I'll give it a go, but I'm also out Weds-Fri. I'll see if I can get it by tomorrow. What's your deadline?

George,

Could you give me a similar paragraph for SW Indianapolis and NW Indiana Lakeshores, please?

Is this too long/too short/about right? Let me know, thanks.

In July 2013 preliminary results from a USEPA-funded study of exposure to and effects of airborne manganese (Mn) in Ohio adults were presented at East Liverpool OH public meetings. Subtle health effects associated with chronic airborne Mn exposure were reported at the East Liverpool meetings; for example, living closer to the Mn source for a longer time (more Mn air exposure) was associated with borderline to mild tremor and slightly lower motor speed and strength. East Liverpool study results are being combined with prior study results from Marietta and Mt. Vernon OH adults for publication in the professional literature. Historic monitored outdoor air Mn concentrations in East Liverpool have been among the highest in the US, but the East Liverpool source most likely responsible (SH Bell) has made substantial operational changes in the past few years that have lowered East Liverpool airborne Mn. Involved state and federal agencies are committed to continuing monitoring and oversight.

This is for an air toxics compilation that MaryPat wants to give to Bharat. The fact sheet is very nice

and provides a lot of useful information but too long for this purpose. I need a paragraph –SAR length, please.

Hmmm…What is this for? When do you need it? Is this "fact sheet" (http://www.epa.gov/nheerl/mnstudy/files/East_Liverpool_Factsheet.pdf) usable? let me know, thanks
