Regional differences were noted in the European hydrochloric acid (HCl) market this week, with the south reported as tight and the north generally stable.

In the **Mediterranean**, plant closures had tightened supply and caused spot prices to rise in both Italy and Spain.

The closure of Caffaro's chor alkali unit in Torviscosa, **Italy**, in mid-September due to alleged environmental pollution has reduced HCl availability and caused buyers to look for product elsewhere. French suppliers report numerous enquiries and are delivering product to Italian buyers.

Spot prices in Italy were reported to have risen to €150/tonne FD and as such the Mediterranean price in the table above has been raised by €30/tonne on the top end to represent this increase.

Sources said it remained unclear how long the unit might be down for, although most expected it would be a temporary closure.

Meanwhile, **in Spain** the streamlining of Ercros' polyvinyl chloride (PVC) business had tightened the market and sources reported spot numbers around €120/tonne FD.

The reduced availability in Italy and Spain had also caused the market in southern France to tighten, sources said.

By contrast, in **northern Europe** the HCl market was described as stable as demand continued to improve after the summer lull.

Thoughts in Germany, northern France and Belgium had turned to **contract pricing for 2009**.

Producers said they would be **looking for increases** of around €5-10/tonne on current levels on the back of higher transport and energy costs. Some reported that they had found little resistance from buyers in preliminary discussions and said they would be firmer with their targets than in previous years this time round.

One French buyer reported that it had started talks with its suppliers and had been **offered the same price** as this year.

The bulk of contract talks were not expected to be concluded until December.

In the **US Gulf**, production issues continued following Hurricane Ike and the market continued to be described as tight, especially for spot, and was expected to remain so for a while.

There were some reports of **business being concluded at levels above the quoted range** of $120-130/tonne ex-works, but could not be confirmed. The above prices were unchanged this week pending further confirmation.

*Thousands of short tons per year hydrogen chloride (HCl), 100 percent basis. Excluding data for coproduct HCl that is generated and recycled in integrated ethylene dichloride/vinyl chloride monomer (EDC/VCM) plants. Coproduct HCl capacity at twelve VCM plants amounts to 4,775 thousand tons.

There are sixty-nine sites producing HCl with a combined annual capacity in excess of 4,620 thousand tons. However, only fifty-four sites ship product into the merchant market. Most manufactured HCl is captive capacity. The plants listed are suppliers to the merchant market, but some of this capacity is also used in-house. More than 90% of the HCl is by-product production as a result of aliphatic and aromatic hydrocarbon chlorinations, the phosgenation of amines for isocyanates and halogenations for making chlorofluorocarbons. The balance of the HCl comes from intentional manufacturing: burning chlorine with hydrogen; the reaction of sodium chloride with sulfuric acid (Mannheim Process); or by reacting sodium chloride, sulfur dioxide, oxygen and water (Hargreaves Process). These last two processes find use at only one plant, each. The market is made up of both anhydrous and aqueous product. Most producers of by-product HCl do not directly serve the market. Rather they rely on distributors to market their acid.

Huntsman acquired the Geismar, La. plant of ICI Polyurethanes in 1999 with the purchase of ICI's industrial chemicals business. In 2001 SASOL acquired CONDEA Vista from RWE-DEA AG, and with it, the linear alkylbenzene plant in Baltimore, Md., which produced by-product HCL. Subsequently the linear alkyl benzene process was converted to a process that does not produce HCl, taking roughly 47,000 short tons off the market.

In 2000 HoltraChem closed its chloralkali facilities in Orrington, Me., and Reigelwood, N.C. eliminating a combined capacity of 45,000 tons. HoltraChem was an on-purpose HCl producer.

Profile last published 11/9/99; This revision, 10/14/02.

DEMAND

2000: 2,375 thousand short tons; 2001: 2,420 thousand short tons; 2005: 2,530 thousand short tons, projected. Demand equals production plus imports (2000: 76 thousand short tons; 2001: 110 thousand short tons) less exports (2000: 55 thousand short tons; 2001: 57 thousand short tons). Obtaining accurate supply and demand

EPAHO073001368

figures for HCl is problematic. There is confusion in what data to count because of the many different HCl source types, some of which recycle HCl back into the process. About 60 percent of the HCl produced (excluding coproduct from VCM) in recent years has gone to serve the merchant market.

GROWTH
Historical (1996 - 2001): 1.5 percent per year; future: 1.1 percent per year through 2005.

PRICE
Historical (1996 - 2001): high, $138 per short ton, list, 22 deg. Baume, Gulf, tanks, works; low, $72 per ton same basis. Current: $72 per ton, same basis. Actual market prices can vary widely, depending on location and time of year.

USES
Excluding HCl consumed in EDC production. Organic chemicals, 29 percent; inorganic chemicals, 12 percent; food processing, 11 percent; brine treatment, 10 percent; steel pickling, 8 percent; oil well acidulation, 4 percent; swimming pools, 2 percent; miscellaneous, including semiconductors, catalyst for chemical syntheses, mineral processing and regeneration of ion-exchange resins used for water treatment, 24%.

STRENGTH
The food segment is HCl's strongest performer, currently growing at better than 2 percent annually. Driving this demand is the manufacture of high-fructose corn syrup, used in soft drinks, and L-lysine monohydrochloride, an amino acid used in animal feeds. And HCl used for oil well acidulation has increased along with the price of oil this year. Growth, however, will be a modest 1 percent over the forecast period.

The HCl market transformed itself during the 90's from seasonal shifts between oversupply and balance, to shifts between balance and very tight. In the past, isocyanate producers combined anhydrous HCl with water to produce wet acid for the merchant market. Now, more isocyanate manufacturers are directing their anhydrous hydrochloric acid to EDC producers. This should result in a tighter but more steady industry segment.

WEAKNESS
The steel pickling sector is flat as most of the large steel picklers have installed processes for HCl recycling. The consumption decline, which began in the late 1980's, is apparently slowing but no growth is anticipated in the forecast period.

OUTLOOK
Captive demand is growing faster than that of the merchant market and with isocyanate demand down, due to the soft economy, HCl supply will become increasingly tight with the reduction of this coproduct source. No real shortage however is anticipated, as more hydrogen and chlorine can be burned to satisfy demand. Demand growth through 2005 is projected to be 1.1 percent per year.

Subject: Socotherm

Socotherm needs a load Saturday night after 6:00pm so Luis Resendez is going to do the load. We need to pay him $100 extra and charge it towards Dan's job. I have to save the "on-call" driver for Sunday in case something calls in since there isn't anyone left because they are all on Joy's Vertex job.

Sorry.....
