reviewer corrected forms are included in Appendix B.

2. A quality control report for chloride (page 12) was not complete. Also, the incorrect laboratory control sample result was reported. The reviewer-corrected form is included in Appendix B.

3. A matrix spike was not provided by the laboratory for sulfide. All other laboratory-supplied QC was within acceptance limits.

4. There are no field blank samples associated with this order.

SUMMARY

This review has identified matrix spike %Rs and field duplicate precision as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix B.

* PQL (Practical Quantitation Level) represents laboratory reporting limits and may not reflect sample-specific reporting limits. Sample-specific limits are indicated by results annotated with '<' values.

(1) Sample Preparation on 01/24/95 by WD using 3010
(2) Sample Preparation on 01/23/95 by WD using 3020
(3) Due to sample matrix interferences, the reported value has been determined by the technique of standard additions (i.e., standards for the analyte of interest added directly to an aliquot of the sample).
(4) Sample Preparation on 01/17/95 by GFB using 7195
(5) Sample preparation was begun 5 minutes after the expiration of the analytical hold time.

RPD = Relative percent difference, which is the absolute value of the difference between two replicate results divided by the mean concentration then multiplied by 100%.

NC = Relative percent difference cannot be calculated for sample results less than the POL.

NA = Not applicable.

Qualify circled results
1/16/95

DATA QUALITY COMMENTS:

Results of all quality control measurements are within the laboratory or contract specified acceptance range except as noted. The laboratory does not use the sample duplicate and matrix spike acceptance ranges as acceptance criteria for a specific analysis. Sample duplicate and matrix spike data are used to evaluate method performance in the environmental sample matrix only. Please refer to LCS data for assessment of quality control for each parameter.

* Matrix spike recovery is outside the laboratory's specified acceptance range indicating potential sample matrix interference and potential bias of reported value for this parameter.

RPD = Relative percent difference, which is the absolute value of the difference between two duplicate results divided by the mean concentration then multiplied by 100%.

NA = Not applicable.

NC = Relative percent difference cannot be calculated for sample results less than the PQL.

*Because of the large uncertainty (i.e., 33% or greater) associated with measurements made near the detection level, the acceptance range for relative percent difference for duplicate measurements at such low concentrations is 0-100%.

DATA QUALITY COMMENTS:
Results of all quality control measurements are within the laboratory or contract specified acceptance range except as noted. The laboratory does not use the sample duplicate and matrix spike acceptance ranges as acceptance criteria for a specific analysis. Sample duplicate and matrix spike data are used to evaluate method performance in the environmental sample matrix only. Please refer to LCS data for assessment of quality control for each parameter.

~ Matrix spike recovery is outside the laboratory specified acceptance range. The spike concentration for this parameter is significantly below the sample concentration and cannot be distinguished from the sample's analytical signal.

REPORT OF LABORATORY ANALYSIS

TECHNICAL NARRATIVE

Laboratory Number: 42817

Samples were received in acceptable condition, with the exceptions noted on the sample receipt condition report.

All samples were prepared and analyzed within the holding times specified in the referenced methods.

Instrumentation used for analysis was calibrated and/or tuned with the appropriate frequency and to the appropriate specifications required by the referenced methods.

Blank contamination was not observed at levels affecting the analytical results.

Matrix effects, as monitored by matrix spike recovery, unusual physical properties and/or surrogate analyte recovery, were not apparent with the following exception:

> Matrix spike recovery for sulfate for laboratory number 42817-5 was 65.6%.

Accuracy and precision as monitored by laboratory control sample analyses were within laboratory acceptance limits.

DATA VALIDATION REPORT
METALS AND SELECTED ANALYTES
OLIN CORPORATION
SURFACE WATER SAMPLES

INTRODUCTION

A validation was performed on the analytical data from the surface water samples collected on February 2, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number WL-0197 which contained 6 filtered surface water samples, 6 unfiltered surface water samples, 1 filtered field duplicate sample, and 1 unfiltered field duplicate sample. All samples in this report were analyzed by Pace, Incorporated Environmental Laboratories (Pace, Inc.), Westbrook, Maine, following United States Environmental Protection Agency (EPA) Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846), Methods for Chemical Analysis of Water and Wastes (MCAWW), and Standard Methods for the Examination of Water and Wastewater, 16th Edition, 1985 (SM), American Public Health Association (APHA). The individual analyses were performed using the following methods:

Analytes	Method
aluminum, barium, calcium, chromium, iron, magnesium, manganese, potassium, silicon, and sodium	200.7
hexavalent chromium	7195/6010
arsenic	206.2
lead	239.2
bicarbonate as HCO3 and carbonate as CO3	SM406C
bromide	320.1
chemical oxygen demand	410.4
nitrate as N and nitrite as N	353.2
dissolved organic carbon (DOC) and total organic carbon (TOC)	415.1
phosphorus as P	365.4
solids - filterable residue	160.1

Because the analyses were not performed according to the EPA Contract Laboratory Program (CLP) methods, the findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis, June 1988, where applicable.

SMITH

The support documentation in Appendix A of this report summarizes the specifics of this review. Appendix A also provides the sample results as reported by the laboratory. The data summary lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers section. Other issues which arose which did not warrant qualification are detailed in the Notes Section.

FINDINGS/QUALIFIERS

This data validation report addresses Pace, Inc. work order number WL-0197 which contained 6 filtered surface water samples, 6 unfiltered surface water samples, 1 filtered field duplicate sample, and 1 unfiltered field duplicate sample. The data were evaluated for the following parameters:

*	data completeness
*	holding times
*	data calibration verification
*	laboratory blank analysis
+	field blank analysis
*	interference check sample results
	matrix spike recoveries
	laboratory duplicates
	field duplicates
*	laboratory control sample results
	furnace atomic absorption results
+	serial dilution results
*	detection limit results
*	sample results

* All criteria were met for this parameter.

\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

- Positive results and detection limits for iron for all filtered and unfiltered samples are estimated because the associated matrix spike percent recoveries (%Rs) were below criteria. (Matrix spike results are also discussed in the Notes Section.)

- Positive results for iron and bromide for filtered and unfiltered samples and positive results for aluminum, manganese, silicon, sodium, bicarbonate as HCO3, chemical oxygen demand (COD) (except sample SW-16 (unfiltered/WL-0197-17)), nitrate, and

total organic carbon (TOC) for all unfiltered samples are estimated because laboratory duplicate precision was not met.

- The graphite furnace post-digestion analytical spike %Rs for arsenic and lead for sample SW-16 (filtered/WL-0197-8) and lead for sample SW-16 (unfiltered/WL-0197-17) were below criteria. These detection limits are estimated.

- Positive results for iron and manganese for all filtered and unfiltered samples and positive results for aluminum, bicarbonate as HCO3, nitrate, and TOC for all unfiltered samples are estimated because field duplicate precision was not met. Details are presented on the Field Duplicate Precision Worksheet provided in Appendix A.

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. Matrix spike %Rs of criteria for calcium (filtered and unfiltered) and sodium (unfiltered only) were out of the associated acceptance ranges. Because the spike concentrations significantly below the sample concentrations (i.e., less than four times), no data are qualified.

2. It appears from reviewing the bromide preparation notes that the matrix spike sample associated with unfiltered bromide samples was not spiked. The preparation notes are included in Appendix A. No data are qualified.

3. Transcription errors for bromide, COD, dissolved organic carbon (DOC), and TOC are present on the Quality Control Report Form. The reviewer-corrected form is included in Appendix A.

4. A serial dilution sample was not provided by the laboratory as recommended by the MCAWW Method 200.7. Since performance of a serial dilution is not required by the method, no data are qualified.

5. There are no field blank samples associated with this order.

SUMMARY

This review has identified matrix spike %Rs, laboratory and field duplicate precision, and graphite furnace post-digestion analytical spike %Rs as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix A.

SMITH

FINDINGS/QUALIFIERS

This data validation report addresses Pace, Inc. work order number 42964 which contained 6 filtered surface water samples, 6 unfiltered surface water samples, 1 filtered field duplicate sample, and 1 unfiltered field duplicate sample. The data were evaluated for the following parameters:

* data completeness
* holding times
* data calibration verification
* laboratory blank analysis
+ field blank analysis
matrix spike recoveries
laboratory duplicates
field duplicates
* laboratory control sample results
* detection limit results
* sample results

* All criteria were met for this parameter.

\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

- The positive sulfide result for filtered sample SW-15 (42964-018) is estimated because the matrix spike percent recovery (%R) was above criteria.

- Positive ammonia results for all unfiltered samples are estimated because laboratory duplicate precision was not met.

- Positive ammonia results for all filtered are estimated because field duplicate precision was not met. Details are presented on the Field Duplicate Precision Worksheet provided in Appendix B.

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

- There are no field blank samples associated with this order.

SMITH

SUMMARY

This review has identified a matrix spike %R and laboratory and filed duplicate precision as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix B.

SMITH

DATA VALIDATION REPORT
CHLORIDE, SULFATE, ORTHOPHOSPHATE, SULFIDE, AND AMMONIA-N
OLIN CORPORATION
SURFACE WATER SAMPLES

INTRODUCTION

A data validation was performed on additional data from the surface water samples collected on February 2, 1995 (6 filtered surface water samples, 6 unfiltered surface water samples, 1 filtered field duplicate sample, and 1 unfiltered field duplicate sample) at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of Pace Inc.'s Hampton, New Hampshire laboratory work order number 42964 which contained the same 6 filtered surface water samples, 6 unfiltered surface water samples, 1 filtered field duplicate sample, and 1 unfiltered field duplicate sample that were analyzed in work order WL-0197 by Pace Inc. of Westbrook, Maine. The individual analyses were performed using the following from Methods for Chemical Analysis of Water and Wastes (MCAWW):

Analytes	Methods
chloride and sulfate	300.0
orthophosphate	365.2
sulfide	376.1
ammonia-N	350.2

The findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis, June 1988, where applicable.

The support documentation in Appendix B of this report summarizes the specifics of this review. Appendix B also provides the sample results as reported by the laboratory. The data summary lists all compounds that were analyzed. Analytical problems are outlined in the following Findings Qualifiers section. Other issues which arose which did not warrant qualification are detailed in the Notes Section.

RPD = Relative percent difference, which is the absolute value of the difference between two replicate results divided by the mean concentration then multiplied by 100%.

NC = Relative percent difference cannot be calculated for sample results less than the PQL.

NA = Not applicable.

MDeuser 11/16/96

TECHNICAL NARRATIVE

Laboratory Number: 42964

Samples were received in acceptable condition, with the exceptions noted on the sample receipt condition report.

All samples were prepared and analyzed within the holding times specified in the referenced methods.

Instrumentation used for analysis was calibrated and/or tuned with the appropriate frequency and to the appropriate specifications required by the referenced methods.

Blank contamination was not observed at levels affecting the analytical results.

Matrix effects, as monitored by matrix spike recovery, unusual physical properties and/or surrogate analyte recovery, were not apparent.

Accuracy and precision as monitored by laboratory control sample analyses were within laboratory acceptance limits.

Laboratory sample numbers 42964-1 through -27 represent data on client filtered samples. Samples 42964-28 through -54 represent data on unfiltered samples.

DATA REVIEW COVER SHEET

Date: June 25, 1996
Subject: Data Validation of the October 1995 Sampling Event at the Olin Corporation's Wilmington, MA Facility
Smith Env. Tech. Corp. Project No. 00-7074-0102

Data validation was performed on selected analytical results from the October 1995 sampling event at Olin Corporation's Wilmington, Massachusetts Facility. Samples collected during these events were analyzed by Katahdin Analytical Services' Westbrook, Maine and New Hampshire facilities. The laboratory work order numbers reviewed were WL-1612, WL-1595, WL-1622, WL-1628 (surface water samples only), and WL-1644.

The data validation guidelines that were used for the reviews are referenced in the individual reports. The data validation reports address all issues detailed in the appropriate data validation guidelines.

The following Smith Environmental Technologies Corporation Quality Assurance (QA) Department personnel contributed to the preparation of the data review reports:

Atwood F. Davis, CPC, QA Director

Martin B. Kudlesky, CPC, Senior QA Scientist

Danielle M. Leauby, QA Scientist

Marybeth Ousey, QA Scientist

E. Bryan Rivers, QA Scientist

A copy of this cover sheet with appropriate signatures must accompany all listed reports.

GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the 6 groundwater samples collected on October 12, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number WL-1595 which contained 6 unfiltered groundwater samples, 1 unfiltered field duplicate, 1 unfiltered field blank, 6 filtered groundwater samples, 1 filtered field duplicate, and 1 filtered field blank. All samples in this report were analyzed by Katahdin Analytical Services, Inc. (formerly PACE Incorporated Environmental Laboratories), Westbrook, Maine, following United States Environmental Protection Agency (EPA) Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846), Methods for Chemical Analysis of Water and Wastes (MCAWW), and Standard Methods for the Examination of Water and Wastewater, 16th Edition, 1985 (SM), American Public Health Association (APHA). The individual analyses were performed using the following methods:

Analytes	Methods
aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, nickel, potassium, selenium, silicon, silver, sodium, thallium, vanadium, and zinc	200.7
mercury	245.1
hexavalent chromium*	7195/6010
bicarbonate as HCO3 and carbonate as CO3*	SM406C
nitrate as N and nitrite as N*	353.2
dissolved organic carbon (DOC)*	415.1
phosphorus as P *	365.4
solids - filterable residue (TDS)*	160.1

*Analyses performed on filtered samples only.

Because the analyses were not performed according to the EPA Contract Laboratory Program (CLP) methods, the findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA

SMITH

Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis (data validation guidelines), June 1988, where applicable.

The support documentation in Appendix A of this report summarizes the specifics of this review. Appendix A also provides the sample results as reported by the laboratory. The data summary table lists all analytes that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers section. Other issues which arose which did not warrant qualification are detailed in the Notes Section.

FINDINGS/QUALIFIERS

This data validation report addresses Pace, Inc. work order number WL-1595 which contained 6 filtered groundwater samples, 1 filtered field duplicate, 6 unfiltered groundwater samples, and 1 unfiltered duplicate. The data were evaluated for the following parameters:

* data completeness
* holding times
data calibration verification
CRDL standard
* laboratory blank analysis
field blank analysis
* interference check sample results
matrix spike recoveries
\+ laboratory duplicates
field duplicates
* laboratory control sample results
\+ serial dilution results
detection limit results
sample results

* All criteria were met for this parameter.
\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

1. The zinc result for sample GW-80S (WL-1595-11) and the nitrate result for sample GW-65BR (WL-1595-19) are negated due to field blank contamination. The reported results were changed to reflect adjusted detection limits.

2. Standards for certain metals were analyzed at the contract required detection limit (CRDL) as required by the Contract Laboratory Program (CLP). Although the analyses associated with this data were not CLP analyses, this standard represents system performance at or near the concentration of the CRDL. It was the reviewer's professional judgment to qualify data which were out of the criteria specified in the Region I data validation guidelines.

   - The following filtered hexavalent chromium results are estimated due to low CRDL standard percent recoveries (%Rs): GW-80S (WL-1595-11), GW-80D (WL-1595-12), GW-80BR (WL-1595-13), GW-81D (WL-1595-16), GW-300 (WL-1595-17), GW-81D (WL-1595-18), GW-65BR (WL-1595-19), and GW-81BR (WL-1595-20).

   - Due to the estimated hexavalent chromium results, all detected limits for trivalent chromium are also estimated.

3. Due to high recoveries of the initial standards below 10 ppm, all results for phosphorus as P are estimated. Additionally, these values are also called into question because several sample results and QC results for phosphorus as P exhibited negative concentrations with absolute values above the practical quantitation limit (PQL). A bias for these results could not be determined. Copies of the raw data are included in Appendix A of this report.

4. All results for phosphorus as P are estimated due to a low matrix spike recovery.

5. Results for manganese and potassium for unfiltered field duplicate samples GW-81D (WL-1595-6) and GW-81D (WL-1595-8) are estimated due to poor field duplicate precision results. Details are provided on the Field Duplicate Precision Worksheet in Appendix A of this report.

6. Results for iron and potassium for filtered field duplicate samples GW-81D (WL-1595-16) and GW-81D (WL-1595-18) are estimated due to poor field duplicate precision results. Details are provided on the Field Duplicate Precision Worksheet in Appendix A of this report.

7. The nitrite results of record were analyzed at Katahdin's Maine facility on 10/13/95 within holding times. To determine the nitrate concentrations for the samples nitrate plus nitrite was analyzed on 10/24/95 at Katahdin's New Hampshire facility. This analysis was performed within holding times. However, nitrite which was run as part of these analyses to obtain the nitrate results (by subtracting nitrite from nitrate plus nitrite) was analyzed out of holding times. Therefore, the laboratory evaluated the differences between the results from the two facilities and chose the most appropriate analyses to determine the nitrate results-of-record. However, the nitrite results-of-

record (from Katahdin's Maine facility) for samples GW-80S (WL-1595-11), GW-80D (WL-1595-12), and GW-80BR (WL-1595-13) were reported at concentrations greater than the nitrate plus nitrite results which were below the PQL. Due to the inconsistencies between the Maine facility's and the New Hampshire facility's results, all nitrite and nitrate results for the samples listed above are estimated.

8. Several filtered analytical results were reported at higher concentrations than their associated unfiltered results. Smith Environmental Technologies Corporation has established a relative percent difference (RPD) criteria to evaluate the precision of these results (see the spreadsheet included in Appendix A of this report). Due to RPDs which exceeded the expected precision, the following filtered and unfiltered sample results are estimated:

   - the iron results for unfiltered sample GW-81D (WL-1595-8) and filtered sample GW-81D (WL-1595-18)

   - the arsenic results for unfiltered sample GW-65BR (WL-1595-9) and filtered sample GW-65BR (WL-1595-19)

9. The detection limits for phosphorus as P are estimated in samples GW-300 filtered (WL-1595-17), GW-65BR filtered (WL-1595-19), and GW-81BR filtered (WL-1595-20) because the PQL could not be achieved. As a result, the phosphorus as P results were analyzed at dilutions, and the detection limits of these results were elevated by the laboratory to reflect the dilution factors as indicated on the Report of Analysis Forms included in Appendix A. A specific explanation was not provided by the laboratory.

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. Several QC results were reported in the raw data that were not provided on the Method Blank and Laboratory Control Sample Results Form for alkalinity, nitrite, nitrate, total phosphate, dissolved organic carbon, and TDS. In instances where it was difficult to determine which QC results in the raw data were associated with order WL-1595, all QC information provided in the raw data were reviewed.

2. A serial dilution sample was not provided by the laboratory as recommended by the MCAWW Method 200.7. Since performance of a serial dilution is not required by the method, no data are qualified.

3. The %Rs for several initial and continuing calibration verifications could not be verified because sufficient information was not provided by the laboratory.

4. The laboratory duplicate sample GW-80BR filtered (WL-1595-15) reported the wrong result for carbonate dissolved as CaCO3 on the Report of Analysis Form. The reviewer-corrected form is included in Appendix A. No data are qualified.

5. Several ICP analyte results which were acceptable results were reanalyzed with unacceptable ICP analyte results. The laboratory's logic for choosing the results of record for those samples is included in Appendix A.

SUMMARY

This review has identified field blank contamination, CRDL standards %Rs, calibration standard recoveries, negative concentrations with absolute values above the PQL, a matrix spike %R, field duplicate results, unfiltered versus filtered sample results, and elevated detection limits for non-detect sample results as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix A.

DATA VALIDATION REPORT
CHLORIDE, SULFATE, BROMIDE, ORTHOPHOSPHATE, SULFIDE, VISCOSITY, AND AMMONIA-N
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the 6 groundwater sampling locations, 1 groundwater field duplicate sample, and 1 field rinse blank sampled on October 12, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number WL-1595 which contained 6 filtered groundwater samples, 6 unfiltered groundwater samples, 1 filtered groundwater field duplicate sample, 1 unfiltered groundwater field duplicate sample, 1 filtered field rinse blank, and 1 unfiltered field rinse blank. All samples in this report were analyzed by Katahdin Analytical Services, Inc. (formerly PACE Incorporated Environmental Laboratories), Westbrook, Maine, following *"Methods for Chemical Analysis of Water and Wastes"* (MCAWW) and *"American Society for Testing and Materials"* (ASTM), Philadelphia, Pennsylvania 1985. The individual analyses were performed using the following from MCAWW and ASTM methods:

Analytes	Methods
bromide and sulfate	300.0
chloride	325.1
orthophosphate	365.2
sulfide	376.1
viscosity	D3245-85
ammonia-N	350.2

The findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis, June 1988, where applicable.

The support documentation in Appendix B of this report summarizes the specifics of this review. Appendix B also provides the sample results as reported by the laboratory. The data summary lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers section. Other issues which arose which did not warrant qualification are detailed in the Notes Section.

FINDINGS/QUALIFIERS

This data validation report addresses Pace, Inc. work order number WL-1595 which contained 6 filtered groundwater samples, 6 unfiltered groundwater samples, 1 filtered groundwater field duplicate sample, 1 unfiltered groundwater field duplicate sample, 1 filtered field rinse blank, and 1 unfiltered field rinse blank. The data were evaluated for the following parameters:

* data completeness
* holding times
data calibration verification
\+ laboratory blank analysis
* field blank analysis
matrix spike recoveries
* laboratory duplicates
* field duplicates
* laboratory control sample results
detection limit results
sample results

* All criteria were met for this parameter.
\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

1. The 1.0 milligram per liter (mg/L) standard for bromide and sulfate has experimental values of 1.5 mg/L for bromide and 0.9 mg/L for sulfate. Due to the slightly high recovery of the 1.0 mg/L for bromide the positive result for bromide in sample GW-80S (WL1595-11) is biased high.

2. The raw data for samples GW-300 (WL1595-17) and GW-65BR (WL1595-19) cannot support the reporting limit (RL) of 1.0 mg/L for bromide. The laboratory reported bromide in samples WL1595-17 and WL1595-19 as non-detected at 1.0 mg/L. Therefore, due to concentrations on the quantitation reports above the reporting limits, the reporting limit for bromide in samples WL1595-17 and WL1595-19 are biased low.

3. This order contain one set of field designated matrix spike and matrix spike duplicate (MS/MSD) samples consisting of samples GW-80BR (WL1595-13MS) and GW-80BR (WL1595-13MSD). For this order sample GW-64S (WL1612-1) was also provided as a matrix spike (MS) and a laboratory duplicate (LD) for the sulfate results for 1:5 reanalysis of sample GW65BR (WL1595-19).

   The filtered and unfiltered matrix spike samples GW-80BR (WL1595-3MS and WL1595-13MS) exhibited high recoveries for ammonia. Due to the high %R, the positive results for ammonia in unfiltered and filtered samples GW-80BR (WL1595-3) and GW-80BR (WL1595-13), respectively, are estimated.

   Sample GW-80D (WL1595-12) exhibited a concentration for chloride four times the spike concentration; therefore, a matrix spike analysis is not required. However, the laboratory analyzed the matrix spike for chloride. The %R is acceptable. Therefore there is no impact on the chloride results for the matrix spike analysis.

   The laboratory also analyzed batch quality control (QC) which consisted of a method blank and a laboratory control sample (LCS) for each parameter in this case except viscosity. There is no batch QC required for viscosity. The method blanks and the LCSs for all other parameters are acceptable. No data are qualified due to batch QC criteria.

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. The 1.0 milligram per liter (mg/L) standard for bromide and sulfate analyzed on 10/17/95 has experimental values of 2.3 mg/L for bromide and 2.7 mg/L for sulfate. The 1:5 reanalysis sample dilution for sulfate of sample GW-65BR (WL1595-19) is the only sample associated with this initial calibration.

Bromide is reported from the undiluted analysis run under the 10/13/95 initial calibration. Sulfate is detected at high enough concentration not to be effected by the low level standard. Therefore, no data are qualified due to the high recovery of the low level standard.

2. The raw data provided for bromide and sulfate on the quantitation reports exhibited peak heights and not peak areas. There is not enough information available to reproduce the laboratory's reported concentrations. More information was requested from the laboratory. The laboratory gave an explanation in a letter from Mr. Richard Wellman dated 6/7/96. The laboratory no longer has the software/analytical system capabilities to supply the information used to calibrate the system or quantitate the samples. The reviewer verified the validity of the sample results based on the information provided (peak heights). The results were within the same order of magnitude. The data are acceptable except where mentioned in the Findings/Qualifiers Section of this report.

3. The concentrations exhibited on the quantitation reports for the initial calibration blank (ICB) and the continuing calibration blanks (CCBs) analyzed under the 10/13/95 and 10/17/95 initial calibrations are not an accurate representation of bromide and sulfate in the blanks. It is apparent with review of the ion chromatogram that there are no peaks present in the ICB or CCBs for bromide and sulfate. Therefore, no data are qualified due to blank contamination.

4. There were transcription errors on the laboratory reporting form for samples GW-80BR DUP (WL1595-13DUP) and GW-81D (WL1595-18) for ortho-phosphate and sulfate, respectively. The reviewer-corrected forms are included in Appendix B. No data are qualified.

5. The calibration for the ammonia analysis for this order could not be verified due to lack of information provided by the laboratory. More information was requested by the reviewer. The laboratory gave a brief explanation in a letter from Mr. Richard Wellman dated 6/7/96 is included in Appendix B. Based on review of the data and the letter supplied by the laboratory the ammonia data are acceptable.

SMITH

6. In filtered and unfiltered samples GW-80S (WL1595-11 and WL1595-1), GW-80D (WL1595-12 and WL1595-2), GW-80BR (WL1595-13 and WL1595-3), and GW-300 (10/12/95 Field Blank) the filtered ammonia results were reported as higher concentrations than the unfiltered results. In these instances the relative percent differences (RPDs) between the filtered and the unfiltered results were within normal expected precision. The reviewer concludes that these results are not statistically different. Review of the remaining samples where the unfiltered results were higher than the filtered revealed the same approximate RPDs. The reviewer concludes that all ammonia present is in a dissolved form. No results are qualified.

SUMMARY

This review has identified high recovery for the low concentration initial calibration standard, poor precision results for ammonia, biased high results, and biased low reporting limits as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix B.

SMITH

QUALIFIER CODES AND FOOTNOTES

J - The associated value is an estimated quantity.

UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

---

1 - The reported quantitated value may be biased high. The actual value is expected to be lower.

2 - The reporting limit may be biased low. The actual reporting limit is expected to be higher.

RPD = Relative percent difference, which is the absolute value of the difference between two replicate results divided by the mean concentration then multiplied by 100%.

NA = Not applicable.

NC = Relative percent difference cannot be calculated for sample results less than the PQL.

DATA QUALITY COMMENTS:
Results of all quality control measurements are within the laboratory or contract specified acceptance range except as noted. The laboratory does not use the sample duplicate and matrix spike acceptance ranges as acceptance criteria for a specific analysis. Sample duplicate and matrix spike data are used to evaluate method performance in the environmental sample matrix only. Please refer to LCS data for assessment of quality control for each parameter.

0000358

* Matrix spike recovery is outside the laboratory's specified acceptance range indicating potential sample matrix interference and potential bias of reported value for this parameter.

& Precision of replicate analysis as measured by RPD is outside the laboratory's acceptance range for this parameter. Sample homogeneity may be a factor.

FORM3WC.XLS

* All phosphate results are estimated due to low MS/MSD recovery.

F. Beaudreau 6/12/95

SMITH ENVIRONMENTAL CORPORATE QUALITY ASSURANCE DEPARTMENT
DATA VALIDATION INQUIRY

To: Richard Wellman, Pace, Inc.
cc: Bruce Cushing, Project Manager, SMTH
DATA VALIDATION REPORT

Pace Laboratories Case No.: WL-1595 and WL-1612
Project Name: Semi-Annual Groundwater Monitoring - Wilmington, MA

June 5, 1996

Dear Mr. Wellman:

The following questions pertain the metals' data for WL-1595 and WL-1612:

1 Lead does not appear to be standardized for the ICP run on 10/26/95 (Run ID 951026A, page 255). In particular, see pages 255 and 265. Selenium and antimony do not appear to be standardized for the ICP run on 10/24/95 (Run ID 951024B, page 141). In particular, see pages 141 and 151.

2 Several ICP runs only have one initial standard provided, or two initial standards that are the same concentrations. Therefore, I cannot determine the laboratory's basis for sample dilution (i.e., whether or not a sample exceeds the initial calibration range).

3 The result from ICP Run ID 951024B on page 212 was reported at concentration which exceeded the instrument initial calibration range specified on page 152 for manganese sample WL-1595-11.

4. The report of analysis forms for pages 33, 36, 40, and 45 are not readable. Please resubmit these pages again.

5. The following nitrate as nitrogen (NO3-N) results on the report of analysis forms do not agree with the raw data supplied: samples WL1595-16, WL1595-18, and WL1595-20 for case order WL1595 and samples WL-1612-5 and WL-1612-7 for case WL-1612.

6. The following analytical results could not be verified from the raw data supplied due either to poor copy quality or pages that were cut off at the bottom: potassium for sample WL-1612-1, iron and sodium for sample WL-1612-4, and sodium for sample WL-1612-13. Please provide **only** the necessary pages.

Please call me with any questions that you may have regarding these questions.

Thank you,
E. Bryan Rivers
Quality Assurance Scientist

SMITH ENVIRONMENTAL CORPORATE QUALITY ASSURANCE DEPARTMENT
DATA VALIDATION INQUIRY

To: Richard Wellman, Pace, Inc.
cc: Bruce Cushing, Project Manager, SMTH
DATA VALIDATION REPORT

Pace Laboratories Case No.: WL-1612
Project Name: Semi-Annual Groundwater Monitoring - Wilmington, MA

June 5, 1996

Dear Mr Wellman:

The following questions pertain the metals' data for WL-1612:

1. Lead does not appear to be standardized for the ICP run on 10/27/95 (Run ID 95102773, page 87). In particular, see pages 96 and 106

2. Several ICP runs only have one initial standard provided, or two initial standards that are the same concentrations. Therefore, I cannot determine the laboratory's basis for sample dilution (i.e., whether or not a sample exceeds the initial calibration range). For example, the only initial standard provided for the sodium run on 10/19/95 (Run ID LJ18KNa, page 31) is at a concentration of 50. Several samples exceed 50; however, only certain of these samples were run at dilutions. What is the basis for the required dilutions of samples WL-1612-2, -5, -7, -9, -12, and -14?

3. The following results from Run ID 951101A, page 187 were reported at concentrations which exceed the instrument initial calibration range specified on pages 194 and 220: calcium and iron for sample WL-1612-2 (page 211), iron for sample WL-1612-3 (page 212), calcium and magnesium for sample WL-1612-5 (page 214), calcium and iron for sample WL-1612-7 (page 216), calcium and iron for sample WL-1612-9 (page 220), magnesium for sample WL-1312-12 (page 223), calcium, iron, and magnesium for sample WL-1612-14. Please explain the basis for reporting these concentrations when they exceed the curves specified on pages 194 and 220.

4. For some samples, analytes with acceptable and reported results were reanalyzed in later runs, resulting in differing values (often higher) than the reported analytes. For example, the iron and magnesium results for sample WL-1612-8 were repoted from ICP Run ID 1612ACFM, page 82, and they were rerun during ICP Run ID 951101A, page 217. The reanalyses resulted in higher concentrations of these analytes. Please describe the laboratory's bases for rerunning and reporting such results.

5. The barium result for sample WL-1612-13 from the ICP Run ID95102773, page 169 was not reported. Instead, the result from the ICP Run ID 951101C page 280 was reported. Please explain.

Please call me with any questions that you may have regarding these questions.

Thank you,
Marybeth Ousey
Quality Assurance Scientist

MEMORANDUM

To: Marybeth Ousey, Smith Environmental Technologies Corp.
From: George Brewer, Metals Section Supervisor
Date: 06/05/96
Subject: PACE Work Order No. WL1612

We are providing the following responses to the questions about Work Order WL1612 presented in your fax of 06/05/96. The section numbers below refer to the question numbers in your fax.

1) This run was performed on the Thermo Jarrell Ash Trace ICP. This instrument employs a unique background correction technique to provide improved detection limits for lead, selenium, and antimony. For these elements, signal and background are measured simultaneously by monitoring each analytical wavelength in two spectral orders. The analytical channels for the two orders are standardized independently. After standardization, the weighted means of the analytical results for the two orders of each wavelength are reported. In the standardization report on page 87, standardization information for the 220.3 nm lead wavelength in the first order is identified by "2203/1", and that for the second order is identified by "2203/2". The wavelength identified as "Pb2203" is a "dummy" channel where the weighted mean results of the two orders are reported. Therefore, the "Pb2203" channel is listed on the standarization report as "NOT STANDARDIZED". The same convention is followed for the 196.0 nm selenium wavelength and the 206.8 nm antimony wavelength.

2) Two ICP spectrometers were used to produce data for Work Order WL1612. For runs performed using the Perkin Elmer Plasma II, the linear reporting range is twice the concentration of the initial calibration standard. This is verified by quarterly analysis of a linear range standard at that concentration (recoveries for the linear range standard must be within +/- 5% of the true values). For the run in your example, sodium was calibrated at 50 mg/L and results up to 100 mg/L were reported. Samples with sodium concentrations greater than 100 mg/L were diluted and reanalyzed in a later run.

For runs performed using the TJA Trace ICP, the instrument was calibrated at 500 mg/L for Al, Ca, and Mg; at 200 mg/L for Fe; and at 2.0 mg/L for all other elements. Results have been

Tel (603) 431-5[illegible] Fax (603) 436-3355

reported up to these concentration from this instrument.

3) The standardization reports on pages 194 and 200 of the data package list the slope and y-intercept for each line, but not the concentrations of the calibration standards. The calibration concentrations for the TJA Trace ICP are listed in "2" above. Results have been reported up to 500 mg/L for Al, Ca, and Mg and up to 200 mg/L for Fe. Samples with measured concentrations exceeding these linear ranges were diluted and reanalyzed.

4) Metals are frequently analyzed in more than one analytical run. We attempt to report the first successful analysis for each metal. In your example, iron and magnesium were successfully analyzed in sample WL1612-8 during run 1612ACFM on 10/30/95, and these results were reported. The sample was analyzed for trace metals using another instrument during run 951101A on 11/01/95. It was necessary to calibrate and analyze for iron and magnesium during run 951101A because these metals are common spectral interferents (i.e. they interfere with the determination of some trace metals), and the instrument uses the measured iron and magnesium concentrations to perform interelement correction of trace metal results. We note that the relative percent difference (RPD) for iron results obtained for sample WL1612-8 in the two runs was only 3.5%, and that the RPD for the magnesium results was only 5.3%. These figures are well within method requirements for precision of duplicate analyses (+/- 20% RPD).

5) In run 95102773, the barium recovery (114%) for the continuing calibration verification standard analyzed after sample WL1612-13 exceeded the method limits of 90% - 110% (refer to page 177 of the data package). Therefore, the barium result obtained from this run for sample WL1612-13 was rejected, and the sample was successfully reanalyzed for barium in run 951101C.

I hope this provides the information that you need. Please call me if you have further questions.

3) The reported manganese concentration for sample WL-1595-11 is 1.7 mg/L. This analysis was performed using the TJA Trace ICP. As noted in "2" above, the manganese concentration of the initial calibration standard was 2.0 mg/L, and manganese results up to that concentration have been reported from this run.

4) Report of analysis forms for PACE Sample Nos. WM-1595-14, -15, -16, and -18 are being faxed along with this memo.

5) Your question about nitrate nitrogen has been answered by Richard Wellman in a separate memo.

6) The raw data you requested are being faxed along with this memo. Please note that my copy of the data package is not paginated. I hope that this causes no inconvenience.

I hope this provides the information that you need. Please call me if you have further questions.

ANALYTICAL SERVICES

6/7/96

Ms. Danielle Leauby
Smith BCM
By FAX

Dear Danielle:

In response to questions raised on the phone I am providing the following:

Bromide and sulfate linear regression - It would appear that the data provided in the package was determined from peak area and only peak height is available from the raw chromatograms. This data system is no longer available to us. The data cannot be corrected.

Bromide chromatograms from WL1595 (Hampton 45663-15,16) not integrated for an apparent bromide peak - The laboratory believes that there is no issue with the choice of peaks for bromide quantitation.

Lachat analyses - The Lachat is calibrated by using a point to point method. Results for the analyte are reported in concentration units. No raw absorbance was reported in the package that would allow comparison of sample results to the calibration data. Results from the Lachat are accepted by the laboratory based on the performance of ICVs, CCVs and LCSs.

Please call if you have further questions.

Sincerely,

Richard L. Wellman
Client Services Manager

DATA REVIEW COVER SHEET

Date: June 25, 1996
Subject: Data Validation of the October 1995 Sampling Event at the Olin Corporation's Wilmington, MA Facility
Smith Env. Tech. Corp. Project No. 00-7074-0102

Data validation was performed on selected analytical results from the October 1995 sampling event at Olin Corporation's Wilmington, Massachusetts Facility. Samples collected during these events were analyzed by Katahdin Analytical Services' Westbrook, Maine and New Hampshire facilities. The laboratory work order numbers reviewed were WL-1612, WL-1595, WL-1622, WL-1628 (surface water samples only), and WL-1644.

The data validation guidelines that were used for the reviews are referenced in the individual reports. The data validation reports address all issues detailed in the appropriate data validation guidelines.

The following Smith Environmental Technologies Corporation Quality Assurance (QA) Department personnel contributed to the preparation of the data review reports:

Atwood F. Davis, CPC, QA Director

Martin B. Kudlesky, CPC, Senior QA Scientist

Danielle M. Leauby, QA Scientist

Marybeth Ousey, QA Scientist

E. Bryan Rivers, QA Scientist

A copy of this cover sheet with appropriate signatures must accompany all listed reports.

GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the 7 groundwater sampling locations sampled on October 16, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number WL-1612 which contained 7 filtered groundwater samples and 7 unfiltered groundwater samples. All samples in this report were analyzed by Katahdin Analytical Services, Inc. (formerly PACE Incorporated Environmental Laboratories), Westbrook, Maine, following United States Environmental Protection Agency (EPA) Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846), Methods for Chemical Analysis of Water and Wastes (MCAWW), and Standard Methods for the Examination of Water and Wastewater, 16th Edition, 1985 (SM), American Public Health Association (APHA). The individual analyses were performed using the following methods:

Analytes	Methods
aluminum, arsenic, barium, calcium, chromium, iron, lead, magnesium, manganese, potassium, silicon, and sodium	200.7
hexavalent chromium*	7195/6010
bicarbonate as HCO3 and carbonate as CO3*	SM406C
nitrate as N and nitrite as N*	353.2
dissolved organic carbon (DOC)*	415.1
phosphorus as P *	365.4
solids - filterable residue (TDS)*	160.1

*Analyses were performed on filtered samples only.

Because the analyses were not performed according to the EPA Contract Laboratory Program (CLP) methods, the findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis (data validation guidelines), June 1988, where applicable.

SMITH

The support documentation in Appendix A of this report summarizes the specifics of this review. Appendix A also provides the sample results as reported by the laboratory. The data summary table lists all analytes that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers Section. Other issues which were identified which did not warrant qualification are detailed in the Notes Section.

FINDINGS/QUALIFIERS

This data validation report addresses Pace, Inc. work order number WL-1612 which contained 7 filtered groundwater samples and 7 unfiltered groundwater samples. The data were evaluated for the following parameters:

* data completeness
* holding times
data calibration verification
CRDL standard
* laboratory blank analysis
\+ field blank analysis
* interference check sample results
matrix spike recoveries
\+ laboratory duplicates
\+ field duplicates
* laboratory control sample results
\+ serial dilution results
detection limit results
sample results

* All criteria were met for this parameter.
\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

1. Standards for certain metals were analyzed at the contract required detection limit (CRDL) as required by CLP methodologies. Although the analyses associated with this data were not CLP analyses, this standard represents system performance at or near the concentration of the CRDL. It was the reviewer's professional judgment to

qualify data which were out of the CRDL standard criteria specified in the Region I data validation guidelines. As a result, the following data are qualified:

- The percent recovery (%R) was high for the CRDL standard associated with all lead results. Therefore, the positive lead result for sample GW-62BR unfiltered (WL-1612-12) is estimated and may be biased high. Because the recovery was high, the non-detect results were not estimated.

- The %R was high for the CRDL standard associated with the manganese results for samples GW-62D filtered (WL-1612-4), GW-58S filtered (WL-1612-6), GW-64-S filtered (WL-1612-8), GW-62D unfiltered (WL-1612-11), and GW-58S unfiltered (WL-1612-13). Therefore, these positive manganese results are estimated and may be biased high.

2. Due to low recoveries of the nitrite initial standards, all nitrite results below 0.20 ppm are estimated and may be biased low. All nitrite results are effected.

   These nitrite results of record were analyzed at Katahdin's Maine facility on 10/17/95 within holding times. To determine the nitrate concentration for the samples nitrate plus nitrite was analyzed on 10/25/95 at Katahdin's New Hampshire facility. This analysis was performed within holding times. However, nitrite which was run as part of these analyses to obtain the nitrate results (by subtracting nitrite from nitrate plus nitrite) was analyzed out of holding times. Therefore, the laboratory evaluated the differences between the results from the different facilities and chose the most appropriate analyses to determine the nitrate results. Due to the estimated nitrite results, all nitrate results are also estimated; however, a bias could not be determined.

3. Due to high recoveries of the initial standards below 1.0 ppm, all non-detect results for phosphorus as P are estimated. Additionally, these values are also estimated because several sample results and QC results for phosphorus as P exhibited negative concentrations with absolute values above the practical quantitation limit (PQL). A bias for these results could not be determined. Copies of the raw data are included in Appendix A of this report.

4. All positive dissolved organic carbon results are estimated and may be biased high due to high matrix spike recoveries.

5. The phosphorus as P detection limit for sample GW-62D filtered (WL-1612-4) is estimated because PQL could not be achieved. As a result, the phosphorus non-detect result for sample WL-1612-4 was analyzed at a dilution, and the detection limit of this result was elevated by the laboratory to reflect the dilution factor as indicated on the Report of Analysis Forms included in Appendix A. A specific explanation was not provided by the laboratory.

SMITH

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. There were transcription errors on the aqueous laboratory control sample and preparation blank QC reporting forms. The reviewer-corrected forms are included in Appendix A. No data are qualified.

2. There were no field blank samples or field duplicate samples associated with this order.

3. A serial dilution sample was not provided by the laboratory as recommended by the MCAWW Method 200.7. Since performance of a serial dilution is not required by the method, no data are qualified.

4. The %Rs for several initial and continuing calibration verifications could not be verified because sufficient information was not provided by the laboratory.

5. Several QC results were reported in the raw data that were not provided on the Method Blank and Laboratory Control Sample Results Form for alkalinity, nitrite, nitrate, total phosphate, dissolved organic carbon, and TDS. Because it was difficult to determine which QC results in the raw data were associated with order WL-1612, all QC information provided in the raw data was applied to the data review.

6. For order WL-1612 matrix spike samples were only provided for alkalinity, dissolved organic carbon, and phosphorus as P, and laboratory duplicate samples were only provided for alkalinity, dissolved organic carbon, phosphorus as P, and TDS. These results were within criteria except for the results discussed in the Findings/Qualifiers Section of this report.

   There were no matrix spike or laboratory duplicate samples associated with this order for the metals' analyses. The matrix spike or laboratory duplicate samples associated with the metals' batch was analyzed with order WL-1613. This order contained samples from the same facility as order WL-1612; however, the samples from WL-1613 were analyzed for aluminum and chromium only. The results for these matrix spike or laboratory duplicate samples were acceptable; however, no impact could be determined for the remaining metals based on the matrix spike or laboratory duplicate analyses.

7. Several ICP analyte results which were acceptable results were reanalyzed with unacceptable ICP analyte results. The laboratory's logic for choosing the results of record for those samples is included in Appendix A.

8. Several filtered analytical results were reported at higher concentrations than their associated unfiltered results. In these instances, the relative percent differences (RPDs) between the filtered and unfiltered were within normally expected precision (see the spreadsheet included in Appendix A of this report) The reviewer concludes that these results are not statistically different,and that these results are present in a dissolved form. No results are qualified.

SUMMARY

This review has identified CRDL standard %Rs, initial standard recoveries, negative concentrations with absolute values above the PQL, a matrix spike %R, and elevated detection limits for non-detect sample results as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix A.

DATA VALIDATION REPORT
CHLORIDE, SULFATE, BROMIDE, ORTHOPHOSPHATE, SULFIDE, VISCOSITY, AND AMMONIA-N
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the 7 groundwater sampling locations sampled on October 16, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number WL-1612 which contained 7 filtered groundwater samples and 7 unfiltered groundwater samples. All samples in this report were analyzed by Katahdin Analytical Services, Inc. (formerly PACE Incorporated Environmental Laboratories), Westbrook, Maine, following *"Methods for Chemical Analysis of Water and Wastes"* (MCAWW) and *"American Society for Testing and Materials"* (ASTM), Philadelphia, Pennsylvania 1985. The individual analyses were performed using the following from MCAWW and ASTM methods:

Analytes	Methods
bromide and sulfate	300.0
chloride	325.1
orthophosphate	365.2
sulfide	376.1
viscosity	D3245-85
ammonia-N	350.2

The findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis, June 1988, where applicable.

The support documentation in Appendix B of this report summarizes the specifics of this review. Appendix B also provides the sample results as reported by the laboratory. The data summary lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers section. Other issues which arose which did not warrant qualification are detailed in the Notes Section.

SMITH

FINDINGS/QUALIFIERS

This data validation report addresses Pace, Inc. work order number WL-1612 which contained 7 filtered groundwater samples and 7 unfiltered groundwater samples. The data were evaluated for the following parameters:

* data completeness
* holding times
data calibration verification
\+ laboratory blank analysis
\+ field blank analysis
\+ matrix spike recoveries
\+ laboratory duplicates
\+ field duplicates
* laboratory control sample results
detection limit results
sample results

* All criteria were met for this parameter.
\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

1. The 1.0 milligram per liter (mg/L) standard for bromide and sulfate has experimental values of 2.3 mg/L for bromide and 2.7 mg/L for sulfate. Due to the high recovery of the 1.0 mg/L for bromide and sulfate the positive result for bromide in sample GW-64D (WL1612-2) is biased high.

2. Due to interference from the presence of chloride in the undiluted analysis and due to a 1:100 reanalysis sample dilution, the reporting limit for bromide is elevated to 100 mg/L.

3. The raw data for samples GW-62S (WL1612-3) and GW-62D (WLl612-4) cannot support the reporting limit (RL) of 1.0 mg/L for sulfate and bromide. The laboratory reported bromide in samples WL1612-3 and WL1612-4 as non-detected at 1.0 mg/L. There are positive results reported for sulfate in samples WL1612-3 and WL1612-4. Therefore, due to concentrations on the quantitation reports above the reporting limits, the reporting limit for bromide in samples WL1612-3 and WL1612-4 are biased low.

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. The raw data provided for bromide and sulfate on the quantitation reports exhibited peak heights and not peak areas. There is not enough information available to reproduce the laboratory's reported concentrations. More information was requested from the laboratory. The laboratory gave an explanation in a letter from Mr. Richard Wellman dated 6/7/96. The laboratory no longer has the software/analytical system capabilities to supply the information used to calibrate the system or quantitate the samples. The reviewer verified the validity of the sample results based on the information provided (peak heights). The results were within the same order of magnitude. The data are acceptable except where mentioned in the Findings/Qualifiers Section of this report.

2. The concentrations exhibited on the quantitation reports for the initial calibration blank (ICB) and the continuing calibration blanks (CCBs) are not an accurate representation of bromide and sulfate in the blanks. It is apparent with review of the ion chromatogram that there are no peaks present in the ICB or CCBs for bromide and sulfate. Therefore, no data are qualified due blank contamination.

3. There are no field duplicate or field blank samples associated with this order.

4. There were transcription errors on the aqueous laboratory control sample for ortho-phosphate reporting form. The reviewer-corrected forms are included in Appendix B. No data are qualified.

5. This order did not contain a field designated set samples for matrix spike and matrix spike duplicate (MS/MSD) analyses. The laboratory chose samples to analyze a matrix spike (MS) and a laboratory duplicate (LD) analysis. For this order sample GW-64S (WL1612-1) was used as a MS and a LD for sulfate, bromide, and ortho-phosphate. For chloride and ammonia analyses a sample not associated with this case was used for a MS and a LD analysis. The laboratory analyzed batch quality control (QC) which consisted of a method blank and a laboratory control sample (LCS) for sulfide. There is no batch QC required for viscosity. The matrix spike, laboratory duplicate, LCS and other related batch QC results were within criteria. No data are qualified due to QC criteria.

6. The calibration for the ammonia analysis for this order could not be verified due to lack of information provided by the laboratory. More information was requested by the reviewer. The laboratory gave a brief explanation in a letter from Mr. Richard Wellman dated 6/7/96 is included in Appendix B. Based on review of the data and the letter supplied by the laboratory the ammonia data are acceptable.

7. In samples GW-64S (WL1612-1 and WL1612-8), GW-62D (WL1612-4 and WL1612-11), GW-62BR (WL1612-5 and WL1612-12), and GW-58S (WL1612-6 and WL1612-13) the filtered ammonia results were reported as higher concentrations than the unfiltered results. In these instances the relative percent differences (RPDs) between the filtered and the unfiltered results were within normal expected precision. The reviewer concludes that these results are not statistically different. Review of the remaining samples where the unfiltered results were higher than the filtered revealed the same approximate RPDs. The reviewer concludes that all ammonia present is in a dissolved form. No results are qualified.

SUMMARY

This review has identified high recovery for the low concentration initial calibration standard, elevated reporting limits due sample dilution, biased high results, and biased low reporting limits as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix B.

SMITH

QUALIFIER CODES AND FOOTNOTES

U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is the sample reporting limit.

J - The associated value is an estimated quantity.

UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

---

1 - The reported quantitated value may be biased high. The actual value is expected to be lower.

2 - The reporting limit may be biased low. The actual reporting limit is expected to be higher.

3 - Denotes that the reporting limit has been elevated due to interference or sample dilution.

Smith Env. Technologies Corporation established criteria:

- If sample values are greater than 100 the maximum acceptance RPD is 30 percent.
- If sample values are less than 100 the maximum acceptance RPD is 50 percent.

MEMORANDUM

To: Marybeth Ousey, Smith Environmental
From: George Brewer, Metals Section Supervisor
Date: 06/05/96
Subject: PACE Work Order No. WL1612

We are providing the following responses to the questions about Work Order WL1612 presented in your fax of 06/05/96. The section numbers below refer to the question numbers in your fax.

1) This run was performed on the Thermo Jarrell Ash Trace ICP. This instrument employs a unique background correction technique to provide improved detection limits for lead, selenium, and antimony. For these elements, signal and background are measured simultaneously by monitoring each analytical wavelength in two spectral orders. The analytical channels for the two orders are standardized independently. After standardization, the weighted means of the analytical results for the two orders of each wavelength are reported. In the standardization report on page 87, standardization information for the 220.3 nm lead wavelength in the first order is identified by "2203/1", and that for the second order is identified by "2203/2". The wavelength identified as "Pb2203" is a "dummy" channel where the weighted mean results of the two orders are reported. Therefore, the "Pb2203" channel is listed on the standarization report as "NOT STANDARDIZED". The same convention is followed for the 196.0 nm selenium wavelength and the 206.8 nm antimony wavelength.

2) Two ICP spectrometers were used to produce data for Work Order WL1612. For runs performed using the Perkin Elmer Plasma II, the linear reporting range is twice the concentration of the initial calibration standard. This is verified by quarterly analysis of a linear range standard at that concentration (recoveries for the linear range standard must be within +/- 5% of the true values). For the run in your example, sodium was calibrated at 50 mg/L and results up to 100 mg/L were reported. Samples with sodium concentrations greater than 100 mg/L were diluted and reanalyzed in a later run.

For runs performed using the TJA Trace ICP, the instrument was calibrated at 500 mg/L for Al, Ca, and Mg; at 200 mg/L for Fe; and at 2.0 mg/L for all other elements. Results have been

Tel (603) 431-5777 Fax (603) 436-3553

reported up to these concentration from this instrument.

3) The standardization reports on pages 194 and 200 of the data package list the slope and y-intercept for each line, but not the concentrations of the calibration standards. The calibration concentrations for the TJA Trace ICP are listed in "2" above. Results have been reported up to 500 mg/L for Al, Ca, and Mg and up to 200 mg/L for Fe. Samples with measured concentrations exceeding these linear ranges were diluted and reanalyzed.

4) Metals are frequently analyzed in more than one analytical run. We attempt to report the first successful analysis for each metal. In your example, iron and magnesium were successfully analyzed in sample WL1612-8 during run 1612ACFM on 10/30/95, and these results were reported. The sample was analyzed for trace metals using another instrument during run 951101A on 11/01/95. It was necessary to calibrate and analyze for iron and magnesium during run 951101A because these metals are common spectral interferents (i.e. they interfere with the determination of some trace metals), and the instrument uses the measured iron and magnesium concentrations to perform interelement correction of trace metal results. We note that the relative percent difference (RPD) for iron results obtained for sample WL1612-8 in the two runs was only 3.5%, and that the RPD for the magnesium results was only 5.3%. These figures are well within method requirements for precision of duplicate analyses (+/- 20% RPD).

5) In run 95102773, the barium recovery (114%) for the continuing calibration verification standard analyzed after sample WL1612-13 exceeded the method limits of 90% - 110% (refer to page 177 of the data package). Therefore, the barium result obtained from this run for sample WL1612-13 was rejected, and the sample was successfully reanalyzed for barium in run 951101C.

I hope this provides the information that you need. Please call me if you have further questions.

SMITH ENVIRONMENTAL CORPORATE QUALITY ASSURANCE DEPARTMENT
DATA VALIDATION INQUIRY

To: Richard Wellman, Pace, Inc.
cc: Bruce Cushing, Project Manager, SMTH
DATA VALIDATION REPORT

Pace Laboratories Case No.: WL-1595 and WL-1612
Project Name: Semi-Annual Groundwater Monitoring - Wilmington, MA

June 5, 1996

Dear Mr. Wellman:

The following questions pertain the metals' data for WL-1595 and WL-1612:

1. Lead does not appear to be standardized for the ICP run on 10/26/95 (Run ID 951026A, page 255). In particular, see pages 255 and 265. Selenium and antimony do not appear to be standardized for the ICP run on 10/24/95 (Run ID 951024B, page 141). In particular, see pages 141 and 151.

2. Several ICP runs only have one initial standard provided, or two initial standards that are the same concentrations. Therefore, I cannot determine the laboratory's basis for sample dilution (i.e., whether or not a sample exceeds the initial calibration range).

3. The result from ICP Run ID 951024B on page 212 was reported at concentration which exceeded the instrument initial calibration range specified on page 152 for manganese sample WL-1595-11.

4. The report of analysis forms for pages 33, 36, 40, and 45 are not readable. Please resubmit these pages again.

5. The following nitrate as nitrogen (NO3-N) results on the report of analysis forms do not agree with the raw data supplied: samples WL1595-16, WL1595-18, and WL1595-20 for case order WL1595 and samples WL-1612-5 and WL-1612-7 for case WL-1612.

6. The following analytical results could not be verified from the raw data supplied due either to poor copy quality or pages that were cut off at the bottom: potassium for sample WL-1612-1, iron and sodium for sample WL-1612-4, and sodium for sample WL-1612-13. Please provide **only** the necessary pages.

Please call me with any questions that you may have regarding these questions.

Thank you,
E. Bryan Rivers
Quality Assurance Scientist

MEMORANDUM

To: E. Brian Rivers, Smith Environmental Technologies Corp.
From: George Brewer, Metals Section Supervisor, Katahdin Analytical Services, Inc.
Date: 06/11/96
Subject: Response to your inquiry of 06/05/96 (Inquiry No. MET2) regarding metals data for WL-1595 and WL-1612

We are providing the following responses to the questions about Work Orders WL-1595 and WL-1612 presented in your fax of 06/05/96. The section numbers below refer to the question numbers in your fax.

1) These runs were performed on the Thermo Jarrell Ash Trace ICP. This instrument employs a unique background correction technique to provide improved detection limits for lead, selenium, and antimony. For these elements, signal and background are measured simultaneously by monitoring each analytical wavelength in two spectral orders. The analytical channels for the two orders are standardized independently. After standardization, the weighted means of the analytical results for the two orders of each wavelength are reported. In the standardization report on page 87, standardization information for the 220.3 nm lead wavelength in the first order is identified by "2203/1", and that for the second order is identified by "2203/2". The wavelength identified as "Pb2203" is a "dummy" channel where the weighted mean results of the two orders are reported. Therefore, the "Pb2203" channel is listed on the standarization report as "NOT STANDARDIZED". The same convention is followed for the 196.0 nm selenium wavelength and the 206.8 nm antimony wavelength.

2) Two ICP spectrometers were used to produce data for these work orders. For runs performed using the Perkin Elmer Plasma II, the linear reporting range is twice the concentration of the initial calibration standard. This is verified by quarterly analysis of a linear range standard at that concentration (recoveries for the linear range standard must be within +/- 5% of the true values).

   For runs performed using the TJA Trace ICP, the instrument was calibrated at 500 mg/L for Al, Ca, and Mg; at 200 mg/L for Fe; and at 2.0 mg/L for all other elements. Results have been reported up to these concentration from this instrument.

3) The reported manganese concentration for sample WL-1595-11 is 1.7 mg/L. This analysis was performed using the TJA Trace ICP. As noted in "2" above, the manganese concentration of the initial calibration standard was 2.0 mg/L, and manganese results up to that concentration have been reported from this run.

4) Report of analysis forms for PACE Sample Nos. WM-1595-14, -15, -16, and -18 are being faxed along with this memo.

5) Your question about nitrate nitrogen has been answered by Richard Wellman in a separate memo.

6) The raw data you requested are being faxed along with this memo. Please note that my copy of the data package is not paginated. I hope that this causes no inconvenience.

I hope this provides the information that you need. Please call me if you have further questions.

ANALYTICAL SERVICES

6/7/96

Ms. Danielle Leauby
Smith BCM
By FAX

Dear Danielle:

In response to questions raised on the phone I am providing the following:

Bromide and sulfate linear regression - It would appear that the data provided in the package was determined from peak area and only peak height is available from the raw chromatograms. This data system is no longer available to us. The data cannot be corrected.

Bromide chromatograms from WL1595 (Hampton 45663-15,16) not integrated for an apparent bromide peak - The laboratory believes that there is no issue with the choice of peaks for bromide quantitation.

Lachat analyses - The Lachat is calibrated by using a point to point method. Results for the analyte are reported in concentration units. No raw absorbance was reported in the package that would allow comparison of sample results to the calibration data. Results from the Lachat are accepted by the laboratory based on the performance of ICVs, CCVs and LCSs.

Please call if you have further questions.

Sincerely,

Richard L. Wellman
Client Services Manager

DATA REVIEW COVER SHEET

Date: June 25, 1996
Subject: Data Validation of the October 1995 Sampling Event at the Olin Corporation's Wilmington, MA Facility
Smith Env. Tech. Corp. Project No. 00-7074-C102

Data validation was performed on selected analytical results from the October 1995 sampling event at Olin Corporation's Wilmington, Massachusetts Facility. Samples collected during these events were analyzed by Katahdin Analytical Services' Westbrook, Maine and New Hampshire facilities. The laboratory work order numbers reviewed were WL-1612, WL-1595, WL-1622, WL-1628 (surface water samples only), and WL-1644.

The data validation guidelines that were used for the reviews are referenced in the individual reports. The data validation reports address all issues detailed in the appropriate data validation guidelines.

The following Smith Environmental Technologies Corporation Quality Assurance (QA) Department personnel contributed to the preparation of the data review reports:

Atwood F. Davis, CPC, QA Director

Martin B. Kudlesky, CPC, Senior QA Scientist

Danielle M. Leauby, QA Scientist

Marybeth Ousey, QA Scientist

E. Bryan Rivers, QA Scientist

A copy of this cover sheet with appropriate signatures must accompany all listed reports.

DATA VALIDATION REPORT
METALS AND SELECTED ANALYTES
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the 12 groundwater sampling locations sampled on October 17, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number WL-1622 which contained 12 unfiltered groundwater samples, 1 unfiltered field duplicate sample, 1 unfiltered field blank, 12 filtered groundwater samples, 1 filtered field duplicate sample, and 1 filtered field blank. All samples in this report were analyzed by Katahdin Analytical Services, Inc. (formerly PACE Incorporated Environmental Laboratories), Westbrook, Maine, following United States Environmental Protection Agency (EPA) Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846), Methods for Chemical Analysis of Water and Wastes (MCAWW), and Standard Methods for the Examination of Water and Wastewater, 16th Edition, 1985 (SM), American Public Health Association (APHA). The individual analyses were performed using the following methods:

Analytes	Methods
aluminum, arsenic, barium, calcium, chromium, iron, lead, magnesium, manganese, potassium, silicon, and sodium	200.7
hexavalent chromium*	7195/6010
bicarbonate as HCO3 and carbonate as CO3*	SM406C
nitrate as N and nitrite as N*	353.2
dissolved organic carbon (DOC)*	415.1
phosphorus as P *	365.4
solids - filterable residue (TDS)*	160.1

*Analyses were performed on filtered samples only.

Because the analyses were not performed according to the EPA Contract Laboratory Program (CLP) methods, the findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis (data validation guidelines), June 1988, where applicable.

SMITH

The support documentation in Appendix A of this report summarizes the specifics of this review. Appendix A also provides the sample results as reported by the laboratory. The data summary table lists all analytes that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers Section. Other issues which arose which did not warrant qualification are detailed in the Notes Section.

FINDINGS/QUALIFIERS

This data validation report addresses Katahdin's work order number WL-1622 which contained 12 unfiltered groundwater samples, 1 unfiltered field duplicate sample, 1 unfiltered field blank, 12 filtered groundwater samples, 1 filtered field duplicate sample, and 1 filtered field blank. The data were evaluated for the following parameters:

* data completeness
* holding times
\+ data calibration verification
CRDL standard
* laboratory blank analysis
field blank analysis
* interference check sample results
matrix spike recoveries
* laboratory duplicates
field duplicates
laboratory control sample results
\+ serial dilution results
detection limit results
* sample results

* All criteria were met for this parameter.
\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

1. The following sample results are negated due to field blank contamination. The reported results have been changed to reflect adjusted detection limits.

- iron for samples GW-44S unfiltered (WL-1622-1), GW-43S unfiltered (WL-1622-8), GW-50S unfiltered (WL-1622-13), GW-40S unfiltered (WL-1622-15), GW-40D unfiltered (WL-1622-16), GW-45S filtered (WL-1622-19), GW-43S filtered (WL-1622-24), GW-50S filtered (WL-1622-29), GW-50D filtered (WL-1622-30), GW-40S filtered (WL-1622-31), and GW-40D filtered (WL-1622-32).

- nitrate for samples GW-44S filtered (WL-1622-17), GW-50S filtered (WL-1622-29), GW-50D filtered (WL-1622-30), GW-40S filtered (WL-1622-31), and GW-40D filtered (WL-1622-32).

- TDS for samples GW-44S filtered (WL-1622-17) and GW-40S filtered (WL-1622-31)

2. Standards for certain metals were analyzed at the contract required detection limit (CRDL) as required by CLP methodologies. Although the analyses associated with this data were not CLP analyses, this standard represents system performance at or near the concentration of the CRDL. It was the reviewer's professional judgment to qualify data which were out of the CRDL standard criteria specified in the Region I data validation guidelines. As a result, the following data are qualified:

   - The percent recoveries (%R) were low for the CRDL standards associated with several hexavalent chromium results. Therefore, the following results are estimated and may be biased low: GW-44S filtered (WL-1622-17), GW-45S filtered (WL-1622-19), GW-45D filtered (WL-1622-20), GW-42S filtered (WL-1622-21), GW-43S filtered (WL-1622-24), GW-43D filtered (WL-1622-27), GW-400 filtered (WL-1622-28), GW-50S filtered (WL-1622-29), GW-50D filtered (WL-1622-30), GW-40S filtered (WL-1622-31), and GW-40D filtered (WL-1622-32).

   - Due to the estimated hexavalent chromium results, the trivalent chromium positive results and detection limits for samples GW-44S filtered (WL-1622-17), GW-45S filtered (WL-1622-19), GW-45D filtered (WL-1622-20), GW-42S filtered (WL-1622-21), GW-43S filtered (WL-1622-24), GW-43D filtered (WL-1622-27), GW-400 filtered (WL-1622-28), GW-50S filtered (WL-1622-29), GW-50D filtered (WL-1622-30), GW-40S filtered (WL-1622-31), and GW-40D filtered (WL-1622-32) are also estimated because the trivalent chromium results are calculated from the hexavalent chromium results.

   - The %Rs were high for the CRDL standards associated with several chromium results. Therefore, the positive chromium result for sample GW-43S unfiltered (WL-1622-8) is estimated and may be biased high. Because the recovery was high, the non-detect results were not estimated.

   - The %Rs were high for the CRDL standards associated with several lead results. Therefore, the positive lead results for samples GW-44D unfiltered

(WL-1622-2), GW-45D unfiltered (WL-1622-4), GW-42D unfiltered (WL-1622-6), and GW-42D unfiltered (WL-1622-7) are estimated and may be biased high. Because the recovery was high, the non-detect results were not estimated.

- The %Rs were high for the CRDL standards associated with several manganese results. Therefore, the positive manganese results for the following samples are estimated and may be biased high: GW-44S unfiltered (WL-1622-1), GW-45S unfiltered (WL-1622-3), GW-42S unfiltered (WL-1622-5), GW-43S unfiltered (WL-1622-8), GW-50S unfiltered (WL-1622-13), GW-50D unfiltered (WL-1622-14), GW-44S filtered (WL-1622-17), GW-45S filtered (WL-1622-19), GW-42S filtered (WL-1622-21), GW-43S filtered (WL-1622-24), GW-50S filtered (WL-1622-29), and GW-50D filtered (WL-1622-30). Because the recovery was high, the non-detect results were not estimated.

- The %Rs were high for the CRDL standards associated with several arsenic results; however, there were no positive results for arsenic. Therefore, no data are qualified. Because the recovery was high, the non-detect results were not estimated.

3. Due to low recoveries of the nitrite initial standards, all nitrite results below 0.50 ppm are estimated and may be biased low. All nitrite sample results except the results for samples GW-42D filtered (WL-1622-22) and GW-42D filtered (WL-1622-23) are effected. In addition to the low initial standard recoveries, all nitrite results are estimated and may be biased low due to negative concentrations with absolute values above the practical quantitation limits (PQLs) of several field and laboratory quality control (QC) results.

4. The nitrite results of record were analyzed at Katahdin's Maine facility on 10/17/95 within holding times. To determine the nitrate concentration for the samples, nitrate plus nitrite was analyzed on 10/25/95 at Katahdin's New Hampshire facility. The nitrate results were determined by subtracting the nitrite results (from the Maine facility) from the nitrate plus nitrite results (from the New Hampshire facility). Due to the estimated nitrite results, all nitrate results are also estimated; however, a bias could not be determined.

5. Due to high recoveries of the initial standards below 0.1 ppm, all results for phosphorus as P are estimated. Additionally, these values are also estimated because several sample results and QC results for phosphorus as P exhibited negative concentrations with absolute values above the practical quantitation limit (PQL). A bias for these results could not be determined. Copies of the raw data are included in Appendix A of this report.

6. All phosphorus as P results are estimated and may be biased low due to a low matrix spike recovery.

SMITH

7. The silicon results for samples GW-40S unfiltered (WL-1622-15), GW-40D unfiltered (WL-1622-16), GW-40S filtered (WL-1622-31), and GW-40D filtered (WL-1622-32) are estimated and may be biased low due to a low laboratory control sample recovery.

8. The detection limits for the following sample results are estimated because PQLs could not be achieved. As a result, the non-detect results for these samples were analyzed at dilutions, and the detection limits were elevated by the laboratory to reflect the dilution factors as indicated on the Report of Analysis Forms included in Appendix A. Specific explanations were not provided by the laboratory.

   - arsenic and barium for sample GW-44D unfiltered (WL-1622-2), GW-45D unfiltered (WL-1622-4), GW-42D unfiltered (WL-1622-6), and GW-42D unfiltered (WL-1622-7)
   - arsenic, barium, and lead for samples GW-43D unfiltered (WL-1622-11) and GW-42D filtered (WL-1622-23)
   - arsenic, barium, lead, and nitrite for samples GW-44D filtered (WL-1622-18) and GW-45D filtered (WL-1622-20),
   - arsenic, barium, lead, and potassium for samples GW-42D filtered (WL-1622-22) and GW-43D filtered (WL-1622-27)

9. The potassium results for the unfiltered field duplicate samples of GW-42D (WL-1622-6 and WL-1622-7) and the calcium, nitrite as N, and Phosphorus as P results for the filtered field duplicate samples of GW-42D (samples WL-1622-22 and WL-1622-23) are estimated because field duplicate precision was not met. Details are presented on the Field Duplicate Precision Worksheet provided in Appendix A.

10. Several filtered analytical results were reported at higher concentrations than their associated unfiltered results. Smith Environmental Technologies Corporation has established a relative percent difference (RPD) criteria to evaluate the precision of these results (see the spreadsheet included in Appendix A of this report). Due to RPDs which exceeded the expected precision, the following filtered and unfiltered sample results are estimated:

    - calcium, iron, and magnesium for samples GW-44D unfiltered (WL-1622-2) and GW-44D filtered (WL-1622-18).
    - aluminum, calcium, and magnesium for samples GW-45D unfiltered (WL-1622-4) and GW-45D filtered (WL-1622-20).
    - calcium and magnesium for samples GW-42D unfiltered (WL-1622-7) and GW-42D filtered (WL-1622-23).

The reviewer concludes that these results are present in a dissolved form.

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. There were transcription errors on a Quality Control Report Form and an ICP analysis summary sheet. The reviewer-corrected forms are included in Appendix A.

2. A serial dilution sample was not provided by the laboratory as recommended by the MCAWW Method 200.7. Since performance of a serial dilution is not required by the method, no data are qualified.

3. The %Rs for several initial and continuing calibration verifications could not be verified because sufficient information was not provided by the laboratory.

4. Several QC results were reported in the raw data that were not provided on the Method Blank and Laboratory Control Sample Results Form for alkalinity, nitrite, nitrate, total phosphate, dissolved organic carbon, and TDS. In instances where it was difficult to determine which QC results in the raw data were associated with order WL-1622, all QC information provided in the raw data was applied to the data review.

5. Several ICP analyte results which were acceptable results were reanalyzed with unacceptable ICP analyte results. The laboratory's logic for choosing the results of record for those samples is included in Appendix A.

6. Several silicon and potassium results were reported to significant digits which were not consistent with all other sample results. The reviewer-corrected Report of Analysis Forms are included in Appendix A and the changes are reflected on the Data Summary Table.

SMITH

SUMMARY

This review has identified field blank contamination, CRDL standard %Rs, initial standard recoveries, negative concentrations with absolute values above the PQL, a matrix spike %R, a laboratory control sample recovery, elevated detection limits for non-detect sample results, field duplicate precision, and filtered versus unfiltered sample results as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix A.

SMITH

QUALIFIER CODES

U - The analyte was analyzed for but not detected. The associated numerical value is the sample detection limit. The detected analyte was present in the associated blank(s) at a similar concentration, it is not considered to be present in the sample. The qualified detection limit has been elevated to either the sample concentration or the PQL, which ever is higher.

J - The associated value is an estimated quantity.

UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

DATA VALIDATION REPORT
CHLORIDE, SULFATE, BROMIDE, ORTHOPHOSPHATE, SULFIDE, VISCOSITY, AND AMMONIA-N
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the 12 groundwater sampling locations sampled on October 17, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number WL-1622 which contained 12 filtered groundwater samples, 12 unfiltered groundwater samples, 1 filtered groundwater field duplicate sample, 1 unfiltered groundwater field duplicate sample, 1 filtered field rinse blank, and 1 unfiltered field rinse blank. All samples in this report were analyzed by Katahdin Analytical Services, Inc. (formerly PACE Incorporated Environmental Laboratories), Westbrook, Maine, following *"Methods for Chemical Analysis of Water and Wastes"* (MCAWW) and *"American Society for Testing and Materials"* (ASTM), Philadelphia, Pennsylvania 1985. The individual analyses were performed using the following from MCAWW and ASTM methods:

Analytes	Methods
bromide and sulfate *	300.0
chloride *	325.1
orthophosphate *	365.2
sulfide *	376.1
viscosity *	D3245-85
ammonia-N	350.2

* = Analyses performed on filtered samples only.

The findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis, June 1988, where applicable.

SMITH

The support documentation in Appendix B of this report summarizes the specifics of this review. Appendix B also provides the sample results as reported by the laboratory. The data summary table lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers Section. Other issues which were identified and did not warrant qualification are detailed in the Notes Section.

FINDINGS/QUALIFIERS

This data validation report addresses Pace, Inc. work order number WL-1622 which contained 12 filtered groundwater samples, 12 unfiltered groundwater samples, 1 filtered groundwater field duplicate sample, 1 unfiltered groundwater field duplicate sample, 1 filtered field rinse blank, and 1 unfiltered field rinse blank. The data were evaluated for the following parameters:

* data completeness
* holding times
* data calibration verification
* laboratory blank analysis
  field blank analysis
+ matrix spike recoveries
* laboratory duplicates
  field duplicates
* laboratory control sample results
  detection limit results
  sample results

* All criteria were met for this parameter.

\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the following data validation qualifications:

1. The positive results for sulfate in samples GW-44S (WL1622-17) and GW-42S (WL1622-21) are negated due to field blank contamination. The reported results have been changed to reflect adjusted quantitation limits.

SMITH

2. Four initial calibrations (ICALs) were provided for the sulfate and bromide analyses. The low level 1.0 milligram per liter (mg/L) standards in each of the four ICALs have elevated experimental values for bromide and sulfate greater than 1.0 mg/L. Due to the high recovery of the 1.0 mg/L standard for sulfate, the positive result for sulfate in sample GW-400 (WL1622-28) is biased high.

   There are no apparent peaks identified for bromide in samples GW-45S (WL1622-19), GW-42S (WL1622-21), GW-40S (WL1622-32), and GW-400 (WL1622-28); therefore, there are no impacts on the reporting limits (RLs) for bromide in these samples.

3. The laboratory reported bromide in samples GW-50S (WL1622-29) and GW-43S (WL1622-24) as non-detected at 1.0 mg/L. However, the concentration on the quantitation report for sample WL1622-29 is greater than 1.0 mg/L and there is an unintegrated peak near the retention time (RT) of bromide in sample WL1622-24. No explanation was provided by the laboratory for either sample, and there was not enough information provided by the laboratory for the reviewer to make a positive identification above the RL. Therefore, due to a concentration on the quantitation report above the RL in sample WL1622-29 and the unintegrated peak in sample WL1622-24, the RLs for bromide in samples WL1622-29 and WL1622-24 are biased low.

4. The identification retention time (ID-tm) on the quantitation reports is used to correctly identify bromide and sulfate based on the calibration standards analyzed that day. Review of the raw data for the first ICAL standards indicates that the ID-tm for bromide was not updated to reflect the ICAL standard RTs. The RTs for bromide in the ICAL standards range between 2.49-2.52 minutes. The ID-tm should reflect the average RT of the six ICAL standards. For the first calibration run for the bromide and sulfate analyses, the ID-tm for bromide should be 2.50 minutes. Instead, the ID-tm on the quantitation reports indicates an ID-tm of 2.93 minutes. Bromide was identified at a RT of 2.93 minutes in sample GW-40D (WL1622-32) at a concentration of 2 mg/L. The laboratory reported bromide at 2 mg/L in sample WL1622-32. However, based on the stability of the bromide RT in the calibration standards, the identification of bromide at 2.93 minutes in sample WL1622-32 is questionable. Therefore, due to the uncertainty of the identification of bromide in the undiluted analysis of sample WL1622-32, the reviewer has chosen the 1:10 dilution of sample WL1622-32 as the result of record. The result of record for bromide in sample WL1622-32 is elevated to non-detect at 10 mg/L.

SMITH

5. There are several analyses/dilutions for sample GW-43D (WL1622-27) provided in the data package due to elevated amount of sulfate in the sample. The dilutions for sample WL1622-27 were analyzed in the following order: 1:10, 1:500, 1:100, and 1:1000 dilutions. The 1:10 dilution for sample WL1622-27 was out of the linear range for sulfate; therefore, it was not considered the result-of-record. The 1:500 dilution appears to be in range; however, the laboratory did not use this analysis as the result-of-record for sample WL1622-27. The raw data for the 1:500 dilution states "RE" at a 1:100 dilution. The laboratory then reanalyzed sample WL1622-27 at a 1:100 dilution. The 1:100 dilution indicates that the sample should be diluted and rerun. Sample WL1622-27 was then reanalyzed at a 1:1000 dilution, and the laboratory reported the results for sulfate from the 1:1000 dilution.

   This 1:1000 dilution for sample WL1622-27 was analyzed under the fourth initial calibration (ICAL) for sulfate and bromide. There was no stability for the RTs of sulfate throughout the entire fourth run. The RTs for sulfate for the calibration standards and in the 1:1000 dilution of sample WL1622-27 were shifting earlier and later throughout the run. RTs that fluctuate back and forth are inherent of a system problem. The identification of sulfate may be considered questionable due to the shifting of the RT; however, the 1:10, 1:500 and the 1:100 dilutions support the identification of sulfate in sample WL1622-27. Even though the 1:100 dilution of sample WL1622-27 is out of the linear range, the amount of sulfate recovered supports the reanalysis of the sample at a 1:1000 dilution. Due to the RT shifting, the positive result for sulfate in sample WL1622-27 is estimated.

6. This case contains one set of field duplicates samples consisting of GW-42S (WL1622-22) and its field duplicate GW-42S (WL1622-23). The field duplicate samples were analyzed for both filtered and unfiltered analyses. The field duplicate samples exhibited poor reproducibility for sulfate. Due to poor field duplicate reproducibility, the positive results for sulfate in samples WL1622-22 and WL1622-23 are estimated.

7. Ammonia was analyzed for both the unfiltered and filtered samples. Ammonia in samples GW-44S (WL1622-17 and WL1622-1), GW-45S (WL1622-19 and WL1622-3), GW-42S (WL1622-21 and WL1622-5), GW-42D (WL1622-22 and WL1622-6), GW-42D DUP (WL1622-23 and WL1622-7), GW-43D (WL1622-27 and WL1622-11) and GW-50S (WL1622-29 and WL1622-13) was reported at higher concentration in the filtered samples than in the unfiltered samples. In all instances the relative

percent differences (RPDs) between the filtered and the unfiltered results were within normal expected precision, except in sample GW-44S. The reviewer concludes that the RPD results for samples GW-45S, GW-42S, GW-42D, GW-42D DUP, GW-43D, and GW-50S are not statistically different. The reviewer concludes that all ammonia present is in a dissolved form. Due to the poor RPD between the filtered and unfiltered results for sample GW-44S, the positive results for ammonia-N in the filtered and unfiltered samples are estimated, WL1622-17 and WL1622-1, respectively.

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. The raw data provided for bromide and sulfate on the quantitation reports exhibited peak heights; however, peak areas were not provided. Therefore, there was not enough information provided to reproduce the laboratory's reported concentrations. More information was requested from the laboratory. The laboratory gave an explanation in a letter from Mr. Richard Wellman dated 6/7/96. The laboratory no longer has the software/analytical system capabilities to supply the information used to calibrate the system or quantitate the samples. The reviewer verified the validity of the sample results based on the information provided (peak heights). The results were within the same order of magnitude. The data are acceptable except where mentioned in the Findings/Qualifiers Section of this report.

2. There are unintegrated peaks near the RT of bromide in samples GW-42D (WL1622-22), its field duplicate sample GW-42D (WL1622-23), and GW-43D (WL1622-27). These peaks may not have been integrated due to interferences with chloride. These samples were reanalyzed at dilutions, and the RLs for bromide in samples WL1622-22, WL1622-23, and WL1622-27 are elevated by the laboratory. Based on a review of all dilutions of these samples, the reviewer accepted the elevated detection limits as reported.

   It is further noted that samples GW-44D (WL1622-18), GW-45D (WL1622-20), and GW-50D (WL1622-30) were also analyzed at dilutions and the RLs for bromide were elevated by the laboratory. Based on a review of all dilutions of these samples, the reviewer accepted the elevated detection limits as reported.

3. The quantitation reports for the initial calibration blank (ICB) and the continuing calibration blanks (CCBs) analyzed under the 10/24/95 and 10/25/95 ICALs exhibit concentrations above the RL of 1 mg/L. However, these concentrations do not reflect the ion chromatograms, which do not exhibit peaks for bromide and sulfate. The reviewer has concluded that bromide and sulfate are not present in the ICB and CCBs. Therefore, no data are qualified due to laboratory blank contamination.

4. On the field chain of custody, the laboratory's client indicated that the matrix spike and laboratory duplicate samples were to be analyzed from sampling location GW-43S. For this order, sample GW-44S (WL1622-17) was also provided as a matrix spike (MS) and a laboratory duplicate (LD) for the sulfate, bromide and ortho-phosphate analyses.

   The laboratory also analyzed batch quality control (QC) which consisted of a method blank and a laboratory control sample (LCS) for each parameter in this case except viscosity. There is no batch QC required for viscosity. The method blanks and the LCSs for all other parameters are acceptable. No data are qualified due to batch QC criteria.

5. There were transcription errors on the laboratory reporting of analyses forms, analytical sequence summary forms, and the laboratory quality control (QC) forms. The reviewer-corrected forms are included in Appendix B. No data are qualified.

6. The calibration for the ammonia analysis for this order could not be verified due to lack of information provided by the laboratory. More information was requested by the reviewer. The laboratory gave a brief explanation in a letter from Mr. Richard Wellman dated 6/7/96 is included in Appendix B. Based on review of the data and the letter supplied by the laboratory the ammonia data are acceptable.

SMITH

SUMMARY

This review has identified field blank contamination, high recovery for the low concentration initial calibration standards for bromide and sulfate, biased low reporting limits, unintegrated peaks, elevated RL due to the ID-tm, RT shifting, poor field duplicate reproducibility for sulfate, and filtered versus unfiltered ammonia results as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix B.

SMITH

QUALIFIER CODES AND FOOTNOTES

U - The analyte was analyzed for but not detected. The associated numerical value is the sample quantitation limit.

J - The associated value is an estimated quantity.

UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

---

1 - The associated numerical value is the sample quantitation limit due to blank contamination.

2 - Denotes an elevated reporting limit due to sample dilution.

3 - The reported quantitated value may be biased high. The actual value is expected to be lower.

4 - The reporting limit may be biased low. The actual reporting limit is expected to be higher.

1	Sulfide																				
	Viscosity	N/A		3.5		N/A		N/A		3.0		3.5		4.0		N/A		N/A		N/A	

The PQL for ammonia varies for the filtered and the unfiltered samples. The highest PQL is documented on the data table.

N/A = Not Analyzed for that parameter

Samples WL1622-18, -20,-22, -27, and -30 were analyzed at dilutions, the reporting limit for bromide has been elevated. See report for details.

Sodium, Total	12	mg/L	1.0	0.10	200.7/6010	10/27/95	KW	1

* PQL (Practical Quantitation Level) represents laboratory reporting limits and may not reflect sample-specific reporting limits. Sample-specific limits are indicated by results annotated with '<' values.

(1) Sample Preparation on 10/20/95 by VM using 3010

(2) A result reported with a "B" qualifier indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample. The concentration of calcium in the method blank was 0.28 mg/L.

(1) Sample Preparation on 10/20/95 by VM using 3010

(2) The laboratory's Practical Quantitation Level could not be achieved for this parameter due to sample composition, matrix effects, sample volume, or quantity used for analysis.

(3) A result reported with a "B" qualifier indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample. The concentration of calcium in the method blank was 0.28 mg/L.

* PQL (Practical Quantitation Level) represents laboratory reporting limits and may not reflect sample-specific reporting limits. Sample-specific limits are indicated by results annotated with '<' values.

(1) Sample Preparation on 11/22/95 by JAF using 3010

(2) A result reported with a "B" qualifier indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample. The concentration of calcium in the method blank was 0.10 mg/L.

RPD = Relative percent difference, which is the absolute value of the difference between two replicate results divided by the mean concentration then multiplied by 100%.

17

NC = Relative percent difference cannot be calculated for sample results less than the PQL.

~~post~~ Total phosphate results are biased low

NA = Not applicable.

DATA QUALITY COMMENTS:

Results of all quality control measurements are within the laboratory or contract specified acceptance range except as noted. The laboratory does not use the sample duplicate and matrix spike acceptance ranges as acceptance criteria for a specific analysis. Sample duplicate and matrix spike data are used to evaluate method performance in the environmental sample matrix only. Please refer to LCS data for assessment of quality control for each parameter.

* Matrix spike recovery is outside the laboratory's specified acceptance range indicating potential sample matrix interference and potential bias of reported value for this parameter.

DATA VALIDATION REPORT

Pace Laboratories Case No.: WL-1628
Project Name: Semi-Annual Groundwater Monitoring - Wilmington, MA

June 11, 1996

Dear Mr Wellman:

The following questions pertain the metals' data for WL-1628:

1. Potassium and sodium data were not found in this order. Please provided page numbers of where the data for these analytes are located in the package or submit the data for data review.

2. The silicon data can not be verified with the information provided in this order. Please submit cross references or needed material to complete data review.

3. Lead does not appear to be standardized for ICP run on 11/06/95 (Run ID 951106B, page 148).

Please call me with any questions that you may have regarding these questions.

Thank you,
E. Bryan Rivers
Quality Assurance Scientist

ANALYTICAL SERVICES

M E M O R A N D U M

To: - E. Brian Rivers, Smith Environmental Technologies Corp.
From: George Brewer, Metals Section Supervisor, Katahdin Analytical Services, Inc.
Date: 06/11/96
Subject: Response to your inquiry of 06/11/96 (Inquiry No. MET1) regarding metals data for WL-1628

We are providing the following responses to the questions about Work Order WL-1628 presented in your fax of 06/11/96. The section numbers below refer to the question numbers in your fax.

1) For PACE-ME Work Orders WL-1622 and WL-1628, potassium, sodium, and silicon were analyzed by PACE's New Hampshire laboratory on 11/04/96. The samples of Work Orders WL-1622 and WL-1628 were logged in under different sample numbers at the New Hampshire laboratory, and these sample numbers appear on the raw data. I am providing a table with this memo that cross-references PACE-ME sample numbers and PACE-NH sample numbers. In that table, the column headed "CLIENT ID." lists PACE-ME sample numbers, and the column headed "PACE #" lists the corresponding PACE-NH sample numbers.

   The potassium and sodium data are located immediately following the silicon raw data in the data package. Our copy of the package is not paginated, so I can't provide you with page numbers. Please call me if you need further help in locating the potassium and sodium data.

2) As noted above, silicon was analyzed by PACE-NH. A table cross-referencing PACE-ME and PACE-NH sample numbers is being provided with this memo.

3) This run was performed on the Thermo Jarrell Ash Trace ICP. This instrument employs a unique background correction technique to provide improved detection limits for lead, selenium, and antimony. For these elements, signal and background are measured simultaneously by monitoring each analytical wavelength in two spectral orders. The analytical channels for the two orders are standardized independently. After standardization, the weighted means of the analytical results for the two orders of each wavelength are reported. In the standardization report, standardization information for the 220.3 nm lead wavelength in the first order is identified

RECEIVED
JUN 17 1996

P.O. Box 720, Westbrook, ME 04098
Tel (207) 874-2400 Fax (207) 775-4029
210 West Road, Unit N, Portsmouth, NH 03801
Tel (603) 436-3556 Fax (603) 436-3556

by "2203/1", and that for the second order is identified by "2203/2". The wavelength identified as "Pb2203" is a "dummy" channel where the weighted mean results of the two orders are reported. Therefore, the "Pb2203" channel is listed on the standarization report as "NOT STANDARDIZED". The same convention is followed for the 196.0 nm selenium wavelength and the 206.8 nm antimony wavelength.

I hope this provides the information that you need. Please call me if you have further questions.

DATA VALIDATION REPORT

Pace Laboratories Case No.: WL-1622 and WL-1628
Project Name: Semi-Annual Groundwater Monitoring - Wilmington, MA

Raw Data ?

June 17, 1996

Dear Ms. Lil Pepin:

The following questions pertain the metals' data for WL-1622 and WL-1628:

- It appears that the nitrate results were not included in these data packages. Please provided page numbers of where the data for nitrite+nitrate and nitrate are located in the package or submit the data for data review.

If there is no inconvenience, we need this information as soon as possible. Please call us with any questions that you may have regarding this issue.

Thank you,
E. Bryan Rivers/Marybeth Ousey
Quality Assurance Scientist

APPENDIX B

Wet Chemistry Data Validation Summary

Project Name: Clin Wilmington, MA
Project No.: CC-7074-0102
Project Manager: Bruce Cushing
Laboratory: Pace, Inc (Katahdin)

Case No./SDG: WL1622
Sampling Date(s): 10/17/95
Reviewed By: Danielle Leauby
Completion Date: 6/20/96

Compounds/Analytes Bromide, Sulfate, Sulfide, Ammonia, ortho-Phosphate, Chlonds, viscosity
Methods: [X] ASTM, MCAWW [ ] Other _____
Matrix: [ ] soil/solid (mg/Kg) [X] aqueous (mg/L) [ ] Other _____

The following table indicates the data validation criteria examined, problems identified, and QA action.

Sam 10/17 SO_4 + Br 10/18, 10/22, 10/24 + 10/25
Cl 10/18; OP 10/18; VIS 10/18
Ammon 10/19 + 10/23; SULFIDE 10/18

Data Validation Criteria:	accept	FYI	qualify	comments
Holding Times	✓	✓		Br, Cl, SO_4, Ammonia - 28 days; Sulfide - 7 days; OP nos - 48 hrs
Calibration (r and y-intercept)	✓	✓		Sulfide + Viscosity - NA; Cl - Lachat Instr. - see letter; Ammon - 2pt Cal; SO_4 - 4 int cals - ok (995) Br - 4 int cal - OK
Inital Calibration Verification	✓	✓		Cl 102.8; OP - ①; OP nos - ok; VIS - NA; Amm - 98.2 + 93.6%; Sulfide - 101.6 ③; Br 93-95% (4); SO_4 94-[illegible].3 (4)
Continuing Calibration Verification	✓	✓		Cl 100.2 - 102.3; OP - ①; VIS - NA; Amm 101.2 - 106.2 + [illegible]; Sulfide - ③ Br 4 runs all ok; SO_4 4 runs all okay
Initial Calibration Blank	✓	✓		Cl < MDL; OP - ①; VIS - NA; Amm < 0.05 + < 0.05; Sulfide < 1.0 ③ Br all < 1.0 SO_4 all < 1.0
Continuing Calibration Blank	✓	✓		Cl < 1.0; OP - ①; VIS - NA; Amm < 0.05 + < 0.05; Sulfide ③ Br ④ SO_4 ⑤
Laboratory Blank	✓	✓		Cl < 1.0; OP < 0.02; VIS - NA; Amm < 0.05 + < 0.05; Sulfide ③ Br < 1.0 SO_4 < 1.0
Blank Spike Results / LCS	✓	✓		Cl 104.9; OP 98.8%; VIS - NA; Amm 89 + 93%; Sulfide ③ SO_4 ⑤ Br ⑤
Field Blank		✓		Cl < 1.0; OP < 0.02; VIS - NA; Amm < 0.05; Sulfide - NA SO_4 1.9 Br < 1.0
Matrix Spike Results		✓		Cl 81%; OP 103%; VIS - NA; Amm 112% + 100.5%; Sulfide NC 5% Br 107%, 92.6%, Other; SO_4 99.6, 91.2%
Laboratory Duplicate Results	✓	✓		Cl 9.4% RPD - OP NC ②; VIS NA; Amm 2.3% + 4.1%; Sulfide - NC ② Br ③; SO_4 3.4, 7.8
Field Duplicate Results		✓	✓	Cl 0% RPD; OP 0.5% RPD; VIS - NA; Amm 2.7%; Sulfide - NC ④ SO_4 - 42%; Br ④
Sample Result Verification		✓	✓	Cl all okay; OP - all ok; VIS ok; Amm - ok; Sulfide - ok Br checked RT due to matrix; SO_4 - RTs shifting
Other:				
Other:				

General Comments: Problem w/ RTs for Br + SO_4

① ICB - used for MB + ICV used as LCS for OPnos results, Als, CCV + CCB results + %R not provided
② NC - not calculable since both results less than MDL
③ MB - used as ICB, LCS used as ICV; CCB + CCVs not run
Unintegrated peaks in Br SO_4 analysis ⑤ or near RT of Br.
SO_4 RT shifting throughout analysis. 4th Cal major shifting both - further uncertainty of results
④ CCB - Br + SO_4 values significant are not true representation of values in blank - no apparent peak present
⑤ ICV + ICB used as LCS + MB for SO_4 + Br.

NA - Not applicable
NR - Not reviewed

QA Scientist D Leauby Date 6/20/96

IDtm = Identification time for Br never updated to reflect ICAL RTs that's why computer identifying Br incorrectly.

big shift for Br
Due to stability of Br RTs in stds & the big Rt shift identification in this sample Br @ 2.43 is considered questionable & use next run (10X) for Br result. DMH 6/20/96

Br does not show fluctuation like this (back-n-forth) & reviewer considers ID of Br questionable. Use 1:10X dilution as result of record. DMH 6/20/96

TECHNICAL NARRATIVE

Laboratory Number: 45696

Samples were received in acceptable condition, with the exceptions noted on the sample receipt condition report.

All samples were prepared and analyzed within the holding times specified in the referenced methods.

Instrumentation used for analysis was calibrated and/or tuned with the appropriate frequency and to the appropriate specifications required by the referenced methods.

Blank contamination was not observed at levels affecting the analytical results.

Matrix effects, as monitored by matrix spike recovery, unusual physical properties and/or surrogate analyte recovery were not apparent with the following exception:

> The detection limit for the analysis for bromide was raised for laboratory numbers 45696-2, -4, -6, 7, -11 and -13 due to matrix interference.
>
> The detection limit for the analysis for sulfide was raised for laboratory numbers 45696-38, -40, -42 and -43 due to matrix interference.

Accuracy and precision as monitored by laboratory control sample analyses were within laboratory acceptance limits.

Ms. Danielle Leauby
Smith BCM
By FAX

Dear Danielle:

In response to questions raised on the phone I am providing the following:

Bromide and sulfate linear regression - It would appear that the data provided in the package was determined from peak area and only peak height is available from the raw chromatograms. This data system is no longer available to us. The data cannot be corrected.

Bromide chromatograms from WL1595 (Hampton 45663-15,16) not integrated for an apparent bromide peak - The laboratory believes that there is no issue with the choice of peaks for bromide quantitation.

Lachat analyses - The Lachat is calibrated by using a point to point method. Results for the analyte are reported in concentration units. No raw absorbance was reported in the package that would allow comparison of sample results to the calibration data. Results from the Lachat are accepted by the laboratory based on the performance of ICVs, CCVs and LCSs.

Please call if you have further questions.

Sincerely,

Richard L. Wellman
Client Services Manager

DATA REVIEW COVER SHEET

Date: June 25, 1996
Subject: Data Validation of the October 1995 Sampling Event at the Olin Corporation's Wilmington, MA Facility
Smith Env. Tech. Corp. Project No. 00-7074-0102

Data validation was performed on selected analytical results from the October 1995 sampling event at Olin Corporation's Wilmington, Massachusetts Facility. Samples collected during these events were analyzed by Katahdin Analytical Services' Westbrook, Maine and New Hampshire facilities. The laboratory work order numbers reviewed were WL-1612, WL-1595, WL-1622, WL-1628 (surface water samples only), and WL-1644.

The data validation guidelines that were used for the reviews are referenced in the individual reports. The data validation reports address all issues detailed in the appropriate data validation guidelines.

The following Smith Environmental Technologies Corporation Quality Assurance (QA) Department personnel contributed to the preparation of the data review reports:

Atwood F. Davis, CPC, QA Director

Martin B. Kudlesky, CPC, Senior QA Scientist

Danielle M. Leauby, QA Scientist

Marybeth Ousey, QA Scientist

E. Bryan Rivers, QA Scientist

A copy of this cover sheet with appropriate signatures must accompany all listed reports.

DATA VALIDATION REPORT
METALS AND SELECTED ANALYTES
OLIN CORPORATION
SURFACE WATER SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the 4 surface water sampling locations sampled on October 18, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of the 4 unfiltered surface water samples, 1 unfiltered surface water field duplicate sample, 4 filtered surface water samples, and 1 filtered surface water field duplicate sample contained in work order number WL-1628. Work order number WL-1628 also contained several groundwater samples; however, they were not reviewed as part of this data validation. All samples in this report were analyzed by Katahdin Analytical Services, Inc. (formerly PACE Incorporated Environmental Laboratories), Westbrook, Maine, following United States Environmental Protection Agency (EPA) Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846), Methods for Chemical Analysis of Water and Wastes (MCAWW), and Standard Methods for the Examination of Water and Wastewater, 16th Edition, 1985 (SM), American Public Health Association (APHA). The individual analyses were performed using the following methods:

Analytes	Methods
aluminum, arsenic, barium, calcium, chromium, iron, lead, magnesium, manganese, potassium, silicon, and sodium	200.7
hexavalent chromium	7195/6010
bicarbonate as HCO3 and carbonate as CO3*	SM406C
nitrate as N and nitrite as N*	353.2
dissolved organic carbon (DOC)*	415.1
phosphorus as P *	365.4
solids - filterable residue (TDS)*	160.1

*Analyses were performed on filtered samples only.

Because the analyses were not performed according to the EPA Contract Laboratory Program (CLP) methods, the findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis (data validation guidelines), June 1988, where applicable.

SMITH

Only surface water samples were evaluated in this review. The support documentation in Appendix A of this report summarizes the specifics of this review. Appendix A also provides the sample results as reported by the laboratory. The data summary table lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers Section. Other issues which arose which did not warrant qualification are detailed in the Notes Section.

FINDINGS/QUALIFIERS

This data validation report addresses only the 4 unfiltered surface water samples, 1 unfiltered surface water field duplicate sample, 4 filtered surface water samples, and 1 filtered surface water field duplicate sample of the Pace, Inc. work order number WL-1628. The surface water data were evaluated for the following parameters:

* data completeness
* holding times
data calibration verification
CRDL standard
laboratory blank analysis
\+ field blank analysis
* interference check sample results
matrix spike recoveries
laboratory duplicates
field duplicates
* laboratory control sample results
\+ serial dilution results
detection limit results
sample results

* All criteria were met for this parameter.
\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

SMITH

1. The iron results for samples SW-14 (WL-1628-1), SW-14 (WL-1628-18), and SW-16 (WL-1628-24) are negated due to preparation blank contamination. The reported results have been changed to reflect adjusted detection limits.

2. Standards for certain metals were analyzed at the contract required detection limit (CRDL) as required by CLP methodologies. Although the analyses associated with this data were not CLP analyses, this standard represents system performance at or near the concentration of the CRDL. It was the reviewer's professional judgment to qualify data which were out of the CRDL standard criteria specified in the Region I data validation guidelines. As a result, the following data are qualified:

   - The %R was low for the CRDL standard associated with all hexavalent chromium surface water results. Therefore, all positive results and detection limits for hexavalent chromium are estimated and may be biased low.

   - Due to the estimated hexavalent chromium results, all positive results and detection limits for trivalent chromium are also estimated because the trivalent chromium results are calculated from the hexavalent chromium results.

3. Due to a low calibration standard recovery of a nitrite initial standard, all filtered and unfiltered nitrite results below 0.20 ppm are estimated and may be biased low. All nitrite sample results are effected. In addition to a low initial standard recovery, all nitrite results are estimated and may be biased low due to negative concentrations with absolute values above the PQL of several field and laboratory quality control (QC) results. Copies of the raw data are included in Appendix A of this report.

4. To determine the nitrate concentrations for the samples, nitrate plus nitrite was analyzed at Katahdin's New Hampshire facility. The laboratory duplicate reproducibility and the matrix spike %R for nitrate plus nitrite were not met. All filtered nitrate results are estimated and may be biased low. Details are provided on the Laboratory Quality Control Report included in Appendix A.

5. The nitrite results of record were analyzed at Katahdin's Maine facility. The nitrate results were determined by subtracting the nitrite results (analyzed at the Maine facility) from the nitrate plus nitrite results (analyzed at the New Hampshire facility). Due to the estimated nitrite results, all filtered and unfiltered nitrate results are also estimated; however, a bias could not be determined.

6. Due to high calibration standard recoveries of the initial standards below 0.5 ppm, all filtered and unfiltered non-detect results for phosphorus as P are estimated. Additionally, these values are also estimated because several sample results and QC results for phosphorus as P exhibited negative concentrations of calibration blanks with absolute values above the practical quantitation limit (PQL). A bias for these

results could not be determined. Copies of the raw data are included in Appendix A of this report.

7. The detection limits for the following sample results are estimated because the PQL could not be achieved. Consequently, the results for these samples were analyzed at dilutions, and the detection limits were elevated by the laboratory to reflect the dilution factor as indicated on the Report of Analysis Forms included in Appendix A. Specific explanations were not provided by the laboratory.

   - nitrite for samples SW-14 filtered (WL-1628-1), SW-12 filtered (WL-1628-2), SW-17 filtered (WL-1628-5), SW-17 Field Dup filtered (WL-1628-6), SW-14 unfiltered (WL-1628-18), SW-12 unfiltered (WL-1628-19), SW-17 unfiltered (WL-1628-22), and SW-17 Field Dup unfiltered (WL-1628-23)
   - phosphorus as P for sample SW-17 Field Dup filtered (WL-1628-6)

8. The following results are estimated and may be biased low due to low matrix spike recoveries: all results for calcium, sodium, and silicon, and the filtered results for manganese.

9. All positive results for arsenic are estimated because the laboratory duplicate results were outside acceptable limits.

10. Results for barium, magnesium, and sodium for unfiltered field duplicate samples SW-17 (WL-1628-22) and SW-17 Field Dup (WL-1628-23) are estimated due to poor field duplicate precision. Details are provided on the Field Duplicate Precision Worksheet included in Appendix A of this report.

11. The nitrate result for the filtered sample SW-12 (WL-1628-2) is estimated and may be biased high because it's result of 0.58 mg/L does not agree with the associated filtered or unfiltered laboratory duplicates or the associated unfiltered result for sample SW-12 (WL-1628-19) which are all non-detect below 0.050 mg/L. Additionally, the filtered and unfiltered matrix spike %Rs which are associated with this sampling location indicate that the nitrate results of the unspiked sample are non-detect. Details are provided on the associated Quality Control Report Form and the filtered versus unfiltered RPD spreadsheet included in Appendix A.

12. Several filtered analytical results were reported at higher concentrations than their associated unfiltered results. Smith Environmental Technologies Corporation has established a relative percent difference (RPD) criteria to evaluate the precision of these results (see the spreadsheet included in Appendix A of this report). Due to RPDs which exceeded the expected precision, the nitrate results for filtered sample SW-12 (WL-1628-2) and unfiltered sample SW-12 (WL-1628-19) are estimated.

SMITH

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. There were transcription errors on the Aqueous Laboratory Control Sample forms and the Quality Control Report forms. The reviewer-corrected forms are included in Appendix A. No data are qualified.

2. Several sample results were reported to significant digits which were not consistent with all other sample results. The reviewer-corrected Report of Analysis Forms are included in Appendix A and the changes are reflected on the Data Summary Table.

3. A serial dilution sample was not provided by the laboratory as recommended by the MCAWW Method 200.7. Since performance of a serial dilution is not required by the method, no data are qualified.

4. Several %Rs for initial and continuing calibration verifications could not be verified because sufficient information was not provided by the laboratory.

5. The field blanks in this order were only associated with the groundwater samples. No data are qualified.

SUMMARY

This review has identified CRDL standard %Rs, initial standard recoveries, negative concentrations with absolute values above the PQL, blank contamination, matrix spike %Rs, laboratory and field duplicate results, and elevated detection limits for non-detect sample results as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix A.

SMITH

QUALIFIER CODES

U - The material was analyzed for, but not detected above the level of the associated value.

J - The associated value is an estimated quantity.

UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

DATA VALIDATION REPORT
CHLORIDE, SULFATE, BROMIDE, ORTHOPHOSPHATE, SULFIDE, VISCOSITY, AND AMMONIA-N
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the 4 surface water sampling locations sampled on October 18, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of the 4 unfiltered surface water samples, 1 unfiltered surface water field duplicate sample, 4 filtered surface water samples, and 1 filtered surface water field duplicate sample contained in work order number WL-1628. Work order number WL-1628 also contained several groundwater samples; however, they were not reviewed as part of this data validation. All samples in this report were analyzed by Katahdin Analytical Services, Inc. (formerly PACE Incorporated Environmental Laboratories), Westbrook, Maine, following *"Methods for Chemical Analysis of Water and Wastes"* (MCAWW). The individual analyses were performed using the following from MCAWW and ASTM methods:

Analytes	Methods
bromide and sulfate	300.0
chloride	325.1
orthophosphate	365.2
sulfide	376.1
ammonia-N	350.2

The findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis, June 1988, where applicable.

The support documentation in Appendix B of this report summarizes the specifics of this review. Appendix B also provides the sample results as reported by the laboratory. The data summary table lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers Section. Other issues which were identified and did not warrant qualification are detailed in the Notes Section.

SMITH

FINDINGS/QUALIFIERS

This data validation report addresses the 4 filtered surface water samples, 4 unfiltered surface water samples, 1 filtered surface water field duplicate sample, and 1 unfiltered surface water field duplicate sample contained in Pace, Inc. work order number WL-1628. The data were evaluated for the following parameters:

* data completeness
* holding times
+ data calibration verification
+ laboratory blank analysis
+ field blank analysis
* matrix spike recoveries
* laboratory duplicates
  field duplicates
* laboratory control sample results
  detection limit results
  sample results

* All criteria were met for this parameter.

\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the following data validation qualifications:

1. The bromide results for the filtered and unfiltered samples SW-17 (WL1628-5 and WL1628-22), SW-17 DUP (WL1628-6 and WL1628-23), and SW-16 (WL1628-7 and WL1628-24) were each analyzed undiltued and at a 1:10 dilution. For these samples, the laboratory reported bromide as non-detected at 1.0 milligram per liter (mg/L). However, there are unintegrated peaks near the retention time of bromide in the in the undiluted analyses of these samples. In the 1:10 dilutions of these samples, there are no apparent peaks near the retention time of bromide. Therefore, due to the unintegrated peaks present in undiluted analyses of the filtered and unfiltered samples SW-17, SW-17 DUP and SW-16, it was the reviewer's professional judgment to elevate the laboratory RLs for bromide in these samples from 1 mg/L to 10 mg/L.

2. This case contains two field duplicate pairs consisting of the filtered samples SW-17 (WL1628-5) and SW-17 DUP (WL1628-6) and the unfiltered samples SW-17 (WL1628-22) and SW-17 DUP (WL1628-23). Due to poor field duplicate reproducibility, the following samples results are qualified:

   - the positive results for sulfate in the filtered samples WL1628-5 and WL1628-6 are estimated and

   - the positive result for sulfide in the unfiltered sample WL1628-22 and the reporting limit in the unfiltered sample WL1628-23 are estimated.

3. There are unfiltered and filtered results for all analytes for all samples in this case. The following results were reported at higher concentrations in the filtered samples than in the unfiltered samples:

   - ammonia in samples SW-14 (WL1628-1 and WL1628-18), SW-17 (WL1628-5 and WL1628-22), SW-17 DUP (WL1628-6 and WL1628-23), and SW-18 (WL1628-7 and WL1628-24), and

   - chloride in sample SW-12 (WL1628-2 and WL1628-19).

   The chloride relative percent difference (RPD) between the filtered and the unfiltered results was within the normal expected precision. For the abovementioned ammonia results the relative percent differences (RPDs) between the filtered and the unfiltered results were outside the normal expected precision. Therefore, due to poor reproducibility between the majority of the filtered and unfiltered ammonia results, it is the reviewer's professional judgment to estimate all positive results and reporting limits for ammonia in all samples for this case.

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. The raw data provided for bromide and sulfate on the quantitation reports exhibited peak heights; however, peak areas were not provided. Therefore, there was not enough information provided to reproduce the laboratory's reported concentrations. More information was requested from the laboratory. The laboratory gave an explanation in a letter from Mr. Richard

Wellman dated 6/7/96. The laboratory no longer has the software/analytical system capabilities to supply the information used to calibrate the system or quantitate the samples. The reviewer verified the validity of the sample results based on the information provided (peak heights). The results were within the same order of magnitude. The data are acceptable except where mentioned in the Findings/Qualifiers Section of this report.

2. There were three initial calibrations provided for the sulfate and bromide analyses. The low level 1.0 mg/L standard in each of the three initial calibrations have elevated experimental values for bromide and sulfate greater than 1.0 mg/L. Since all the bromide results in the samples are non-detect, there is no qualification necessary based on the low level standard. There are no low level positive results for sulfate in the samples; therefore, there is no impact due the high recoveries of the low level standard.

3. The concentrations on the quantitation reports for the initial calibration blank (ICB) and the continuing calibration blanks (CCBs) analyzed under the three initial calibrations are above the reporting limits; however, these concentrations do not reflect the ion chromatograms, which do not exhibit peaks for bromide and sulfate. The reviewer has concluded that bromide and sulfate are not present in the ICB and CCBs. Therefore, no data are qualified due to laboratory blank contamination.

4. There were transcription errors on the laboratory reporting of analyses forms, analytical sequence summary forms, and the laboratory quality control (QC) forms. The reviewer-corrected forms are included in Appendix B. No data are qualified.

5. The calibration for the ammonia analysis for this order could not be verified due to lack of information provided by the laboratory. More information was requested by the reviewer. The laboratory gave a brief explanation in a letter from Mr. Richard Wellman dated 6/7/96 is included in Appendix B. Based on review of the data and the letter supplied by the laboratory the ammonia data are acceptable.

6. There are no field blank samples associated with surface water samples for this order.

7. On the field chain of custody, the laboratory's client indicated that the matrix spike and laboratory duplicate samples were to be analyzed from sampling location SW-12 for both the filtered and unfiltered analyses (WL1628-2 and WL1628-19). The laboratory also analyzed batch quality control (QC) which consisted of a method blank and a laboratory control sample (LCS) for each parameter in this case except viscosity. There is no batch QC required for viscosity. The method blanks and the LCSs for all other parameters are acceptable. No data are qualified due to QC criteria.

SUMMARY

This review has identified unintegrated peaks, poor field duplicate reproducibility, filtered versus unfiltered ammonia results, and high recovery for the low concentration initial calibration standards for bromide and sulfate as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix B.

SMITH

QUALIFIER CODES AND FOOTNOTES

U - The analyte was analyzed for but not detected. The associated numerical value is the sample quantitation limit.

J - The associated value is an estimated quantity.

UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.

---

1 - Denotes an elevated reporting limit due to sample dilution.

(2) Sample Preparation on 10/18/95 by GFB using 7195

(4) A result reported with a "B" qualifier indicates the analyte was detected in the laboratory method blank analyzed concurrently with the sample. The concentration of iron in the method blank was 0.11 mg/L.

(3) This is a calculation and is not applicable to a matrix spike.

Raw Data ?

June 17, 1996

Dear Ms. Lil Pepin:

The following questions pertain the metals' data for WL-1622 and WL-1628:

- It appears that the nitrate results were not included in these data packages. Please provided page numbers of where the data for nitrite+nitrate and nitrate are located in the package or submit the data for data review.

If there is no inconvenience, we need this information as soon as possible. Please call us with any questions that you may have regarding this issue.

Thank you,
E. Bryan Rivers/Marybeth Ousey
Quality Assurance Scientist

ANALYTICAL SERVICES

M E M O R A N D U M

To: E. Brian Rivers, Smith Environmental Technologies Corp.
From: George Brewer, Metals Section Supervisor, Katahdin Analytical Services, Inc.
Date: 06/11/96
Subject: Response to your inquiry of 06/11/96 (Inquiry No. MET1) regarding metals data for WL-1628

We are providing the following responses to the questions about Work Order WL-1628 presented in your fax of 06/11/96. The section numbers below refer to the question numbers in your fax.

1) For PACE-ME Work Orders WL-1622 and WL-1628, potassium, sodium, and silicon were analyzed by PACE's New Hampshire laboratory on 11/04/96. The samples of Work Orders WL-1622 and WL-1628 were logged in under different sample numbers at the New Hampshire laboratory, and these sample numbers appear on the raw data. I am providing a table with this memo that cross-references PACE-ME sample numbers and PACE-NH sample numbers. In that table, the column headed "CLIENT ID." lists PACE-ME sample numbers, and the column headed "PACE #" lists the corresponding PACE-NH sample numbers.

   The potassium and sodium data are located immediately following the silicon raw data in the data package. Our copy of the package is not paginated, so I can't provide you with page numbers. Please call me if you need further help in locating the potassium and sodium data.

2) As noted above, silicon was analyzed by PACE-NH. A table cross-referencing PACE-ME and PACE-NH sample numbers is being provided with this memo.

3) This run was performed on the Thermo Jarrell Ash Trace ICP. This instrument employs a unique background correction technique to provide improved detection limits for lead, selenium, and antimony. For these elements, signal and background are measured simultaneously by monitoring each analytical wavelength in two spectral orders. The analytical channels for the two orders are standardized independently. After standardization, the weighted means of the analytical results for the two orders of each wavelength are reported. In the standardization report, standardization information for the 220.3 nm lead wavelength in the first order is identified

ANALYTICAL SERVICES

by "2203/1", and that for the second order is identified by "2203/2". The wavelength identified as "Pb2203" is a "dummy" channel where the weighted mean results of the two orders are reported. Therefore, the "Pb2203" channel is listed on the standarization report as "NOT STANDARDIZED". The same convention is followed for the 196.0 nm selenium wavelength and the 206.8 nm antimony wavelength.

I hope this provides the information that you need. Please call me if you have further questions.

Methods: ☒ MCAWW, ASTM ☐ Other _____

Matrix: ☐ soil/solid (mg/Kg) ☒ aqueous (mg/L) surface water only

The following table indicates the data validation criteria examined, problems identified, and QA action.

Data Validation Criteria:	accept	FYI	qualify	comments
Holding Times	✓	✓		Br, Cl, SO_4, Ammonia - 28 days all met Sulfide - 7 days Ophos 48 hrs
Calibration (r and y-intercept)	✓	✓		Sulfide - NA; Cl - lachat - see letter; Ammonia - 2pt
Inital Calibration Verification	✓	✓		SO_4 & Br 3 CARS lab CC & y int okay - see letter
Continuing Calibration Verification	✓	✓		all met lab criteria for SO_4, Br, Cl, Sulfide ammonia tophos
Initial Calibration Blank	✓	✓		(2) all met lab criteria
Continuing Calibration Blank	✓	✓		all below MDL for all analyses
Laboratory Blank	✓	✓		all below MDL for all analyses
Blank Spike Results	✓	✓		(1)
Field Blank		✓		(1)
Matrix Spike Results	✓	✓		NA
Laboratory Duplicate Results	✓	✓		met all lab criteria for all analyses
Field Duplicate Results		✓	✓	met all lab criteria for all analyses
Sample Result Verification		✓	✓	ammonia - okay; sulfate & sulfide qualified all others okay
Other:				all okay except Br elevated due to matrix/ dilutions; Ammonia - filtered vs unfiltered
Other:				

General Comments:

Some samples analyzed @ 1:10 & straight. Ran up-rated results from 1:10 when straight analysis above upper linear calibration range for Sulfate.

(1) KB used for MB, ICV used as LCS for some analytes

(2) Some CCV & CCB limits not summarized

(3) Unanticipated peaks in Br analyses near RT of Br

(4) NA - Not applicable, Low level std high %RS for Br & SO_4

NR - Not reviewed

REPORT OF LABORATORY ANALYSIS

TECHNICAL NARRATIVE

Laboratory Number: 45718

Samples were received in acceptable condition, with the exceptions noted on the sample receipt condition report.

All samples were prepared and analyzed within the holding times specified in the referenced methods.

Instrumentation used for analysis was calibrated and/or tuned with the appropriate frequency and to the appropriate specifications required by the referenced methods.

Blank contamination was not observed at levels affecting the analytical results.

Matrix effects, as monitored by matrix spike recovery, unusual physical properties and/or surrogate analyte recovery, were not apparent.

Accuracy and precision as monitored by laboratory control sample analyses were within laboratory acceptance limits.

Ms. Danielle Leauby
Smith BCM
By FAX

Dear Danielle:

In response to questions raised on the phone I am providing the following:

Bromide and sulfate linear regression - It would appear that the data provided in the package was determined from peak area and only peak height is available from the raw chromatograms. This data system is no longer available to us. The data cannot be corrected.

Bromide chromatograms from WL1595 (Hampton 45663-15,16) not integrated for an apparent bromide peak - The laboratory believes that there is no issue with the choice of peaks for bromide quantitation.

Lachat analyses - The Lachat is calibrated by using a point to point method. Results for the analyte are reported in concentration units. No raw absorbance was reported in the package that would allow comparison of sample results to the calibration data. Results from the Lachat are accepted by the laboratory based on the performance of ICVs, CCVs and LCSs.

Please call if you have further questions.

Sincerely,

Richard L. Wellman
Client Services Manager

DATA REVIEW COVER SHEET

Date: June 25, 1996
Subject: Data Validation of the October 1995 Sampling Event at the Olin Corporation's Wilmington, MA Facility
Smith Env. Tech. Corp. Project No. 00-7074-0102

Data validation was performed on selected analytical results from the October 1995 sampling event at Olin Corporation's Wilmington, Massachusetts Facility. Samples collected during these events were analyzed by Katahdin Analytical Services' Westbrook, Maine and New Hampshire facilities. The laboratory work order numbers reviewed were WL-1612, WL-1595, WL-1622, WL-1628 (surface water samples only), and WL-1644.

The data validation guidelines that were used for the reviews are referenced in the individual reports. The data validation reports address all issues detailed in the appropriate data validation guidelines.

The following Smith Environmental Technologies Corporation Quality Assurance (QA) Department personnel contributed to the preparation of the data review reports:

Atwood F. Davis, CPC, QA Director

Martin B. Kudlesky, CPC, Senior QA Scientist

Danielle M. Leauby, QA Scientist

Marybeth Ousey, QA Scientist

E. Bryan Rivers, QA Scientist

A copy of this cover sheet with appropriate signatures must accompany all listed reports.

DATA VALIDATION REPORT
TARGET COMPOUND LIST VOLATILES
AND ADDITIONAL COMPOUNDS
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the 6 groundwater sampling locations sampled on October 19, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number WL-1644 which contained 6 groundwater samples, 1 field duplicate sample, 1 field blank, and 1 trip blank. All samples in this report were analyzed by Katahdin Analytical Services, Inc. (formerly PACE Incorporated Environmental Laboratories), Westbrook, Maine, following United States Environmental Protection Agency (EPA) Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846) Method 8240 for target compound list volatiles and the additional compound 2,4,4-trimethyl-2-pentene and 2,4,4-trimethyl-1-pentene.

Because the analyses were not performed according to the EPA Contract Laboratory Program (CLP) methods, the findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was performed according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Organics Analysis (data validation guidelines), February 1988, where applicable. The validation performed was a Tier II level validation which evaluates data reporting forms only. When necessary, raw data was also evaluated to obtain further information.

The support documentation in Appendix A of this report summarizes the specifics of this review. Appendix A also provides the sample results as reported by the laboratory. The data summary lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers section. Other issues which were identified which did not warrant qualification are detailed in the Notes Section.

SMITH

FINDINGS/QUALIFIERS

This data validation report addresses Katahdin work order number WI -1644 which contained 6 groundwater samples, 1 field duplicate sample, 1 field blank, and 1 trip blank. The data were evaluated for the following parameters:

* data completeness
* holding times
* GC/MS Tuning
  calibrations
  blanks
* surrogate recoveries
  matrix spike/matrix spike duplicate results
* field duplicate reproducibility
  laboratory duplicate reproducibility
  laboratory control sample results
* internal standard performance
+ compound identification

* All criteria were met for this parameter.
\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the following data qualifications:

1. The methylene chloride results are negated in samples GW-81D (WL-1644-6), the field blank sample GW-300 (WL-1644-10), and Trip Blank (WL-1644-11) due to method blank contamination. The reported concentrations have been changed to reflect adjusted quantitation limits.

2. The following sample results are negated due to field blank contamination. The reported concentrations have been changed to reflect adjusted quantitation limits.

   - acetone in samples GW-80S (WL-1644-1), GW-80D (WL-1644-2), GW-80BR (WL-1644-3), and GW-65BR (WL-1644-8).

   - toluene in samples GW-81D (WL-1644-6), GW-81BR (WL-1644-7), GW-65BR (WL-1644-8), and the field duplicate sample GW-81D (WL-1644-9)

3. All positive acetone results are estimated because the initial calibration percent relative standard deviation (%RSD) exceeded 30%. It is noted that the positive acetone results for the groundwater samples are previously negated due to field blank contamination.

4. A laboratory duplicate sample was performed for field sample GW-80BR (WL-1644-3). Smith Environmental Technologies Corporation has established a maximum relative percent difference (RPD) criteria of 30 percent for aqueous samples to evaluate the precision of these results. Due to RPDs of greater than 30 percent, vinyl chloride, chloroethane, 1,1-dichloroethane, and 1,2-dichloroethane are estimated. Details are provided on the Laboratory Worksheet included in Appendix A.

5. The retention time for 1,1,2-trichloroethane for sample GW-80BR (WL-1644-3) is 16.08 which is the same as the retention time for tetrachloroethene in this sample. The sample spectra for both 1,1,2-trichloroethane and tetrachloroethene for this sample are the same and best match the reference spectrum for tetrachloroethene. However, since mass spectrum includes the 97 quantitation ion for 1,1,2-trichloroethane, the reported result for 1,1,2-trichloroethane in sample GW-80BR (WL-1644-3) is considered presumptively present and qualified with an "N".

6. All sample results identified at concentrations less than the reporting limits are estimated.

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. The following observations were noted based upon review of the sample mass spectra. Identifications are considered valid, there is no effect on the data.

   - The mass spectra for acetone, 1,1-dichloroethene, and 4-methyl-2-pentanone for sample GW-80BR (WL-1644-3) exhibited low abundances for their associated primary ions and extraneous ions. Since the proper primary ions were used for quantitations, the reported concentrations are considered valid.

   - The mass spectra for chlorobenzene and 1,1,2,2-tetrachloroethane for sample GW-80BR (WL-1644-3) exhibited extraneous ions and elevated ion peaks. Since the proper primary ions were used for quantitations, the reported concentrations are considered valid.

- The mass spectrum for toluene for sample GW-81D (WL-1644-6) exhibited a low abundance for the primary ion and extraneous ions. Since the proper primary ion was used for quantitation, the reported concentration is considered valid.

SUMMARY

This review has identified laboratory and field blank contamination, initial calibration results, laboratory duplicate variability, and presumptive compound evidence as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix A.

SMITH

QUALIFIER CODES

U - The compound was analyzed for but not detected. The associated numerical value is the sample quantitation limit. The detected compound was present in the associated blank(s) at a similar concentration, it is not considered to be present in the sample. The qualified quantitation limit has been elevated to either the sample concentration or the method quantitation limit, whichever is higher.

J - The associated numerical value is an estimated concentration.

UJ - The compound was analyzed for, but was not detected. The sample quantitation limit is an estimated quantity.

N - Denotes presumptive evidence of a compound.

DATA VALIDATION REPORT
TARGET COMPOUND LIST SEMIVOLATILES
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the 6 groundwater sampling locations sampled on October 19, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number WL-1644 which contained 6 groundwater samples, 1 field duplicate sample, and 1 field blank. All samples in this report were analyzed by Katahdin Analytical Services, Inc. (formerly PACE Incorporated Environmental Laboratories), Westbrook, Maine, following United States Environmental Protection Agency (EPA) Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846) Method 8270 for target compound list semivolatiles.

Because the analyses were not performed according to the EPA Contract Laboratory Program (CLP) methods, the findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was performed according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Organics Analysis (data validation guidelines), February 1988, where applicable. The validation performed was a Tier II level validation which evaluates data reporting forms only. When necessary, raw data were also evaluated to obtain further information.

The support documentation in Appendix B of this report summarizes the specifics of this review. Appendix B also provides the sample results as reported by the laboratory. The data summary lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers Section. Other issues which were identified which did not warrant qualification are detailed in the Notes Section.

FINDINGS/QUALIFIERS

This data validation report addresses Katahdin work order number WL-1644 which contained 6 groundwater samples, 1 field duplicate sample, and 1 field blank. The data were evaluated for the following parameters:

* data completeness
* holding times
* GC/MS Tuning
  calibrations

SMITH

blanks
* surrogate recoveries
+ matrix spike/matrix spike duplicate results
field duplicate reproducibility
laboratory duplicate reproducibility
* laboratory control sample results
internal standard performance
* compound identification

* All criteria were met for this parameter.
\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the following data qualifications:

1. The bis(2-ethylhexyl)phthalate results are negated in samples GW-80S (WL-1644-1), GW-80D (WL-1644-2), GW-80BR (WL-1644-3), GW-81D (WL-1644-6), GW-81BR (WL-1644-7), GW-65BR (WL-1644-8), the field duplicate sample GW-81D (WL-1644-9), and the field blank sample GW-300 (WL-1644-10) due to method blank contamination. The reported concentrations have been changed to reflect adjusted quantitation limits.

2. The phenol results are negated in samples GW-80S (WL-1644-1), GW-80D (WL-1644-2), and GW-80BR (WL-1644-3) due to field blank contamination. The reported concentrations have been changed to reflect adjusted quantitation limits.

3. The positive 4-methylphenol result in sample GW-80D (WL-1644-2) is estimated because the initial calibration percent relative standard deviation (%RSD) exceeded 30%.

4. The quantitation limits for bis(2-chloroethyl)ether in samples GW-80S (WL-1644-1), GW-81BR (WL-1644-7), the field duplicate sample GW-81D (WL-1644-9), and the field blank sample GW-300 (WL-1644-10) are estimated because the continuing calibration percent difference (%D) exceeded 50%.

5. A laboratory duplicate sample was performed for field sample GW-80BR (WL-1644-3). Smith Environmental Technologies Corporation has established a maximum relative percent difference (RPD) criteria of 30 percent for aqueous samples to evaluate the precision of these results based upon Region I guidance for field duplicate results. Due to RPDs of greater than 30 percent, positive results for phenol, 2-

methylphenol, 4-methylphenol, and bis(2-ethylhexyl)phthalate are estimated in sample GW-80BR (WL-1644-3).

6. Field duplicate results were reviewed to evaluate duplicate precision. Due to a RPD greater than 30 percent, the positive result and the quantitation limit for di-n-octylphthalate is estimated in sample GW-81D (WL-1644-6) and the field duplicate sample GW-81D (WL-1644-9). Diethylphthalate and di-n-butylphthalate were detected in sample GW-81D (WL-1644-6) at estimated concentrations below the reporting limits but were not detected in GW-81D (WL-1644-9). Bis(2-ethylhexyl)phthalate was detected in both samples but is negated due to blank contamination. No further qualification is required for diethylphthalate, di-n-butylphthalate, and bis(2-ethylhexyl)phthalate.

7. Due to low chrysene-d12 and perylene-d12 internal standard areas, quantitation limits are estimated for pyrene, butylbenzylphthalate, 3,3'-dichlorobenzidine, benzo(a)anthracene, chrysene, bis(2-ethylhexyl)phthalate, di-n-octylphthalate, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h) anthracene, and benzo(g,h,i)perylene in sample GW-80BR (WL-1644-3).

8. All sample results identified at concentrations less than the reporting limits are estimated.

NOTES

The following item was noted during the validation review which did not impact results or necessitate further qualification of data:

1. The matrix spike (MS) sample met the accuracy criteria for all spiked compounds. A matrix spike duplicate (MSD) analysis was not performed; therefore, MS/MSD precision criteria could not be evaluated. Instead, the laboratory performed a laboratory duplicate analysis of sample GW-80BR (WL-1644-3) to evaluate precision. Qualifications based upon the laboratory duplicate analysis results are discussed in Item 5 of the Findings/Qualifiers Section.

SUMMARY

This review has identified laboratory and field blank contamination, initial and continuing calibration variability, laboratory and field duplicate variability, and low internal standard areas as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix B.

SMITH

QUALIFIER CODES

U - The compound was analyzed for but not detected. The associated numerical value is the sample quantitation limit. Because the qualified compound was present in the associated blank(s) at a similar concentration it is not considered to be present in the sample. The qualified quantitation limit has been elevated to either the sample concentration or the method quantitation limit, whichever is higher.

J - The associated numerical value is an estimated concentration.

UJ - The compound was analyzed for, but was not detected. The sample quantitation limit is an estimated quantity.

DATA VALIDATION REPORT
PESTICIDE ORGANIC COMPOUNDS
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

A data validation was performed on the analytical data from the 6 groundwater sampling locations sampled on October 19, 1995 at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number WL-1644 which contained 6 groundwater samples, 1 field duplicate sample, and 1 field blank. All samples in this report were analyzed by Katahdin Analytical Services, Inc. (formerly PACE Incorporated Environmental Laboratories), Westbrook, Maine, following United States Environmental Protection Agency (EPA) *"Test Methods for Evaluating Solid Waste, Physical/Chemical Methods"* (SW-846) Method 8080 for pesticide organic compounds.

Because the analyses were not performed according to the EPA Contract Laboratory Program (CLP) methods, the findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical methods and provided by the laboratory. The quality assurance review was performed according to EPA Region I *"Laboratory Data Validation Functional Guidelines for Evaluating Organics Analysis"* (data validation guidelines), February 1988, where applicable to Method 8080. In addition, EPA Region III *"Modifications to National Functional Guidelines for Pesticide/Aroclor Data Review"*, May 1993, was applied to the data for the evaluation of surrogates, since it provides updated guidance for qualification of sample results based upon two surrogate compound recoveries.

The support documentation in Appendix C of this report summarizes the specifics of this review. Appendix C also provides the sample results as reported by the laboratory. The data summary lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers Section. Other issues which were identified which did not warrant qualification are detailed in the Notes Section.

FINDINGS/QUALIFIERS

This data validation report addresses Katahdin work order number WL-1644 which contained 6 groundwater samples, 1 field duplicate sample, and 1 field blank. The data were evaluated for the following parameters:

* data completeness
* holding times

SMITH

+ instrument performance
  calibrations
* blanks
  surrogate recoveries
  matrix spike results
* field duplicate reproducibility
  laboratory duplicate reproducibility
* laboratory control sample results
* compound identification and retention time criteria

* All criteria were met for this parameter.

\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the following data qualifications:

1. According to SW-846, all continuing calibration standards (CCs) must respond within 15 percent difference (%D) of the initial calibration standards. For the CC (File ID 8OCB238.RST) analyzed on the DB608 column, heptachlor, endrin aldehyde, and endrin ketone exhibited a decrease in response greater than 15 %D. All the compounds for the DB1701 column were within the %D criteria. There are no positive results or identifications for endrin ketone and endrin aldehyde above the practical quantitation limit (PQL) on the DB1701 column for any of the samples in this case. However, heptachlor was identified in sample GW-80BR (WL-1644-3) on both columns above the PQL. The lower of the two values was reported by the laboratory from the DB608 column. Since the DB608 column response exhibited a greater than 15 %D, the positive results for heptachlor in sample WL-1644-3 and in the laboratory duplicate sample GW-80BR (WL-1644-5) are estimated.

2. The field chain of custody indicated that the matrix spike (MS) and laboratory duplicate (LD) samples were to be analyzed from sampling location GW-80BR (WL-1644-3). A matrix spike duplicate was not performed on this sample. Therefore, the MS/MSD precision could not be evaluated. The MS sample exhibited low percent recoveries (%Rs) for aldrin and dieldrin. Due to the low %Rs, the PQLs for aldrin and dieldrin in sample WL-1644-3 are estimated.

The laboratory performed a laboratory duplicate analysis of sample GW-80BR (WL-1644-3) to evaluate precision. Smith Environmental Technologies Corporation has established a maximum relative percent difference (RPD) criteria of 30 percent for aqueous samples to evaluate the precision of the duplicate results based upon Region I guidance for field duplicates. Delta-BHC was detected in the laboratory duplicate of WL-1644-3 above the PQL, but it was not detected in the original analysis. Due to the RPD greater than 30% for delta-BHC, the PQL in sample WL-1644-3 and the positive result in the laboratory duplicate sample GW-80BR (WL-1644-5) are estimated.

It is further noted that the laboratory analyzed batch quality control (QC) which consisted of a method blank and a laboratory control sample (LCS). The method blanks and the LCS for all compounds are within the laboratory established QC limits.

3. Due to surrogate compound recovery outliers, the following samples are qualified:

   - beta-BHC and heptachlor in sample GW-80BR (WL-1644-3) are estimated,
   - heptachlor, beta-BHC and delta-BHC in sample GW-80BR (WL-1644-5) are estimated, and
   - all non-detected pesticides in sample GW-81BR (WL-1644-7) are estimated.

   It is further noted that WL-1644-5 is the laboratory duplicate analysis of sample WL-1644-3.

4 Smith Environmental Technologies Corporation has adopted a maximum acceptance criteria for the evaluation of chromatograms that exhibit on-scale interferences. Chromatograms with on-scale interferences greater than 25% of full scale have been closely evaluated to determine the impact on the quantitation limits in the range of the interference. Sample GW-80BR (WL-1644-3) exhibited on-scale positive peak interferences at different retention times throughout the entire chromatogram on both the DB608 and the DB1701 columns. As a result, the positive results for beta-BHC and heptachlor, and the PQLs for non-detected compounds in sample WL-1644-3 are estimated. Positive on-scale interferences, may be indicative of carryover.

It is further noted that the MS sample and the LD analysis of sample WL-1644-3 exhibited the same positive on-scale interference as the unspiked sample. There is no impact on the rest of the samples in this case due to the positive on-scale interference exhibited in the MS and LD.

NOTES

The following items were noted during the validation review which did not impact results or necessitate further qualification of data:

1. According to SW-846, the initial calibration percent relative standard deviation (%RSD) for all pesticide compounds must be below 20%. Due to the non-linearity of the low level concentration standard of 0.01 nanograms per microliters (ng/µL), there are several compounds analyzed on the DB1701 and the DB608 columns that exceeded the 20% criteria. However, the PQLs are based on the 0.05 ng/µL standard which is within the linear calibration of the instrument. Therefore, there is no impact on the reported PQLs. For the compounds that did not meet the 20% criteria, there are no positive results above the PQLs. Therefore, no qualification is necessary due to %RSD criteria. See Appendix C for support documentation.

2. Samples GW-80S (WL-1644-1), the matrix spike GW-80BR (WL-1644-4), and the field blank GW-300 (WL-1644-10) have one surrogate recovery out of criteria. No qualification is necessary when one surrogate falls out of criteria.

   It is further noted that there are two peaks present near the retention time (RT) of tetrachloro-m-xylene (TCX) in sample WL-1644-10. Both peaks were integrated as one and identified as TCX. Therefore, due to poor integration of the two peaks and the incorrect identification of TCX, the percent recovery of TCX in sample WL-1644-10 is biased high. The peak area for TCX appears to be high enough that, if the peaks were reintegrated properly, the %R would be within criteria.

SMITH

SUMMARY

This review has identified continuing calibration variability, poor accuracy results, laboratory duplicate variability, and surrogate outliers, on-scale positive inferences, and initial calibration outliers areas as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix C.

GW-80BR (UNFILT/MS)	Aqueous	R. MEHALICK	10/19/95	10/19/95

PARAMETER	RESULT	UNITS	DF	*PQL	METHOD	ANALYZED	BY	NOTES
TCL Volatile Organics + Trimethylpentenes by USEPA 8240								1,2
Chloromethane	370.	µg/L	10	10	EPA 8240	10/20/95	TG	
Bromomethane	460.	µg/L	10	10	EPA 8240	10/20/95	TG	
Vinyl chloride	780.	µg/L	10	10	EPA 8240	10/20/95	TG	
Chloroethane	1300.	µg/L	10	10	EPA 8240	10/20/95	TG	
Methylene chloride	B690	µg/L	10	10	EPA 8240	10/20/95	TG	
Acetone	710.	µg/L	10	15	EPA 8240	10/20/95	TG	
Carbon disulfide	470.	µg/L	10	10	EPA 8240	10/20/95	TG	
1,1-Dichloroethene	630.	µg/L	10	5	EPA 8240	10/20/95	TG	
1,1-Dichloroethane	1800.	µg/L	10	5	EPA 8240	10/20/95	TG	
Total 1,2-Dichloroethene	11000.	µg/L	100.	5	EPA 8240	10/20/95	TG	
Chloroform	510.	µg/L	10	5	EPA 8240	10/20/95	TG	
1,2-Dichloroethane	520.	µg/L	10	5	EPA 8240	10/20/95	TG	
2-Butanone	550.	µg/L	10	15	EPA 8240	10/20/95	TG	

* PQL (Practical Quantitation Level) represents laboratory reporting limits and may not reflect sample-specific reporting limits. Sample-specific limits are indicated by results annotated with '<' values.

(1) "B" flag denotes detection of this analyte in the laboratory method blank analyzed concurrently with the sample.

(2) Sample dilution required for quantitation of one or more target analytes; therefore, standard laboratory Practical Quantitation Level (PQL) could not be achieved.

* Only positive hits have been included. The remaining compounds were not detected in the method blank.

~ The Dilution Factor (DF) indicates whether a sample, prepared in accordance with the analytical method protocol, was diluted prior to analysis. The Dilution Factor could also indicate that a smaller aliquot than specified in the method was utilized for sample preparation and analysis. For example, a dilution factor of 5 means that the sample was effectively diluted by a factor of 5 prior to analysis, i.e., the sample was analyzed at 20% its reported concentration.

"J"flag denotes an estimated value less than the Laboratory's Practical Quantitation Level.

"B"flag denotes detection of this analyte in the laboratory method blank currently analyzed with sample.

NC = Not Calculated

^ Only positive results have been included. The remaining compounds were not detected.

* The laboratory does not use the calculated relative percent difference (RPD) for sample duplicates to assess quality control; RPD data for sample duplicates are used to evaluate method precision for the environmental sample matrix. Please refer to LCS data for assessment of quality control for this method.

APPENDIX B

Volatile/Semivolatile Data Validation Summary — SMTH

SMTH Project Name: Olin - Wilmington
SMTH Project No.: 00-7074-0102
Project Manager: Bruce Cushing
Laboratory: Pace
Case No./SDG: WL-1644
Sampling Date(s): 10/19/95
Reviewed By: M. Kudlesky
Completion Date: 6/21/96

Fraction Reviewed: [ ] VOLATILE ORGANICS [X] SEMIVOLATILE ORGANICS

Compound List: [X] TCL [ ] Priority Pollutant [ ] Appendix IX [ ] Other

Method: [ ] CLP SOW ____ [ ] 40 CFR 136 Method ____ [X] SW-846 Method 8270 [ ] Other

The following table indicates the data validation criteria examined, problems identified, and QA acti

Data Validation Criteria:	accept	FYI	qualify	comments
Holding Times	✓	✓		WL-1644-1RE, 2RE, & 4RE (MS) re-extracted w/in hold time.
GC/MS Tuning	✓			
Initial Calibrations	(NA) ✓		✓	MS1 = 4-methylphenol & hexachloroethane %RSD > 3 but LT 50%. Estimate positive results
Continuing Calibrations			✓	28800 - bis(2-chloroethyl)ether
Blank Analysis Results			✓	bis(2-ethylhexyl)phthalate questioned due to method blanks. Phenol - Rinse b
System Monitoring/Surrogate Results	✓	✓		Blanks - OK, LCS - OK, RE/DLs - OK. 644-6 1:300 - surrog diluted out
Matrix spike / lab duplicate ~~MS/MSD~~ Results		✓	✓	MS %Rs - OK. Duplicate %RPDs >20% for 8% compounds
Field Duplicate Results		✓		Diethylphthalate & di-n-butylphthalate detected in GW-8ID below QL; not detected in GW-8ID (Field ~~bis(2-ethylhexyl)phthalate detected in both~~ but questionable
Internal Standard Areas/RT			✓	WL-1644-3 (DF 1.0 & 1.0RE) chrysene D12 & Perylene
Target Compound Identification	✓			Quant report reviewed / compared to report form - OK. Mass spectra OK
TIC Identification		✓		N/A
Quantitation/Detection Limits	✓			Transcriptions for hits on report forms verified from quant report.
System Performance	✓			
Overall Assessment of Data	✓			
Other: LCS	✓			LCS spike %Rs OK

General Comments: _____

NA - Not applicable
NR - Not reviewed

* PQL (Practical Quantitation Level) represents laboratory reporting limits and may not reflect sample-specific reporting limits. Sample-specific limits are indicated by results annotated with '<' values.
(1) Sample Preparation on 10/26/95 by RAL using EPA 3520
(2) "J" flag denotes an estimated value less than the Laboratory's Practical Quantitation Level.
(3) "E" flag indicates an estimated value. The analyte was detected in the sample at a concentration greater than the standard calibration range.
(4) Sample dilution required for quantitation of one or more target analytes; therefore, standard laboratory Practical Quantitation Level (PQL) could not be achieved.

* PQL (Practical Quantitation Level) represents laboratory reporting limits and may not reflect sample-specific reporting limits. Sample-specific limits are indicated by results annotated with '<' values

(1) Sample Preparation on 10/20/95 by RAL using EPA 3520
(2) "J" flag denotes an estimated value less than the Laboratory's Practical Quantitation Level.
(3) "B" flag denotes detection of this analyte in the laboratory method blank analyzed concurrently with the sample.

Compound	Concn (ug/L)
bis(2-ethylhexyl)Phthalate	J6 X 10 = 60

Only positive hits have been included. The remaining compounds were not detected in the method blank.

The Dilution Factor (DF) indicates whether a sample, prepared in accordance with the analytical method protocol, was diluted prior to analysis. The Dilution Factor could also indicate that a smaller aliquot than specified in the method was utilized for sample preparation and analysis. For example, a dilution factor of 5 means that the sample was effectively diluted by a factor of 5 prior to analysis, i.e., the sample was analyzed at 20% its reported concentration.

"J" flag denotes an estimated value less than the Laboratory's Practical Quantitation Level.
"B" flag denotes detection of this analyte in the laboratory method blank analyzed concurrently with sample.

^ Only positive results have been included. The remaining compounds were not detected.
* The laboratory does not use the calculated relative percent difference (RPD) for sample duplicates to assess quality control; RPD data for sample duplicates are used to evaluate method precision for the environmental sample matrix. Please refer to LCS/LCSD data for assessment of quality control for this method.

"J" flag denotes an estimated value. The analyte was detected in the sample at a concentration greater than the measured detection limit but less than the laboratory's Practical Quantitation Level.

* Acceptance ranges are obtained when available from the applicable US EPA analytical method. These ranges are based upon method performance data generated from the analysis of quality control check samples and not actual environmental samples. The laboratory does not use the MS/MSD acceptance ranges as quality control acceptance criteria; the MS/MSD data are used to evaluate method performance for the environmental sample matrix. Please refer to LCS/LCSD data for assessment of quality control for this method.

APPENDIX C

Pesticide/PCB Data Validation Summary

BCM Project Name: Clin. Wilmington
BCM Project No.: 20-7074-0102
Project Manager: Bruce Cushing
Laboratory: Pace, Inc.

Case No./SDG WCL16244
Sampling Date(s): 10/19/95
Reviewed By: Danielle Leauby
Completion Date: 6/12/96

Compound List: [X] TCL [ ] Priority Pollutant [ ] Appendix IX [ ] Other ____

Method: [ ] CLP SOW ____ [ ] 40 CFR 136 Method ____ [X] SW-846 Method 8000 8260. ext by 3510 [ ] Other ____

The following table indicates the data validation criteria examined, problems identified, and QA action.

Data Validation Criteria:	accept/	FYI/	qualify	comments
Holding Times	✓	✓		sampled 10/19 ext. 10/20 analyzed 10/23 + 10/24
Instrument Performance		✓		on cals interference noted
- Resolution Check		✓		NA samples analyzed by Hrd ECD.
- PEM Check / EVALUATION Mix	✓	✓		%B of endrin + DDT acceptable on both channels initial & VER acceptable
- TMX/DCB Retention Time	✓	✓		No shifts noted from ccals
- Retention Time Windows	✓	✓		information not provided (req.) See response SOW#6 and 8000
Initial Calibrations		✓		%RSD above 20% for TMX/DCB ccals both channels labused cal. curve to quantitate, TMX/DCB stds run on different instrument
Continuing Calibrations		✓		%DS not provided (req.) 0.005–0.015 ng/L outliers cannot verify WOBBK ICAL info from different column
Blank Analysis Results	✓	✓		No target compds confirming
Surrogate Recoveries		✓	✓	QC limits provided inquiry response—outliers present labed. QC limits
MS/MSD Results matrix spike / matrix duplicate		✓	✓	lab dup - non detect & present so delta RPD - estimate RL + RPD result / Also 1 diff out of %R criteria - estimate RL
Field Duplicate Results	✓	✓		Both field dups non detects
Target Compound Identification	✓	✓		ccals above MDL reported only
Quantitation/Detection Limits	✓	✓		Laboratory using MDLs 0.05 + 0.1 ng/L
Overall Assessment of Data		✓	✓	useable as qualified
Other:		✓		TMX CHA RF 9408870 CHB 9975150 DCB CHA RF 9508730 CHB 12494245

General Comments: ① No ICAL, CCAL or QC summary forms provided, ② Lab uses calibration curves not RFs to quant, dcoff not provided.
ICAL - WOBA analyzed on 8/21/95; WOBA analyzed on 10/12/95; TOX analyzed on 9/10/95
Samples concentrated to 1.0 ml instead of 10 ml
ICAL - TMX/DCB stds analyzed on different instrument from samples & cont cals.

NA - Not applicable
NR - Not reviewed

Compound	Conc. (ug/L)

* Only positive hits have been included. The remaining compounds were below the laboratory Practical Quantitation Levels.

~ The Dilution Factor (DF) indicates whether a sample, prepared in accordance with the analytical method protocol, was diluted prior to analysis. The Dilution Factor could also indicate that a smaller aliquot than specified in the method was utilized for sample preparation and analysis. For example, a dilution factor of 5 means that the sample was effectively diluted by a factor of 5 prior to analysis, i.e., the sample was analyzed at 20% its reported concentration.

* Acceptance range as specified in EPA Method 8080; insufficient laboratory data are available to generate statistically based limits.

^ Acceptance range established using laboratory statistical 99% confidence ranges for LCS spike compound recoveries.

** EPA method 8080 does not specify acceptance criteria for this compound; insufficient laboratory data are available to generate statistically based limits.

See cover letter for additional information.

REPORT OF LABORATORY ANALYSIS

November 17, 1995

Mr. Don Cameron
Olin Chemicals
51 Eames Street
Wilmington, MA 01887

RE: PACE Lab Number: WL1644
Project ID: Wilmington
Project Manager: Mr. Jon B. Boutet
Sample Receipt Date: October 19, 1995

Dear Mr. Cameron:

Please find enclosed the following information:

* Reissued Report of Analysis

Sample WL1644-4 (Client ID-GW-80BR) was originally logged in as a duplicate of WL1644-3 (Client ID-GW-80BR). Sample WL1644-5 (Client ID-GW-80BR) was originally logged in as a matrix spike of WL1644-3. Due to laboratory error sample WL1644-4 was spiked instead of WL1644-5 for pesticide analyses. WL1644-5 was analyzed as the duplicate for the same analyses.

Because the correct sample was spiked for volatile and semivolatile analyses, it is not possible to change the site identifications for the pesticide samples through our LIMS system. We have hard corrected the site Ids for sample WL1644-4 and WL1644-5 for pesticide analyses. Sample WL1644-4 not reads GW-80BR (unfilt/spk) and sample WL1644-5 reads GW-80BR (unfilt/dup) for the pesticide analyses. The hand corrected pages have been signed and dated and are included for insertion into your report. We were not able to correct the diskette without affecting other analyses. We apologize for any inconvenience this error may have caused you.

Should you have any questions or comments concerning this Reissued Report of Analysis, please do not hesitate to contact the project manager listed above. This cover letter is an integral part of the ROA.

cc: Bruce Cushing, Project Manager, SMTH
DATA VALIDATION REPORT

Pace Laboratories Case No.: WL-1644
Project Name: Semi-Annual Groundwater Monitoring - Wilmington, MA

June 18, 1996

Dear Ms Pepin:

There are several summary forms and information that was not provided in the data package. The information and/or forms are necessary in order to complete the data validation. The following is a list information and questions that pertain to the pesticides data package for WL-1644:

1. A Case Narrative explaining any information about the samples, Login information, the analytical methods use for analysis, detailed information of any quality control (QC), problems that arose through out the sample analysis, etc.. should be including in the data package. Please provide a Case Narrative.

2. The sequence listings for the initial calibration standards were not provided. Please provide the sequence listings that documents the initial individual mix A (INDA) calibration standards, the initial individual mix B (INDB) calibration standards, an initial evaluation mix (EVAL) run prior to the INDA standards, and the toxaphene initial calibration standards.

3. The raw data for the initial EVAL run prior to the INDA standards was not provided. Please provide the raw data. This EVAL is needed in order to determine the percent breakdown prior to the standards.

4. The Retention Time Windows (RTWs) for each compound were not provided. Please provide the RTWs for each compound so that an assessment of RT can be performed. Also, please provide an explanation of the laboratory's procedure for updating the RTWs?

5. The EPA Method 8080 and the Contract Laboratory Protocol (CLP) Statement of Work (SOW) requires that all compounds to be below an initial calibration percent relative standard deviation (%RSD) of 20 %. Most of the compounds for the INDA standards are out of the method criteria. What is the laboratory's established acceptance criteria for the %RSDs? If the laboratory uses either of the method requirements, please explain why the system was not recalibrated prior to samples analysis?

6. The EPA Method 8080 requires that the Continuing Calibration (CC) standards meet a percent difference (%D) of 15 % for each compound. This information or any other information used for the comparison of the CC standards to the initial calibration standards was not provided. Please provide a summary form or a list of all the %Ds for each CC standard analyzed. If necessary, please provide an explanation of the laboratory's procedure for verifying the CC standards.

7. What are the known and expected amounts for the two surrogates, tetra-m-xylene (TMX) and decachlorobiphenyl (DCB). The information is needed in order to calculate the percent recoveries (%Rs) of the surrogates in each sample. Also, what response factors (RFs) are being used to calculate the raw amounts of TMX and DCB in the samples? What standards are the RFs for TMX and DCB being calculated from?

8. The raw data for the initial 0.25 INDB standard for Channel A (DB1701) was not provided. Please provide the raw data for the INDB standard.

9. The response factors (RFs) on the initial calibration summary form for the initial 0.05 INDA standard analyzed on Channel A (DB1701) are incorrect for all compounds. It appears that the area counts on the quantitation reports were divided by 0.1 instead of 0.05. Please verify the RFs for the 0.05 INDA standard. If the RFs are incorrect, please revise and resubmit the initial calibration data for Channel A (the RFs, the %RSDs, and the averages), the CC standards quantitation, and the quantitation of the samples.

10. The initial calibration summary form for methoxychlor on Channel B (DB608) documents the RFs for the 0.01 and the 0.025 standards as 2.508E+6. However, according to the raw data the RFs should be 1.397E+6 and 2.2345E+6, respectively. Please verify the RFs for the methoxychlor 0.01 and the 0.025 standards. If the RFs are incorrect, please revise and resubmit all affected data (see inquiry item 9 above).

11. The initial calibration summary form for gamma-chlordane and alpha-chlordane on Channel A (DB1701) documents the RFs for the 0.4 as 9.2184E+6 and 9.0246E+6, respectively. However, according to the raw data the RFs should be 9.4607E+6 and 9.2906E+6, respectively. Please verify the RFs for the gamma-chlordane and alpha-chlordane 0.4 standard. If the RFs are incorrect, please revise and resubmit all affected data (see inquiry item 9 above).

Please resubmit all appropriate data, forms, and information for the initial calibration standards, (CC) standards, and the samples to me by June 24, 1996 so that the package review may be completed. If you have any questions regarding this inquiry, please feel free to call me at (610) 825-3800 ext. 265.

Thank you,
Danielle M. Leauby

DATA VALIDATION REPORT

Pace Laboratories Case No.: WL-1644
Project Name: Semi-Annual Groundwater Monitoring - Wilmington, MA

June 19, 1996

Dear Ms Pepin:

The following questions pertain to the pesticides data package for WL-1644:

1. The concentration units of the initial calibration (ICAL) standards and continuing calibrations (CC) standards were not provided. Please provide the units.

2. The calculated raw amount on the sample quantitation reports can not be reproduced with the information provided. Please provide the proper response factors (RFs) in order to quantitate the sample concentrations. If the correct RFs were provided then please explain how the raw amounts are calculated. Also, provide a example calculation. If the RFs provided are correct, the sample concentrations (raw amounts) are incorrect, and the samples need to be requantitated with proper RFs, then please verify that all positive results that are above the practical quantitation limits (PQLs) are reported.

3. Review of the reporting form for the spiked samples indicates that estimated values (below the PQLs) were reported. Please explain why these values were reported in the spiked sample and not in any of the other samples.

4. Review of the raw data indicates that the retention times (RTs) of the CC standards and the samples shifted from the ICAL standards. Please provide information or an explanation indicating that the RTs and the RT windows were updated in order to identify target compounds properly in the samples.

5. Please provide the laboratory established quality control (QC) limits for percent recoveries for 2,4,5,6-tetrachloro-m-xylene (TMX) and decachlorobiphenyl (DCB).

Please resubmit all appropriate data, forms, and information for the samples to me by June 21, 1996 so that the package review may be completed. If you have any questions regarding this inquiry, please feel free to call me at (610) 825-3800 ext. 265.

Thank you,
Danielle M. Leauby

ANALYTICAL SERVICES

June 20, 1996

Ms. Danielle M. Leauby
Smith Environmental Technologies Corporation
Plymouth Meeting, PA

Dear Ms. Leauby:

This letter is written in response to your June 19, 1996 fax requesting additional information (Inquiry No. PESTQ2) for the pesticides fraction of Pace Laboratories Case No. WL1644 for the Semi-Annual Groundwater Monitoring at the Olin Chemicals Wilmington, MA site.

The following explanations are given to your questions:

1. The concentration units of the initial calibration (ICAL) standards and continuing calibrations (CC) standards are ng/uL.

2. The calibration procedure for method 8080 is taken from the general calibration procedures referenced in SW 846 method 8000. Section 7.4.2.2 of method 8000 states that the following calibration procedure should be employed:

"Tabulate peak height or area responses against the mass injected. The results can be used to prepare a calibration curve for each analyte. Alternatively, for samples that are introduced into the gas chromatograph using a syringe, the ratio of the response to the amount injected (CF), can be calculated for each analyte at each standard concentration. If the percent relative standard deviation (%RSD) of the calibration factors is less than 20% over the working range, linearity through the origin can be assumed and the average calibration factor can be used in place of a calibration curve."

The former Pace laboratory chose to use the calibration curve for the quantitation of all pesticide samples. The %RSD is provided on the initial calibration forms only to provide information about the initial calibration. The calibration curves were prepared using the equation:

$$y = mx + b$$

where,

y = response (height or area)
m= slope of the line between two calibration points
x = amount injected (ng/uL)
b = y-intercept of the line

The above curves are generated automatically through our PE Nelson Turbochrom data system software. The former Pace Laboratory used peak area for the quantitation of single component pesticides and used peak height for the quantitation of multi-component pesticides. The amount injected (in ng as calculated above) is then used in the following equation to calculate a sample specific result:

$$\text{conc (ug/L)} = \frac{(Vt)(x)(D)}{(Vi)}$$

where,

Vt = Volume of extract
x = amount injected (ng/uL) as calculated above
D = Dilution factor
Vi = Volume sample extracted

Using these equations, the reported sample concentrations can be calculated.

RECEIVED

P.O. Box 720, Westbrook, ME 04098
Tel: (207) 874-2400 Fax: (207) 775-4029

210 West Road No. 5, Portsmouth, NH 03801
Tel: (603) 431-5777 Fax: (603) 436-3356

3. Estimated values (below the PQL) were reported for the spiked samples because we knew that these compounds were really in the spiked samples (because we spiked them in). Due to matrix interfence, the decreased recovery of these compounds caused the results to be below the laboratory practical quantitation limit. Although below the PQL, results for these compounds were reported for your information.

4. Retention time windows are calculated according to the described in SW846 method 8000. Three injections of all single and multi-response products are injected throughout the course of a 72-hour period. The standard deviation of the three retention times is then calculated. Three times the standard deviation of the retention times for each standard is used to define the retention time window. Retention time windows are calculated each time a new analytical column is installed in the GC or if any major changes have been made to the chromatographic system. The retention time of the analyte from the daily continuing calibration standard (CC) is used to define the center of the daily retention time window for that analyte. These windows are updated daily in the PE Nelson Turbochrom data system. Copies of the initial 72-hour retention time windows are appended to this letter.

5. The laboratory established quality control (QC) limits for percent recoveries for TCMX and DCB are as follows:

Surrogate	Aqueous limits (%)	Soil /Solid limits (%)
TCMX	13 - 121	19 - 157
DCB	34 - 148	20 - 150

The response to Inquiry No. PESTQ1 will be sent to you under separate cover. If you have any questions or require additional information, please contact me or Lil Pepin at (207)874-2400.

Sincerely,

Kelly Perkins

July 5, 1996

RECEIVED
JUL - 8 1996
Leauby

Ms. Danielle M. Leauby
Smith Environmental Technologies Corporation
Plymouth Meeting, PA

Dear Ms. Leauby:

This letter is written in response to your June 18, 1996 fax requesting additional information (Inquiry No. PESTQ1) for the pesticides fraction of Pace Laboratories Case No. WL1644 for the Semi-Annaul Groundwater Monitoring at the Olin Chemicals Wilmington, MA site.

For this project, a MADEP QC package was requested by our client. This deliverable is not intended to provide an easily validatable package. It is intended to provide quality control information about the analytical batch (i.e. method blank, laboratory control spike, matrix spike and sample duplicate results). With the inclusion of the raw data and supporting documents, it is possible to validate a data package, although this task is not as easily accomplished as when summary forms are initially requested. At this time, we do not intend to provide additional summary forms and we give the following explanations to your questions:

1. A case narrative was not requested with this data package. A cover letter was included that would indicate any quality control (QC) problems that arose out of the sample analysis. Login information and analytical methods used in the analysis are included on the confirmation, the sample receiving documentation and on the applicable organic extraction log (pages 0000084 and 0000085 of the Pesticide Analysis section of the data report).

2. The sequence listings for the initial calibration standards are appended to this letter.

3. The raw date for the initial EVAL run prior to the INDA standards is appended to this letter

4. The retention time windows were provided in the response to PESTQ2 question 4 on June 20, 1996.

5. EPA method 8080 that all compounds in the initial calibration be below 20% relative standard deviation only if the average calibration factor is to be used for quantitation. The former Pace laboratory chose to use the calibration curve for quantitation. Please refer to the response for PESTQ2 question on June 20, 1996.

6. Method 8080 requires that continuing calibration compounds on the primary column be within 15% D from the initial calibration. If there is a hit for a particular compound, the confirmation column should also be within 15% D for that compound. The INDA continuing calibration standards were analyzed at 0.10 ng/ul. Therefore, the continuing calibration standards should be between 0.085 and 0.115 ng/ul. The INDB continuing calibration standards were analyzed at 0.25 ng/ul. Therefore, the continuing calibration standards should be between 0.2125 and 0.2875 ng/ul. The Toxaphene continuing calibration standards were analyzed at 2.5 ng/ul. Therefore, the continuing calibration standards should be between 2.125 and 2.875 ng/ul.

7. The surrogates were spiked in the samples at 0.1 ppb and in the standards at 0.1 ng/ul. The response factors for the surrogates were taken from the 0.01 ng/ul INDA standard.

8. The raw data for the initial 0.25 INDB standard is appended to this letter

340 County Road No. 5
P.O. Box 720, Westbrook, ME 04098
Tel: (207) 874-2400 Fax: (207) 775-4029

210 West Road No. 5, Portsmouth, NH 03801
Tel: (603) 431-5777 Fax: (603) 436-3356

9. The response factors on the initial calibration summary form were entered incorrectly. A corrected form is appended to this letter. Because the calibration curve- not the average RF calculated on the summary form was used for quantitation, quantitation of the continuing calibrations and the samples was not affected.

10. The data for methoxychlor on the initial calibration summary form was entered incorrectly. Corrected summary forms are appended to this letter. As in the response to inquiry item 9 above, the quantitation of the continuing calibration standards and the samples was not affected because the actual calibration curve was used for sample quantitation.

11. Corrected initial calibration summary forms for gamma-chlordane and alpha-chlordane are appended to this letter. Again, because the calibration curve was used for sample quantitation, no data was affected.

If you have any questions or require additional information, please contact me or Lil Pepin at (207)874-2400.

Sincerely,

Kelly Perkins

DATA VALIDATION REPORT

Pace Laboratories Case No.: WL-1644
Project Name: Semi-Annual Groundwater Monitoring - Wilmington, MA

July 22, 1996

Dear Ms Pepin:

The following situation pertains to the pesticides data package for WL-1644:

1. Review of the raw data for the initial calibration standards (ICALs) indicates that the INDB ICALs (alpha-chlordane and gamma-chlordane only) have different Data File names then the INDA ICALs, the continuing calibration standards (CCALs) for INDA and INDB, and the samples. Were the INDB ICALs analyzed on a different instrument, or does the naming convention of the data files change from day to day on each instrument. Please look into to this situation. If the standards and samples were all analyzed on the same instrument regardless of the Data File names, then please provide a brief explanation. If the incorrect INDB ICALs were provided, and the data must be resubmitted, then please contact me so we can discuss the impacts on the data.

Please look into this situation and let me know today what needs to be done, so that the report may be completed. If you have any questions regarding this inquiry, please feel free to call me at (610) 825-3800 ext. 265.

Thank you,
Danielle M. Leauby
Quality Assurance Scientist

ANALYTICAL SERVICES

July 23, 1996

Ms. Danielle M. Leauby
Smith Environmental Technologies Corporation
Plymouth Meeting, PA

Dear Ms. Leauby:

This letter is written in response to Inquiry No. PESTQ3 for the semi-annual groundwater monitoring at Wilmington, MA (Pace Laboratories Case No.: WL-1644). The former Pace-ME laboratory used the following convention for the naming of pesticide/PCB data files.

#AABNNN

where,

# = a number designation for the instrument
AA = a two letter designation for the month the analytical sequence was started
B = a one letter designation for the analytical sequence
NNN= a three number designation for the data file

The correct INDB initial calibration was submitted with the pesticide package for WL-1644. The INDB mix contains alpha-chlordane and gamma-chlordane only. The response for these compounds is fairly consistent on the GC/ECD system- therefore, these compounds do not require frequent recalibration.

If you have any questions, or if you require additional information, please call me or Lil Pepin at (207)874-2400.

Sincerely,

Kelly Perkins

DATA VALIDATION REPORT
SELECTED INORGANICS
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

This data review report addresses the metals data from the July 31, and August 1, 1996 groundwater sampling event at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number A1462 which consisted of 14 filtered groundwater samples and 3 field duplicate samples analyzed for ammonia, bicarbonate, carbonate, chloride and sulfate. All samples in this report were analyzed by IEA Corporation, Monroe, Connecticut, according to the laboratories Standard Operating Procedures (SOPs) which reference the United States Environmental Protection Agency (EPA) Methods for Chemical Analysis of Water and Wastes (MCAWW) or Standard Methods for the Examination of Water and Wastewater, 16th Edition, 1985 (SM), American Public Health Association (APHA). The following individual methods were referenced:

Analytes	Methods
ammonia	350.3
bicarbonate and carbonate	2320B
chloride	325.2
sulfate	375.4

Because the analyses were not performed according to the EPA Contract Laboratory Program (CLP) methods, the findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical SOPs and methods provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis (data validation guidelines), June 1988, where applicable.

The support documentation in Appendix B of this report summarizes the specifics of this review. Appendix B also provides the sample results as reported by the laboratory. The data summary table lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers Section. Issues that arose which did not warrant qualification are detailed in the Notes Section.

SMITH

FINDINGS/QUALIFIERS

These data validation report addresses the 14 filtered groundwater samples and 3 field duplicate samples analyzed for ammonia, bicarbonate, carbonate, chloride and sulfate for work order number A1462 analyzed by IEA Corporation. The groundwater data were evaluated for the following parameters:

* data completeness
* holding times
* data calibration verification
* laboratory blank analysis
+ field blank analysis

matrix spike recoveries

* laboratory duplicates

field duplicates

+ laboratory control sample results
* detection limit results
+ sample results

* All criteria were met for this parameter.

\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

1. All chloride results are estimated due to low matrix spike percent recoveries (%Rs).

2. The positive results for ammonia for the field duplicate pair Blind #2 (1462010) and GW64D (1462007) are estimated due to poor field duplicate precision. Details are provided on the Inorganic Field Duplicate Precision Worksheet included in Appendix B of this report.

SMITH

NOTES

The following items were noted during the validation review that did not impact results or necessitate further qualification of data:

1. The method qualifiers were not reported on the revised Wet Chem Analysis Data Sheets (Form 1s) for samples GW64S (1462006) and Butters Row #2 (1462008). No data are qualified. The reviewer-corrected Form 1s are included in Appendix B.

2. The %R for chloride was incorrectly reported on the Laboratory Control Sample Form (Form 6). No data are qualified. The reviewer-corrected Form 6 is included in Appendix B.

3. The analytical method referenced by the laboratory for ammonia in the case narrative is incorrect. The correct analytical method as verified by the laboratory is annotated on the case narrative is included in Appendix B. No data are qualified.

4. There were no field blanks associated with this sampling event.

SUMMARY

This review has identified a matrix spike %R and field duplicate results as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix B.

Case Narrative

Classical Chemistry - Listed below are the wet chemistry analyte methods and references for all samples analyzed in this SDG. Chloride failed the control limits for spike recovery analysis for sample Butler's Row # 1. This appears to be due to a sample matrix interference. No other analytical problems were encountered and all holding times were met.

Analyte	Method	Reference
Ammonia	~~310.1~~ 350.3	1
Bicarbonate	2320B	2
Carbonate	2320B	2
Chloride	325.2	1
Sulfate	375.4	1

EBL 10/2/96

References:

1. Methods for Chemical Analysis of Water and Wastes, USEPA 600, 1983.
2. Test Methods for the Evaluation of Solid Waste, SW846, 3rd edition, 1986.

Metals - ICAP metals were determined using a JA61 simultaneous ICAP and a JA61E trace ICAP using guidance provided in SW846 according to the following Methods: ICAP-3010/6010.

No problems occurred during analysis. All appropriate protocols were employed. All data appears to be consistent.

I certify that this data package is in compliance with the terms of this contract, both technically and for completeness, for other than the conditions detailed above. Release of this hardcopy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

CORRECTIVE ACTION FORM

A. Originator Information — **Client Inquiry** X

Client: OLIN / WILMINGTON MA
Job/Case: 7096-1462A
Date/time: 9/30/96 9:30
Sample Number(s): CC8
Client/Lab Contact: D. Plumbtree
Date/Time Response Due: 10/4/96 11:00am

Detailed Description of Potential Problem: On some places in the report the RDL for sulfate is 5 and in others its 10. Which is correct? Also sulfate for sample CC8 is reported ~~as~~ ~~Report~~ is that correct? (Ck 3.0)

B. Quality Assurance Information — **Corrective Action ID#** 1957

Recommended Corrective Action:

* DM Results for IDL's for CC4 CC8, letter to State changing Sulfate results

Groups Involved: __Sample Control __Wet Chemistry __Metals
__Gas Chromatography __Mass Spectrometry __Report Generation 10/2
__Client Service __Sample Preparation

C. Final Resolution

Describe What Happened and Long Term Corrective Action Taken:
CC4 results for Sulfate should be 5.0 RDLs & <10. Sample CC8 Sample CC8 should be <10. See attached memo from T. Tillis 10/1/96
Sent regmail

Supervisor Signature C. Ciccella Date 10/02/96 — Date/Time Client Notified:

D. Quality Assurance Final Approval (QA Manager use only)

Corrective Action Approved: _____
Date Finalized: _____
Was a problem identified? Yes / No

Mr. Bruce Cushing
OLIN CORPORATION
c/o Smith Environmental Corp.
One Plymouth Meeting
Plymouth Meeting, PA 19462

Dear Mr. Cushing:

In reference to corrective action report #4957, please find enclosed the revised analytical results for IEA report #7096-1462A.

The following tables have been revised: TABLE CC-1.0; Form I's.

The changes are based on the following issues: revised sulfate results.

Very truly yours,

Michele Scionga

DATA VALIDATION REPORT
SELECTED METALS
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

This data review report addresses the metals data from the July 31, and August 1, 1996 groundwater sampling event at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number A1462 which consisted of 14 filtered groundwater samples and 3 field duplicate samples analyzed for calcium, chromium, magnesium and sodium, and 14 unfiltered groundwater samples and 3 unfiltered field duplicate samples analyzed for chromium. All samples in this report were analyzed by IEA Corporation Monroe, Connecticut, according to the United States Environmental Protection Agency (EPA) Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846) for Methods 3010 and 6010.

Data deliverables were reported following the United States Environmental Protection Agency (EPA) Contract Laboratory Program (CLP) Statement of Work (SOW) for Inorganic Analysis. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis (data validation guidelines), June 1988, where applicable. The findings in this report are based upon a general review of the raw data (where applicable), analytical holding times, calibration results, standards performed at the CLP contract required detection limits (CRDL), blank analysis results, interference check sample results, laboratory control sample results, laboratory and field duplicate results, matrix spike results, serial dilutions, detection limits, and a general review of the CLP forms provided.

The support documentation in Appendix A of this report summarizes the specifics of this review. Appendix A also provides the sample results as reported by the laboratory. The data summary table lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers Section. Issues that arose which did not warrant qualification are detailed in the Notes Section.

SMITH

FINDINGS/QUALIFIERS

This data validation report addresses the 14 filtered groundwater samples and 3 field duplicate samples analyzed for calcium, chromium, magnesium and sodium, and 14 unfiltered groundwater samples and 3 unfiltered field duplicate samples analyzed for chromium analysis of IEA Corporation work order number A1462. The groundwater data were evaluated for the following parameters:

* * data completeness
* * holding times
* * data calibration verification
* \+ CRDL standard
* * laboratory blank analysis
* * field blank analysis
* \+ interference check sample results
* * matrix spike recoveries
* * laboratory duplicates
* * field duplicates
* * laboratory control sample results
* \+ serial dilution results
* * detection limit results
* * sample results

* All criteria were met for this parameter.

\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

Based upon the data validation performed there were no quality control outliers or issues that warrant qualification of the sample results. The data are acceptable as reported on the summary tables.

NOTES

The following items noted during the validation review has not impact results or necessitate further qualification of data:

SMITH

1. The ICP Interference Check Sample (ICS) %R result for calcium was low. However, all sample concentrations did not exceed 50% of the ICS solution concentration; therefore, no data are qualified.

2. The serial dilution result for magnesium was incorrectly reported on the ICP Serial Dilution Form (Form 9). No data are qualified. The reviewer-corrected Form 9 is included in Appendix A.

3. The standards reported at the CRDL for calcium, magnesium, and sodium are incorrectly reported on the CRDL Standard for AA and ICP Forms (Form 2Bs). These metals are not required for CRDL standard analysis according to the EPA. It was confirmed by the Laboratory that standards at the CRDL were not performed for these analytes. The reviewer-corrected Form 2Bs are included in Appendix A.

SUMMARY

The reported data are usable based upon the data validation performed. There were no quality control outliers or issues that warrant qualification of the sample results. The data are acceptable as reported on the summary tables. For specifics relating to this review, see the attached documentation in Appendix A.

Case Narrative

Classical Chemistry - Listed below are the wet chemistry analyte methods and references for all samples analyzed in this SDG. Chloride failed the control limits for spike recovery analysis for sample Butler's Row # 1. This appears to be due to a sample matrix interference. No other analytical problems were encountered and all holding times were met.

Analyte	Method	Reference
Ammonia	~~310.1~~ 350.3	1
Bicarbonate	2320B	2
Carbonate	2320B	2
Chloride	325.2	1
Sulfate	375.4	1

ESK 10/2/96

References:

1. Methods for Chemical Analysis of Water and Wastes, USEPA 600, 1983.
2. Test Methods for the Evaluation of Solid Waste, SW846, 3rd edition, 1986.

Metals - ICAP metals were determined using a JA61 simultaneous ICAP and a JA61E trace ICAP using guidance provided in SW846 according to the following Methods: ICAP-3010/6010.

No problems occurred during analysis. All appropriate protocols were employed. All data appears to be consistent.

I certify that this data package is in compliance with the terms of this contract, both technically and for completeness, for other than the conditions detailed above. Release of this hardcopy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

Dear Mr. Cushing:

In reference to corrective action report #4947, please find enclosed the revised analytical results for IEA report #7096-1462A.

The tables have been revised and are enclosed.

The changes are based on the following issues: chromium results were incorrect; calcium, magnesium and sodium are not present in the spiking solution.

Very truly yours,

Cheryl Ann Cascella

DATA VALIDATION REPORT

I.E.A. An Aquarion Company Case No.:A1462
Project Name: Wilmington, MA

September 25, 1996

Dear Mr. Curran:

The following questions pertain the metals' data for A1462:

1. The spike sample for the filtered metals was only analyzed for one analyte (chromium). Please send an explanation to why the other analytes were not analyzed or send the rest of the spike sample results as soon as possible.

2. I was informed that the detection limit for chromium is 10U and to ignore the 4U that was provided in some of the current data because the correct data is going to be sent later. If this information is incorrect please contact me as well.

Please call me with any questions that you may have regarding these issues.

Thank you,
E. Bryan Rivers
Quality Assurance Scientist

1 Plymouth Meeting
Plymouth Meeting PA 19462

Dear Mr. Rivers:

The following is in response to a question concerning the elements showing poor recoveries in the CRDL standard. These analytes are not part of the commercially prepared standard solution. Due to a software programing issues these analytes are calculated and a very low or negative recovery is printed on the form. This issue is in the process of being reviewed by the systems department.

If you have any further question concerning this response, please do not hesitate to contact me or Stephanie Plunkett at (203) 261-4458.

Sincerely,

Marsha K. Culik

DATA VALIDATION REPORT
SELECTED METALS
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

This data review report addresses the metals data from the July 31, and August 1, 1996 groundwater sampling event at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number A1462 which consisted of 14 filtered groundwater samples and 3 field duplicate samples analyzed for calcium, chromium, magnesium and sodium, and 14 unfiltered groundwater samples and 3 unfiltered field duplicate samples analyzed for chromium. All samples in this report were analyzed by IEA Corporation Monroe, Connecticut, according to the United States Environmental Protection Agency (EPA) Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846) for Methods 3010 and 6010.

Data deliverables were reported following the United States Environmental Protection Agency (EPA) Contract Laboratory Program (CLP) Statement of Work (SOW) for Inorganic Analysis. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis (data validation guidelines), June 1988, where applicable. The findings in this report are based upon a general review of the raw data (where applicable), analytical holding times, calibration results, standards performed at the CLP contract required detection limits (CRDL), blank analysis results, interference check sample results, laboratory control sample results, laboratory and field duplicate results, matrix spike results, serial dilutions, detection limits, and a general review of the CLP forms provided.

The support documentation in Appendix A of this report summarizes the specifics of this review. Appendix A also provides the sample results as reported by the laboratory. The data summary table lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers Section. Issues that arose which did not warrant qualification are detailed in the Notes Section.

SMITH

FINDINGS/QUALIFIERS

This data validation report addresses the 14 filtered groundwater samples and 3 field duplicate samples analyzed for calcium, chromium, magnesium and sodium, and 14 unfiltered groundwater samples and 3 unfiltered field duplicate samples analyzed for chromium analysis of IEA Corporation work order number A1462. The groundwater data were evaluated for the following parameters:

* * data completeness
* * holding times
* * data calibration verification
* \+ CRDL standard
* * laboratory blank analysis
* * field blank analysis
* \+ interference check sample results
* * matrix spike recoveries
* * laboratory duplicates
* * field duplicates
* * laboratory control sample results
* \+ serial dilution results
* * detection limit results
* * sample results

* All criteria were met for this parameter.

\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

Based upon the data validation performed there were no quality control outliers or issues that warrant qualification of the sample results. The data are acceptable as reported on the summary tables.

NOTES

The following items noted during the validation review has not impact results or necessitate further qualification of data:

1. The ICP Interference Check Sample (ICS) %R result for calcium was low. However, all sample concentrations did not exceed 50% of the ICS solution concentration; therefore, no data are qualified.

2. The serial dilution result for magnesium was incorrectly reported on the ICP Serial Dilution Form (Form 9). No data are qualified. The reviewer-corrected Form 9 is included in Appendix A.

3. The standards reported at the CRDL for calcium, magnesium, and sodium are incorrectly reported on the CRDL Standard for AA and ICP Forms (Form 2Bs). These metals are not required for CRDL standard analysis according to the EPA. It was confirmed by the Laboratory that standards at the CRDL were not performed for these analytes. The reviewer-corrected Form 2Bs are included in Appendix A.

SUMMARY

The reported data are usable based upon the data validation performed. There were no quality control outliers or issues that warrant qualification of the sample results. The data are acceptable as reported on the summary tables. For specifics relating to this review, see the attached documentation in Appendix A.

Case Narrative

Classical Chemistry - Listed below are the wet chemistry analyte methods and references for all samples analyzed in this SDG. Chloride failed the control limits for spike recovery analysis for sample Butler's Row # 1. This appears to be due to a sample matrix interference. No other analytical problems were encountered and all holding times were met.

Analyte	Method	Reference
Ammonia	~~310.1~~ 350.3	1
Bicarbonate	2320B	2
Carbonate	2320B	2
Chloride	325.2	1
Sulfate	375.4	1

EDL 10/2/96

References:

1. Methods for Chemical Analysis of Water and Wastes, USEPA 600, 1983.
2. Test Methods for the Evaluation of Solid Waste, SW846, 3rd edition, 1986.

Metals - ICAP metals were determined using a JA61 simultaneous ICAP and a JA61E trace ICAP using guidance provided in SW846 according to the following Methods: ICAP-3010/6010.

No problems occurred during analysis. All appropriate protocols were employed. All data appears to be consistent.

I certify that this data package is in compliance with the terms of this contract, both technically and for completeness, for other than the conditions detailed above. Release of this hardcopy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

c/o Smith Environmental Corp.
One Plymouth Meeting
Plymouth Meeting, PA 19462

Dear Mr. Cushing:

In reference to corrective action report #4947, please find enclosed the revised analytical results for IEA report #7096-1462A.

The tables have been revised and are enclosed.

The changes are based on the following issues: chromium results were incorrect; calcium, magnesium and sodium are not present in the spiking solution.

Very truly yours,

Cheryl Ann Cascella

DATA VALIDATION REPORT

I.E.A. An Aquarion Company Case No.:A1462
Project Name: Wilmington, MA

September 25, 1996

Dear Mr. Curran:

The following questions pertain the metals' data for A1462:

1. The spike sample for the filtered metals was only analyzed for one analyte (chromium). Please send an explanation to why the other analytes were not analyzed or send the rest of the spike sample results as soon as possible.

2. I was informed that the detection limit for chromium is 10U and to ignore the 4U that was provided in some of the current data because the correct data is going to be sent later. If this information is incorrect please contact me as well.

Please call me with any questions that you may have regarding these issues.

Thank you,
E. Bryan Rivers
Quality Assurance Scientist

CORRECTIVE ACTION FORM

A. Originator Information Client Inquiry____

Client: Olin - Data reviewer
Job/Case: 7096 - 1462A
Date/time: 9/25/96
Sample Number(s): Metals
Client/Lab Contact: M Cusick
Date/Time Response Due:

Detailed Description of Potential Problem: See attached

① Ca, Mg, Na are not present in the spiking solution

② Dissolved is 10 u what about Total?

B. Quality Assurance Information Corrective Action # 4947

Recommended Corrective Action:

Groups Involved: __Sample Control __ Wet Chemistry X Metals
__Gas Chromatography __ Mass Spectrometry __ Report Generation
__Client Service __ Sample Preparation

C. Final Resolution

Describe What Happened and Long Term Corrective Action Taken:
1462A Total - forms' corrected + attached.
Report will be revised and data forms will be sent to Rpt address + CC's. Modified per M. Cusick.

Supervisor Signature: C. Casella Date 9/26/96 Date/Time Client Notified:

D. Quality Assurance Final Approval (QA Manager use only)

Corrective Action Approved: M. Cusick
Date Finalized: 9/27/96
Was a problem identified? Yes / No

Plymouth Meeting PA 19462

Dear Mr. Rivers:

The following is in response to a question concerning the elements showing poor recoveries in the CRDL standard. These analytes are not part of the commercially prepared standard solution. Due to a software programing issues these analytes are calculated and a very low or negative recovery is printed on the form. This issue is in the process of being reviewed by the systems department.

If you have any further question concerning this response, please do not hesitate to contact me or Stephanie Plunkett at (203) 261-4458.

Sincerely,

Marsha K. Culik

DATA VALIDATION REPORT
SELECTED INORGANICS
OLIN CORPORATION
GROUNDWATER SAMPLES

INTRODUCTION

This data review report addresses the metals data from the July 31, and August 1, 1996 groundwater sampling event at the Olin Corporation's Wilmington, Massachusetts Facility. This review is of work order number A1462 which consisted of 14 filtered groundwater samples and 3 field duplicate samples analyzed for ammonia, bicarbonate, carbonate, chloride and sulfate. All samples in this report were analyzed by IEA Corporation, Monroe, Connecticut, according to the laboratories Standard Operating Procedures (SOPs) which reference the United States Environmental Protection Agency (EPA) Methods for Chemical Analysis of Water and Wastes (MCAWW) or Standard Methods for the Examination of Water and Wastewater, 16th Edition, 1985 (SM), American Public Health Association (APHA). The following individual methods were referenced:

Analytes	Methods
ammonia	350.3
bicarbonate and carbonate	2320B
chloride	325.2
sulfate	375.4

Because the analyses were not performed according to the EPA Contract Laboratory Program (CLP) methods, the findings in this report are based upon a review of sample data and of quality control (QC) specified by the individual analytical SOPs and methods provided by the laboratory. The quality assurance review was prepared according to EPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis (data validation guidelines), June 1988, where applicable.

The support documentation in Appendix B of this report summarizes the specifics of this review. Appendix B also provides the sample results as reported by the laboratory. The data summary table lists all compounds that were analyzed. Analytical problems are outlined in the following Findings/Qualifiers Section. Issues that arose which did not warrant qualification are detailed in the Notes Section.

SMITH

FINDINGS/QUALIFIERS

These data validation report addresses the 14 filtered groundwater samples and 3 field duplicate samples analyzed for ammonia, bicarbonate, carbonate, chloride and sulfate for work order number A1462 analyzed by IEA Corporation. The groundwater data were evaluated for the following parameters:

* * data completeness
* * holding times
* * data calibration verification
* * laboratory blank analysis
* \+ field blank analysis
* matrix spike recoveries
* * laboratory duplicates
* field duplicates
* \+ laboratory control sample results
* * detection limit results
* \+ sample results

* All criteria were met for this parameter.

\+ All criteria were met for this parameter; however, this parameter is discussed in the Notes Section of this report.

The data summary table provided at the end of this report summarizes the validation recommendations which were based on the following information:

1. All chloride results are estimated due to low matrix spike percent recoveries (%Rs).

2. The positive results for ammonia for the field duplicate pair Blind #2 (1462010) and GW64D (1462007) are estimated due to poor field duplicate precision. Details are provided on the Inorganic Field Duplicate Precision Worksheet included in Appendix B of this report.

SMITH

NOTES

The following items were noted during the validation review that did not impact results or necessitate further qualification of data:

1. The method qualifiers were not reported on the revised Wet Chem Analysis Data Sheets (Form 1s) for samples GW64S (1462006) and Butters Row #2 (1462008). No data are qualified. The reviewer-corrected Form 1s are included in Appendix B.

2. The %R for chloride was incorrectly reported on the Laboratory Control Sample Form (Form 6). No data are qualified. The reviewer-corrected Form 6 is included in Appendix B.

3. The analytical method referenced by the laboratory for ammonia in the case narrative is incorrect. The correct analytical method as verified by the laboratory is annotated on the case narrative is included in Appendix B. No data are qualified.

4. There were no field blanks associated with this sampling event.

SUMMARY

This review has identified a matrix spike %R and field duplicate results as areas of concern. The reported data are usable as qualified on the data summary table. For specifics relating to this review, see the attached documentation in Appendix B.

Case Narrative

Classical Chemistry - Listed below are the wet chemistry analyte methods and references for all samples analyzed in this SDG. Chloride failed the control limits for spike recovery analysis for sample Butler's Row # 1. This appears to be due to a sample matrix interference. No other analytical problems were encountered and all holding times were met.

Analyte	Method	Reference
Ammonia	~~310.1~~ 350.3	1
Bicarbonate	2320B	2
Carbonate	2320B	2
Chloride	325.2	1
Sulfate	375.4	1

EDK 10/2/96

References:

1. Methods for Chemical Analysis of Water and Wastes, USEPA 600, 1983.
2. Test Methods for the Evaluation of Solid Waste, SW846, 3rd edition, 1986.

Metals - ICAP metals were determined using a JA61 simultaneous ICAP and a JA61E trace ICAP using guidance provided in SW846 according to the following Methods: ICAP-3010/6010.

No problems occurred during analysis. All appropriate protocols were employed. All data appears to be consistent.

I certify that this data package is in compliance with the terms of this contract, both technically and for completeness, for other than the conditions detailed above. Release of this hardcopy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

CORRECTIVE ACTION FORM

A. Originator Information

Client Inquiry X

Client: OLIN / WILMINGTON MA
Job/Case: 7096-1462A
Date/time: 9/30/96 9:30
Sample Number(s): CCS
Client/Lab Contact: D. Plumstead
Date/Time Response Due: 10/1/96 11:00am

Detailed Description of Potential Problem: On some places in the report the RDL for sulfate is 5 and in others its 10? Which is correct? Sulfate for sample 00X is reported is that correct? (RL 3-10)

B. Quality Assurance Information

Corrective Action ID# 1057

Recommended Corrective Action:

* DM Review for MDLS for CC4 CS, Letter to State Clarify Sulfate results

Groups Involved: __Sample Control __Wet Chemistry __Metals
__Gas Chromatography __Mass Spectrometry __Report Generation 10/2
__Client Service __Sample Preparation

C. Final Resolution

Describe What Happened and Long Term Corrective Action Taken:
CCC results for Sulfate show some values RDL & <10. Samples + Samples 00X shown as <10. See attached memo from T. Tutis 10/1/96
Sent regmail

Supervisor Signature C. Cisneros Date 10/02/96 Date/Time Client Notified:

D. Quality Assurance Final Approval (QA Manager use only)

Corrective Action Approved: _____
Date Finalized: _____
Was a problem identified? Yes / No

Mr. Bruce Cushing
OLIN CORPORATION
c/o Smith Environmental Corp.
One Plymouth Meeting
Plymouth Meeting, PA 19462

Dear Mr. Cushing:

In reference to corrective action report #4957, please find enclosed the revised analytical results for IEA report #7096-1462A.

The following tables have been revised: TABLE CC-1.0; Form I's.

The changes are based on the following issues: revised sulfate results.

Very truly yours,

Michele Sciongay
