Hi Greg,
Both scenarios you provide below are true. East Liverpool is compared to Marietta and Mt Vernon in the town comparisons. However, only Marietta and East Liverpool are included in the analyses that have the cDEI – the modeled ambient level air Mn concentration that take into account distance from source of Mn. Mt. Vernon did not have an air monitor that measured Mn, thus could not model air Mn concentration for Mt. Vernon.

Subject: Community Fact Sheet

Hello Mn Group:
I am currently working on pulling some information from Dr. Bowler's power point presentation and creating a one-page (front and back) fact sheet "we" can distribute at the April 18, 2013 community meeting in East Liverpool, OH. This will be very similar to the fact sheet produced for the Marietta study, with a review of our study population versus the control (Mt. Vernon). With that said, when I am going through Dr. Bowler's current slides, it appears I should be comparing the E Liverpool study to Mt. Vernon AND Marietta? Is that correct?
It shouldn't take me long to throw something out for some draft review.
So, I guess I want to know if "we" are comparing E Liverpool to Mt. Vernon or E Liverpool to BOTH Mt. Vernon and Marietta? Just want to make sure before I move forward.
Thanks,
Greg
