1. Introduction

This Site Characterization Technical Memorandum (SCTM) report presents the results of work completed to date for the groundwater investigation at the South Dayton Dump and Landfill Site (Site). The Site is located on the west side of Dryden Road (also known as Springboro Pike), at 1901 through 2153 Dryden Road and 2225 East River Road in Moraine, Ohio. The Site location is shown on Figure 1.1 and the Site layout is shown on Figure 1.2.

GHD has prepared this SCTM report on behalf of the Respondents to the Administrative Settlement Agreement and Order on Consent for Remedial Investigation/Feasibility Study for Operable Unit (OU)1 and OU2, United States Environmental Protection Agency (USEPA) Docket No. V-W-16-C-011 (Respondents).

1.1 Overview

This SCTM report provides the groundwater investigation activities results from work conducted from October 2017 to February 2019, which includes completion of boreholes for vertical aquifer sampling (VAS) and temporary monitoring wells (TMW), monitoring well (MW) installation, water level monitoring, sample collection/ laboratory analysis, and data validation/ assessment. The SCTM also incorporates results from previous investigations in support of the data assessment.

The groundwater investigations were completed in accordance with the phased approach detailed in the Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2 (GHD, September 20, 2017) (RI/FS Work Plan), approved by the USEPA on September 22, 2017.

1.1.1 Groundwater Investigation Objectives

Section 5.7 of the RI/FS Work Plan details the groundwater investigation purpose, summarized as follows:

- The purpose of Phase 1B monitoring well installation is to monitor groundwater at locations determined from previous investigations
- The purpose of Phase 2A vertical aquifer sampling (VAS) includes:
  - Determining whether or not groundwater migrating from OU1 contains contaminants of concern (COCs) at concentrations greater than Action Levels
  - Determining whether some groundwater contamination results from off-Site or upgradient sources
  - Delineating the vertical extent of known groundwater contamination
  - Determining the depth intervals of maximum contaminant concentrations in Site-related areas of concern

1.2 Report Organization

The SCTM report is organized as follows:

Section 1 is the introduction

Section 2 provides information regarding investigative activities conducted from October 2017 through February 2019

Section 3 provides information related to Site setting, geology and hydrogeology

Section 4 presents the analytical results for groundwater sampling conducted to date

Section 5 presents an assessment of groundwater data and soil/fill data

Section 6 presents proposed work to be conducted

Section 7 provides references

2. Field Investigation Activities

2.1 General

The field investigation included the following:

- Installation of new monitoring wells, well development, water level monitoring, and collection of groundwater samples from monitoring wells for laboratory analysis (as discussed in Section 2.2).
- Completion of boreholes for collection of groundwater samples using temporary monitoring wells (as discussed in Section 2.3).
- Completion of vertical aquifer sampling (VAS) boreholes for collection of groundwater samples (as discussed in Section 2.4).

The field program was implemented concurrently with the soil/fill investigation (GHD, July 17, 2019). Soil/fill investigative locations are shown on Figure 2.1. Groundwater investigative locations (including VAS, boreholes/temporary monitoring wells, and permanent monitoring wells) are shown on Figure 2.2. Stratigraphic and instrumentation logs are provided in Appendix A.

2.2 Monitoring Well Installation and Sampling

The RI/FS Work Plan proposed installation of new monitoring wells and collection of groundwater samples from new and existing monitoring wells. The activities completed from October 2017 to present are described in the following subsections.

2.2.1 2017 Groundwater Sampling

The RI/FS Work Plan included collection of groundwater samples from selected monitoring wells, at the commencement of the OU1 groundwater investigation, to supplement data from the most recent prior (2015) sampling event.

The October 2017 sampling event targeted 14 monitoring wells located on or immediately adjacent to OU1 (GHD, December 5, 2017). Sampling at monitoring wells located within the Dayton Power & Light (DP&L) facility was deferred pending access approval. Prior to sampling, GHD measured water levels in all accessible monitoring wells. Water level data are included in Table 2.1. Monitoring well locations are shown on Figure 2.1.

Groundwater samples were collected from 11 of 14 targeted monitoring wells (MW-206, MW-207, MW-208, MW-210, MW-210A, MW-210B, MW-218A, MW-218B, MW-225, MW-226, and MW-227) from October 3 to 6, 2017. Three monitoring wells could not be sampled due to access difficulties as follows:

- Access was not granted by the property owner to MW-214, located on Jim City Salvage Inc. property. This well was subsequently sampled in March 2018.
- MW-217 and MW-228, located on Valley Asphalt property were not found. MW-217 was subsequently determined to be covered by asphalt pavement and was repaired in May 2018 and sampled in October 2018. MW-228, which was buried by a stockpile of reclaimed asphalt was subsequently uncovered and then abandoned in February 2019. In addition, one monitoring well (MW-223B) located at the DP&L facility was not found during the October 2017 event. MW-223B was subsequently located, repaired and sampled in 2018. The well repair and abandonment activities are discussed in Section 2.2.2.1.

Information regarding groundwater sample collection is provided by the following:

- Low-flow purging was completed at a rate of 150 milliliters per minute (mL/min) using a bladder pump with dedicated Teflon tubing, and with the pump intake set at the middle of each well screen interval. Field parameters were recorded to determine stabilization before sampling. The field parameters included dissolved oxygen (DO), oxidation-reduction potential (ORP), pH, temperature, specific conductance, and turbidity. Well purging records are provided in Appendix B.
- GHD submitted groundwater samples (17 total, including three trip blanks, one field duplicate, one rinsate blank, and one matrix spike/matrix spike duplicate) to TestAmerica Laboratories in North Canton, Ohio for analysis of volatile organic compounds (VOCs) - Target Compound List (TCL) and Method SW-846 8011; semi-volatile organic compounds (SVOCs); pesticides; herbicides; poly-chlorinated biphenyls (PCBs); Target Analyte List (TAL) metals including mercury (total and dissolved); major anions (chloride, nitrate, nitrite, sulfate); and cyanide.

2.2.2 Monitoring Well Installation

Four monitoring wells (MW-230, MW-233, MW-224, and MW-235) were installed in 2018 in accordance with the procedures shown below (as outlined in the RI/FS Work Plan):

- Two monitoring wells (MW-230 and MW-233) were installed using the sonic drilling method using a nominal 6-inch inside diameter casing. Two monitoring wells (MW-234 and MW-235) were installed using a direct-push drilling method using 4.25-inch dual tube hollow stem augers (HSA). Two other monitoring wells (MW-231, MW-232) that were proposed in the RI/FS Work Plan were not installed pending completion of other nearby sampling locations and assessment of the results, with USEPA agreement.

- Prior to monitoring well installation, soil core samples from drilling activities were collected continuously for field screening with a photoionization detector (PID) and classification using the Unified Soil Classification System (USCS) in accordance with American Society for Testing Materials International (ASTM International) Method D2488-11. GHD did not submit soil samples for laboratory analyses based on negative field screening results (i.e., no visual observations of staining, no odor, no positive Sudan IV dyes test results, and absence of undifferentiated VOCs based on PID readings).
- Each monitoring well was completed with 2-inch diameter well screens and risers, 2-inch diameter number 10-slot, 5- or 10-foot long Schedule 40 PVC well screens and flush threaded Schedule 40 PVC riser pipe allowing for approximately 3 feet of stick up. Ten-foot long Schedule 40 PVC well screen was used for water table wells (i.e., MW-230, MW-233, and MW-234) and 5-foot long Schedule 40 PVC well screens was used for the other well (i.e., MW-235). A tremie pipe was used to place a filter pack consisting of coarse silica sand (10/20 mesh) from the bottom of the well screen to 2 feet above the well screen, and 1 foot of fine (20/40 mesh) silica sand from 2 to 3 feet above the well screen. Approximately 2 to 3 feet of bentonite pellets were placed above the filter sand to help provide a seal for the bentonite grout.
- The boring annulus above the bentonite pellet layer was backfilled with bentonite grout to within 3 feet of ground surface. The uppermost 3 feet of the boring annulus was filled with concrete, forming a pad with a diameter of at least 2 feet at ground surface. Each pad was constructed to slope away from the monitoring well. A lockable protective steel casing was set in the concrete over the well riser. The well casing extended to approximately 2.5 feet above ground surface, and was fitted with a hinged cap with lock. The well identification number was permanently marked on the outer casing of each newly installed monitoring well.
- Stratigraphic and instrumentation logs for new monitoring wells (MW-230, MW-233, MW-234, and MW-235) are included in Appendix A.

The following subsections provide information regarding monitoring well repair and abandonment, and well development.

2.2.2.1 Monitoring Well Repair and Abandonment

Two monitoring wells (MW-217 and MW-223B) were repaired in 2018 and one monitoring well (MW-228) was abandoned in 2019, with agency approval. These activities were conducted in accordance with GHD's Well Location and Decommissioning Work Plan (Attachment 1 to GHD letter dated June 22, 2018 regarding Notice of Violation of OAC 3745 9 03[B] and OAC 3745 9 03[C]) summarized as follows:

- On May 31, 2018, MW-217 on Valley Asphalt property was repaired by removing the asphalt pavement to expose the existing flush-mount cover followed by installation of a new road box cover.
- On September 6, 2018, MW-223B at the DP&L facility was repaired by removing the overlying asphalt pavement and installing a new flush-mount cover.
- Decommissioning of MW-228 was completed by Cascade Drilling on February 21, 2019, and was overseen by a GHD field technician. The well was over drilled and the borehole grouted to the surface. In accordance with Ohio Revised Code 1521.05(C), on March 21, 2019, Cascade

Drilling electronically filed the original well sealing report (Form #322955) with Ohio Department of Natural Resources (ODNR) Division of Geological Survey; Cascade Drilling electronically filed a corrected well sealing report (Form 323035) on March 25, 2019.

Notice of completion of the well repair and abandonment activities were provided in GHD's letter to Ohio EPA dated April 1, 2019. Ohio EPA provided written approval confirming resolution of the violation via letter to GHD dated May 30, 2019.

2.2.2.2 Monitoring Well Development

Four new monitoring wells (MW-230, MW-233, MW-234, and MW-235) and two repaired monitoring wells (MW-217 and MW-223B) were developed in 2018 as outlined below:

- Monitoring well development was completed as follows: MW-230 and MW-233 on August 9, 2018; MW-217 and MW-234 on September 27, 2018; MW-235 on September 28, 2018; and MW-223B on October 15, 2018.
- Each monitoring well was developed by alternating cycles of surging and over pumping or bailing at rates greater than those used during sampling, at least 48 hours after grouting was completed.
- Turbidity and other stabilization parameters were measured at the beginning of each period of purging (following surging). Development continued until the turbidity of the development water was equal to or less than 5 nephelometric turbidity units (NTUs), or until achieving the Work Plan requirements based on volume removed and other stabilization parameters (temperature, conductivity, temperature).
- Well development records are provided in Appendix B.

2.2.3 2018 Groundwater Sampling

Groundwater samples were collected from 13 monitoring wells in 2018 (GHD, February 21, 2019). This includes six monitoring wells (MW-214, MW-217, MW-223A, MW-223B, MW-224A, and MW-224B) that could not be sampled in 2017 due to access issues, four new monitoring wells (MW-230, MW-233, MW-234, and MW-235), and three monitoring wells (MW-209, MW-209A, MW-212) located near the Quarry Pond[1]. Each of these monitoring wells was sampled from October 16 to October 25, 2018, with the exception of MW-214 (located at Jim City property), which was sampled on March 23, 2018.

GHD measured groundwater elevation levels at all accessible monitoring wells in March and October 2018 prior to collecting groundwater samples, as well as in June and December 2018. Water level data are included in Table 2.1. Monitoring well locations are shown on Figure 2.2. GHD notes that several DP&L monitoring wells located near the Transportation Building were abandoned by DP&L in 2018 and are therefore no longer available. Also, one monitoring well (MW-220) installed by Respondents within the DP&L facility adjacent to the Transportation Building was erroneously abandoned by DP&L in 2018.

[1] The RI/FS Work Plan includes collection of groundwater samples from selected monitoring wells related to the Quarry Pond Investigation.

Information regarding sample collection is provided by the following:

- Low-flow purging was completed at rates between 200 to 500 milliliters per minute (mL/min) using a bladder pump with dedicated Teflon tubing, and with the pump intake set at the middle of each well screen interval. Field parameters were recorded to determine stabilization before sampling. The field parameters included DO, ORP, pH, temperature, specific conductance, and turbidity. Well purging records are provided in Appendix B.
- GHD submitted 15 groundwater samples (including two field duplicates) to TestAmerica Laboratories in North Canton, Ohio for analysis of VOCs - TCL and Method SW-846 8011; SVOCs; pesticides; PCBs; TAL metals including mercury (total and dissolved); major anions (chloride, nitrate, nitrite, sulfate); and cyanide. In addition, 13 of 15 samples were submitted for laboratory analysis of herbicides.

2.3 Temporary Monitoring Wells

The RI/FS Work Plan included 20 proposed boreholes/ temporary monitoring well (BH/TMW) installations to collect groundwater samples. All proposed BH/TMW locations were completed from May 2018 to January 2019 with one exception as discussed below. The BH/TMW locations that were completed, in sequence, include the following:

- BH03-18, BH01-18, BH02-18, BH04-18, BH05-18, BH06-18, BH07-18, BH08-18, BH10-18, BH09-18, BH14-18, BH20-18, BH12-18, and BH13-18; completed in May 2018 (GHD, August 13, 2018).
- BH11-18, BH16-18, BH15-18 and BH14-18; completed in July to September 2018 (GHD, January 22, 2019).
- BH18-19 and BH19-19; completed in January 2019 (GHD, May 6, 2019).

One proposed location at East River Road (BH17) was not completed due to property access issues. Deletion of this sample location was proposed in GHD's letter dated January 22, 2019.

Each BH/TMW location was completed to the depth required by the RI/FS Work Plan, with the exception of BH11-18, where two screen intervals were completed as an alternative to VAS-45 due to access and potential disruption of business operations expressed by the property owner (Globe Equipment). Stratigraphic logs are included in Appendix A.

Information regarding field activities and sample collection is provided by the following:

- Drilling was conducted using direct push technology (DPT) methods at 16 locations and sonic methods at three locations (BH14-18, BH15-18, and BH16-18)[2]. The soil core retrieved from each location was logged to determine stratigraphy to the required depth, up to 44 feet below ground surface (BGS). The soil boring was sealed using bentonite.
- At each location a second off-set boring was advanced to install a temporary monitoring well, constructed with a 4-foot steel screen set at the desired depth based on stratigraphic information.

[2] At BH14-18 the initial attempt using DPT was unsuccessful due to equipment limitations. This location was subsequently completed using sonic equipment.

- Low flow purging was completed using a bladder pump with Teflon tubing, and with the pump intake set at the middle of each sampling interval (middle of 4-foot screen). Field parameters were recorded to determine stabilization before sampling. The field parameters included DO, ORP, pH, temperature, specific conductance, and turbidity. Purging and stabilization data are summarized in Appendix B.
- Groundwater samples were collected from each temporary monitoring well, with the exception of BH14-18, where a sample was not collected due to equipment limitations. GHD resampled this location using sonic drilling methods.
- GHD submitted a total of 20 investigative groundwater samples plus quality assurance/ quality control (QA/QC) samples (including 13 trip blanks, 4 field duplicates, 2 equipment blanks, and 1 matrix spike/ matrix spike duplicate samples) to TestAmerica Laboratories in North Canton, Ohio for analysis parameters required by the RI/FS Work Plan.
- All investigative samples were analyzed for VOCs, metals (total and dissolved) and general chemistry parameters, with the exception of one sample (BH11-18, 38 to 43 feet BGS) that was analyzed for only VOCs due to insufficient water production. Select samples were analyzed for the other parameters listed above in accordance with the RI/FS Work Plan.
- Sudan IV testing was positive for non-aqueous phase liquids (NAPL) for two screened soil borehole samples, one from borehole BH08-18 (25 to 26 feet BGS) and one from BH10-18 (39 to 41 feet BGS). At both soil sample intervals staining and odors were noted. The PID readings were zero at BH08-18, and 5.1 ppm at BH10-18 at 41 feet BGS. The detected concentrations of individual VOCs and SVOCs in the groundwater samples at these locations (see Section 4) are less than 10 µg/L. These observations indicate that the presence of NAPL is unlikely.

2.4 Vertical Aquifer Sampling

The RI/FS Work Plan included 16 proposed VAS locations to collect groundwater samples to depths up to 150 feet BGS). All proposed VAS locations were completed during the period of October 2017 through February 2019 with one exception as discussed below. The VAS locations that were completed, in sequence, include the following:

- VAS-15B, VAS-35, VAS-32, VAS-33, VAS-31, VAS-44, VAS-38, and VAS-34; completed from December 2017 through February 2018 (GHD, May 3, 2018).
- VAS-42, VAS-43, VAS-40, VAS-37, VAS-22b, and VAS-36; completed from July 2018 through October 2018 (GHD, January 22, 2019).
- VAS-39, completed in February 2019 (GHD, May 6, 2019).

One proposed VAS location at DP&L property (VAS-41) was not completed based on the results for other nearby VAS locations. Deletion of this sample location was proposed in GHD's letter dated January 22, 2019.

Each VAS location was completed to the depth required by the RI/FS Work Plan, either 100 or 150 feet BGS depending on the location. Stratigraphic logs are included in Appendix A.

Information regarding field activities and sample collection is provided by the following:

- Drilling was conducted using sonic methods. The amount of water added during drilling was recorded. Pumping was conducted to remove at least two times the volume added at each sample interval, prior to purging for sample collection.
- Low flow purging was completed using a bladder pump with Teflon tubing, and with the pump intake set at the middle of each sampling interval. Field parameters were recorded to determine stabilization before sampling. The field parameters included DO, ORP, pH, temperature, specific conductance, and turbidity.
- Groundwater samples were collected from the required sample intervals at each location, with the exception of three sample intervals where purging could not be conducted due to insufficient water. Purging and stabilization data are summarized in Appendix B.
- GHD submitted a total of 179 investigative groundwater samples plus various quality assurance/ quality control (QA/QC) samples (including 79 trip blanks, 15 field duplicates, 16 rinsate blanks/ equipment blanks, and 9 matrix spike/ matrix spike duplicate samples) to TestAmerica Laboratories in North Canton, Ohio for analysis parameters required by the RI/FS Work Plan, which includes the following: VOCs; SVOCs; Pesticides PCBs; Metals (total and dissolved) and cyanide; and general chemistry (chloride, nitrate, nitrite, sulfate).
- All investigative samples were analyzed for VOCs, metals (total and dissolved) and general chemistry parameters. Select samples were analyzed for the other parameters listed above in accordance with the RI/FS Work Plan.
- Sudan IV testing was positive for NAPL at two VAS locations including: VAS-33 (24 to 25 feet BGS) and VAS-35 (50 to 55 feet BGS):
  - At VAS-33 a faint odor was noted at 24 feet BGS and the PID reading was 7.2 ppm at 20 to 24 feet BGS. The groundwater sample collected from VAS-33 at 25 to 30 feet BGS identified the presence of VOCs with detected concentrations (see Section 4) less than 10 µg/L. These observations indicate that the presence of NAPL at VAS-33 is unlikely.
  - At VAS-35 a hydrocarbon odor was noted and elevated PID readings were recorded at 50 to 55 feet BGS (678 ppm) and 55 to 60 feet BGS (1125 ppm). The groundwater sample collected from VAS-35 at 50 to 60 feet BGS (see Section 4) identified the presence of VOCs including cyclohexane (890 µg/L), ethylbenzene (1600 µg/L) and xylenes (4800 µg/L). This suggests that NAPL may be present at VAS-35.

2.5 Groundwater Sample Laboratory Analysis and Data Validation

Groundwater samples were collected and submitted for laboratory analysis as described in the preceding sections. The list of samples submitted for laboratory analysis are presented in Appendix B – Table B5.1. Per the RI/FS Work Plan the analytical laboratory deliverables were reviewed by GHD for data validation purposes. GHD's data validation reports for groundwater samples are included in Appendix C. The results of GHD's assessment were used to identify data qualifiers for inclusion in the analytical database, as presented in the data tables within this report.

2.6 Summary of Remaining Activities

A summary of investigative activities, outlined in the RI/FS Work Plan that remain to be completed or could not be completed or altered are summarized as follows:

- Two proposed monitoring wells (MW-231 and MW-232) in the MW-210 area were not installed pending results of other proposed groundwater sampling on adjacent properties, i.e., VAS-36, BH11-18, BH12-18, and BH13-18, as agreed with USEPA. GHD proposes to delete these locations from the investigation based on installation of new proposed monitoring wells discussed in Section 6.
- Proposed VAS-45 was modified and completed as BH11-18 due to access and potential disruption of business operations expressed by the property owner (Globe Equipment), with USEPA approval (as reported in GHD's letter to USEPA dated January 22, 2019).
- Proposed VAS-41, located at the DP&L facility, was to be completed contingent on the results from VAS-40. GHD determined that VAS-40 results are consistent with available analytical results for other groundwater sample locations along the northern side of the DP&L facility, i.e., VAS-28, VAS-30, MW-222A, MW-222B, MW-224A, and MW-224B (as reported in GHD's letter to USEPA dated January 22, 2019). GHD concludes that VAS-41 is not necessary to determine the extent of contamination in this area and proposes to delete VAS-41 from the investigation.
- Proposed BH17, located on non-responsive (East River Road) was not completed due to denial of property access. GHD proposed to delete this location from the investigation (as reported in GHD's letter to USEPA dated January 22, 2019).
- A second round of groundwater sampling at four new monitoring wells (MW-230, MW-233, MW-234, and MW-235) remains to be completed during periods of high groundwater levels (i.e., spring). GHD proposes to complete this as part of additional work described in Section 6.

3. Site Setting

3.1 General

The area of the Site generally includes a combination of developed and undeveloped land. The northern and central areas include a variety of operating businesses with access along Dryden Road, and open ground within the central area situated between the operating businesses and the Miami Conservancy District (MCD) floodway. The southern area includes operating businesses with access along East River Road, and the Quarry Pond situated adjacent to the MCD floodway. Figure 3.1 shows the Site vicinity including the OU1 boundary, the Great Miami River (GMR), and adjacent land use.

Figure 3.2 shows a topographic map of the Site and surrounding area. As shown on the figure the ground elevation along the Dryden Road corridor and portions of the northern and central areas is generally around 730 to 740 feet above mean sea level (AMSL). Lower elevations are found within the central area, where the "large pond" and small pond" are located, and the area of the Quarry Pond. Figure 3.3a presents information for depth to native soil based on borehole information from previous and current investigations. As shown on the figure, the depth to native material within OU1

varies from around 5 feet BGS to over 40 feet BGS. Figure 3.3b shows elevation contours for the contact of the native soil and the overlying fill material.

3.2 Geology and Hydrogeology

The Dayton area is located within the buried pre-glacial valley system that underlies the present day GMR and its tributaries in southwestern Ohio. This pre-glacial valley system is known as the Miami Valley Aquifer System. The regional overburden geology of the Dayton area consists of glacial tills, and glaciofluvial sand and gravel deposits. Norris and Spieker (1966) defined the overburden units, based on general character and relative position to be (from top to bottom):

- Ground Moraine (glacial till) – composed of silt, gravel, and clay; found primarily in the uplands area (not present at the Site).
- Upper Aquifer Zone – the saturated glaciofluvial sand and gravel zone located above a major till-rich zone.
- Till-Rich Zone – composed of discontinuous fine-grained glacial till and other fine-grained materials with substantial components of sand and gravel.
- Lower Aquifer Zone – the glaciofluvial sand and gravel zone located beneath the Till-Rich Zone.

The subsurface geology in the vicinity of the Site, identified by GHD, consists of fill and waste underlain by glacial tills, and glaciofluvial sand and gravel deposits.

Norris and Spieker (1966) identified three principal hydrogeologic units in the Dayton area, as follows:

- Upper Aquifer Zone – the upper portion of the saturated glaciofluvial sand and gravel facies.
- Till-Rich Zone – a zone of discontinuous low permeability till facies interspersed with sand and gravel facies which acts as an aquitard in some areas.
- Lower Aquifer Zone – the lower portion of the saturated glaciofluvial sand and gravel facies.

The subsurface hydrostratigraphy in the vicinity of the Site is consistent with the regional geology of the Miami Valley Aquifer with the exception that the Till Rich Zone is highly discontinuous beneath the Site. Monitoring wells screened above approximately 675 feet AMSL appear to be representative of the Upper Aquifer Zone. Monitoring wells screened below 675 feet AMSL appear to be representative of the Lower Aquifer Zone. Due to the stratigraphic variation of the Till Rich Zone both vertically and laterally, the implied 675 feet AMSL boundary between the Upper and Lower Aquifer Zones is approximate and may vary in elevation across the Site.

GHD prepared geologic cross-sections based on previous and current investigation results, at the locations shown on Figure 3.4. Cross-sections are shown on Figures 3.5a through 3.5f. Cross-section A-A' (Figure 3.5a) is oriented from north to south along the west side of Dryden Road, then toward the southwest within the East River Road and Jim City properties. The cross-section shows a fill layer of variable thickness underlain by silty sand and gravel deposits. Lenses containing clay and silt exist within the sand and gravel deposits. The remaining cross-sections (B-B' through F-F') are generally oriented in an east-west direction. In the northern area, cross-section B-B' (Figure 3.5b) and cross-section C-C' (Figure 3.5c) show the fill layer of variable thickness at the Site, extending to the DP&L facility east of Dryden Road, with underlying silty sand and gravel deposits,

and clay/silt lenses that separates the upper and lower aquifers. In the central area, cross-section D-D' (Figure 3.5d) and cross-section F-F' (Figure 3.5f) show the fill layer of variable thickness underlain by silty sand and gravel deposits and occasional clay/silt lenses. Cross-section E-E' (Figure 3.5e) located along the southern side of the Quarry Pond illustrates predominantly silty sand and gravel deposits.

Groundwater flow in the Upper Aquifer Zone is influenced by the presence of the GMR. Shallow groundwater (i.e., Upper Aquifer Zone) typically flows west/southwest across the Site, and/or radially (in the northern part of OU1) towards the GMR. Occasional flow slightly to the southeast has been documented during extended periods of high flow in the GMR. Depending on surface water elevations at different times of the year, shallow groundwater discharges to, or is recharged by the GMR. During flood events, groundwater flow is occasionally reversed and migrates from the GMR towards the Site. Groundwater flow in the Lower Aquifer Zone is predominantly to the southwest across the Site, with occasional slight southeasterly components, and is not significantly affected by the GMR. The groundwater elevation in the vicinity of the Site is typically between 700 and 725 feet AMSL (likely closer to 710 feet AMSL at OU1). Groundwater contour maps from previous investigations are included in Appendix H of the RI/FS Work Plan.

GHD prepared groundwater level contour maps using 2018 water level data, presented on Figures 3.6 through 3.13. The maps illustrate groundwater level contours for four separate quarterly events (March, June, October, and December) for the upper aquifer and lower aquifer based on available data, i.e., wells that were accessible for each event. The upper aquifer groundwater level contour maps indicate gradients from the Site toward the GMR floodplain in March (Figure 3.6) and June (Figure 3.8) with a southerly flow component toward the Quarry Pond. The upper aquifer groundwater maps for October (Figure 3.10) and December (Figure 3.12) indicate southerly gradients within the central part of the Site toward the Quarry Pond and relatively flay gradients in the northern part of the Site. The lower aquifer groundwater level contour maps indicate southwesterly gradients at the Site in March (Figure 3.7) and June (Figure 3.9). The lower aquifer groundwater maps for October (Figure 3.11) and December (Figure 3.13) indicate southwesterly gradients at the southern part of the Site and mounding in the central part of the Site, with inclusion of data from the DP&L facility. Each of the lower aquifer groundwater contour maps indicates relatively small gradients by comparing water levels at the north and south limits of the Site.

4. Groundwater Analytical Results

This section presents analytical results for groundwater samples collected from OU1 (Section 4.1) and areas outside of OU1 (Section 4.2). This includes results for samples collected during the current RI program (2017 to present) and earlier investigations, and comparison with USEPA Regional Screening Levels (RSLs). The RSLs include chemical-specific values, i.e., Maximum Contaminant Levels (MCLs) for drinking water, and risk-based (tap water) values.

4.1 Operable Unit 1

Analytical results for groundwater samples collected from OU1 are presented in Appendix D, in the tables listed below:

- Appendix D – Table 1: Analytical Results for Groundwater Samples – OU1 Upper Aquifer

- Appendix D – Table 2: Analytical Results for Groundwater Samples – OU1 Lower Aquifer

Each table in Appendix D includes analytical results for samples collected during the current RI program and earlier investigations as noted above. The tables also show USEPA RSLs and indicate the detected values that are greater than the RSLs.

Table 4.1 and Table 4.2 provide information for each detected parameter (number of samples, number of detects, minimum detected concentration, and maximum detected concentration) for the upper aquifer and lower aquifer samples, respectively (derived from the tables included in Appendix D). The following provides an overview of the analytical results for each parameter group.

4.1.1 Volatile Organic Compounds

The VOCs that were detected with maximum concentrations greater than RSLs are listed below.

VOCs	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
OU1 Upper Aquifer						
1,1-Dichloroethane	-	2.8	349	111	31.8%	39
1,2,4-Trichlorobenzene	70	0.4	280	1	0.4%	1.2
1,2-Dibromo-3-chloropropane	0.2	0.00033	278	1	0.4%	0.0096
1,2-Dichloroethane	5	0.17	349	4	1.1%	34
1,4-Dichlorobenzene	75	0.48	280	19	6.8%	5.6
Benzene	5	0.46	349	71	20.3%	100
Bromodichloromethane	80	0.13	280	5	1.8%	1.3
Chlorobenzene	100	7.8	349	74	21.2%	130
Chloroform	80	0.22	280	23	8.2%	3.1
cis-1,2-DCE	70	3.6	278	194	69.8%	3,900
Ethylbenzene	700	1.5	280	47	16.8%	100
Methylene chloride	5	11	349	15	4.3%	51
PCE	5	4.1	349	18	5.2%	4.6
Toluene	1,000	110	349	164	47.0%	270
TCE	5	0.28	349	161	46.1%	5,100
Vinyl chloride	2	0.019	349	130	37.2%	760
Xylenes (total)	10,000	19	349	44	12.6%	190
OU1 Lower Aquifer						
1,1-Dichloroethane	-	2.8	212	51	24.1%	3.5
1,2-Dichloroethane	5	0.17	212	3	1.4%	1.2
Benzene	5	0.46	212	39	18.4%	1,100
Bromodichloromethane	80	0.13	212	4	1.9%	1.1
Chloroform	80	0.22	212	18	8.5%	1.8
cis-1,2-DCE	70	3.6	212	124	58.5%	650
Methylene chloride	5	11	212	3	1.4%	9.8
TCE	5	0.28	212	49	23.1%	220
Vinyl chloride	2	0.019	212	147	69.3%	350

As shown above 17 VOCs in OU1 upper aquifer samples and nine VOCs in OU1 lower aquifer samples were detected at concentrations greater than RSLs. The VOCs detected at the greatest concentrations in the upper aquifer samples include cis-1,2-DCE (up to 3,900 µg/L), TCE (up to

5,100 µg/L), and vinyl chloride (up to 760 µg/L). These VOCs were detected at the greatest frequency in upper aquifer samples, along with toluene (up to 270 µg/L). The VOCs detected at the greatest concentrations in the lower aquifer samples include benzene (up to 1,100 µg/L), cis-1,2-DCE (up to 650 µg/L), TCE (up to 220 µg/L), and vinyl chloride (up to 350 µg/L). The VOCs detected at the greatest frequency in lower aquifer samples are cis-1,2-DCE and vinyl chloride.

VOCs that were detected in OU1 groundwater samples at concentrations greater than MCLs include the following:

- OU1 upper aquifer: 1,2-Dichloroethane, Benzene; Chlorobenzene, cis-1,2-DCE; Methylene chloride, TCE; Vinyl chloride
- OU1 lower aquifer: Benzene, cis-1,2-DCE, Methylene chloride, TCE; Vinyl chloride

As indicated above, the VOCs detected at the greatest maximum concentrations and greatest frequency in OU1 groundwater samples include benzene, cis-1,2-DCE, TCE, and vinyl chloride. In addition, the maximum detected VOC concentrations are greater in the upper aquifer samples compared to the lower aquifer samples, with the exception of benzene.

4.1.2 Semi-volatile Organic Compounds

The SVOCs that were detected at concentrations greater than RSLs are listed below.

SVOCs	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
OU1 Upper Aquifer						
2-Methylnaphthalene	-	3.6	88	10	11.4%	56
Benzo(a)anthracene	-	0.03	88	4	4.5%	1.3
Benzo(a)pyrene	0.2	0.025	88	5	5.7%	1.1
Benzo(b)fluoranthene	-	0.25	88	5	5.7%	1.2
Biphenyl	-	0.083	86	2	2.3%	1.2
bis(2-Ethylhexyl)phthalate	6	5.6	88	11	12.5%	160
Dibenz(a,h)anthracene	-	0.025	88	1	1.1%	0.3
Dibenzofuran	-	0.79	88	4	4.5%	3.2
Indeno(1,2,3-cd)pyrene	-	0.25	88	4	4.5%	0.88
Naphthalene	-	0.17	187	18	9.6%	17
OU1 Lower Aquifer						
None detected > RSLs						

As shown above SVOCs were generally not detected at concentrations greater than RSLs in OU1 groundwater samples. Ten SVOCs were detected at concentrations greater than RSLs in OU1 upper aquifer samples, with relatively low detection frequencies. Those detected at the greatest concentrations and frequencies include 2-Methylnaphthalene, bis(2-Ethylhexyl)phthalate, and naphthalene. Two SVOCs (Benzo(a)pyrene and bis(2-Ethylhexyl)phthalate) were detected in OU1 upper aquifer groundwater samples at concentrations greater than respective MCLs. SVOCs were not detected in any OU1 lower aquifer samples at concentrations greater than RSLs.

4.1.3 Metals

The metals that were detected at concentrations greater than RSLs in total and/or dissolved groundwater samples are listed below.

Metals	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	Total - detection frequency	Total - Max. detect (µg/L)	Dissolved - detection frequency	Dissolved - max. detect (µg/L)
OU1 Upper Aquifer						
Aluminum	-	2,000	76.1%	62,000	23.9%	8,700
Antimony	6	0.78	30.7%	23	13.0%	3.3
Arsenic	10	0.052	88.7%	3,200	62.2%	230
Barium	2,000	380	92.1%	5,000	100.0%	5,200
Beryllium	4	2.5	29.5%	4.3	5.4%	0.86
Cadmium	5	0.92	21.8%	14	7.6%	0.49
Chromium	100	-	49.5%	610	15.2%	22
Cobalt	-	0.6	75.0%	72	70.7%	33
Copper	1,300	80	58.0%	1,900	35.9%	39
Iron	-	1,400	94.3%	390,000	91.3%	28,000
Lead	15	15	74.6%	1,940	21.4%	20
Manganese	-	43	98.9%	15,000	97.8%	2,400
Mercury	2	0.063	4.3%	0.56	0.0%	ND
Nickel	-	39	70.5%	300	63.0%	28
Selenium	50	10	40.9%	25.3	30.4%	26.3
Thallium	2	0.02	29.5%	4.4	15.2%	6.7
Vanadium	-	8.6	43.2%	160	12.0%	20
Zinc	-	600	53.4%	5,500	44.6%	4,400
OU1 Lower Aquifer						
Aluminum	-	2,000	83.3%	120,000	18.2%	10,000
Antimony	6	0.78	31.9%	6	15.2%	1.5
Arsenic	10	0.052	98.6%	1,030	91.8%	38
Barium	2,000	380	97.2%	2,200	97.0%	737
Beryllium	4	2.5	16.7%	5.4	9.1%	1.6
Cadmium	5	0.92	19.4%	4.1	6.1%	0.41
Chromium	100	-	52.8%	300	10.6%	25
Cobalt	-	0.6	80.6%	100	69.7%	8.7
Copper	1,300	80	43.1%	370	18.2%	31
Iron	-	1,400	100.0%	300,000	100.0%	25,000
Lead	15	15	83.1%	320	18.4%	17
Manganese	-	43	100.0%	7,500	100.0%	1,200
Mercury	2	0.063	6.9%	0.24	3.0%	0.24
Nickel	-	39	58.3%	310	22.7%	26
Selenium	50	10	11.1%	14	6.1%	1.3
Thallium	2	0.02	13.9%	3	6.1%	0.63
Vanadium	-	8.6	33.3%	260	7.6%	21
Zinc	-	600	79.2%	2,700	86.4%	2,600

As shown above, 18 metal parameters were detected at concentrations greater than RSLs in OU1 groundwater samples. The metals detected at the greatest frequency (>90%) in total and dissolved

samples from both aquifers include barium, iron and manganese[3]. Arsenic was detected in more than 90% of total and dissolved samples from the lower aquifer but was less frequently detected (<90%) in upper aquifer samples. Most of the other metals were detected less frequently in dissolved samples compared to total samples.

In addition to arsenic, barium, iron and manganese, metals that were detected in at least 50% of total samples from both aquifers include aluminum, cobalt, lead, nickel, and zinc. The remaining metals, detected in less than 50% of total samples, include antimony, beryllium, cadmium, mercury, selenium, thallium and vanadium. Chromium was detected in slightly less than 50% of samples from the upper aquifer and more than 50% of samples from the lower aquifer. Copper was detected in more than 50% of total samples from the upper aquifer, but less than 50% of total samples from the lower aquifer. Mercury was detected at the lowest frequency, in less than 10% of samples from both aquifers.

As indicated above, the maximum detected concentrations of individual metal parameters range from less than 1 µg/L to greater than 100,000 µg/L (in total or dissolved samples), summarized as follows:

- >10,000 µg/L: aluminum, iron, and manganese
- >1,000 to 10,000 µg/L: arsenic, barium, copper, lead, and zinc
- >100 µg/L to 1,000 µg/L: chromium, nickel, and vanadium
- ≤100 µg/L: antimony, beryllium, cadmium, cobalt, mercury, selenium, and thallium

In general, the maximum detected concentrations in total samples are greater than the corresponding concentrations in dissolved samples, in some cases by two orders of magnitude.

Metals that were detected in OU1 groundwater samples at concentrations greater than MCLs include the following:

- OU1 upper aquifer: Antimony, Arsenic, Arsenic (dissolved), Barium; Barium (dissolved), Beryllium, Cadmium, Chromium, Copper, Lead, Lead (dissolved), Thallium, and Thallium (dissolved).
- OU1 lower aquifer: Arsenic, Arsenic (dissolved), Barium, Beryllium, Chromium, Lead, Lead (dissolved); and Thallium.

4.1.4 Polychlorinated Biphenyls

The PCBs that were detected at concentrations greater than RSLs are listed below.

PCBs	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
OU1 Upper Aquifer						
Aroclor-1242 (PCB-1242)	-	0.0078	76	2	2.6%	0.19
Aroclor-1254 (PCB-1254)	-	0.0078	76	3	3.9%	0.3
Aroclor-1260 (PCB-1260)	-	0.0078	76	2	2.6%	0.19

[3] Other metal parameters including calcium, magnesium, potassium and sodium were detected in most or all samples but are not shown here since RSLs do not exist.

PCBs	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
OU1 Lower Aquifer						
Aroclor-1254 (PCB-1254)	-	0.0078	15	2	13.3%	1.3

As shown above, PCBs were generally not detected at concentrations greater than RSLs in OU1 groundwater samples. PCB-1254 was detected in both upper aquifer and lower aquifer samples, with similar maximum detected concentrations.

4.1.5 Pesticides

The pesticides that were detected at concentrations greater than RSLs are listed below.

Pesticides	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
OU1 Upper Aquifer						
alpha-BHC	-	0.0072	49	1	2.0%	0.034
beta-BHC	-	0.025	49	3	6.1%	0.049
Heptachlor	0.4	0.0014	49	2	4.1%	0.051
OU1 Lower Aquifer						
alpha-BHC	-	0.0072	15	2	13.3%	0.04

As shown above, pesticides were generally not detected at concentrations greater than RSLs in OU1 groundwater samples. One pesticide (alpha-BHC) was detected in both upper aquifer and lower aquifer samples, with similar maximum detected concentrations. No parameters were detected at concentrations greater than MCLs.

4.1.6 Herbicides

Herbicides were not detected in any groundwater samples collected from OU1.

4.1.7 Other Parameters

Other parameters (categorized as general chemistry in Tables 4.1 and 4.2) that were detected at concentrations greater than RSLs are listed below.

Other Parameters	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
OU1 Upper Aquifer						
Cyanide (total)	200	0.15	38	10	26.3%	580
Nitrate (as N)	10,000	3,200	87	39	44.8%	19,000
OU1 Lower Aquifer						
None detected > RSLs						

As shown above, cyanide and nitrate were detected in OU1 upper aquifer groundwater samples at concentrations greater than RSLs. No parameters were detected in OU1 lower aquifer samples at concentrations greater than RSLs.

4.2 Outside OU1

Analytical results for groundwater samples collected from outside of OU1 are presented in Appendix D, in the tables listed below.

- Appendix D – Table 3: Analytical Results for Groundwater Samples – Outside OU1 Upper Aquifer
- Appendix D – Table 4: Analytical Results for Groundwater Samples – Outside OU1 Lower Aquifer

Each table includes analytical results for samples collected during the current RI program and earlier investigation results. The tables also show USEPA RSLs and indicate the detected values that are greater than the RSLs.

Table 4.3 and Table 4.4 provide information for each detected parameter (number of samples, number of detects, minimum detected concentration, and maximum detected concentration) for the upper aquifer and lower aquifer samples, respectively (derived from the tables included in Appendix D). The following provides an overview of the analytical results for each parameter group.

4.2.1 Volatile Organic Compounds

The VOCs that were detected at concentrations greater than RSLs are listed below.

VOCs	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
Outside OU1 Upper Aquifer						
1,1,2,2-Tetrachloroethane	-	0.076	213	1	0.5%	1
1,2-Dibromoethane	0.05	0.0075	165	1	0.6%	0.036
Benzene	5	0.46	213	43	20.2%	2,600
Bromodichloromethane	80	0.13	168	4	2.4%	0.39
Chloroform	80	0.22	168	35	20.8%	6.6
cis-1,2-DCE	70	3.6	165	37	22.4%	10
Ethylbenzene	700	1.5	168	48	28.6%	2,500
Isopropyl benzene	-	45	165	30	18.2%	120
Methylene chloride	5	11	213	6	2.8%	6
Toluene	1,000	110	213	107	50.2%	3,600
TCE	5	0.28	213	94	44.1%	24
Vinyl chloride	2	0.019	213	1	0.5%	0.32
Xylenes (total)	10,000	19	213	47	22.1%	13,000
Outside OU1 Lower Aquifer						
1,1,2,2-Tetrachloroethane	-	0.076	198	1	0.5%	4.2
1,2,4-Trichlorobenzene	70	0.4	198	2	1.0%	5.3
1,2-Dibromo-3-chloropropane	0.2	0.00033	198	1	0.5%	0.011
1,2-Dichloroethane	5	0.17	198	3	1.5%	1.6
2-Hexanone	-	3.8	198	1	0.5%	11
Benzene	5	0.46	198	55	27.8%	360
Bromodichloromethane	80	0.13	198	12	6.1%	2.3
Chloroform	80	0.22	198	50	25.3%	5.2

VOCs	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
cis-1,2-DCE	70	3.6	198	123	62.1%	840
Dibromochloromethane	80	0.87	198	5	2.5%	1.2
Ethylbenzene	700	1.5	198	22	11.1%	1,600
Isopropyl benzene	-	45	198	15	7.6%	75
Methylene chloride	5	11	198	1	0.5%	9.1
TCE	5	0.28	198	14	7.1%	6.9
Vinyl chloride	2	0.019	198	115	58.1%	260
Xylenes (total)	10,000	19	198	29	14.6%	4,800

As shown above, 13 VOCs in outside OU1 upper aquifer samples, and 16 VOCs in outside OU1 lower aquifer samples, were detected at concentrations greater than RSLs. The VOCs detected at the greatest concentrations in the upper aquifer samples include benzene (up to 2,600 µg/L), ethylbenzene (up to 2,500 µg/L), toluene (up to 3,600 µg/L), and xylenes (up to 13,000 µg/L). Toluene was detected at the greatest frequency (50.2%). TCE was also detected at a similar frequency (44.1%) but at relatively lower concentrations (up to 24 µg/L). The VOCs detected at the greatest concentrations in the lower aquifer samples include ethylbenzene (up to 1,600 µg/L) and xylenes (up to 4,800 µg/L) but both being relatively infrequently detected. The VOCs detected at the greatest frequency in lower aquifer samples are benzene (up to 360 µg/L), cis-1,2-DCE (up to 840 µg/L), and vinyl chloride (up to 260 µg/L).

VOCs that were detected in outside OU1 groundwater samples at concentrations greater than MCLs include the following:

- Outside OU1 upper aquifer: Benzene; Ethylbenzene; Methylene chloride; Toluene; TCE; Xylenes
- Outside OU1 lower aquifer: Benzene; cis-1,2-DCE; Ethylbenzene; Methylene chloride; TCE; Vinyl chloride

As indicated above, the VOCs detected at the greatest maximum concentrations from outside OU1 groundwater samples include benzene, ethylbenzene, toluene and xylenes; all of which were detected at greater concentrations in upper aquifer samples compared to lower aquifer samples. Conversely, cis-1,2-DCE and vinyl chloride were detected at greater frequencies and concentrations in lower aquifer samples compared to upper aquifer samples.

4.2.2 Semi-volatile Organic Compounds

The SVOCs that were detected at concentrations greater than RSLs are listed below.

SVOCs	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
Outside OU1 Upper Aquifer						
2-Methylnaphthalene	-	3.6	77	8	10.4%	190
Benzo(a)anthracene	-	0.03	77	2	2.6%	0.24
Benzo(a)pyrene	0.2	0.025	77	1	1.3%	0.36
Benzo(b)fluoranthene	-	0.25	77	1	1.3%	0.42
Biphenyl	-	0.083	74	1	1.4%	1.6

SVOCs	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
Dibenzofuran	-	0.79	77	4	5.2%	2.9
Indeno(1,2,3-cd)pyrene	-	0.25	77	1	1.3%	0.32
Naphthalene	-	0.17	77	11	14.3%	250
Outside OU1 Lower Aquifer						
2-Methylnaphthalene	-	3.6	21	2	9.5%	110
Biphenyl	-	0.083	21	1	4.8%	0.46
bis(2-Ethylhexyl)phthalate	6	5.6	21	3	14.3%	7.9
Dibenz(a,h)anthracene	-	0.025	21	1	4.8%	0.35
Indeno(1,2,3-cd)pyrene	-	0.25	21	1	4.8%	0.35
Naphthalene	-	0.17	21	2	9.5%	250

As shown above SVOCs were generally not detected at concentrations greater than RSLs from outside OU1 groundwater samples. Ten SVOCs were detected at concentrations greater than RSLs from outside OU1 groundwater (upper aquifer and lower aquifer) samples, with relatively low detection frequencies. SVOCs detected at the greatest concentrations include 2-Methylnaphthalene and Naphthalene. Two SVOCs [Benzo(a)pyrene and bis(2-Ethylhexyl)phthalate] were detected in outside OU1 groundwater samples at concentrations greater than MCLs.

4.2.3 Metals

The metals that were detected at concentrations greater than RSLs in total and/or dissolved groundwater samples are listed below.

Metals	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	Total - detection frequency	Total - max. detect (µg/L)	Dissolved - detection frequency	Dissolved - max. detect (µg/L)
Outside OU1 Upper Aquifer						
Aluminum	-	2,000	64.3%	170,000	20.3%	35,000
Antimony	6	0.78	21.4%	5.7	16.9%	1.9
Arsenic	10	0.052	75.9%	860	58.5%	240
Barium	2000	380	91.7%	21,000	100.0%	8,300
Beryllium	4	2.5	18.4%	12	13.6%	3
Cadmium	5	0.92	13.0%	4.4	10.2%	0.78
Chromium	100	-	38.0%	510	8.5%	93
Cobalt	-	0.6	50.0%	190	67.8%	32
Copper	1300	80	41.8%	420	20.3%	66
Iron	-	1,400	85.7%	500,000	65.7%	65,000
Lead	15	15	63.6%	330	26.8%	53
Manganese	-	43	99.0%	8,800	96.6%	1,600
Mercury	2	0.063	8.7%	0.39	0.0%	ND
Nickel	-	39	68.4%	480	55.9%	78
Selenium	50	10	64.1%	60	72.9%	60
Silver	-	9.4	12.6%	2	8.5%	0.44
Thallium	2	0.02	19.4%	5.4	11.9%	1.5
Vanadium	-	8.6	42.9%	470	16.9%	84
Zinc	-	600	48.0%	6,000	67.8%	6,600

Metals	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	Total - detection frequency	Total - max. detect (µg/L)	Dissolved - detection frequency	Dissolved - max. detect (µg/L)
Outside OU1 Lower Aquifer						
Aluminum	-	2,000	87.3%	63,000	22.7%	16,000
Antimony	6	0.78	31.0%	1.8	10.6%	5.6
Arsenic	10	0.052	100.0%	221	98.6%	10.7
Barium	2,000	380	100.0%	1,200	100.0%	1,200
Beryllium	4	2.5	31.0%	3.4	18.2%	0.94
Cadmium	5	0.92	21.1%	1.3	4.5%	0.34
Chromium	100	-	62.0%	110	15.2%	24
Cobalt	-	0.6	77.5%	39	53.0%	7.7
Copper	1,300	80	54.9%	130	9.1%	27
Iron	-	1,400	100.0%	91,000	98.5%	21,000
Lead	15	15	87.5%	392	33.3%	16
Manganese	-	43	100.0%	2,800	100.0%	760
Mercury	2	0.063	0.0%	ND	0.0%	ND
Nickel	-	39	63.4%	110	27.3%	22
Selenium	50	10	28.2%	5.4	7.6%	1.4
Silver	-	9.4	19.7%	23	1.5%	3.2
Thallium	2	0.02	25.4%	1.5	6.1%	0.35
Vanadium	-	8.6	54.9%	130	13.6%	31
Zinc	-	600	78.9%	2,300	83.3%	2,300

As shown above, 19 metal parameters were detected at concentrations greater than RSLs in OU1 groundwater samples. The metals detected at the greatest frequency (>90%) in total and dissolved samples include barium and manganese in the upper aquifer; and arsenic, barium, iron and manganese in the lower aquifer[4]. Most of the other metals were detected less frequently in dissolved samples compared to total samples.

In addition to arsenic, barium, iron, and manganese, metals that were detected in at least 50% of total samples from either aquifer include aluminum, chromium, cobalt, copper, lead, nickel, selenium, vanadium, and zinc. The remaining metals, detected in less than 50% of total samples, include antimony, beryllium, cadmium, mercury, silver, and thallium. Mercury was detected at the lowest frequency, in less than 10% of samples from the upper aquifer, and none in the lower aquifer.

As indicated above, the maximum detected concentrations of individual metal parameters range from less than 1 µg/L to greater than 100,000 µg/L (in total or dissolved samples), summarized as follows:

- >10,000 µg/L: aluminum, barium, and iron
- >1,000 to 10,000 µg/L: manganese and zinc
- >100 µg/L to 1,000 µg/L: arsenic, chromium, cobalt, copper, lead, nickel, and vanadium
- ≤100 µg/L: antimony, beryllium, cadmium, mercury, selenium, silver, and thallium

[4] Other metal parameters including calcium, magnesium, potassium and sodium were detected in most or all samples but are not shown here since RSLs do not exist.

In general, the maximum detected concentrations in total samples are greater than the corresponding concentrations in dissolved samples, in some cases by two orders of magnitude.

Metals that were detected in outside OU1 groundwater samples at concentrations greater than MCLs include the following:

- Outside OU1 upper aquifer: Arsenic, Arsenic (dissolved), Barium, Barium (dissolved), Beryllium, Chromium, Lead, Lead (dissolved), Selenium, Selenium (dissolved), and Thallium.
- Outside OU1 lower aquifer: Arsenic, Arsenic (dissolved), Chromium, Lead, and Lead (dissolved).

4.2.4 Polychlorinated Biphenyls

The PCBs that were detected at concentrations greater than RSLs are listed below.

PCBs	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
Outside OU1 Upper Aquifer						
Aroclor-1248 (PCB-1248)	-	0.0078	64	1	1.6%	0.39
Aroclor-1260 (PCB-1260)	-	0.0078	64	1	1.6%	0.082
Outside OU1 Lower Aquifer						
None detected > RSLs						

As shown above, PCBs were generally not detected at concentrations greater than RSLs from outside OU1 groundwater samples.

4.2.5 Pesticides

The pesticides that were detected at concentrations greater than RSLs are listed below.

Pesticides	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
Outside OU1 Upper Aquifer						
alpha-BHC	-	0.0072	42	1	2.4%	0.038
Dieldrin	-	0.0018	42	1	2.4%	0.013
gamma-BHC (lindane)	0.2	0.042	42	1	2.4%	0.016
Heptachlor	0.4	0.0014	42	3	7.1%	0.0095
Outside OU1 Lower Aquifer						
None detected > RSLs						

As shown above, pesticides were generally not detected at concentrations greater than RSLs from outside OU1 groundwater samples. No pesticides were detected at concentrations greater than MCLs.

4.2.6 Herbicides

Herbicides were not detected in any groundwater samples collected from outside OU1.

4.2.7 Other Parameters

Other parameters (categorized as general chemistry in Tables 4.3 and 4.4) that were detected at concentrations greater than RSLs are listed below.

Other Parameters	RSL – MCL (µg/L)	RSL – tapwater (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
Outside OU1 Upper Aquifer						
Cyanide (total)	200	0.15	25	1	4.0%	9.2
Nitrate (as N)	10,000	3,200	77	62	80.5%	13,000
Nitrite (as N)	1,000	200	69	18	26.1%	260
Outside OU1 Lower Aquifer						
Nitrate (as N)	10,000	3,200	71	34	47.9%	4,600

As shown above, parameters that were detected at concentrations greater than RSLs from outside OU1 groundwater samples include cyanide, nitrate, and nitrite in upper aquifer samples; and nitrate in lower aquifer samples.

5. Data Assessment

This section presents GHD's data assessment based on available field investigation results. Section 5.1 includes an assessment of groundwater chemistry data, based on information presented in Section 4. Section 5.2 includes an assessment of potential leaching to groundwater based on available soil/fill data. Data from all of the various RI phases of activity are included.

5.1 Groundwater Chemistry

5.1.1 Volatile Organic Compounds

The analytical results for selected VOCs in groundwater samples are illustrated on Figure 5.1 (upper aquifer) and Figure 5.2 (lower aquifer). Each figure shows the results for VOCs that were detected at concentrations greater than MCLs, or tap water values in cases where MCLs do not exist. The figures include results for each aquifer, based on investigative samples from VAS, boreholes/temporary monitoring wells, and permanent monitoring wells. Figure 5.3 illustrates the results for VAS locations only, showing sample intervals in both the upper and lower aquifers. Note that data are not shown for sample locations where VOCs were not detected at concentrations greater than the criteria noted above.

5.1.1.1 VOC Concentration Contour Maps

As stated in Section 4, the VOCs that were detected at the greatest maximum concentrations and greatest frequency in OU1 groundwater samples include benzene, cis-1,2-DCE, TCE, and vinyl chloride. GHD prepared concentration contour maps for each of these VOCs for the upper aquifer

and lower aquifer, shown on Figures 5.4 through 5.11. The procedure for preparation of the concentration contour maps is summarized as follows:

- Data selection:
  - Analytical results for groundwater samples collected from the current investigation (2017 to 2019) were used and supplemented using results from earlier investigations. All sample results were classified as either upper aquifer or lower aquifer.
  - For monitoring wells the most recent results were used for each individual well location. For BH/TMW locations all available results were used (2013 to 2019).
  - For VAS locations all available results were used with the exception of locations where co-located monitoring wells exist, providing more recent data. For VAS results, the maximum detected concentrations were used for each aquifer (upper and lower).
- Data processing and presentation:
  - The selected data for detected values were used as input. In the case of non-detect results, a non-zero value equal to 10% of the reporting limit was applied.
  - The process of chemical-specific variogram derivation and kriging was performed using Surfer software application (Surfer® 15.5.382 [Golden Software, LLC]). The contour information was transferred to the Site base map to show contour information within the general limits of the data points, and adjusted as appropriate based on technical review.
  - Each figure shows the concentration values that were applied, including non-detect results.

GHD observations regarding VOC distribution as shown on the figures are summarized below.

Benzene

Benzene concentration contour maps are shown on Figure 5.4 (upper aquifer) and Figure 5.5 (lower aquifer). As shown on Figure 5.4, some discrete areas with benzene concentrations greater than the MCL (5 µg/L) in OU1 upper aquifer groundwater are indicated. One area is located at the northeast portion of the Valley Asphalt facility, based on the benzene results for BH33-13 (80 µg/L) and BH46-13 (100 µg/L). The other area is within the central part of OU1 immediately south of the Valley Asphalt facility, including BH77-13 (12 µg/L). One area with benzene concentrations greater than the MCL outside of OU1 adjacent to the DP&L Transportation Building is indicated. Upper aquifer benzene concentrations up to 2,600 µg/L have been detected in this area as shown on Figure 5.1, along with other fuel-related constituents.

As shown on Figure 5.5, based on the most recent sampling results, an area with benzene concentrations greater than the MCL in the lower aquifer is indicated in the area of the DP&L Transportation Building (38 µg/L at MW-220) extending to the west side of Dryden Road (36 µg/L at VAS-35). Benzene was detected at greater concentrations in the lower aquifer based on previous sampling at VAS-26 (up to 360 µg/L) located near the DP&L Transportation Building.

TCE

TCE concentration contour maps are shown on Figure 5.6 (upper aquifer) and Figure 5.7 (lower aquifer). As shown on Figure 5.6, some areas in the upper aquifer with TCE concentrations greater than the MCL (5 µg/L) are indicated within and outside of OU1. One area is located within the Valley Asphalt facility and the others are located along the Dryden Road corridor, summarized as follows:

- At the Valley Asphalt area TCE was detected at multiple locations (VAS-06, BH43-13, BH03-18, VAS-31, BH31-13, BH30-13, and MW-229) with concentrations up to 85 µg/L.
- The second area is located within and adjacent to Parcel 5172. At this area TCE was detected at multiple locations (VAS-8, BH69-13, VAS-34, and BH70-13) at concentrations up to 74 µg/L. This area is interpreted as being contiguous with TCE detections in upper aquifer groundwater at VAS-43 (up to 24 µg/L) located on the east side of Dryden Road at the DP&L facility. TCE was also detected within the DP&L facility at VAS-42 (up to 9 µg/L).
- Two smaller areas are indicated at Parcels 5174 and 5175, where TCE was detected at VAS-15 (up to 18 µg/L) and BH89-13 (11 µg/L). These areas appear to be isolated but are in relatively close proximity to the second area discussed above.
- At the remaining area, located within the unnumbered OU1 parcel at the Site entrance (near the intersection of Dryden Road and East River Road), TCE was detected at multiple locations (VAS-21, BH16-13, BH17-13, BH18-13, and MW-210) at concentrations up to 94 µg/L. This area is interpreted as being contiguous with TCE detections in upper aquifer groundwater at nearby locations outside OU1 (VAS-24, MW-213-VAS, BH11-18, BH12-18, and BH13-18) up to 12 µg/L.

As shown on Figure 5.7, discrete areas in the lower aquifer with TCE concentrations greater than the MCL are indicated within and outside of OU1. One area is located within the Valley Asphalt facility where TCE was detected at VAS-32 (up to 6.9 µg/L). At the other areas, within and adjacent to Parcel 5173, TCE was detected at VAS-9 (up to 220 µg/L), but was not detected at nearby monitoring well MW-215B. TCE was detected at another nearby location, VAS-15 (up to 8.9 µg/L) located within Parcel 5173. In addition, TCE detected at VAS-43 (up to 5.4 µg/L) located on the east side of Dryden Road within the DP&L facility.

Cis-1,2-DCE

Cis-1,2-DCE concentration contour maps are shown on Figure 5.8 (upper aquifer) and Figure 5.9 (lower aquifer). As shown on Figure 5.8, some small discrete areas with cis-1,2-DCE concentrations greater than the MCL (70 µg/L) in OU1 upper aquifer groundwater are indicated. Two of these areas with are located along the Dryden Road corridor including VAS-44 (up to 220 µg/L) at Parcel 5171 and MW-235 (1,100 µg/L) at Parcel 5173. One other area is indicated within the central area of OU1 at VAS-38 (up to 520 µg/L) located north of the Quarry Pond.

As shown on Figure 5.9, two areas with cis-1,2-DCE concentrations greater than the MCL in the lower aquifer are indicated within and outside OU1. The larger area, located along Dryden Road, is based on multiple VAS locations and monitoring wells within OU1 and the DP&L facility. The greatest detected concentration of cis-1,2-DCE within this area is located at VAS-43 (up to 840 µg/L) within the DP&L facility. Other locations within OU1 with cis-1,2-DCE detections greater than the MCL include VAS-9 (up to 88 µg/L) located in Parcel 5171.

Vinyl Chloride

Vinyl chloride concentration contour maps are shown on Figure 5.10 (upper aquifer) and Figure 5.11 (lower aquifer). As shown on Figure 5.10, some areas in the upper aquifer with vinyl chloride concentrations greater than the MCL (2 µg/L) are indicated within OU1, summarized as follows:

- At the northern area, within the Valley Asphalt facility, vinyl chloride was detected at multiple locations with concentrations up to 400 µg/L, at VAS-32. At VAS-44 located on Parcel 5171, vinyl chloride was detected at concentrations up to 250 µg/L. Much lower concentrations of vinyl chloride (approximately 10 µg/L or less) are evident in the area between VAS-32 and VAS-44, and the surrounding area.
- In the central area, vinyl chloride was detected at MW-235 (620 µg/L) located within Parcel 5173, and at BH86-13 (54 µg/L) located nearby within Parcel 5177. Vinyl chloride concentrations at other surrounding locations are generally less than 10 µg/L or not detected. Several smaller areas near Dryden Road with vinyl chloride concentration greater than the MCL are also indicated on Figure 5.10 including VAS-8 (up to 3.4 µg/L), VAS-33 (up to 15 µg/L), and VAS-15B (up to 29 µg/L).
- Other locations within OU1 with vinyl chloride detections greater than the MCL include VAS-11 (up to 5 µg/L) and VAS-38 (up to 270 µg/L, estimated), both located within Parcel 5177. VAS-11 is located near the center of Parcel 5177 and VAS-38 is located north of the Quarry Pond.

As shown on Figure 5.11, vinyl chloride is detected at concentrations greater than the MCL in the lower aquifer at multiple locations within and adjacent to OU1. In general, the greatest concentrations of vinyl chloride within OU1 are detected at locations along the Dryden Road corridor, such as MW-216 (350 µg/L), VAS-34 (up to 110 µg/L), and VAS-35 (up to 190 µg/L). Similar concentrations (>100 µg/L) are observed within lower aquifer samples collected outside OU1 on the east side of Dryden Road, within the DP&L facility. The vinyl chloride detections on either side of Dryden Road are represented as being contiguous as shown on Figure 5.11.

5.1.1.2 Summary of VAS Results

VAS results are illustrated on Figure 5.3, and are used in the development of the VOC concentration contour maps shown on Figures 5.4 through 5.11. Analytical results for detected VOCs for VAS locations are presented in Table 5 of Appendix D. GHD observations regarding the VOC data for VAS locations are discussed below.

VAS locations completed within OU1 include VAS-1, VAS-2, VAS-3, VAS-4, VAS-5, VAS-6, VAS-7, VAS-8, VAS-9, VAS-11, VAS-12, VAS-14, VAS-15, VAS-15B, VAS-17, VAS-19, VAS-21, VAS-21B, VAS-22, VAS-22B, VAS-31, VAS-32, VAS-33, VAS-34, VAS-37, VAS-38, and VAS-44. In general each VAS location was completed to depths of approximately 100 feet BGS or 150 feet BGS[5]. The sample location within OU1 with the greatest total detected VOC concentration[6] is VAS-9 (9,796 µg/L at 27 to 32 feet BGS). VAS-9 is located within Parcel 5173 and was completed in 2008.

[5] VAS locations completed to less than 100 feet BGS in the northern part of OU1 include VAS-2, VAS-4, VAS-6, and VAS-7. VAS-22 was also completed to less than 100 feet BGS and supplemented by VAS-22B to 150 feet BGS.

[6] Based on the sum of detected VOC concentrations for each individual sample interval, as shown in Table 5 of Appendix D.

This area was further investigated by collecting groundwater samples from multiple BH/TMW locations in 2013, and by installation/sampling of monitoring wells (see Section 5.1.1.3). The next greatest total detected VOC concentrations within OU1 are found at VAS-38 (828 µg/L at 45 to 50 feet BGS), VAS-21b (580 µg/L at 97 to 102 feet BGS), and VAS-14 (513 µg/L at 60 to 65 feet BGS). At the remaining VAS locations within OU1, the maximum total detected VOC concentrations are all less than 500 µg/L. The VAS data demonstrate significant decreases in total VOC concentrations with depth. For example, at VAS-9, the total VOC concentration in the deepest sample interval (92 to 97 feet BGS) is 50.2 µg/L, compared to the maximum value of 9,796 µg/L (27 to 32 feet BGS) noted above. At all other VAS locations within OU1, the maximum total VOC concentration in the deepest sample intervals is 32 µg/L, with the exception of VAS-33 where the maximum value of 90 µg/L is found at the deepest sample interval.

VAS locations completed outside OU1 include MW-213-VAS, VAS-13, VAS-20, VAS-23, VAS-24, VAS-25, VAS-26, VAS-27, VAS-28, VAS-29, VAS-30, VAS-35, VAS-36, VAS-39, VAS-40, VAS-42, and VAS-43. With the exception of VAS-20, each VAS was completed to depths of approximately 100 feet BGS, 150 feet BGS or 200 feet BGS. VAS-20 was completed to 57 feet BGS. The sample locations outside OU1 with the greatest total detected VOC concentrations are VAS-26 (11,756 µg/L at 46 to 51 feet BGS) and VAS-35 (12,090 µg/L at 50 to 60 feet BGS). VAS-26 is located adjacent to the Transportation Building, within the DP&L facility. VAS-35 is located southeast of VAS-26, on the opposite side of Dryden Road. The next greatest total detected VOC concentrations outside OU1 are found at VAS-27 (509 µg/L at 81 to 86 feet BGS), VAS-29 (490 µg/L at 96 to 106 feet BGS), VAS-42 (650 µg/L at 80 to 90 feet BGS), and VAS-43 (913 µg/L at 70 to 80 feet BGS); all located within the DP&L facility. At the remaining VAS locations outside OU1, the maximum total detected VOC concentrations are all less than 200 µg/L. Consistent with the OU1 results, the VAS data outside OU1 demonstrate significant decreases in total VOC concentrations with depth. For example, at VAS-35, the total VOC concentration in the deepest sample interval (140 to 150 feet BGS) is 147 µg/L, compared to the maximum value of 12,090 µg/L (50 to 60 feet BGS) noted above. At all other VAS locations outside OU1, the maximum total VOC concentration in the deepest sample intervals is 38.8 µg/L, with the exception of VAS-27 (191 µg/L at 96 to 101 feet BGS).

Figure 5.3 shows the VAS results for VOCs that were detected at concentrations greater than MCLs, or tap water values in cases where MCLs do not exist. Based on inspection of Figure 5.3, it is evident that some VOCs (primarily vinyl chloride) are detected at concentrations greater than respective MCL at depth in various VAS locations within OU1 and outside OU1. The presence of vinyl chloride in the lower aquifer is reflected in the concentration contour map shown on Figure 5.11.

VOCs were not detected at concentration greater than MCLs in any sample intervals at multiple locations within OU1 including VAS-1, VAS-3, VAS-4, VAS-5, and VAS-37. Also, VOCs were not detected at concentrations greater than MCLs outside OU1 at the periphery of the Quarry Pond (VAS-13, VAS-20, VAS-23, and VAS-39); nor at VAS-40 located at the north side of the DP&L facility.

5.1.1.3 Summary of Monitoring Well Results

Monitoring wells results are illustrated on Figure 5.1 (upper aquifer) and Figure 5.2 (lower aquifer). VOC analytical results for monitoring well groundwater samples are presented in Appendix D, in the tables listed below.

- Appendix D – Table 6: Analytical Results for Monitoring Well Groundwater Samples – OU1 Detected VOCs
- Appendix D – Table 7: Analytical Results for Monitoring Well Groundwater Samples – Outside OU1 Detected VOCs

Each table includes analytical results for samples collected during the current RI program and earlier investigation results. The tables also show USEPA RSLs and indicate the detected values that are greater than the RSLs.

GHD observations regarding the VOC data for monitoring well locations are discussed below.

OU1 Upper Aquifer

Upper aquifer monitoring wells located within OU1 include: MW-101A, MW-202, MW-203, MW-204, MW-208, MW-209, MW-210, MW-212, MW-215A, MW-217, MW-219, MW-225, MW-227, MW-228[7], MW-229, MW-230, MW-233, and MW-235. Monitoring well locations are shown on Figure 5.1 with analytical results for VOCs that were detected at concentrations greater than MCLs, or tap water values in cases where MCLs do not exist. Based on inspection of Figure 5.1, VOCs were detected in multiple monitoring wells over time at concentrations greater than MCLs. The most recent sampling results indicate four locations (out of 18) where individual VOC concentrations are greater than MCLs, summarized as follows:

- MW-210 is located within the unnumbered parcel near the Site entrance from Dryden Road. MW-210 has been sampled multiple times since 1996, most recently in October 2017. TCE concentrations have decreased from up to 260 µg/L in 2008 and earlier, to 47 µg/L in 2017. Other detected VOCs include cis-1,2-DCE (12 µg/L in 2017).
- MW-228 (now abandoned) was located in the Valley Asphalt facility. MW-228 was sampled once (April 2010) and vinyl chloride was detected at a concentration of 6.3 µg/L. Other detected VOCs include 1,1-DCA (2 µg/L, estimated) and cis-1,2-DCE (1.6 µg/L).
- MW-229 is located within the Valley Asphalt facility. MW-229 was sampled twice (April 2010 and May 2015). TCE was detected in April 2010 (70 µg/L) and May 2015 (85 µg/L and 73 µg/L in the duplicate sample). Other detected VOCs include cis-1,2-DCE (up to 12 µg/L).
- MW-235 is located near VAS-9, within Parcel 5173. MW-235 was installed and sampled in 2018. Detected VOCs include cis-1,2-DCE (1,100 µg/L) and vinyl chloride (620 µg/L).

[7] MW-228 was abandoned in February 2019 as discussed in Section 2.2.2.1.

As indicated above, VOCs were not detected at concentrations greater than MCLs at the 14 other OU1 upper aquifer monitoring wells. Some VOCs are detected at concentrations greater than RSLs for tap water as shown in the Appendix D tables.

OU1 Lower Aquifer

Lower aquifer monitoring wells located within OU1 include: MW-209A, MW-210A, MW-210B, MW-215B, and MW-216. Monitoring well locations are shown on Figure 5.2 with analytical results for VOCs that were detected at concentrations greater than MCLs, or tap water values in cases where MCLs do not exist. Based on inspection of Figure 5.2, VOCs were detected in each monitoring well at concentrations greater than MCLs, summarized as follows:

- MW-209A is located in the southern part of OU1 near the northeast corner of the Quarry Pond. Vinyl chloride is detected at concentrations greater than the MCL, decreasing from 19 µg/L in 2009 to 3.8 µg/L in 2018. Other detected VOCs include cis-1,2-DCE (up to 1.9 µg/L).
- MW-210A is located within the unnumbered parcel near the Site entrance from Dryden Road. Vinyl chloride is detected at concentrations greater than the MCL, decreasing from 55 µg/L (estimated) in 2009 to 24 µg/L in 2017. Other detected VOCs include cis-1,2-DCE (up to 1.5 µg/L).
- MW-210B is located adjacent to MW-210A. Benzene was detected at concentrations greater than the MCL, up to 1,100 µg/L in 2009, decreasing to 4 µg/L in 2017. No other VOCs were detected.
- MW-215B is located in the central portion of OU1, within Parcel 5173. Vinyl chloride is detected at concentrations greater than the MCL, 6.2 µg/L in 2009 and 5.4 µg/L in 2015. Other detected VOCs include 1,1-DCA (up to 1.2 µg/L), cis-1,2-DCE (up to 35 µg/L), and trans-1,2-DCE (up to 0.23 µg/L, estimated).
- MW-216 is located in the northern portion of OU1, within Parcel 5171, adjacent to Dryden Road. Cis-1,2-DCE and vinyl chloride are detected at concentrations greater than MCLs. The concentrations of cis-1,2-DCE decreased from 650 µg/L in 2010 to 480 µg/L in 2015. Conversely, vinyl chloride concentrations increased from 92 µg/L (estimated) in 2010 to 350 µg/L in 2015. Other detected VOCs include trans-1,2-DCE (up to 5.9 µg/L (estimated).

Outside OU1 Upper Aquifer

Upper aquifer monitoring wells located outside OU1 include the following:

- MW-102, MW-103, MW-201, MW-206, MW-207, and MW-226, located in the GMR floodplain adjacent to OU1.
- MW-218A and MW-234, located along the southern side of the Quarry Pond.
- MW-104, located adjacent to the DP&L facility[8].
- MW-222A, MW-223A, and MW-224A, located within the DP&L facility[9].

[8] MW-104 could not be located during the September 2019 site visit and may no longer exist.

[9] Other monitoring wells installed by DP&L exist within the DP&L facility including but not limited to GW-2, GW-3, GW-5, GW-6, GW-7, GW-8, MW-1, MW-3, MW-4, MW-5, MW-A, and MW-B.

Monitoring well locations are shown on Figure 5.1 with analytical results for VOCs that were detected at concentrations greater than MCLs, or tap water values in cases where MCLs do not exist. Based on inspection of Figure 5.1, VOCs were previously detected (prior to 2008) in three monitoring wells (MW-102, MW-103, and MW-201) at concentrations greater than MCLs. Based on the most recent sampling results, no VOCs are detected at concentrations greater than MCLs at any of the monitoring wells listed above. Some VOCs are detected at concentrations greater than RSLs for tap water as shown in the Appendix D tables.

Outside OU1 Lower Aquifer

Lower aquifer monitoring wells located outside OU1 include the following:

- MW-214 and MW-218B, located beyond the southern boundary of OU1, near the Quarry Pond.
- MW-220[10], MW-221, MW-222, MW223B, and MW-224B, located within the DP&L facility.

Monitoring well locations are shown on Figure 5.2 with analytical results for VOCs that were detected at concentrations greater than MCLs, or tap water values in cases where MCLs do not exist. Based on inspection of Figure 5.2, no VOCs have been detected at MW-214 or MW-218B at concentrations greater than MCLs. Both wells are located beyond the southern boundary of OU1. MW-214 is located within Parcel 3261, near the southeast corner of the Quarry Pond. MW-218B is located within Parcel 3274, near the southwest corner of the Quarry Pond. The detected VOCs at these wells include vinyl chloride (up to 1.2 µg/L) at MW-214, and 1,2-dibromo-3-chloropropane (0.011 µg/L, estimated) at MW-218B.

As noted above, five lower aquifer monitoring wells are located within the DP&L facility. VOC monitoring results are summarized by the following:

- MW-220 is located near the Transportation Building. VOCs detected at concentrations greater than MCLs include benzene (up to 38 µg/L), cis-1,2-DCE (up to 86 µg/L), and vinyl chloride (up to 41 µg/L).
- MW-221 is located near the southwest corner of the Service Building. VOCs detected at concentrations greater than MCLs include cis-1,2-DCE (up to 440 µg/L), methylene chloride (up to 9.1 µg/L, estimated), and vinyl chloride (up to 110 µg/L). The results indicate that concentrations of cis-1,2-DCE decreased and concentrations of vinyl chloride have increased over time (from 2010 to 2015).
- MW-222 is located near the northwest corner of the Service Building. VOCs detected at concentrations greater than MCLs include vinyl chloride (up to 5.6 µg/L).
- MW-223B is located on the east side of the Service Building. VOCs detected at concentrations greater than MCLs include cis-1,2-DCE (up to 170 µg/L), and vinyl chloride (up to 98 µg/L). The results indicate that the VOC concentrations decreased from 2010 to 2018.
- MW-224B is located at the north side of the DP&L facility. No VOCs were detected at concentrations greater than MCLs.

[10] MW-220 is not accessible after being erroneously plugged by DP&L in 2018.

5.1.1.4 Vapor Intrusion Screening

VOC analytical results for upper aquifer groundwater samples are presented in Appendix D, in the tables listed below.

- Appendix D – Table 8: Analytical Results for Groundwater Samples – OU1 Upper Aquifer VOCs
- Appendix D – Table 9: Analytical Results for Groundwater Samples – Outside OU1 Upper Aquifer VOCs

Each table includes analytical results for samples collected during the current RI program and earlier investigation results. The tables also show USEPA Vapor Intrusion Screening Levels (VISLs) and indicate the detected values that are greater than the VISLs. Note that the VISL comparison is conservatively applied to all sample intervals within the upper aquifer, regardless of depth below the water table.

The VOCs that were detected at concentrations greater than VISLs are listed below.

VOCs	Residential VISL (µg/L)	Commercial VISL (µg/L)	# of samples	# of detects	Detection frequency	Max. detect (µg/L)
OU1 Upper Aquifer						
1,1-Dichloroethane	7.64	33.4	349	111	31.8%	39
1,2-Dichloroethane	2.24	9.78	349	4	1.1%	34
1,4-Dichlorobenzene	2.59	11.3	280	19	6.8%	5.6
Benzene	1.59	6.93	349	71	20.3%	100
Bromodichloromethane	0.876	3.82	280	5	1.8%	1.3
Chlorobenzene	41	172	349	74	21.2%	130
Chloroform	0.814	3.55	280	23	8.2%	3.1
Ethylbenzene	3.49	15.2	280	47	16.8%	100
TCE	0.518	2.18	349	161	46.1%	5,100
Vinyl chloride	0.147	2.45	349	130	37.2%	760
Xylenes (total)	38.5	162	349	44	12.6%	190
Outside OU1 Upper Aquifer						
Benzene	1.59	6.93	213	43	20.2%	2,600
Chloroform	0.814	3.55	168	35	20.8%	6.6
Cyclohexane	102	429	165	62	37.6%	620
Ethylbenzene	3.49	15.2	168	48	28.6%	2,500
Isopropyl benzene	88.7	373	165	30	18.2%	120
Toluene	1,920	8,070	213	107	50.2%	3,600
TCE	0.518	2.18	213	94	44.1%	24
Vinyl chloride	0.147	2.45	213	1	0.5%	0.32
Xylenes (total)	38.5	162	213	47	22.1%	13,000

As shown above 11 VOCs in OU1 upper aquifer samples, and 9 VOCs in outside OU1 upper aquifer samples, were detected at concentrations greater than VISLs. The VOCs detected at the greatest concentrations and frequency in the OU1 upper aquifer samples include TCE (up to 5,100 µg/L) and vinyl chloride (up to 760 µg/L). The VOCs detected at the greatest concentrations in the outside OU1 upper aquifer samples include benzene (up to 2,600 µg/L), ethylbenzene (up to 2,500 µg/L), toluene

(up to 3,600 µg/L), and xylenes (up to 13,000 µg/L). The VOCs detected at the greatest frequency in outside OU1 upper aquifer samples are toluene, TCE, and cyclohexane.

As stated above, the VOCs detected at the greatest maximum concentrations and greatest frequency in OU1 upper aquifer groundwater samples include TCE and vinyl chloride. Conversely, the outside OU1 samples exhibit the presence of greater concentrations of benzene, toluene, ethylbenzene, and xylenes (BTEX) and other fuel substances related to off-Site sources[11], and much lower concentrations of TCE and vinyl chloride.

The upper aquifer VOC concentration contour maps for benzene (Figure 5.4), TCE (Figure 5.6), and vinyl chloride (Figure 5.10) illustrate areas with contour values greater than VISLs.

5.1.2 Semi-volatile Organic Compounds

SVOCs were generally not detected at concentrations greater than RSLs in groundwater samples collected within OU1 (see Section 4.1.2) or outside OU1 (see Section 4.2.2).

The SVOCs detected at the greatest concentrations and frequencies within OU1 upper aquifer groundwater include 2-Methylnaphthalene (up to 56 µg/L), bis(2-Ethylhexyl)phthalate (up to 160 µg/L), and Naphthalene (up to 17 µg/L). SVOCs were not detected in any OU1 lower aquifer samples at concentrations greater than RSLs. Within OU1, SVOC detections are sporadic and hence not indicative of any discernible pattern of SVOC presence in groundwater.

The SVOCs detected at the greatest concentrations and frequencies in groundwater samples collected outside OU1 include the following:

- Outside OU1 upper aquifer: 2-Methylnaphthalene (up to 190 µg/L) and Naphthalene (up to 250 µg/L).
- Outside OU1 lower aquifer: 2-Methylnaphthalene (up to 110 µg/L) and Naphthalene (up to 250 µg/L).

As indicated above, the greatest maximum detected concentrations of 2-Methylnaphthalene and Naphthalene are found in samples collected outside OU1. Based on inspection of the analytical results provided in Appendix D, the greatest concentrations of these SVOCs occur at locations adjacent to the DP&L Transportation Building including GW-5, GW-6, MW-A, MW-B, and BH18-13; and at VAS-35 located on the opposite (west) side of Dryden Road. These results are indicative of the presence of fuel-related substances in groundwater originating at the DP&L facility.

5.1.3 Metals

Analytical results for metals, presented in Section 4, indicate that many parameters were frequently detected in upper and lower aquifer groundwater samples, within OU1 and outside OU1. In general, the presence of metals in groundwater samples is a common occurrence, potentially related to anthropogenic and non-anthropogenic sources.

[11] The greatest concentrations of BTEX and other substances are found at sample locations near the Transportation Building within the DP&L facility, e.g., GW-5, GW-6, MW-A, MW-B, and VAS-26.

The metals that are detected at concentrations greater than MCLs, as discussed in Section 4.1.3 (OU1) and Section 4.2.3 (outside OU1) are listed below (designated with 'X').

	OU1 upper aquifer	OU1 lower aquifer	Outside OU1 upper aquifer	Outside OU1 lower aquifer
Antimony	X			
Arsenic	X	X	X	X
Arsenic (dissolved)	X	X	X	X
Barium	X	X	X	
Barium (dissolved)	X		X	
Beryllium	X	X	X	
Cadmium	X			
Chromium	X	X	X	X
Copper	X			
Lead	X	X	X	X
Lead (dissolved)	X	X	X	X
Selenium			X	
Selenium (dissolved)			X	
Thallium	X	X	X	
Thallium (dissolved)	X			

GHD observations regarding the analytical results for the metals listed above are summarized by the following:

- Antimony is detected at concentrations greater than the MCL (6 µg/L) in OU1 upper aquifer samples only (up to 23 µg/L). The dissolved antimony concentrations in all samples (up to 5.6 µg/L) are less than the MCL.
- Arsenic is detected at concentrations greater than the MCL (10 µg/L) within and outside OU1, in both upper and lower aquifers. The maximum detected concentrations are: OU1 upper aquifer (3,200 µg/L); OU1 lower aquifer (1,030 µg/L); outside OU1 upper aquifer (860 µg/L); and outside OU1 lower aquifer (221 µg/L). These values generally indicate that arsenic concentrations decrease at greater depths. The results for dissolved arsenic also indicate that arsenic concentrations decrease with depth. The maximum detected concentrations of dissolved arsenic are: OU1 upper aquifer (230 µg/L); OU1 lower aquifer (38 µg/L); outside OU1 upper aquifer (240 µg/L); and outside OU1 lower aquifer (10.7 µg/L).
- Barium is detected at concentrations greater than the MCL (2,000 µg/L) within OU1 (upper and lower aquifer) and outside OU1 (upper aquifer). The maximum detected concentrations are: OU1 upper aquifer (5,000 µg/L); OU1 lower aquifer (2,200 µg/L); outside OU1 upper aquifer (21,000 µg/L); and outside OU1 lower aquifer (1,200 µg/L). These values generally indicate that barium concentrations decrease at greater depths. The results for dissolved barium also indicate that barium concentrations decrease with depth. The maximum detected concentrations of dissolved barium are: OU1 upper aquifer (5,200 µg/L); OU1 lower aquifer (737 µg/L); outside OU1 upper aquifer (8,300 µg/L); and outside OU1 lower aquifer (1,200 µg/L). The dissolved barium concentrations in lower aquifer samples are less than the MCL.
- Beryllium is detected at concentrations greater than the MCL (4 µg/L) within OU1 (upper and lower aquifer) and outside OU1 (upper aquifer). The maximum detected concentrations are:

OU1 upper aquifer (4.3 µg/L); OU1 lower aquifer (5.4 µg/L); outside OU1 upper aquifer (12 µg/L); and outside OU1 lower aquifer (3.4 µg/L). The dissolved beryllium concentrations in all samples (up to 1.6 µg/L) are less than the MCL.

- Cadmium is detected at concentrations greater than the MCL (5 µg/L) in OU1 upper aquifer samples only (up to 14 µg/L). The dissolved cadmium concentrations in all samples (up to 0.78 µg/L) are less than the MCL.
- Chromium is detected at concentrations greater than the MCL (100 µg/L) within and outside OU1, in both upper and lower aquifers. The maximum detected concentrations are: OU1 upper aquifer (610 µg/L); OU1 lower aquifer (300 µg/L); outside OU1 upper aquifer (510 µg/L); and outside OU1 lower aquifer (110 µg/L). These values generally indicate that chromium concentrations decrease at greater depths. The dissolved chromium concentrations in all samples (up to 93 µg/L) are less than the MCL.
- Copper is detected at concentrations greater than the MCL (1,300 µg/L) in OU1 upper aquifer samples only (up to 1,900 µg/L). The dissolved copper concentrations in all samples (up to 66 µg/L) are less than the MCL.
- Lead is detected at concentrations greater than the MCL (15 µg/L) within and outside OU1, in both upper and lower aquifers. The maximum detected concentrations are: OU1 upper aquifer (1,940 µg/L); OU1 lower aquifer (320 µg/L); outside OU1 upper aquifer (330 µg/L); and outside OU1 lower aquifer (392 µg/L). The maximum detected concentrations of dissolved lead are: OU1 upper aquifer (20 µg/L); OU1 lower aquifer (17 µg/L); outside OU1 upper aquifer (53 µg/L); and outside OU1 lower aquifer (16 µg/L).
- Selenium is detected at concentrations greater than the MCL (50 µg/L) in outside OU1 upper aquifer samples only (up to 60 µg/L), total and dissolved. The selenium concentrations in all OU1 samples (up to 26.3 µg/L) are less than the MCL.
- Thallium is detected at concentrations greater than the MCL (2 µg/L) within OU1 (upper and lower aquifer) and outside OU1 (upper aquifer). The maximum detected concentrations are: OU1 upper aquifer (4.4 µg/L); OU1 lower aquifer (3 µg/L); outside OU1 upper aquifer (5.4 µg/L); and outside OU1 lower aquifer (1.5 µg/L). The dissolved thallium concentrations in OU1 upper aquifer samples (up to 6.7 µg/L) is also greater than the MCL. The dissolved thallium concentration in all other samples (up to 1.5 µg/L) are less than the MCL.

As indicated above, the metals that are most prevalent in terms of concentrations compared to MCLs and spatial distribution include arsenic, barium, chromium, and lead.

5.1.4 Other Parameters

As discussed in Sections 4.1 and 4.2, PCBs and pesticides were generally not detected in groundwater samples within and outside of OU1, and herbicides were not detected. The results do not indicate any discernible pattern of presence of these substances in groundwater.

5.2 OU1 Soil/Fill

This section presents analytical results for soil/fill samples collected from OU1 with comparison to USEPA Soil Screening Levels (SSLs).

Analytical results for soil/fill samples collected from OU1 areas are included in Appendix E subdivided by Site area. Appendix E – Table 1 includes the results for soil/fill samples collected from the Southern Area. Appendix E – Table 2 includes the results for soil/fill samples collected from the Central and Northern Areas. Each table includes results for samples collected during the current RI program (2017 to present), and earlier investigation results. Sample locations are shown on Figure 2.1.

Tables 5.1 and 5.2 provide information for each detected parameter (risk-based SSL, MCL-based SSL, number of samples, number of detects, minimum detected concentration, and maximum detected concentration) for each area (derived from the tables included in Appendix E).

As shown in Tables 5.1 and 5.2, multiple parameters were detected in soil/fill samples with maximum concentrations greater than SSLs. The soil/fill data are summarized below, with observations regarding OU1 upper aquifer groundwater analytical results summarized in Table 5.3 (southern area) and Table 5.4 (central and northern area).

Southern Area

- VOCs (11 total) detected in one or more soil/fill samples with maximum concentrations greater than SSLs include: 1,1,1-TCA, 1,4-Dichlorobenzene, Benzene, Carbon disulfide, cis-1,2-DCE, Ethylbenzene, Isopropyl benzene, Methylene chloride, PCE, Toluene, and Xylenes. Of these VOCs, toluene was the most frequently detected, in 14% of samples, and the other VOCs were detected in fewer than 10% of samples. Eight VOCs were detected in OU1 upper aquifer groundwater samples from the southern area (see Table 5.3). Three VOCs (methylene chloride, TCE, and vinyl chloride) were detected at concentrations greater than RSLs. One VOC (methylene chloride) was detected at a concentration greater than the MCL.
- SVOCs (24 total) detected in one or more soil/fill samples with maximum concentrations greater than SSLs include: 2-Methylnaphthalene, Acenaphthene, Acetophenone, Anthracene, Benzaldehyde, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Biphenyl, bis(2-Ethylhexyl)phthalate, Caprolactam, Chrysene, Dibenz(a,h)anthracene, Dibenzofuran, Di-n-butylphthalate, Fluoranthene, Fluorene, Hexachlorobenzene, Indeno(1,2,3-cd)pyrene, Isophorone, Naphthalene, Pentachlorophenol, and Pyrene. PAHs are the most frequently detected SVOC parameters. Fifteen SVOCs were detected in OU1 upper aquifer groundwater samples from the southern area (see Table 5.3). ---Three SVOCs (Benzo(a)anthracene, Benzo(a)pyrene, and Benzo(b)fluoranthene) were detected at concentrations greater than RSLs. One SVOC (Benzo(a)pyrene) was detected at a concentration greater than the MCL.
- Metals (19 total) detected in one or more soil/fill samples with maximum concentrations greater than SSLs include: Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Chromium VI (hexavalent), Cobalt, Copper, Iron, Lead, Manganese, Mercury, Nickel, Selenium, Silver, Thallium, Vanadium, and Zinc. Most of these metals were detected in all samples, and all were detected in at least 80% of samples, with the exception of Chromium VI (41%). Seventeen metals were detected in OU1 upper aquifer groundwater samples from the southern area (see Table 5.3). Seven metals (Arsenic, Barium, Cobalt, Iron, Lead, Manganese, and Thallium) were detected at concentrations greater than RSLs. Three metals (Arsenic, Lead, and Thallium) were detected at concentrations greater than MCLs.

- PCBs (4 total) detected in one or more soil/fill samples with maximum concentrations greater than SSLs include: PCB-1242, PCB-1248, PCB-1254, and PCB-1260. Of these, PCB-1254 was the most frequently detected, in 21% of samples, and the others were detected in fewer than 5% of samples. PCBs were not detected in any OU1 upper aquifer groundwater samples from the southern area (see Table 5.3).
- Pesticides (7 total) detected in one or more soil/fill samples with maximum concentrations greater than SSLs include: 4,4'-DDD, 4,4'-DDE, beta-BHC, Dieldrin, Endrin, gamma-BHC (lindane), and Heptachlor epoxide. All of these were detected in fewer than 10% of samples. Pesticides were not detected in any OU1 upper aquifer groundwater samples from the southern area (see Table 5.3).
- Other parameters detected in one or more soil/fill samples with maximum concentrations greater than SSLs include Cyanide, in 29% of samples. Cyanide was not detected in any OU1 upper aquifer groundwater samples from the southern area (see Table 5.3).

In summary, the soil/fill data for the southern area indicates multiple parameters (66 total) with maximum detected concentrations greater than SSLs. In comparison, only 23 parameters were detected in OU1 upper aquifer groundwater samples with maximum detected concentrations greater than RSLs.

Central and Northern Area

- VOCs (29 total) detected in one or more soil/fill samples with maximum concentrations greater than SSLs include: 1,1,1-TCA, 1,1,2-Trichloroethane, 1,1-DCA, 1,1-DCE, 1,2,4-Trichlorobenzene, 1,2-Dichlorobenzene, 1,2-DCA, 1,2-Dichloropropane, 1,4-Dichlorobenzene, 2-Butanone, 4-Methyl-2-pentanone, Acetone, Benzene, Carbon disulfide, Carbon tetrachloride, Chlorobenzene, Chloroform, cis-1,2-DCE, Cyclohexane, Ethylbenzene, Isopropyl benzene, Methyl acetate, Methylene chloride, PCE, Toluene, trans-1,2-DCE, TCE, Vinyl chloride, and Xylenes. Of these VOCs, toluene and TCE were the most frequently detected, in 43% and 34% of samples respectively. Forty-one VOCs were detected in OU1 upper aquifer groundwater samples from the central and northern areas (see Table 5.4). Seventeen VOCs (1,1-DCA, 1,2,4-Trichlorobenzene, 1,2-Dibromo-3-chloropropane,1,2-DCA, 1,4-Dichlorobenzene, Benzene, Bromodichloromethane, Chlorobenzene, Chloroform, cis-1,2-DCE, Ethylbenzene, Methylene chloride, PCE, Toluene, TCE, Vinyl chloride, and Xylenes) were detected at concentrations greater than RSLs. Seven VOCs (1,2-DCA, benzene, chlorobenzene, cis-1,2-DCE, methylene chloride, TCE, and vinyl chloride) were detected at concentrations greater than MCLs.
- SVOCs (21 total) detected in one or more soil/fill samples with maximum concentrations greater than SSLs include: 2-Methylnaphthalene, Acenaphthene, Acetophenone, Anthracene, Benzaldehyde, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Biphenyl, bis(2-Ethylhexyl)phthalate, Chrysene, Dibenz(a,h)anthracene, Dibenzofuran, Di-n-butylphthalate, Fluoranthene, Fluorene, Indeno(1,2,3-cd)pyrene, Naphthalene, Phenol, and Pyrene. PAHs are the most frequently detected SVOC parameters. Twenty-seven SVOCs were detected in OU1 upper aquifer groundwater samples (see Table 5.4). Ten SVOCs (2-Methylnaphthalene, Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Biphenyl, bis(2-Ethylhexyl)phthalate, Dibenz(a,h)anthracene, Dibenzofuran, Indeno(1,2,3-cd)pyrene, and Naphthalene) were detected at concentrations

greater than RSLs. Two SVOCs (Benzo(a)pyrene and bis(2-Ethylhexyl)phthalate) were detected at concentrations greater than MCLs.

- Metals (19 total) detected in one or more soil/fill samples with maximum concentrations greater than SSLs include: Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Chromium VI (hexavalent), Cobalt, Copper, Iron, Lead, Manganese, Mercury, Nickel, Selenium, Silver, Thallium, Vanadium, and Zinc. Most of these metals were detected in all samples, and all were detected in at least 80% of samples, with the exception of Chromium VI (27%). Twenty-three metals were detected in OU1 upper aquifer groundwater samples from the central and northern areas (see Table 5.4). Seventeen metals (Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Chromium, Cobalt, Copper, Lead, Manganese, Mercury, Nickel, Selenium, Thallium, Vanadium, and Zinc) were detected at concentrations greater than RSLs. Nine metals (Antimony, Arsenic, Barium, Beryllium, Cadmium, Chromium, Copper, Lead, and Thallium) were detected at concentrations greater than MCLs. Note that chromium was detected in OU1 upper aquifer groundwater samples at concentrations greater than the MCL, but was not detected is soil/fill samples at concentrations greater than SSLs.
- PCBs (2 total) detected in one or more soil/fill samples with maximum concentrations greater than SSLs include PCB-1254 and PCB-1260, in 43% and 15% of samples, respectively. Both of the above PCBs (PCB-1254 and PCB-1260) and PCB-1242 were detected in OU1 upper aquifer groundwater samples from the central and northern areas (see Table 5.4), each with concentrations greater than RSLs.
- Pesticides (2 total) detected in one or more soil/fill samples with maximum concentrations greater than SSLs include 4,4'-DDE and 4,4'-DDT, in 18% and 15% of samples, respectively. Three pesticides (alpha-BHC, beta-BHC, and heptachlor) were detected in OU1 upper aquifer groundwater samples from the central and northern areas (see Table 5.4) at concentrations greater than RSLs.
- Other parameters detected in one or more soil/fill samples with maximum concentrations greater than SSLs include 2,3,7,8-TCDD (in 61% of samples) and Cyanide (in 43% of samples). Cyanide was detected in OU1 upper aquifer groundwater samples from the central and northern areas (see Table 5.4) at concentrations greater than RSLs, and 2,3,7,8-TCDD was not analyzed.

In summary, the soil/fill data for the central and northern areas indicates multiple parameters (74 total) with maximum detected concentrations greater than SSLs. In comparison, 50 parameters were detected in OU1 upper aquifer groundwater samples with maximum detected concentrations greater than RSLs.

6. Proposed Work

Groundwater conditions within and outside OU1 have been extensively investigated through completion of VAS, BH/TMWs, and monitoring well installation and sampling. As discussed in preceding sections, the groundwater assessment is primarily focused on VOCs, due to their prevalence and/or potential mobility in groundwater, and considering that other organic compounds are sporadically detected and much less mobile than VOCs. Various discrete areas of VOCs,

primarily TCE and vinyl chloride in OU1 upper aquifer groundwater are indicated by the concentration maps presented in Section 5. The VOC data for the lower aquifer suggests a broader distribution of vinyl chloride, and cis-1,2-DCE to a lesser extent, centered around the Dryden Road corridor and the DP&L facility. Metals are also broadly distributed within the upper and lower aquifers, but the pattern of metals distribution is distinctly different than the VOC distribution, requiring further assessment.

Based on review of the VOC distribution noted above, additional monitoring well installations are proposed at specific locations (subject to property access approval and logistics). Proposed monitoring well locations are shown on Figure 6.1 and described in Table 6.1 below.

Table 6.1 Summary of Proposed Monitoring Well Locations

Proposed Location (see Figure 6.1)	Existing location	Notes regarding existing data	Proposed location details and rationale
Northern Area			
N-1	VAS-32	Greatest total detected VOC concentration (483 µg/L) found at 45 to 50 feet BGS	Install UA well (45 to 50 feet BGS) offset to the north of VAS-32 (due to Valley Asphalt operations) to monitor potential VOC migration north toward OU1 boundary (EU17)
N-2	VAS-44	Greatest total detected VOC concentration (470 µg/L) found at 40 to 45 feet BGS	Install UA well (40 to 45 feet BGS) to monitor conditions along eastern OU1 boundary (EU15)
N-3	VAS-34	Greatest total detected VOC concentration (198 µg/L) found at 70 to 80 feet BGS	Install LA well (70 to 80 feet BGS) to monitor conditions along the OU1 boundary (EU14)
N-4	VAS-2 and MW-217	VOCs detected, generally less than 5 µg/L. MW-217 screened at 45 to 50 feet BGS	Install LA well (approx. 70 to 80 feet BGS) to provide water quality and water level data in lower aquifer along west side of OU1 (EU16)
Central Area			
C-1	VAS-38	Greatest total detected VOC concentration (828 µg/L) found at 45 to 50 feet BGS	Install UA well (45 to 50 feet BGS) to monitor conditions adjacent to and north of Quarry Pond (EU19)
C-2	VAS-12 and MW-233	Greatest total detected VOC concentration (29 µg/L) found at 20 to 25 feet BGS. MW-233 screened at 22 to 32 feet BGS.	Install LA well (approx. 70 to 80 feet BGS) to provide water quality and water level data in lower aquifer along west side of OU1 (EU19)
C-3	VAS-37	Greatest total detected VOC concentration (163 µg/L) found at 25 to 30 feet BGS	Install shallow well (approx. 25 feet BGS) to provide water quality and water level data in central area (EU19)
C-4	VAS-35	Greatest total detected VOC concentrations found at 50 to 60 feet BGS (12,090 µg/L). Vinyl chloride detected up to 190 µg/L from 130 to 140 feet BGS.	Install two LA wells (50 to 60 feet BGS and 130 to 140 feet BGS) to monitor conditions at the eastern OU1 boundary (EU11)

Table 6.1 Summary of Proposed Monitoring Well Locations

Proposed Location (see Figure 6.1)	Existing location	Notes regarding existing data	Proposed location details and rationale
Outside OU1			
OS-1	Various	TCE and vinyl chloride detected >MCL within OU1 (see Figure 5.6 and Figure 5.10)	Install UA well at water table (~10 to 20 feet BGS) to monitor conditions adjacent to OU1 in GMR floodplain
OS-2	VAS-39	No VOCs detected >MCLs. TCE detected (up to 2.8 µg/L) at 30 to 40 feet BGS.	Install UA well (30 to 40 feet BGS) to monitor conditions adjacent to Quarry Pond in GMR floodplain
OS-3	MW-213-VAS	Greatest total detected VOC concentration (32 µg/L) found at 67 to 72 feet BGS. TCE presence sporadic but generally not detected above 47 feet BGS.	Install UA well at water table (~20 to 30 feet BGS) to monitor groundwater conditions and potential TCE presence
OS-4	BH13-18	TCE detected >MCL within and outside OU1 (see Figure 5.6)	Install UA well at water table (~20 to 30 feet BGS) to monitor TCE impacted groundwater at East Road properties
OS-5	BH19-18	No VOCs detected >MCLs	Install UA well at the water table (~20 to 30 feet BGS) to monitor conditions at East River Road properties

One synoptic round of groundwater sampling is proposed for all new and existing monitoring wells, with laboratory analysis for VOCs - Target Compound List (TCL) and Method SW-846 8011; SVOCs; Target Analyte List (TAL) metals including mercury (total and dissolved); major anions (chloride, nitrate, nitrite, sulfate); and cyanide.

Total organic carbon (TOC)	ug/L	-	-	12	11	2000	11000

Notes:

- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.

B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).

B - Compound is found in the associated blank as well as in the sample (Organics).

D - Result was obtained from the analysis of a dilution.

E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.

J - Estimated concentration.

NJ - Tentatively identified compound, estimated concentration.

P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.

R - Rejected.

U - Non-detect at associated value.

UJ - Not detected; associated reporting limit is estimated.

- - Not applicable.

Notes:

- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.

B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).

B - Compound is found in the associated blank as well as in the sample (Organics).

D - Result was obtained from the analysis of a dilution.

E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.

J - Estimated concentration.

NJ - Tentatively identified compound, estimated concentration.

P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.

R - Rejected.

U - Non-detect at associated value.

UJ - Not detected; associated reporting limit is estimated.

- - Not applicable.

Notes:

- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.

B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).

B - Compound is found in the associated blank as well as in the sample (Organics).

D - Result was obtained from the analysis of a dilution.

E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.

J - Estimated concentration.

NJ - Tentatively identified compound, estimated concentration.

P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.

R - Rejected.

U - Non-detect at associated value.

UJ - Not detected; associated reporting limit is estimated.

- - Not applicable.

Sample ID: GW-38443-10 0.3 17-SG-001 (MS/MSD) Sample Time: 1310

Notes:

(1) The pump intake will be placed at the well screen mid-point or at a minimum of 0.6 m (2 ft) above any sediment accumulated at the well bottom.

(2) The well screen volume will be based on a 1.52 metres (5-foot) screen length (L). For metric units, $V_s=\pi*(r^2)*L$ in mL, where r (r=D/2) and L are in cm.
For Imperial units, $V_s=\pi*(r^2)*L*(2.54)^3$, where r and L are in inches

(3) The drawdown from the initial water level should not exceed 0.1 m (0.3 ft). The pumping rate should not exceed 500 mL/min.

(4) Purging will continue until stabilization is achieved or until 20 well screen volumes have been purged (unless purge water remains visually turbid and appears to be clearing, or unless stabilization parameters are varying slightly outside of the stabilization criteria and appear to be stabilizing), No. of Well Screen Volumes Purged= Vp/Vs.

(5) For conductivity, the average value of three readings <1 mS/cm ±0.005 mS/cm or where conductivity >1 mS/cm ±0.01 mS/cm.

Notes:

(1) The pump intake will be placed at the well screen mid-point or at a minimum of 0.6 m (2 ft) above any sediment accumulated at the well bottom.

(2) The well screen volume will be based on a 1.52 metres (5-foot) screen length (L). For metric units, $V_s=\pi*(r^2)*L$ in mL, where r (r=D/2) and L are in cm.
For Imperial units, $V_s=\pi*(r^2)*L*(2.54)^3$, where r and L are in inches

(3) The drawdown from the initial water level should not exceed 0.1 m (0.3 ft). The pumping rate should not exceed 500 mL/min.

(4) Purging will continue until stabilization is achieved or until 20 well screen volumes have been purged (unless purge water remains visually turbid and appears to be clearing, or unless stabilization parameters are varying slightly outside of the stabilization criteria and appear to be stabilizing), No. of Well Screen Volumes Purged= Vp/Vs.

(5) For conductivity, the average value of three readings <1 mS/cm ±0.005 mS/cm or where conductivity >1 mS/cm ±0.01 mS/cm.

Sample ID: GW-38443-10 04 17- DA-008

Sample Time: 1320

Notes:

(1) The pump intake will be placed at the well screen mid-point or at a minimum of 0.6 m (2 ft) above any sediment accumulated at the well bottom.

(2) The well screen volume will be based on a 1.52 metres (5-foot) screen length (L). For metric units, $V_s=\pi*(r^2)*L$ in mL, where r (r=D/2) and L are in cm.
For Imperial units, $V_s=\pi*(r^2)*L*(2.54)^3$, where r and L are in inches

(3) The drawdown from the initial water level should not exceed 0.1 m (0.3 ft). The pumping rate should not exceed 500 mL/min.

(4) Purging will continue until stabilization is achieved or until 20 well screen volumes have been purged (unless purge water remains visually turbid and appears to be clearing, or unless stabilization parameters are varying slightly outside of the stabilization criteria and appear to be stabilizing), No. of Well Screen Volumes Purged= Vp/Vs.

(5) For conductivity, the average value of three readings <1 mS/cm ±0.005 mS/cm or where conductivity >1 mS/cm ±0.01 mS/cm.

Sample ID: GW-38443-10 66 17- DA - 013
Sample Time: 0950

Notes:

(1) The pump intake will be placed at the well screen mid-point or at a minimum of 0.6 m (2 ft) above any sediment accumulated at the well bottom.

(2) The well screen volume will be based on a 1.52 metres (5-foot) screen length (L). For metric units, $V_s=\pi*(r^2)*L$ in mL, where r (r=D/2) and L are in cm.
For Imperial units, $V_s=\pi*(r^2)*L*(2.54)^3$, where r and L are in inches

(3) The drawdown from the initial water level should not exceed 0.1 m (0.3 ft). The pumping rate should not exceed 500 mL/min.

(4) Purging will continue until stabilization is achieved or until 20 well screen volumes have been purged (unless purge water remains visually turbid and appears to be clearing, or unless stabilization parameters are varying slightly outside of the stabilization criteria and appear to be stabilizing), No. of Well Screen Volumes Purged= Vp/Vs.

(5) For conductivity, the average value of three readings <1 mS/cm ±0.005 mS/cm or where conductivity >1 mS/cm ±0.01 mS/cm.

Sample ID:

Sample Time:

Notes:

(1) The pump intake will be placed at the well screen mid-point or at a minimum of 0.6 m (2 ft) above any sediment accumulated at the well bottom.

(2) The well screen volume will be based on a 1.52 metres (5-foot) screen length (L). For metric units, $V_s=\pi*(r^2)*L$ in mL, where r (r=D/2) and L are in cm.
For Imperial units, $V_s=\pi*(r^2)*L*(2.54)^3$, where r and L are in inches

(3) The drawdown from the initial water level should not exceed 0.1 m (0.3 ft). The pumping rate should not exceed 600 mL/min.

(4) Purging will continue until stabilization is achieved or until 20 well screen volumes have been purged (unless purge water remains visually turbid and appears to be clearing, or unless stabilization parameters are varying slightly outside of the stabilization criteria and appear to be stabilizing), No. of Well Screen Volumes Purged= Vp/Vs.

(5) For conductivity, the average value of three readings <1 mS/cm ±0.005 mS/cm or where conductivity >1 mS/cm ±0.01 mS/cm.

Sample ID: _____ Sample Time: _____

Notes:

(1) The pump intake will be placed at the well screen mid-point or at a minimum of 0.6 m (2 ft) above any sediment accumulated at the well bottom.

(2) The well screen volume will be based on a 1.52 metres (5-foot) screen length (L). For metric units, $V_s=\pi*(r^2)*L$ in mL, where r (r=D/2) and L are in cm.
For Imperial units, $V_s=\pi*(r^2)*L*(2.54)^3$, where r and L are in inches

(3) The drawdown from the initial water level should not exceed 0.1 m (0.3 ft). The pumping rate should not exceed 600 mL/min.

(4) Purging will continue until stabilization is achieved or until 20 well screen volumes have been purged (unless purge water remains visually turbid and appears to be clearing, or unless stabilization parameters are varying slightly outside of the stabilization criteria and appear to be stabilizing), No. of Well Screen Volumes Purged= Vp/Vs.

(5) For conductivity, the average value of three readings <1 mS/cm ±0.005 mS/cm or where conductivity >1 mS/cm ±0.01 mS/cm.

Subject: **Analytical Results and Full Validation**
Monitoring Well Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
October 2017

1. Introduction

This document details a validation of analytical results for water samples collected in support of the Monitoring Well Sampling Program at the Moraine, Ohio site during October 2017. Samples were submitted to TestAmerica Laboratories, Inc. (TA) located in North Canton, Ohio. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, duplicate data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spike (MS) samples and field quality assurance/quality (QA/QC) samples. The assessment of analytical and in-house data included checks for data consistency (by observing comparability of duplicate analyses), adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2, Appendix E – Quality Assurance Project Plan", September 20, 2017

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review", USEPA 540-R-10-011, January 2010

iii) "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008

Items ii) and iii) will subsequently be referred to as the "Guidelines" in this Memorandum.

2. Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Gas Chromatography/Mass Spectrometer (GC/MS) – Tuning and Mass Calibration (Instrument Performance Check) and Inductively Coupled Plasma/Mass Spectrometer (ICP/MS)

3.1 Organic Analyses

Prior to volatile organic compound (VOC) and semi-volatile organic compound (SVOC) analysis, GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, methods require the analysis of specific tuning compounds bromofluorobenzene (BFB) and decafluorotriphenylphosphine (DFTPP), respectively. The resulting spectra must meet the criteria cited in the methods before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument.

Tuning compounds were analyzed at the required frequency throughout VOC and SVOC analysis periods. All tuning criteria were met indicating that proper optimization of the instrumentation was achieved.

3.2 Inorganic Analyses

To ensure adequate mass resolution, identification, and to some degree, sensitivity, the performance of each ICP/MS instrument used for metals analyses is checked prior to calibration and initiating an analysis sequence through the analysis of a tuning solution.

Instrument performance check data were reviewed. The tuning solution was analyzed at the required frequency throughout the analyses. The results of all instrument performance checks were within the method acceptance criteria, indicating that proper optimization of the instrumentation was achieved.

4. Initial Calibration - Organic Analyses

4.1 GC/MS

To quantify VOCs and SVOCs of interest in samples, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds of interest is

analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity of the calibration curve and instrument sensitivity are evaluated against the following criteria:

i) All relative response factors (RRFs) must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent (40.0 percent for compounds that exhibit poor response) or a minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

The initial calibration data for VOCs and SVOCs were reviewed. All compounds met the above criteria for sensitivity and linearity.

4.2 GC

To quantify pesticides, the performance evaluation mixture (PEM) is analyzed at the beginning and end of the initial calibration sequence and throughout the analytical sequence. The results of these analyses are used to evaluate dichlorodiphenyltrichloroethane (DDT)/endrin breakdown, using the method degradation criteria of <15 percent. PEM standards were analyzed at the required frequency throughout sample analysis and all method performance criteria were met.

4.2.1 External Standard Calibration – Fumigants and Herbicides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Initially, a calibration curve consisting of a minimum of five concentration levels is analyzed for all single component compounds of interest. Linearity of the calibration curve is acceptable if all RSD values are less than or equal to 20.0 percent or if the correlation coefficient (R) is 0.995 or greater for linear regression curves.

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the methods.

4.2.2 Internal Standard Calibration – PCBs and Organochlorine Pesticides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Polychlorinated biphenyls (PCBs) and organochlorine pesticides were calibrated with a dual column analysis using internal standardization. Five peaks, representing five congeners, were used for the analysis of each Aroclor with a separate curve fitted to the calibration data for each congener. A calibration curve consisting of a minimum of five concentration levels was analyzed for all single component compounds of interest. Linearity of the calibration curves are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent, or

ii) A minimum correlation coefficient (R) and minimum coefficient of determination (R2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

5. Initial Calibration – Inorganic Analyses

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For ICP/MS analysis, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve. For mercury atomic absorption (AA) analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater. For instrumental general chemistry analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	Parameter	Control Limits
ICP/MS	Metals	90 - 110%
Cold Vapor AA	Mercury	80 - 120%
Instrumental Wet Chemistry	Cyanide, Anions	85 - 115%

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that all of the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals and general chemistry analyses were properly calibrated prior to sample analysis.

6. Continuing Calibration - Organic Analyses

6.1 GC/MS

To ensure that instrument calibration for VOC and SVOC analyses is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) All RRF values must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) Percent difference (%D) values must not exceed 25.0 percent (40.0 percent for compounds that exhibit poor response)

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability with the exception of the sample results presented with qualifiers in Table 4.

6.2 GC

To ensure that the calibration of the instrument for organic analyses by GC is valid throughout the sample analysis period, continuing calibration standards are analyzed and evaluated on a regular basis. To evaluate the continued linearity of the calibration, %D values are calculated for each compound. As specified in the methods, all %D values should not exceed 15 percent. To ensure that compound retention times do not vary over the analysis period, all retention times for continuing calibration compounds must fall within the established retention time windows.

All continuing calibration standards were analyzed at the required frequency. All %D values and compound retention times met the above criteria indicating acceptable instrument calibration throughout the analysis period.

7. Continuing Calibration - Inorganic Analyses

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. All analyte recoveries reported for the CCVs were within the specified limits.

8. Laboratory Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for the inorganic parameters.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

8.1 Organic Analyses

All method blank results were non-detect indicating that laboratory contamination was not a factor for this investigation.

8.2 Inorganic Analyses

Upon review of the ICBs, CCBs, and method blanks, it was noted that metal concentrations were observed above the method detection limit (MDL). Most investigative samples associated with the low-level detections reported either non-detect concentrations or concentrations significantly greater than the associated laboratory blank concentrations for the analytes of interest. These sample results were not impacted by the contamination detected. Associated positive sample results with similar concentrations to the levels reported in the blanks were qualified as non-detect (see Table 5).

9. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for organic determinations were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Due to dilutions ($\geq$5 times) that were necessary to successfully analyze the samples, some surrogate recoveries could not be assessed.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. All surrogate recoveries that could be assessed were within the laboratory criteria.

10. Internal Standards (IS) Analyses

IS data were evaluated for all VOC, SVOC, PCB, Pesticide, and ICP/MS metals sample analyses.

10.1 Organics Analyses

To ensure that changes in the GC/MS and GC sensitivity and response do not affect sample analysis results IS compounds are added to each sample prior to analysis. All results are then calculated as a ratio of the IS responses.

The sample IS results were evaluated against the following criteria:

i) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard

ii) IS area counts must not vary by more than a factor of two (-50 percent to +100 percent) from the associated calibration standard

All organic IS recoveries and retention times met the above criteria.

10.2 Inorganic Analyses

IS elements were added to all samples prior to metals analysis by ICP/MS. Overall instrument stability and performance for metals analyses were monitored using the IS intensity data. IS recoveries were assessed using control limits of 60-125 percent.

All inorganic IS recoveries were acceptable demonstrating adequate analytical performance.

11. Laboratory Control Sample Analyses

LCS and/or LCS/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

11.1 Organic Analyses

The LCS or LCS/LCSD contained all compounds of interest or the compounds specified in the method. All LCS recoveries and RPDs were within the laboratory control limits, demonstrating acceptable analytical accuracy and precision with the exception of chloroform that recovered with high bias in one LCS. The associated non-detect sample results were not impacted. Table 6 presents the qualified sample result.

11.2 Inorganic Analyses

The LCS or LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries and RPDs were within the control limits, demonstrating acceptable analytical accuracy and precision.

12. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

If the original sample concentration is significantly greater than the spike concentration, the recovery is not assessed. If only the MS or MSD recovery was outside of control limits, no qualification of the data was performed based on the acceptable recovery of the companion spike and the acceptable RPD.

MS/MSD analyses were performed as specified in Table 1.

12.1 Organic Analyses

The MS/MSD samples were spiked with all compounds of interest or the compounds specified in the method. All percent recoveries and RPD values were within the laboratory control limits, demonstrating

acceptable analytical accuracy and precision with the exception of the sample results presented with qualifiers in Table 7.

12.2 Inorganic Analyses

The MS/MSD samples were spiked with the analytes of interest, and the results were evaluated using the "Guidelines". All percent recoveries and RPD values were within the control limits, demonstrating acceptable analytical accuracy and precision with the exception of the sample results presented with qualifiers in Table 7.

13. Matrix Spike Analyses

To evaluate the effects of sample matrices on the preparation, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS samples. For this study, MS samples were prepared and analyzed by the laboratory as specified in Table 1.

The MS results were evaluated per the "Guidelines". In accordance with the "Guidelines", MS recoveries for samples with analyte concentrations significantly greater than the spike concentrations could not be assessed.

All MS analyses performed were acceptable demonstrating acceptable analytical accuracy.

14. Duplicate Sample Analyses – Inorganic Analyses

Analytical precision is evaluated based on the analysis of laboratory duplicate samples. For this study, duplicate samples were prepared and analyzed by the laboratory as specified in Table 1. The duplicate results were evaluated per the "Guidelines".

All duplicate analyses performed were acceptable, demonstrating acceptable analytical precision.

15. ICP/MS Serial Dilution

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. A minimum of 1 per 20 investigative samples or at least 1 per analytical batch must be analyzed at a five-fold dilution. For samples with sufficient analyte concentrations (>50 times the method detection limit), the serial dilution results must agree within 10 percent of the original results.

A serial dilution was performed on each MS/MSD sample. All results met the criteria above.

16. ICP Interference Check Sample Analysis (ICS)

To verify that the laboratory has established proper inter-element and background correction factors, ICSs are analyzed. These samples contain high concentrations of aluminum, calcium, magnesium, and iron and

are analyzed at the beginning and end of each sample analysis period. The ICSs are evaluated against recovery control limits in the “Guidelines” of 80 to 120 percent.

ICS analysis results were evaluated for all samples using the criteria in the "Guidelines". All ICS recoveries and results were acceptable.

17. Field QA/QC Samples

The field QA/QC consisted of three trip blank samples, one rinse blank sample, and one field duplicate sample set.

17.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, three trip blank samples were submitted to the laboratory for VOC analysis. All results were non-detect for the compounds of interest.

17.2 Rinse Blank Sample Analysis

To assess field decontamination procedures, ambient conditions at the site, and cleanliness of sample containers, one rinse blank sample was submitted for analysis, as identified in Table 1. All results were non-detect for the analytes of interest with the exception of a few low level metals. Table 8 presents the sample results that were qualified as non-detect due to results that were similar to the rinse blank sample.

17.3 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, one field duplicate sample set was collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 50 percent for water samples. If the reported concentration in either the investigative sample or its duplicate is less than five times the reporting limit (RL), the evaluation criterion is one times the RL value for water samples.

All field duplicate results were within acceptable agreement demonstrating acceptable sampling and analytical precision.

18. Analyte Reporting

The laboratory reported detected results down to the laboratory's method detection limit (MDL) for each analyte. Positive analyte detections less than the RL but greater than the MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the MDL in Table 2.

19. Miscellaneous

19.1 Dual Column Reporting

GC analyses were performed using dual column analyses. In general, the results showed good correlation between the two columns (<40 RPD). Variability was observed between some of the results (see Table 9). The associated data were qualified as estimated to reflect the indicated variability.

19.2 Total versus Dissolved Analytes

Most dissolved metals results were less than the total results or were within the normal variability of the method (20%D). The dissolved potassium result for sample GW-38443-100417-DA-008 was greater than the total result and was in exceedance of the method variability. The associated results were qualified as estimated in Table 10.

20. Target Compound Identification

To minimize erroneous compound identification during organic analyses, qualitative criteria including compound retention time and mass spectra (if applicable) were evaluated according to the identification criteria established by the methods. The samples identified in Table 1 were reviewed. The organic compounds reported adhered to the specified identification criteria.

21. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are acceptable with the specific qualifications noted herein.

Subject: **Analytical Results and Full Validation**
VAS-15b and VAS-35 Groundwater Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
December 2017-January 2018

1. Introduction

This document details a validation of analytical results for water samples collected in support of the VAS-15b and VAS-35 Groundwater Sampling Program at the Moraine, Ohio site during December 2017 through January 2018. Samples were submitted to TestAmerica Laboratories, Inc. (TA) located in North Canton, Ohio. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, duplicate data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spike (MS) samples and field quality assurance/quality (QA/QC) samples. The assessment of analytical and in-house data included checks for data consistency (by observing comparability of duplicate analyses), adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2, Appendix E – Quality Assurance Project Plan", September 20, 2017

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review", USEPA 540-R-10-011, January 2010

iii) "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008

Items ii) and iii) will subsequently be referred to as the "Guidelines" in this Memorandum.

2. Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Gas Chromatography/Mass Spectrometer (GC/MS) – Tuning and Mass Calibration (Instrument Performance Check) and Inductively Coupled Plasma/Mass Spectrometer (ICP/MS)

3.1 Organic Analyses

Prior to volatile organic compound (VOC) and semi-volatile organic compound (SVOC) analysis, GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, methods require the analysis of specific tuning compounds bromofluorobenzene (BFB) and decafluorotriphenylphosphine (DFTPP), respectively. The resulting spectra must meet the criteria cited in the methods before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument.

Tuning compounds were analyzed at the required frequency throughout VOC and SVOC analysis periods. All tuning criteria were met indicating that proper optimization of the instrumentation was achieved.

3.2 Inorganic Analyses

To ensure adequate mass resolution, identification, and to some degree, sensitivity, the performance of each ICP/MS instrument used for metals analyses is checked prior to calibration and initiating an analysis sequence through the analysis of a tuning solution.

Instrument performance check data were reviewed. The tuning solution was analyzed at the required frequency throughout the analyses. The results of all instrument performance checks were within the method acceptance criteria, indicating that proper optimization of the instrumentation was achieved.

4. Initial Calibration - Organic Analyses

4.1 GC/MS

To quantify VOCs and SVOCs of interest in samples, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity of the calibration curve and instrument sensitivity are evaluated against the following criteria:

i) All relative response factors (RRFs) must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent (40.0 percent for compounds that exhibit poor response) or a minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

The initial calibration data for VOCs and SVOCs were reviewed. All compounds met the above criteria for sensitivity and linearity.

4.2 GC

To quantify pesticides, the performance evaluation mixture (PEM) is analyzed at the beginning and end of the initial calibration sequence and throughout the analytical sequence. The results of these analyses are used to evaluate dichlorodiphenyltrichloroethane (DDT)/endrin breakdown, using the method degradation criteria of <15 percent. PEM standards were analyzed at the required frequency throughout sample analysis and all method performance criteria were met.

4.2.1 Internal Standard Calibration – PCBs and Organochlorine Pesticides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Polychlorinated biphenyls (PCBs) and organochlorine pesticides were calibrated with a dual column analysis using internal standardization. Five peaks, representing five congeners, were used for the analysis of each Aroclor with a separate curve fitted to the calibration data for each congener. A calibration curve consisting of a minimum of five concentration levels was analyzed for all single component compounds of interest. Linearity of the calibration curves are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent

ii) A minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

4.2.2 External Standard Calibration – Fumigants

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Initially, a calibration curve consisting of a minimum of five concentration levels is analyzed for all single component compounds of interest. Linearity of the calibration curve is acceptable if all RSD values are less than or equal to 20.0 percent or if the coefficient of determination (R^2) is 0.990 or greater for linear regression curves.

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

5. Initial Calibration – Inorganic Analyses

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For ICP/MS analysis, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve. For mercury atomic absorption (AA) analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater. For instrumental general chemistry analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	Parameter	Control Limits
ICP/MS	Metals	90 - 110%
Cold Vapor AA	Mercury	80 - 120%
Instrumental Wet Chemistry	Cyanide	85 - 115%
Instrumental Wet Chemistry	Anions	90 - 110%

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that all of the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals and general chemistry analyses were properly calibrated prior to sample analysis.

6. Continuing Calibration - Organic Analyses

6.1 GC/MS

To ensure that instrument calibration for VOC and SVOC analyses is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) All RRF values must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) Percent difference (%D) values must not exceed 25.0 percent (40.0 percent for compounds that exhibit poor response)

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability with the exception of the sample results presented with qualifiers in Table 4.

6.2 GC

To ensure that the calibration of the instrument for organic analyses by GC is valid throughout the sample analysis period, continuing calibration standards are analyzed and evaluated on a regular basis. To evaluate the continued linearity of the calibration, %D values are calculated for each compound. As specified in the methods, all %D values should not exceed 15 percent. To ensure that compound retention times do not vary over the analysis period, all retention times for continuing calibration compounds must fall within the established retention time windows.

All continuing calibration standards were analyzed at the required frequency. All %D values and compound retention times met the above criteria indicating acceptable instrument calibration throughout the analysis period with the exception of one pesticide result presented with qualifiers in Table 4.

7. Continuing Calibration - Inorganic Analyses

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. All analyte recoveries reported for the CCVs were within the specified limits.

8. Laboratory Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for the inorganic parameters.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

8.1 Organic Analyses

Most method blank results were non-detect. Table 5 presents the sample results that were qualified as non-detect due to analyte concentrations in the method blanks.

8.2 Inorganic Analyses

Upon review of the ICBs, CCBs, and method blanks, it was noted that metal concentrations were observed above the method detection limit (MDL). Most investigative samples associated with the low-level detections reported either non-detect concentrations or concentrations significantly greater than the associated laboratory blank concentrations for the analytes of interest. These sample results were not impacted by the contamination detected. Associated positive sample results with similar concentrations to the levels reported in the blanks were qualified as non-detect (see Table 5 and Table 6).

9. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for organic determinations were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. Due to dilutions equal to or greater than 5 times that were necessary to successfully analyze the samples, numerous surrogate recoveries in investigative samples analyzed for pesticides, PCBs, and SVOCs were not assessed. Most remaining surrogate recoveries were within the laboratory criteria. Where surrogate recoveries were above the control limits, non-detect sample results were not impacted by the implied high bias and were not qualified. Table 7 presents the sample results that were qualified due to outlying surrogate recoveries.

10. Internal Standards (IS) Analyses

IS data were evaluated for all VOC, SVOC, PCB, Pesticide, and ICP/MS metals sample analyses.

10.1 Organics Analyses

To ensure that changes in the GC/MS and GC sensitivity and response do not affect sample analysis results IS compounds are added to each sample prior to analysis. All results are then calculated as a ratio of the IS responses.

The sample IS results were evaluated against the following criteria:

i) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard

ii) IS area counts must not vary by more than a factor of two (-50 percent to +100 percent) from the associated calibration standard

All organic IS recoveries and retention times met the above criteria.

10.2 Inorganic Analyses

IS elements were added to all samples prior to metals analysis by ICP/MS. Overall instrument stability and performance for metals analyses were monitored using the IS intensity data. IS recoveries were assessed using control limits of 60-125 percent.

All inorganic IS recoveries were within the acceptance limits.

11. Laboratory Control Sample Analyses

LCS or LCS/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

11.1 Organic Analyses

The LCS or LCS/LCSD contained all compounds of interest or the compounds specified in the method. Most LCS recoveries and RPDs were within the laboratory control limits demonstrating acceptable analytical accuracy and precision. Table 8 presents the sample results that were qualified as estimated due to observed high bias in the associated LCS.

11.2 Inorganic Analyses

The LCS or LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries and RPDs were within the control limits demonstrating acceptable analytical accuracy and precision.

12. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

If the original sample concentration is significantly greater than the spike concentration, the recovery is not assessed.

If only the MS or MSD recovery was outside of control limits, no qualification of the data was performed based on the acceptable recovery of the companion spike and the acceptable RPD.

Due to dilutions that were necessary to successfully analyze the samples, some MS/MSD recoveries were not assessed.

MS/MSD analyses were performed as specified in Table 1.

12.1 Organic Analyses

The MS/MSD samples were spiked with all compounds of interest or the compounds specified in the method. All percent recoveries and RPD values, if applicable, were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision.

12.2 Inorganic Analyses

The MS or MS/MSD samples were spiked with the analytes of interest, and the results were evaluated using the "Guidelines". All percent recoveries and RPD values, if applicable, were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision.

13. ICP/MS Serial Dilution

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. A minimum of 1 per 20 investigative samples or at least 1 per analytical batch must be analyzed at a five-fold dilution. For samples with sufficient analyte concentrations (>50 times the method detection limit), the serial dilution results must agree within 10 percent of the original results.

A serial dilution was performed on each MS/MSD sample. All results met the criteria above.

14. ICP Interference Check Sample Analysis (ICS)

To verify that the laboratory has established proper inter-element and background correction factors, ICSs are analyzed. These samples contain high concentrations of aluminum, calcium, magnesium, and iron and are analyzed at the beginning and end of each sample analysis period. The ICSs are evaluated against recovery control limits in the "Guidelines" of 80 to 120 percent.

ICS analysis results were evaluated for all samples using the criteria in the "Guidelines". All ICS recoveries and results were acceptable.

15. Field QA/QC Samples

The field QA/QC consisted of eight trip blank samples, one field blank sample, and two field duplicate sample sets.

15.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, eight trip blanks were submitted to the laboratory for VOC analysis. Acetone was detected in one trip blank sample.

The associated sample results were non-detect and were not impacted. All remaining results were non-detect for the compounds of interest.

15.2 Field Blank Sample Analysis

To assess field decontamination procedures, ambient conditions at the site, and cleanliness of sample containers, one field blank was submitted for analysis, as identified in Table 1. All results were non-detect for the analytes of interest.

15.3 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, two field duplicate sample sets were collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 50 percent for water samples. If the reported concentration in either the investigative sample or its duplicate is less than five times the reporting limit (RL), the evaluation criterion is one times the RL value for water samples.

Most field duplicate results were within acceptable agreement demonstrating acceptable sampling and analytical precision. Table 9 presents the sample results that were qualified due to variability in the field duplicate results.

16. Total versus Dissolved Results

Most dissolved metals results were less than the total results or were within the normal variability of the method (20% D). The dissolved antimony and cadmium results for sample GW-38443-010418-KVM-022 were greater than the total results and were in exceedance of the method variability. The associated results were qualified as estimated in Table 10.

17. Analyte Reporting

The laboratory reported detected results down to the laboratory's method detection limit (MDL) for each analyte adjusted for specific sample dilutions and volumes. Positive analyte detections less than the RL but greater than the sample-specific MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the sample specific MDL in Table 2.

18. Target Compound Identification

To minimize erroneous compound identification during organic analyses, qualitative criteria including compound retention time and mass spectra (if applicable) were evaluated according to the identification criteria established by the methods. The samples identified in Table 1 were reviewed. The organic compounds reported adhered to the specified identification criteria.

Pesticide and PCB analyses were performed using dual column analyses. All the results showed good correlation between the two columns (<40 RPD).

19. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are acceptable with the specific qualifications noted herein.

Subject: **Analytical Results and Full Validation**
VAS-32 and VAS-33 Groundwater Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
January 2018

1. Introduction

This document details a validation of analytical results for water samples collected in support of the VAS-32 and VAS-33 Groundwater Sampling Program at the Moraine, Ohio site during January 2018. Samples were submitted to TestAmerica Laboratories, Inc. (TA) located in North Canton, Ohio. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, duplicate data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spike (MS) samples and field quality assurance/quality (QA/QC) samples. The assessment of analytical and in-house data included checks for data consistency (by observing comparability of duplicate analyses), adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2, Appendix E-Quality Assurance Project Plan", September 20, 2017

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review", USEPA 540-R-10-011, January 2010

iii) "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008

Items ii) and iii) will subsequently be referred to as the "Guidelines" in this Memorandum.

2. Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. Due to laboratory QC issues, two samples submitted for PCB analyses were re-extracted outside the required holding times. The associated PCB data were qualified estimated, as noted in Table 4.

Several samples that were submitted for volatile organic compound (VOC) analyses were received at the laboratory with a pH >2. Since the associated samples were analyzed within seven days of sample collection, no data qualification was required. The remaining investigative samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Gas Chromatography/Mass Spectrometer (GC/MS) – Tuning and Mass Calibration (Instrument Performance Check) and Inductively Coupled Plasma/Mass Spectrometer (ICP/MS)

3.1 Organic Analyses

Prior to VOC and semi-volatile organic compound (SVOC) analysis, GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, methods require the analysis of specific tuning compounds bromofluorobenzene (BFB) and decafluorotriphenylphosphine (DFTPP), respectively. The resulting spectra must meet the criteria cited in the methods before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument.

Tuning compounds were analyzed at the required frequency throughout VOC and SVOC analysis periods. All tuning criteria were met indicating that proper optimization of the instrumentation was achieved.

3.2 Inorganic Analyses

To ensure adequate mass resolution, identification, and to some degree, sensitivity, the performance of each ICP/MS instrument used for metals analyses is checked prior to calibration and initiating an analysis sequence through the analysis of a tuning solution.

Instrument performance check data were reviewed. The tuning solution was analyzed at the required frequency throughout the analyses. The results of all instrument performance checks were within the method acceptance criteria, indicating that proper optimization of the instrumentation was achieved.

4. Initial Calibration - Organic Analyses

4.1 GC/MS

To quantify VOCs and SVOCs of interest in samples, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds of interest is

analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity of the calibration curve and instrument sensitivity are evaluated against the following criteria:

i) All relative response factors (RRFs) must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent (40.0 percent for compounds that exhibit poor response) or a minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

The initial calibration data for VOCs and SVOCs were reviewed. All compounds met the above criteria for sensitivity and linearity.

4.2 GC

To quantify pesticides, the performance evaluation mixture (PEM) is analyzed at the beginning and end of the initial calibration sequence and throughout the analytical sequence. The results of these analyses are used to evaluate dichlorodiphenyltrichloroethane (DDT)/endrin breakdown, using the method degradation criteria of <15 percent. PEM standards were analyzed at the required frequency throughout sample analysis and all method performance criteria were met.

4.2.1 Internal Standard Calibration – PCBs and Organochlorine Pesticides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Polychlorinated biphenyls (PCBs) and organochlorine pesticides were calibrated with a dual column analysis using internal standardization. Five peaks, representing five congeners, were used for the analysis of each Aroclor with a separate curve fitted to the calibration data for each congener. A calibration curve consisting of a minimum of five concentration levels was analyzed for all single component compounds of interest. Linearity of the calibration curves are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent

ii) A minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

4.2.2 External Standard Calibration – Fumigants

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Initially, a calibration curve consisting of a minimum of five concentration levels is analyzed for all single component compounds of interest. Linearity of the calibration

curve is acceptable if all RSD values are less than or equal to 20.0 percent or if the coefficient of determination (R^2) is 0.990 or greater for linear regression curves.

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

5. Initial Calibration – Inorganic Analyses

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For ICP/MS analysis, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve. For mercury atomic absorption (AA) analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater. For instrumental general chemistry analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	Parameter	Control Limits
ICP/MS	Metals	90 - 110%
Cold Vapor AA	Mercury	80 - 120%
Instrumental Wet Chemistry	Cyanide	85 - 115%
Instrumental Wet Chemistry	Anions	90 - 110%

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that all of the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals and general chemistry analyses were properly calibrated prior to sample analysis.

6. Continuing Calibration - Organic Analyses

6.1 GC/MS

To ensure that instrument calibration for VOC and SVOC analyses is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) All RRF values must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) Percent difference (%D) values must not exceed 25.0 percent (40.0 percent for compounds that exhibit poor response)

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability with the exception of the sample results presented with qualifiers in Table 5.

6.2 GC

To ensure that the calibration of the instrument for organic analyses by GC is valid throughout the sample analysis period, continuing calibration standards are analyzed and evaluated on a regular basis. To evaluate the continued linearity of the calibration, %D values are calculated for each compound. As specified in the methods, all %D values should not exceed 15 percent. To ensure that compound retention times do not vary over the analysis period, all retention times for continuing calibration compounds must fall within the established retention time windows.

All continuing calibration standards were analyzed at the required frequency. All %D values and compound retention times met the above criteria indicating acceptable instrument calibration throughout the analysis period.

7. Continuing Calibration - Inorganic Analyses

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. Several CCV recoveries for beryllium were reported slightly above the upper control limit during one analytical sequence. Since the associated sample data were non-detect, no data qualification was required. All other analyte recoveries reported for the CCVs were within the specified limits.

8. Laboratory Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for the inorganic parameters.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

8.1 Organic Analyses

Most method blank results were non-detect. Table 6 presents the sample results that were qualified as non-detect due to analyte concentrations in the method blanks.

8.2 Inorganic Analyses

Upon review of the ICBs, CCBs, and method blanks, it was noted that metal concentrations were observed above the method detection limit (MDL). Most investigative samples associated with the low-level detections reported either non-detect concentrations or concentrations significantly greater than the associated laboratory blank concentrations for the analytes of interest. These sample results were not impacted by the contamination detected. Associated positive antimony results with similar concentrations to the levels reported in CCBs were qualified as non-detect (Table 7).

9. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for organic determinations were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. Due to dilutions equal to or greater than five times that were necessary to successfully analyze the samples, several surrogate recoveries in investigative samples were not assessed. Most of the remaining surrogate recoveries were within the laboratory criteria. Where surrogate recoveries were above the control limits, non-detect sample results were not impacted by the implied high bias and were not qualified. Table 8 presents the sample results that were qualified due to outlying surrogate recoveries.

10. Internal Standards (IS) Analyses

IS data were evaluated for all VOC, SVOC, PCB, Pesticide, and ICP/MS metals sample analyses.

10.1 Organics Analyses

To ensure that changes in the GC/MS and GC sensitivity and response do not affect sample analysis results IS compounds are added to each sample prior to analysis. All results are then calculated as a ratio of the IS responses.

The sample IS results were evaluated against the following criteria:

i) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard

ii) IS area counts must not vary by more than a factor of two (-50 percent to +100 percent) from the associated calibration standard

All organic IS recoveries and retention times met the above criteria.

10.2 Inorganic Analyses

IS elements were added to all samples prior to metals analysis by ICP/MS. Overall instrument stability and performance for metals analyses were monitored using the IS intensity data. IS recoveries were assessed using control limits of 60-125 percent.

All inorganic IS recoveries were within the acceptance limits.

11. Laboratory Control Sample Analyses

LCS are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects.

11.1 Organic Analyses

The LCS contained all compounds of interest or the compounds specified in the method. Most LCS recoveries were within the laboratory control limits demonstrating acceptable analytical accuracy. Table 9 presents the sample results that were qualified as estimated due to observed high bias in the associated LCS.

11.2 Inorganic Analyses

The LCS contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries were within the control limits demonstrating acceptable analytical accuracy.

12. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

If the original sample concentration is significantly greater than the spike concentration, the recovery is not assessed.

If only the MS or MSD recovery was outside of control limits, no qualification of the data was performed based on the acceptable recovery of the companion spike and the acceptable RPD.

MS/MSD analyses were performed as specified in Table 1.

12.1 Organic Analyses

The MS/MSD samples were spiked with all compounds of interest or the compounds specified in the method. Table 10 presents the outlying matrix spike results from VOC analyses. The associated sample data were qualified estimated, as noted in the table. The remaining percent recoveries and RPD values, if applicable, were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision.

12.2 Inorganic Analyses

The MS or MS/MSD samples were spiked with the analytes of interest, and the results were evaluated using the "Guidelines". Table 10 presents the outlying matrix spike results from beryllium (metals) analyses. The associated sample data were qualified estimated, as noted in the table. The remaining percent recoveries and RPD values, if applicable, were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision.

13. ICP/MS Serial Dilution

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. A minimum of 1 per 20 investigative samples or at least 1 per analytical batch must be analyzed at a five-fold dilution. For samples with sufficient analyte concentrations (>50 times the method detection limit), the serial dilution results must agree within 10 percent of the original results.

A serial dilution was performed on each MS/MSD sample. All results met the criteria above.

14. ICP Interference Check Sample Analysis (ICS)

To verify that the laboratory has established proper inter-element and background correction factors, ICSs are analyzed. These samples contain high concentrations of aluminum, calcium, magnesium, and iron and are analyzed at the beginning and end of each sample analysis period. The ICSs are evaluated against recovery control limits in the "Guidelines" of 80 to 120 percent.

ICS analysis results were evaluated for all samples using the criteria in the "Guidelines". Table 11 presents the outlying ICS results for beryllium. The associated sample detections were qualified estimated, as noted in the table. The remaining ICS recoveries and results were acceptable.

15. Field QA/QC Samples

The field QA/QC consisted of six trip blank samples, one field blank sample, one rinse blank sample and two field duplicate sample sets.

15.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, six trip blanks were submitted to the laboratory for VOC analysis. All trip blank results were non-detect for the compounds of interest.

15.2 Field Blank Sample Analysis

To assess ambient conditions at the site and cleanliness of sample containers, one field blank was submitted for analysis, as identified in Table 1. All results were non-detect for the analytes of interest.

15.3 Rinse Blank Sample Analysis

To assess field decontamination procedures, one rinse blank was submitted for analysis, as identified in Table 1. The rinse blank yielded several detections of VOCs and inorganic parameters. The associated sample that contained similar concentrations of metals parameters was assumed a reflection of field contamination and the results were qualified non-detect, as detailed in Table 12. The associated non-metals parameters were either non-detect or did not require qualification.

15.4 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, two field duplicate sample sets were collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 50 percent for water samples. If the reported concentration in either the investigative sample or its duplicate is less than five times the reporting limit (RL), the evaluation criterion is one times the RL value for water samples.

Most field duplicate results were within acceptable agreement demonstrating acceptable sampling and analytical precision. Table 13 presents metals sample results from one field duplicate set that were qualified estimated due to variability in the field duplicate results.

16. Total versus Dissolved Results

Most dissolved metals results were less than the total results or were within the normal variability of the method (20%D). The dissolved zinc result for one investigative sample was greater than the total result and were in exceedance of the method variability. The associated results were qualified estimated, as noted in Table 14.

17. Analyte Reporting

The laboratory reported detected results down to the laboratory's method detection limit (MDL) for each analyte adjusted for specific sample dilutions and volumes. Positive analyte detections less than the RL but greater than the sample-specific MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the sample specific MDL in Table 2.

18. Target Compound Identification

To minimize erroneous compound identification during organic analyses, qualitative criteria including compound retention time and mass spectra (if applicable) were evaluated according to the identification criteria established by the methods. The samples identified in Table 1 were reviewed. The organic compounds reported adhered to the specified identification criteria.

Pesticide, PCB and fumigant analyses were performed using dual column analyses. All the results showed good correlation between the two columns (<40 RPD).

19. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are acceptable with the specific qualifications noted herein.

U - Not detected at the associated reporting limit
UJ - Not detected; associated reporting limit is estimated
- - Not applicable
PCBs - Polychlorinated Biphenyls

Table 3

Analytical Methods
VAS-32 and VAS-33 Groundwater Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
January 2018

Parameter	Method	Matrix	Holding Time	
			Collection to Extraction (Days)	Collection or Extraction to Analysis (Days)
Volatile Organic Compounds (VOCs)	SW-846 8260B	Water	-	14
Fumigants	SW-846 8011	Water	-	14
Semi-Volatile Organic Compounds (SVOCs)	SW-846 8270C	Water	7	40
Organochlorine Pesticides	SW-846 8081A	Water	7	40
Polychlorinated Biphenyls (PCBs)	SW-846 8082A	Water	7	40
Total & Dissolved Metals	SW-846 6020	Water	-	180
Total & Dissolved Mercury	SW-846 7470A	Water	-	28
Cyanide	SW-846 9012B	Water	-	14
Anions (Chloride, Sulfate, Nitrate, Nitrite)	EPA 300.0	Water	-	28 48 hours for Nitrate & Nitrite

Notes:

SW-846 - "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", SW-846, Third Edition, 1986, with subsequent revisic
\- - Not applicable

CC:	Brent Ramdial, Valerie Chan		

Subject: **Analytical Results and Full Validation**
VAS-31, VAS-44, VAS-34 and VAS-38 Groundwater Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
January-February 2018

1. Introduction

This document details a validation of analytical results for water samples collected in support of the VAS-31, VAS-44, VAS-34 and VAS-38 Groundwater Sampling Program at the Moraine, Ohio site during January through February 2018. Samples were submitted to TestAmerica Laboratories, Inc. (TA) located in North Canton, Ohio. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2A and Table 2B. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, duplicate data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spike (MS) samples and field quality assurance/quality (QA/QC) samples. The assessment of analytical and in-house data included checks for data consistency (by observing comparability of duplicate analyses), adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2, Appendix E – Quality Assurance Project Plan", September 20, 2017

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review", USEPA 540-R-10-011, January 2010

iii) "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008

Items ii) and iii) will subsequently be referred to as the "Guidelines" in this Memorandum.

2. Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times with the exception of two samples for nitrate and nitrite analysis. Table 4 presents the qualified sample results.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Gas Chromatography/Mass Spectrometer (GC/MS) – Tuning and Mass Calibration (Instrument Performance Check) and Inductively Coupled Plasma/Mass Spectrometer (ICP/MS)

3.1 Organic Analyses

Prior to volatile organic compound (VOC) and semi-volatile organic compound (SVOC) analysis, GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, methods require the analysis of specific tuning compounds bromofluorobenzene (BFB) and decafluorotriphenylphosphine (DFTPP), respectively. The resulting spectra must meet the criteria cited in the methods before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument.

Tuning compounds were analyzed at the required frequency throughout VOC and SVOC analysis periods. All tuning criteria were met indicating that proper optimization of the instrumentation was achieved.

3.2 Inorganic Analyses

To ensure adequate mass resolution, identification, and to some degree, sensitivity, the performance of each ICP/MS instrument used for metals analyses is checked prior to calibration and initiating an analysis sequence through the analysis of a tuning solution.

Instrument performance check data were reviewed. The tuning solution was analyzed at the required frequency throughout the analyses. The results of all instrument performance checks were within the method acceptance criteria, indicating that proper optimization of the instrumentation was achieved.

4. Initial Calibration - Organic Analyses

4.1 GC/MS

To quantify VOCs and SVOCs of interest in samples, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds of interest is

analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity of the calibration curve and instrument sensitivity are evaluated against the following criteria:

i) All relative response factors (RRFs) must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent (40.0 percent for compounds that exhibit poor response) or a minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

The initial calibration data for VOCs and SVOCs were reviewed. All compounds met the above criteria for sensitivity and linearity.

4.2 GC

To quantify pesticides, the performance evaluation mixture (PEM) is analyzed at the beginning and end of the initial calibration sequence and throughout the analytical sequence. The results of these analyses are used to evaluate dichlorodiphenyltrichloroethane (DDT)/endrin breakdown, using the method degradation criteria of <15 percent. PEM standards were analyzed at the required frequency throughout sample analysis and all method performance criteria were met.

4.2.1 Internal Standard Calibration – PCBs and Organochlorine Pesticides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Polychlorinated biphenyls (PCBs) and organochlorine pesticides were calibrated with a dual column analysis using internal standardization. Five peaks, representing five congeners, were used for the analysis of each Aroclor with a separate curve fitted to the calibration data for each congener. A calibration curve consisting of a minimum of five concentration levels was analyzed for all single component compounds of interest. Linearity of the calibration curves are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent

ii) A minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

4.2.2 External Standard Calibration – Fumigants

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Initially, a calibration curve consisting of a minimum of five concentration levels is analyzed for all single component compounds of interest. Linearity of the calibration

curve is acceptable if all RSD values are less than or equal to 20.0 percent or if the coefficient of determination (R^2) is 0.990 or greater for linear regression curves.

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

5. Initial Calibration – Inorganic Analyses

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For ICP/MS analysis, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve. For mercury atomic absorption (AA) analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater. For instrumental general chemistry analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	Parameter	Control Limits
ICP/MS	Metals	90 - 110%
Cold Vapor AA	Mercury	80 - 120%
Instrumental Wet Chemistry	Cyanide	85 - 115%
Instrumental Wet Chemistry	Anions	90 - 110%

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that all of the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals and general chemistry analyses were properly calibrated prior to sample analysis.

6. Continuing Calibration - Organic Analyses

6.1 GC/MS

To ensure that instrument calibration for VOC and SVOC analyses is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) All RRF values must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) Percent difference (%D) values must not exceed 25.0 percent (40.0 percent for compounds that exhibit poor response)

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability with the exception of the sample results presented with qualifiers in Table 5.

6.2 GC

To ensure that the calibration of the instrument for organic analyses by GC is valid throughout the sample analysis period, continuing calibration standards are analyzed and evaluated on a regular basis. To evaluate the continued linearity of the calibration, %D values are calculated for each compound. As specified in the methods, all %D values should not exceed 15 percent. To ensure that compound retention times do not vary over the analysis period, all retention times for continuing calibration compounds must fall within the established retention time windows.

All continuing calibration standards were analyzed at the required frequency. All %D values and compound retention times met the above criteria indicating acceptable instrument calibration throughout the analysis period with the exception of PCB results presented with qualifiers in Table 5.

7. Continuing Calibration - Inorganic Analyses

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. All analyte recoveries reported for the CCVs were within the specified limits.

8. Laboratory Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for the inorganic parameters.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

8.1 Organic Analyses

Most method blank results were non-detect. Table 6 presents the sample results that were qualified as non-detect due to analyte concentrations in the method blanks.

8.2 Inorganic Analyses

Upon review of the ICBs, CCBs, and method blanks, it was noted that metal concentrations were observed above the method detection limit (MDL). Most investigative samples associated with the low-level detections reported either non-detect concentrations or concentrations significantly greater than the associated laboratory blank concentrations for the analytes of interest. These sample results were not impacted by the contamination detected. Associated positive sample results with similar concentrations to the levels reported in the blanks were qualified as non-detect (see Table 7).

9. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for organic determinations were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. Due to dilutions equal to or greater than 5 times that were necessary to successfully analyze the samples, numerous surrogate recoveries in investigative samples analyzed for pesticides, PCBs, and SVOCs were not assessed. All remaining surrogate recoveries were within the laboratory criteria.

10. Internal Standards (IS) Analyses

IS data were evaluated for all VOC, SVOC, PCB, Pesticide, and ICP/MS metals sample analyses.

10.1 Organics Analyses

To ensure that changes in the GC/MS and GC sensitivity and response do not affect sample analysis results IS compounds are added to each sample prior to analysis. All results are then calculated as a ratio of the IS responses.

The sample IS results were evaluated against the following criteria:

i) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard

ii) IS area counts must not vary by more than a factor of two (-50 percent to +100 percent) from the associated calibration standard

All organic IS recoveries and retention times met the above criteria.

10.2 Inorganic Analyses

IS elements were added to all samples prior to metals analysis by ICP/MS. Overall instrument stability and performance for metals analyses were monitored using the IS intensity data. IS recoveries were assessed using control limits of 60-125 percent.

All inorganic IS recoveries were within the acceptance limits.

11. Laboratory Control Sample Analyses

LCS or LCS/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

11.1 Organic Analyses

The LCS or LCS/LCSD contained all compounds of interest or the compounds specified in the method. Most LCS recoveries and RPDs were within the laboratory control limits demonstrating acceptable analytical accuracy and precision. Table 8 presents the sample results that were qualified as estimated due to outlying LCS recoveries.

11.2 Inorganic Analyses

The LCS or LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries and RPDs were within the control limits demonstrating acceptable analytical accuracy and precision.

12. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

If the original sample concentration is significantly greater than the spike concentration, the recovery is not assessed.

If only the MS or MSD recovery was outside of control limits, no qualification of the data was performed based on the acceptable recovery of the companion spike and the acceptable RPD.

Due to dilutions that were necessary to successfully analyze the samples, some MS/MSD recoveries were not assessed.

MS/MSD analyses were performed as specified in Table 1.

12.1 Organic Analyses

The MS/MSD samples were spiked with all compounds of interest or the compounds specified in the method. All percent recoveries and RPD values, if applicable, were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision with a few exceptions. Table 9 presents the qualified sample results.

12.2 Inorganic Analyses

The MS or MS/MSD samples were spiked with the analytes of interest, and the results were evaluated using the "Guidelines". All percent recoveries and RPD values, if applicable, were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision with the exception of aluminum and sulfate. Table 9 presents the qualified sample results.

13. ICP/MS Serial Dilution

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. A minimum of 1 per 20 investigative samples or at least 1 per analytical batch must be analyzed at a five-fold dilution. For samples with sufficient analyte concentrations (>50 times the method detection limit), the serial dilution results must agree within 10 percent of the original results.

A serial dilution was performed on each MS/MSD sample. All results met the criteria above.

14. ICP Interference Check Sample Analysis (ICS)

To verify that the laboratory has established proper inter-element and background correction factors, ICSs are analyzed. These samples contain high concentrations of aluminum, calcium, magnesium, and iron and are analyzed at the beginning and end of each sample analysis period. The ICSs are evaluated against recovery control limits in the "Guidelines" of 80 to 120 percent.

ICS analysis results were evaluated for all samples using the criteria in the "Guidelines". All ICS recoveries and results were acceptable.

15. Field QA/QC Samples

The field QA/QC consisted of 23 trip blank samples, 3 equipment rinse blanks, 2 field blank samples, and 3 field duplicate sample sets.

15.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, 23 trip blanks were submitted to the laboratory for VOC analysis. Low levels of target analytes were detected in some of the trip blank samples. Most associated sample results were non-detect or were significantly greater than the trip blank values and were not impacted. Table 10 presents the sample results that were qualified as non-detect due to analytes concentrations in the trip blank samples that were similar in concentration to the investigative sample results.

15.2 Equipment Rinse Blank Sample Analysis

To assess field decontamination procedures, ambient conditions at the site, and cleanliness of sample containers, 3 rinse blanks were submitted for analysis, as identified in Table 1. Numerous target analytes were detected in the rinse blank samples. Table 11 presents the sample results that were qualified as non-detect due to analyte concentrations in the rinse blanks that were similar in concentration to the investigative sample results.

15.3 Field Blank Sample Analysis

To assess ambient conditions at the site, 2 field blanks were submitted for analysis, as identified in Table 1. Most results were non-detect for the analytes of interest. Table 12 presents the sample results that were qualified as non-detect due to analyte concentrations in the field blanks that were similar in concentration to the investigative sample results.

15.4 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, 3 field duplicate sample sets were collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 50 percent for water samples. If the reported concentration in either the investigative sample or its duplicate is less than five times the reporting limit (RL), the evaluation criterion is one times the RL value for water samples.

Most field duplicate results were within acceptable agreement demonstrating acceptable sampling and analytical precision. Table 13 presents the sample results that were qualified due to variability in the field duplicate results.

16. Total versus Dissolved Results

Most dissolved metals results were less than the total results or were within the normal variability of the method (20%D). Table 14 presents the sample results that were qualified due to results that were in exceedance of the method variability.

17. Analyte Reporting

The laboratory reported detected results down to the laboratory's method detection limit (MDL) for each analyte adjusted for specific sample dilutions and volumes. Positive analyte detections less than the RL but greater than the sample-specific MDL were qualified as estimated (J) in Table 2A and Table 2B unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the sample specific MDL in Table 2A and Table 2B.

18. Target Compound Identification

To minimize erroneous compound identification during organic analyses, qualitative criteria including compound retention time and mass spectra (if applicable) were evaluated according to the identification criteria established by the methods. The samples identified in Table 1 were reviewed. The organic compounds reported adhered to the specified identification criteria.

Pesticide and PCB analyses were performed using dual column analyses. All the results showed good correlation between the two columns (<40 RPD).

19. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2A and Table 2B are acceptable with the specific qualifications noted herein.

Table 3

Analytical Methods
VAS-31, VAS-44, VAS-34, and VAS-38 Groundwater Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
January-February 2018

Parameter	Method	Matrix	Holding Time	
			Collection to Extraction (Days)	Collection or Extraction to Analysis (Days)
Volatile Organic Compounds (VOCs)	SW-846 8260B	Water	-	14
Fumigants	SW-846 8011	Water	-	14
Semi-Volatile Organic Compounds (SVOCs)	SW-846 8270C	Water	7	40
Organochlorine Pesticides	SW-846 8081A	Water	7	40
Polychlorinated Biphenyls (PCBs)	SW-846 8082A	Water	7	40
Total & Dissolved Metals	SW-846 6020	Water	-	180
Total & Dissolved Mercury	SW-846 7470A	Water	-	28
Cyanide	SW-846 9012B	Water	-	14
Anions (Chloride, Sulfate, Nitrate, Nitrite)	EPA 300.0	Water	-	28 48 hours for Nitrate & Nitrite

Subject: **Analytical Results and 10/90-Full/Innovative Validation**
Groundwater Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
March 2018-May 2018

1. Introduction

This document details a 10/90-full/innovative validation of analytical results for water samples collected in support of the Groundwater Sampling Program at the Moraine, Ohio site during March 2018 through May 2018. Full data validation was performed on sample delivery group (SDG) 240-95843-1. The remaining data were reviewed using the innovative approach. Samples were submitted to TestAmerica Laboratories, Inc. (TA) located in North Canton, Ohio. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, duplicate data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spike (MS) samples and field quality assurance/quality (QA/QC) samples. The assessment of analytical and in-house data included checks for data consistency (by observing comparability of duplicate analyses), adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2, Appendix E – Quality Assurance Project Plan", September 20, 2017

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review", USEPA 540-R-10-011, January 2010

iii) "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008

iv) “Innovative Approaches for Validation of Organic and Inorganic Data”, USEPA Region 3, June 1995

Items ii), iii), and iv) will subsequently be referred to as the "Guidelines" in this Memorandum.

2. Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Gas Chromatography/Mass Spectrometer (GC/MS) – Tuning and Mass Calibration (Instrument Performance Check) and Inductively Coupled Plasma/Mass Spectrometer (ICP/MS)

3.1 Organic Analyses

Prior to volatile organic compound (VOC) and semi-volatile organic compound (SVOC) analysis, GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, methods require the analysis of specific tuning compounds bromofluorobenzene (BFB) and decafluorotriphenylphosphine (DFTPP), respectively. The resulting spectra must meet the criteria cited in the methods before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument.

Tuning compounds were analyzed at the required frequency throughout VOC and SVOC analysis periods. All tuning criteria were met indicating that proper optimization of the instrumentation was achieved.

3.2 Inorganic Analyses

To ensure adequate mass resolution, identification, and to some degree, sensitivity, the performance of each ICP/MS instrument used for metals analyses is checked prior to calibration and initiating an analysis sequence through the analysis of a tuning solution.

Instrument performance check data were reviewed. The tuning solution was analyzed at the required frequency throughout the analyses. The results of all instrument performance checks were within the method acceptance criteria, indicating that proper optimization of the instrumentation was achieved.

4. Initial Calibration - Organic Analyses

4.1 GC/MS

To quantify VOCs and SVOCs of interest in samples, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity of the calibration curve and instrument sensitivity are evaluated against the following criteria:

i) All relative response factors (RRFs) must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent (40.0 percent for compounds that exhibit poor response) or a minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear or quadratic equation calibration curves are used

The initial calibration data for VOCs and SVOCs were reviewed. All compounds met the above criteria for sensitivity and linearity.

4.2 GC

To quantify pesticides, the performance evaluation mixture (PEM) is analyzed at the beginning and end of the initial calibration sequence and throughout the analytical sequence. The results of these analyses are used to evaluate dichlorodiphenyltrichloroethane (DDT)/endrin breakdown, using the method degradation criteria of <15 percent. PEM standards were analyzed at the required frequency throughout sample analysis and all method performance criteria were met.

4.2.1 Internal Standard Calibration – PCBs and Organochlorine Pesticides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Polychlorinated biphenyls (PCBs) and organochlorine pesticides were calibrated with a dual column analysis using internal standardization. Five peaks, representing five congeners, were used for the analysis of each Aroclor with a separate curve fitted to the calibration data for each congener. A calibration curve consisting of a minimum of five concentration levels was analyzed for all single component compounds of interest. Linearity of the calibration curves are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent

ii) A minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

4.2.2 External Standard Calibration – Fumigants and Herbicides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Initially, a calibration curve consisting of a minimum of five concentration levels is analyzed for all single component compounds of interest. Linearity of the calibration curve is acceptable if all RSD values are less than or equal to 20.0 percent or if the coefficient of determination (R^2) is 0.990 or greater for linear regression curves.

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

5. Initial Calibration – Inorganic Analyses

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For ICP/MS analysis, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve. For mercury atomic absorption (AA) analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater. For instrumental general chemistry analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	Parameter	Control Limits
ICP/MS	Metals	90 - 110%
Cold Vapor AA	Mercury	80 - 120%
Instrumental Wet Chemistry	Cyanide	85 - 115%
Instrumental Wet Chemistry	Anions	90 - 110%

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that all of the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals and general chemistry analyses were properly calibrated prior to sample analysis.

6. Continuing Calibration - Organic Analyses

6.1 GC/MS

To ensure that instrument calibration for VOC and SVOC analyses is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) All RRF values must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) Percent difference (%D) values must not exceed 25.0 percent (40.0 percent for compounds that exhibit poor response)

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability with the exception of the sample results presented with qualifiers in Table 4.

6.2 GC

To ensure that the calibration of the instrument for organic analyses by GC is valid throughout the sample analysis period, continuing calibration standards are analyzed and evaluated on a regular basis. To evaluate the continued linearity of the calibration, %D values are calculated for each compound. As specified in the methods, all %D values should not exceed 15 percent. To ensure that compound retention times do not vary over the analysis period, all retention times for continuing calibration compounds must fall within the established retention time windows.

All continuing calibration standards were analyzed at the required frequency. All %D values and compound retention times met the above criteria indicating acceptable instrument calibration throughout the analysis period with the exception of the results presented with qualifiers in Table 4.

7. Continuing Calibration - Inorganic Analyses

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. All analyte recoveries reported for the CCVs were within the specified limits.

8. Laboratory Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for the inorganic parameters.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

8.1 Organic Analyses

All method blank results were either non-detect or did not impact the associated sample results because they were either non-detect or were concentrations significantly greater than the associated laboratory blank concentrations for the analyte of interest.

8.2 Inorganic Analyses

Upon review of the ICBs, CCBs, and method blanks, it was noted that several metals and general chemistry parameters concentrations were observed above the method detection limit (MDL). Most investigative samples associated with the low-level detections reported either non-detect concentrations or concentrations significantly greater than the associated laboratory blank concentrations for the analytes of interest. These sample results were not impacted by the contamination detected. Associated positive sample results with similar concentrations to the levels reported in the blanks were qualified as non-detect (see Table 5 and Table 6).

9. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for organic determinations were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. Due to dilutions equal to or greater than 5 times that were necessary to successfully analyze the samples, numerous surrogate recoveries in investigative samples analyzed for pesticides were not assessed. All remaining surrogate recoveries were within the laboratory criteria.

10. Internal Standards (IS) Analyses

IS data were evaluated for all VOC, SVOC, PCB, Pesticide, and ICP/MS metals sample analyses.

10.1 Organics Analyses

To ensure that changes in the GC/MS and GC sensitivity and response do not affect sample analysis results IS compounds are added to each sample prior to analysis. All results are then calculated as a ratio of the IS responses.

The sample IS results were evaluated against the following criteria:

i) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard

ii) IS area counts must not vary by more than a factor of two (-50 percent to +100 percent) from the associated calibration standard

All organic IS recoveries and retention times met the above criteria.

10.2 Inorganic Analyses

IS elements were added to all samples prior to metals analysis by ICP/MS. Overall instrument stability and performance for metals analyses were monitored using the IS intensity data. IS recoveries were assessed using control limits of 60-125 percent.

All inorganic IS recoveries were within the acceptance limits.

11. Laboratory Control Sample Analyses

LCS or LCS/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

11.1 Organic Analyses

The LCS or LCS/LCSD contained all compounds of interest or the compounds specified in the method. Most LCS recoveries and RPDs were within the laboratory control limits demonstrating acceptable analytical accuracy and precision. Table 7 presents the sample result that was qualified as estimated due to an outlying LCS recovery.

11.2 Inorganic Analyses

The LCS or LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries and RPDs were within the control limits demonstrating acceptable analytical accuracy and precision.

12. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

If the original sample concentration is significantly greater than the spike concentration, the recovery is not assessed.

If only the MS or MSD recovery was outside of control limits, no qualification of the data was performed based on the acceptable recovery of the companion spike and the acceptable RPD.

Due to dilutions that were necessary to successfully analyze the samples, some MS/MSD recoveries were not assessed.

MS/MSD analyses were performed as specified in Table 1.

12.1 Organic Analyses

The MS/MSD samples were spiked with all compounds of interest or the compounds specified in the method. All percent recoveries and RPD values were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision with a few exceptions. Table 8 presents the qualified and rejected sample results.

12.2 Inorganic Analyses

The MS or MS/MSD samples were spiked with the analytes of interest, and the results were evaluated using the "Guidelines". All percent recoveries and RPD values, if applicable, were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision with the exception of nitrite analysis. Table 8 presents the qualified sample results.

13. ICP/MS Serial Dilution

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. A minimum of 1 per 20 investigative samples or at least 1 per analytical batch must be analyzed at a five-fold dilution. For samples with sufficient analyte concentrations (>50 times the method detection limit), the serial dilution results must agree within 10 percent of the original results.

A serial dilution was performed on each MS/MSD sample. All results met the criteria above.

14. ICP Interference Check Sample Analysis (ICS)

To verify that the laboratory has established proper inter-element and background correction factors, ICSs are analyzed. These samples contain high concentrations of aluminum, calcium, magnesium, and iron and are analyzed at the beginning and end of each sample analysis period. The ICSs are evaluated against recovery control limits in the "Guidelines" of 80 to 120 percent.

ICS analysis results were evaluated for all samples using the criteria in the "Guidelines". All ICS recoveries and results were acceptable.

15. Field QA/QC Samples

The field QA/QC consisted of 10 trip blank samples, 3 equipment rinse blanks, and 3 field duplicate sample sets.

15.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, 10 trip blanks were submitted to the laboratory for VOC analysis. Low levels of target analytes were detected in some of the trip blank samples. Most associated sample results were non-detect or were significantly greater than the trip blank values and were not impacted. Table 9 presents the sample results that were qualified as non-detect due to analytes concentrations in the trip blank samples that were similar in concentration to the investigative sample results.

15.2 Equipment Rinse Blank Sample Analysis

To assess field decontamination procedures, ambient conditions at the site, and cleanliness of sample containers, 3 rinse blanks were submitted for analysis, as identified in Table 1. Numerous target analytes were detected in the rinse blank samples. Table 10 presents the sample results that were qualified as non-detect due to analyte concentrations in the rinse blanks that were similar in concentration to the investigative sample results.

15.3 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, 3 field duplicate sample sets were collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 50 percent for water samples. If the reported concentration in either the investigative sample or its duplicate is less than five times the reporting limit (RL), the evaluation criterion is one times the RL value for water samples.

All field duplicate results were within acceptable agreement demonstrating acceptable sampling and analytical precision.

16. Total versus Dissolved Results

Most dissolved metals results were less than the total results or were within the normal variability of the method (20%D). Table 11 presents the sample results that were qualified due to results that were in exceedance of the method variability.

17. Analyte Reporting

The laboratory reported detected results down to the laboratory's method detection limit (MDL) for each analyte adjusted for specific sample dilutions and volumes. Positive analyte detections less than the RL but greater than the sample-specific MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the sample specific MDL in Table 2.

18. Target Compound Identification

To minimize erroneous compound identification during organic analyses, qualitative criteria including compound retention time and mass spectra (if applicable) were evaluated according to the identification criteria established by the methods. The samples identified in Table 1 were reviewed. The organic compounds reported adhered to the specified identification criteria.

GC analyses were performed using dual column analyses. All the results showed good correlation between the two columns (<40 RPD).

19. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are acceptable with the specific exceptions and qualifications noted herein.

Memorandum

December 6, 2018

To:	Julian Hayward	Ref. No.:	038443-370
From:	Angela Bown/cs/46-NF	Tel:	513-942-4750
CC:	Brent Ramdial, Valerie Chan		

Subject: **Analytical Results and Full Validation**
VAS Groundwater Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
July - October 2018

1. Introduction

This document details a validation of analytical results for water samples collected in support of the VAS Groundwater Sampling Program at the Moraine, Ohio site during July through October 2018. Samples were submitted to TestAmerica Laboratories, Inc. (TA) located in North Canton, Ohio. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, duplicate data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spike (MS) samples and field quality assurance/quality (QA/QC) samples. The assessment of analytical and in-house data included checks for data consistency (by observing comparability of duplicate analyses), adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2, Appendix E – Quality Assurance Project Plan", September 20, 2017

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review", USEPA 540-R-10-011, January 2010

iii) "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008

Items ii) and iii) will subsequently be referred to as the "Guidelines" in this Memorandum.

2. Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times with the exception of a few unpreserved samples for volatile organic compound (VOC) analysis. Table 4 presents the qualified sample results.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Gas Chromatography/Mass Spectrometer (GC/MS) – Tuning and Mass Calibration (Instrument Performance Check) and Inductively Coupled Plasma/Mass Spectrometer (ICP/MS)

3.1 Organic Analyses

Prior to VOC and semi-volatile organic compound (SVOC) analysis, GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, methods require the analysis of specific tuning compounds bromofluorobenzene (BFB) and decafluorotriphenylphosphine (DFTPP), respectively. The resulting spectra must meet the criteria cited in the methods before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument.

Tuning compounds were analyzed at the required frequency throughout VOC and SVOC analysis periods. All tuning criteria were met indicating that proper optimization of the instrumentation was achieved.

3.2 Inorganic Analyses

To ensure adequate mass resolution, identification, and to some degree, sensitivity, the performance of each ICP/MS instrument used for metals analyses is checked prior to calibration and initiating an analysis sequence through the analysis of a tuning solution.

Instrument performance check data were reviewed. The tuning solution was analyzed at the required frequency throughout the analyses. The results of all instrument performance checks were within the method acceptance criteria, indicating that proper optimization of the instrumentation was achieved.

4. Initial Calibration - Organic Analyses

4.1 GC/MS

To quantify VOCs and SVOCs of interest in samples, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity of the calibration curve and instrument sensitivity are evaluated against the following criteria:

i) All relative response factors (RRFs) must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent (40.0 percent for compounds that exhibit poor response) or a minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

The initial calibration data for VOCs and SVOCs were reviewed. All compounds met the above criteria for sensitivity and linearity.

4.2 GC

To quantify pesticides, the performance evaluation mixture (PEM) is analyzed at the beginning and end of the initial calibration sequence and throughout the analytical sequence. The results of these analyses are used to evaluate dichlorodiphenyltrichloroethane (DDT)/endrin breakdown, using the method degradation criteria of <15 percent. PEM standards were analyzed at the required frequency throughout sample analysis and all method performance criteria were met.

4.2.1 Internal Standard Calibration – PCBs and Organochlorine Pesticides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Polychlorinated biphenyls (PCBs) and organochlorine pesticides were calibrated with a dual column analysis using internal standardization. Five peaks, representing five congeners, were used for the analysis of each Aroclor with a separate curve fitted to the calibration data for each congener. A calibration curve consisting of a minimum of five concentration levels was analyzed for all single component compounds of interest. Linearity of the calibration curves are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent

ii) A minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

4.2.2 External Standard Calibration – Fumigants and Herbicides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Initially, a calibration curve consisting of a minimum of five concentration levels is analyzed for all single component compounds of interest. Linearity of the calibration curve is acceptable if all RSD values are less than or equal to 20.0 percent or if the coefficient of determination (R^2) is 0.990 or greater for linear regression curves.

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

5. Initial Calibration – Inorganic Analyses

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For ICP/MS analysis, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve. For mercury atomic absorption (AA) analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater. For instrumental general chemistry analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	Parameter	Control Limits
ICP/MS	Metals	90 - 110%
Cold Vapor AA	Mercury	80 - 120%
Instrumental Wet Chemistry	Cyanide	85 - 115%
Instrumental Wet Chemistry	Anions	90 - 110%

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that all of the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals and general chemistry analyses were properly calibrated prior to sample analysis.

6. Continuing Calibration - Organic Analyses

6.1 GC/MS

To ensure that instrument calibration for VOC and SVOC analyses is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) All RRF values must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) Percent difference (%D) values must not exceed 25.0 percent (40.0 percent for compounds that exhibit poor response)

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability with the exception of the sample results presented with qualifiers in Table 5.

6.2 GC

To ensure that the calibration of the instrument for organic analyses by GC is valid throughout the sample analysis period, continuing calibration standards are analyzed and evaluated on a regular basis. To evaluate the continued linearity of the calibration, %D values are calculated for each compound. As specified in the methods, all %D values should not exceed 15 percent. To ensure that compound retention times do not vary over the analysis period, all retention times for continuing calibration compounds must fall within the established retention time windows.

All continuing calibration standards were analyzed at the required frequency. All %D values and compound retention times met the above criteria indicating acceptable instrument calibration throughout the analysis period with the exception of one herbicide result presented with a qualifier in Table 5.

7. Continuing Calibration - Inorganic Analyses

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. Most analyte recoveries reported for the CCVs were within the specified limits. Table 6 presents the qualified sample data due to outlying calibration criteria.

8. Laboratory Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for the inorganic parameters.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

8.1 Organic Analyses

Most method blank results were non-detect. Table 7 presents the sample results that were qualified as non-detect due to analyte concentrations in the method blanks.

8.2 Inorganic Analyses

Upon review of the ICBs, CCBs, and method blanks, it was noted that metal concentrations were observed above the method detection limit (MDL). Most investigative samples associated with the low-level detections reported either non-detect concentrations or concentrations significantly greater than the associated laboratory blank concentrations for the analytes of interest. These sample results were not impacted by the contamination detected. Associated positive sample results with similar concentrations to the levels reported in the blanks were qualified as non-detect (see Table 7 and Table 8).

9. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for organic determinations were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. Due to dilutions equal to or greater than 5 times that were necessary to successfully analyze the samples, numerous surrogate recoveries in investigative samples were not assessed. Most remaining surrogate recoveries were within the laboratory criteria. Where surrogate recoveries were above the control limits, non-detect sample results were not impacted by the implied high bias and were not qualified. Table 9 presents the sample results that were qualified due to outlying surrogate recoveries.

10. Internal Standards (IS) Analyses

IS data were evaluated for all VOC, SVOC, PCB, Pesticide, and ICP/MS metals sample analyses.

10.1 Organics Analyses

To ensure that changes in the GC/MS and GC sensitivity and response do not affect sample analysis results IS compounds are added to each sample prior to analysis. All results are then calculated as a ratio of the IS responses.

The sample IS results were evaluated against the following criteria:

i) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard

ii) IS area counts must not vary by more than a factor of two (-50 percent to +100 percent) from the associated calibration standard

All organic IS recoveries and retention times met the above criteria.

10.2 Inorganic Analyses

IS elements were added to all samples prior to metals analysis by ICP/MS. Overall instrument stability and performance for metals analyses were monitored using the IS intensity data. IS recoveries were assessed using control limits of 30-125 percent.

All inorganic IS recoveries were within the acceptance limits.

11. Laboratory Control Sample Analyses

LCS or LCS/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

11.1 Organic Analyses

The LCS or LCS/LCSD contained all compounds of interest or the compounds specified in the method. Most LCS recoveries and RPDs were within the laboratory control limits demonstrating acceptable analytical accuracy and precision. Table 10 presents the sample results that were qualified as estimated due to outlying LCS recoveries.

11.2 Inorganic Analyses

The LCS or LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries and RPDs were within the control limits demonstrating acceptable analytical accuracy and precision.

12. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

If the original sample concentration is significantly greater than the spike concentration, the recovery is not assessed.

If only the MS or MSD recovery was outside of control limits, no qualification of the data was performed based on the acceptable recovery of the companion spike and the acceptable RPD.

Due to dilutions that were necessary to successfully analyze the samples, some MS/MSD recoveries were not assessed.

MS/MSD analyses were performed as specified in Table 1.

12.1 Organic Analyses

The MS/MSD samples were spiked with all compounds of interest or the compounds specified in the method. All percent recoveries and RPD values, if applicable, were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision.

12.2 Inorganic Analyses

The MS or MS/MSD samples were spiked with the analytes of interest, and the results were evaluated using the "Guidelines". All percent recoveries and RPD values, if applicable, were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision with the exception of the sample results presented with qualifiers in Table 11.

13. ICP/MS Serial Dilution

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. A minimum of 1 per 20 investigative samples or at least 1 per analytical batch must be analyzed at a five-fold dilution. For samples with sufficient analyte concentrations (>50 times the method detection limit), the serial dilution results must agree within 10 percent of the original results.

A serial dilution was performed on each MS/MSD sample. All results met the criteria above.

14. ICP Interference Check Sample Analysis (ICS)

To verify that the laboratory has established proper inter-element and background correction factors, ICSs are analyzed. These samples contain high concentrations of aluminum, calcium, magnesium, and iron and are analyzed at the beginning and end of each sample analysis period. The ICSs are evaluated against recovery control limits in the "Guidelines" of 80 to 120 percent.

ICS analysis results were evaluated for all samples using the criteria in the "Guidelines". All ICS recoveries and results were acceptable.

15. Field QA/QC Samples

The field QA/QC consisted of 40 trip blank samples, 8 rinse blank samples, and 8 field duplicate sample sets.

15.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, 40 trip blanks were submitted to the laboratory for VOC analysis. Several target analytes were detected in the trip blank samples. Table 12 presents the qualified sample results. The remaining results were non-detect for the compounds of interest.

15.2 Rinse Blank Sample Analysis

To assess field decontamination procedures, ambient conditions at the site, and cleanliness of sample containers, 8 field blanks were submitted for analysis, as identified in Table 1.Table 13 presents the sample results that were qualified as non-detect due to analyte concentrations in the rinse blank samples. The remaining results were non-detect for the analytes of interest.

15.3 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, 8 field duplicate sample sets were collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 50 percent for water samples. If the reported concentration in either the investigative sample or its duplicate is less than five times the reporting limit (RL), the evaluation criterion is one times the RL value for water samples.

Most field duplicate results were within acceptable agreement demonstrating acceptable sampling and analytical precision. Table 14 presents the sample results that were qualified due to variability in the field duplicate results.

16. Total versus Dissolved Results

Most dissolved metals results were less than the total results or were within the normal variability of the method (20%D). Several dissolved results were greater than the total results and were in exceedance of the method variability. The associated results were qualified as estimated in Table 15.

17. Analyte Reporting

The laboratory reported detected results down to the laboratory's MDL for each analyte adjusted for specific sample dilutions and volumes. Positive analyte detections less than the RL but greater than the sample-specific MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the sample-specific MDL in Table 2.

18. Target Compound Identification

To minimize erroneous compound identification during organic analyses, qualitative criteria including compound retention time and mass spectra (if applicable) were evaluated according to the identification

criteria established by the methods. The samples identified in Table 1 were reviewed. The organic compounds reported adhered to the specified identification criteria.

Pesticide and PCB analyses were performed using dual column analyses. All the results showed good correlation between the two columns (<40 RPD).

19. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are acceptable with the specific qualifications noted herein.

Sulfate	µg/L	94000	93000	92000	83000
Fumigant					
1,2-Dibromo-3-chloropropane (DBCP)	µg/L	0.0086 U	0.0086 U	0.0086 U	0.0086 U
1,2-Dibromoethane (Ethylene dibromide)	µg/L	0.0087 U	0.0087 U	0.0087 U	0.0087 U

Notes:

J - Estimated concentration
U - Not detected at the associated reporting limit
UJ - Not detected; associated reporting limit is estimated
BTEX - Benzene, Toluene, Ethylbenzene, and Xylene
PCBs - Polychlorinated Biphenyls
-- Not applicable

Subject: **Analytical Results and Full Validation**
Monitoring Wells Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
October 2018

1. Introduction

This document details a validation of analytical results for water samples collected in support of the Monitoring Wells Sampling Program at the Moraine, Ohio site during October 2018. Samples were submitted to TestAmerica Laboratories, Inc. (TA) located in North Canton, Ohio. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spike (MS) samples and field quality assurance/quality (QA/QC) samples. The assessment of analytical and in-house data included checks for data consistency (by observing comparability of duplicate analyses), adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2, Appendix E – Quality Assurance Project Plan", September 20, 2017

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review", USEPA 540-R-10-011, January 2010

iii) "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008

Items ii) and iii) will subsequently be referred to as the "Guidelines" in this Memorandum.

2. Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Gas Chromatography/Mass Spectrometer (GC/MS) – Tuning and Mass Calibration (Instrument Performance Check) and Inductively Coupled Plasma/Mass Spectrometer (ICP/MS)

3.1 Organic Analyses

Prior to volatile organic compound (VOC) and semi-volatile organic compound (SVOC) analysis, GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, methods require the analysis of specific tuning compounds bromofluorobenzene (BFB) and decafluorotriphenylphosphine (DFTPP), respectively. The resulting spectra must meet the criteria cited in the methods before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument.

Tuning compounds were analyzed at the required frequency throughout VOC and SVOC analysis periods. All tuning criteria were met indicating that proper optimization of the instrumentation was achieved.

3.2 Inorganic Analyses

To ensure adequate mass resolution, identification, and to some degree, sensitivity, the performance of each ICP/MS instrument used for metals analyses is checked prior to calibration and initiating an analysis sequence through the analysis of a tuning solution.

Instrument performance check data were reviewed. The tuning solution was analyzed at the required frequency throughout the analyses. The results of all instrument performance checks were within the method acceptance criteria, indicating that proper optimization of the instrumentation was achieved.

4. Initial Calibration - Organic Analyses

4.1 GC/MS

To quantify VOCs and SVOCs of interest in samples, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity of the calibration curve and instrument sensitivity are evaluated against the following criteria:

i) All relative response factors (RRFs) must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent (40.0 percent for compounds that exhibit poor response) or a minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

The initial calibration data for VOCs and SVOCs were reviewed. All compounds met the above criteria for sensitivity and linearity.

4.2 GC

To quantify pesticides, the performance evaluation mixture (PEM) is analyzed at the beginning and end of the initial calibration sequence and throughout the analytical sequence. The results of these analyses are used to evaluate dichlorodiphenyltrichloroethane (DDT)/endrin breakdown, using the method degradation criteria of <15 percent. PEM standards were analyzed at the required frequency throughout sample analysis and all method performance criteria were met.

4.2.1 Internal Standard Calibration – PCBs and Organochlorine Pesticides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Polychlorinated biphenyls (PCBs) and organochlorine pesticides were calibrated with a dual column analysis using internal standardization. Five peaks, representing five congeners, were used for the analysis of each Aroclor with a separate curve fitted to the calibration data for each congener. A calibration curve consisting of a minimum of five concentration levels was analyzed for all single component compounds of interest. Linearity of the calibration curves are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent

ii) A minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

4.2.2 External Standard Calibration – Fumigants and Herbicides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Initially, a calibration curve consisting of a minimum of five concentration levels is analyzed for all single component compounds of interest. Linearity of the calibration curve is acceptable if all RSD values are less than or equal to 20.0 percent or if the coefficient of determination (R^2) is 0.990 or greater for linear regression curves.

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

5. Initial Calibration – Inorganic Analyses

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For ICP/MS analysis, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve. For mercury atomic absorption (AA) analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater. For instrumental general chemistry analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	Parameter	Control Limits
ICP/MS	Metals	90 - 110%
Cold Vapor AA	Mercury	80 - 120%
Instrumental General Chemistry	Cyanide	85 - 115%
Instrumental General Chemistry	Anions	90 - 110%

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that all of the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals and general chemistry analyses were properly calibrated prior to sample analysis.

6. Continuing Calibration - Organic Analyses

6.1 GC/MS

To ensure that instrument calibration for VOC and SVOC analyses is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) All RRF values must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) Percent difference (%D) values must not exceed 25.0 percent (40.0 percent for compounds that exhibit poor response)

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability with the exception of the sample results presented with qualifiers in Table 4.

6.2 GC

To ensure that the calibration of the instrument for organic analyses by GC is valid throughout the sample analysis period, continuing calibration standards are analyzed and evaluated on a regular basis. To evaluate the continued linearity of the calibration, %D values are calculated for each compound. As specified in the methods, all %D values should not exceed 15 percent. To ensure that compound retention times do not vary over the analysis period, all retention times for continuing calibration compounds must fall within the established retention time windows.

All continuing calibration standards were analyzed at the required frequency. All %D values and compound retention times met the above criteria indicating acceptable instrument calibration throughout the analysis period.

7. Continuing Calibration - Inorganic Analyses

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. All analyte recoveries reported for the CCVs were within the specified limits.

8. Laboratory Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for the inorganic parameters.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

8.1 Organic Analyses

Most method blank results were non-detect. Sample results that were associated with detects in the method blanks were either non-detect or were significantly greater than the blank. Qualification was not necessary on this basis.

8.2 Inorganic Analyses

All ICBs, CCBs, and method blank results were non-detect indicating that laboratory contamination was not a factor for this investigation.

9. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for organic determinations were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. Due to dilutions equal to or greater than 5 times that were necessary to successfully analyze the samples, numerous surrogate recoveries in investigative samples analyzed for pesticides were not assessed. All remaining surrogate recoveries were within the laboratory criteria.

10. Internal Standards (IS) Analyses

IS data were evaluated for all VOC, SVOC, PCB, Pesticide, and ICP/MS metals sample analyses.

10.1 Organics Analyses

To ensure that changes in the GC/MS and GC sensitivity and response do not affect sample analysis results IS compounds are added to each sample prior to analysis. All results are then calculated as a ratio of the IS responses.

The sample IS results were evaluated against the following criteria:

i) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard

ii) IS area counts must not vary by more than a factor of two (-50 percent to +100 percent) from the associated calibration standard

All organic IS recoveries and retention times met the above criteria.

10.2 Inorganic Analyses

IS elements were added to all samples prior to metals analysis by ICP/MS. Overall instrument stability and performance for metals analyses were monitored using the IS intensity data. IS recoveries were assessed using control limits of 60-125 percent.

All inorganic IS recoveries were within the acceptance limits.

11. Laboratory Control Sample Analyses

LCS or LCS/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

11.1 Organic Analyses

The LCS or LCS/LCSD contained all compounds of interest or the compounds specified in the method. All LCS recoveries and RPDs were within the laboratory control limits demonstrating acceptable analytical accuracy and precision.

11.2 Inorganic Analyses

The LCS or LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries and RPDs were within the control limits demonstrating acceptable analytical accuracy and precision.

12. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

If the original sample concentration is significantly greater than the spike concentration, the recovery is not assessed.

If only the MS or MSD recovery was outside of control limits, no qualification of the data was performed based on the acceptable recovery of the companion spike and the acceptable RPD.

Due to dilutions that were necessary to successfully analyze the samples, some MS/MSD recoveries were not assessed.

MS/MSD analyses were performed as specified in Table 1.

12.1 Organic Analyses

The MS/MSD samples were spiked with all compounds of interest or the compounds specified in the method. All percent recoveries and RPD values, if applicable, were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision with the exception of one SVOC analysis. Table 5 presents the sample results that were rejected or qualified due to outlying MS/MSD recoveries.

12.2 Inorganic Analyses

The MS or MS/MSD samples were spiked with the analytes of interest, and the results were evaluated using the "Guidelines". All percent recoveries and RPD values, if applicable, were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision.

13. ICP/MS Serial Dilution

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. A minimum of 1 per 20 investigative samples or at least 1 per analytical batch must be analyzed at a five-fold dilution. For samples with sufficient analyte concentrations (>50 times the method detection limit), the serial dilution results must agree within 10 percent of the original results.

A serial dilution was performed on each MS/MSD sample. All results met the criteria above.

14. ICP Interference Check Sample Analysis (ICS)

To verify that the laboratory has established proper inter-element and background correction factors, ICSs are analyzed. These samples contain high concentrations of aluminum, calcium, magnesium, and iron and are analyzed at the beginning and end of each sample analysis period. The ICSs are evaluated against recovery control limits in the "Guidelines" of 80 to 120 percent.

ICS analysis results were evaluated for all samples using the criteria in the "Guidelines". All ICS recoveries and results were acceptable.

15. Field QA/QC Samples

The field QA/QC consisted of five trip blank samples, one equipment blank sample, and one field duplicate sample set.

15.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, five trip blanks were submitted to the laboratory for VOC analysis. Target analytes were detected in the trip blank samples. Any associated sample results that were non-detect were not impacted. Table 6 presents the

samples that were qualified due to analyte concentrations in the trip blanks. All remaining results were non-detect for the compounds of interest.

15.2 Equipment Blank Sample Analysis

To assess field decontamination procedures, ambient conditions at the site, and cleanliness of sample containers, one field blank was submitted for analysis, as identified in Table 1. All results were non-detect for the analytes of interest or did not impact the associated sample results.

15.3 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, one field duplicate sample set was collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 50 percent for water samples. If the reported concentration in either the investigative sample or its duplicate is less than five times the reporting limit (RL), the evaluation criterion is one times the RL value for water samples.

Most field duplicate results were within acceptable agreement demonstrating acceptable sampling and analytical precision. Table 7 presents the sample results that were qualified due to variability in the field duplicate results.

16. Total versus Dissolved Results

Most dissolved metals results were less than the total results or were within the normal variability of the method (20%D). The dissolved copper result for sample GW-38443-101818-AS-225 was greater than the total result and was in exceedance of the method variability. The associated results were qualified as estimated in Table 8.

17. Analyte Reporting

The laboratory reported detected results down to the laboratory's method detection limit (MDL) for each analyte adjusted for specific sample dilutions and volumes. Positive analyte detections less than the RL but greater than the sample-specific MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the sample specific MDL in Table 2.

18. Target Compound Identification

To minimize erroneous compound identification during organic analyses, qualitative criteria including compound retention time and mass spectra (if applicable) were evaluated according to the identification criteria established by the methods. The samples identified in Table 1 were reviewed. The organic compounds reported adhered to the specified identification criteria.

Pesticide, PCB, and herbicide analyses were performed using dual column analyses. All the results showed good correlation between the two columns (<40 RPD).

19. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are acceptable with the specific exception and qualifications noted herein.

Subject: **Analytical Results and Full Validation**
Vertical Aquifer Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
January and February 2019

1. Introduction

This document details a validation of analytical results for water samples collected in support of the Vertical Aquifer Sampling Event at the Moraine, Ohio site during January and February 2019. Samples were submitted to TestAmerica Laboratories, Inc. (TA) located in North Canton, Ohio. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, duplicate data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spike (MS) samples and field quality assurance/quality (QA/QC) samples. The assessment of analytical and in-house data included checks for data consistency (by observing comparability of duplicate analyses), adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2, Appendix E – Quality Assurance Project Plan", September 20, 2017

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review", USEPA 540-R-10-011, January 2010

iii) "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008

Items ii) and iii) will subsequently be referred to as the "Guidelines" in this Memorandum.

2. Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. Most samples were prepared and analyzed within the required holding times. Table 4 presents the sample results that were qualified or rejected (non-detect results greater than 2 times outside of holding time criteria) due to holding time exceedances.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Gas Chromatography/Mass Spectrometer (GC/MS) – Tuning and Mass Calibration (Instrument Performance Check) and Inductively Coupled Plasma/Mass Spectrometer (ICP/MS)

3.1 Organic Analyses

Prior to volatile organic compound (VOC) and semi-volatile organic compound (SVOC) analysis, GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, methods require the analysis of specific tuning compounds bromofluorobenzene (BFB) and decafluorotriphenylphosphine (DFTPP), respectively. The resulting spectra must meet the criteria cited in the methods before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument.

Tuning compounds were analyzed at the required frequency throughout VOC and SVOC analysis periods. All tuning criteria were met indicating that proper optimization of the instrumentation was achieved.

3.2 Inorganic Analyses

To ensure adequate mass resolution, identification, and to some degree, sensitivity, the performance of each ICP/MS instrument used for metals analyses is checked prior to calibration and initiating an analysis sequence through the analysis of a tuning solution.

Instrument performance check data were reviewed. The tuning solution was analyzed at the required frequency throughout the analyses. The results of all instrument performance checks were within the method acceptance criteria, indicating that proper optimization of the instrumentation was achieved.

4. Initial Calibration - Organic Analyses

4.1 GC/MS

To quantify VOCs and SVOCs of interest in samples, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity of the calibration curve and instrument sensitivity are evaluated against the following criteria:

i) All relative response factors (RRFs) must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent (40.0 percent for compounds that exhibit poor response) or a minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

The initial calibration data for VOCs and SVOCs were reviewed. All compounds met the above criteria for sensitivity and linearity.

4.2 GC

To quantify pesticides, the performance evaluation mixture (PEM) is analyzed at the beginning and end of the initial calibration sequence and throughout the analytical sequence. The results of these analyses are used to evaluate dichlorodiphenyltrichloroethane (DDT)/endrin breakdown, using the method degradation criteria of <15 percent. PEM standards were analyzed at the required frequency throughout sample analysis and all method performance criteria were met.

4.2.1 Internal Standard Calibration – PCBs and Organochlorine Pesticides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Polychlorinated biphenyls (PCBs) and organochlorine pesticides were calibrated with a dual column analysis using internal standardization. Five peaks, representing five congeners, were used for the analysis of each Aroclor with a separate curve fitted to the calibration data for each congener. A calibration curve consisting of a minimum of five concentration levels was analyzed for all single component compounds of interest. Linearity of the calibration curves are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) values of the response factors must not exceed 20.0 percent

ii) A minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

4.2.2 External Standard Calibration – Fumigants and Herbicides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Initially, a calibration curve consisting of a minimum of five concentration levels is analyzed for all single component compounds of interest. Linearity of the calibration curve is acceptable if all RSD values are less than or equal to 20.0 percent or if the coefficient of determination (R^2) is 0.990 or greater for linear regression curves.

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

5. Initial Calibration – Inorganic Analyses

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For ICP/MS analysis, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve. For mercury atomic absorption (AA) analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater. For instrumental general chemistry analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	Parameter	Control Limits
ICP/MS	Metals	90 - 110%
Cold Vapor AA	Mercury	80 - 120%
Instrumental Wet Chemistry	Cyanide and Anions	85 - 115% or laboratory established limits

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that all of the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals and general chemistry analyses were properly calibrated prior to sample analysis.

6. Continuing Calibration - Organic Analyses

6.1 GC/MS

To ensure that instrument calibration for VOC and SVOC analyses is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) All RRF values must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) Percent difference (%D) values must not exceed 25.0 percent (40.0 percent for compounds that exhibit poor response)

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability with the exception of the sample results presented with qualifiers in Table 5.

6.2 GC

To ensure that the calibration of the instrument for organic analyses by GC is valid throughout the sample analysis period, continuing calibration standards are analyzed and evaluated on a regular basis. To evaluate the continued linearity of the calibration, %D values are calculated for each compound. As specified in the methods, all %D values should not exceed 15% (20%D for herbicides and organochlorine pesticides). To ensure that compound retention times do not vary over the analysis period, all retention times for continuing calibration compounds must fall within the established retention time windows.

All continuing calibration standards were analyzed at the required frequency. All %D values and compound retention times met the above criteria indicating acceptable instrument calibration throughout the analysis period.

7. Continuing Calibration - Inorganic Analyses

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. All analyte recoveries reported for the CCVs were within the specified limits.

8. Laboratory Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for the inorganic parameters.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

8.1 Organic Analyses

All method blank results were non-detect, indicating that laboratory contamination was not a factor for this investigation.

8.2 Inorganic Analyses

ICBs, CCBs, and method blanks were analyzed for all inorganic parameters. Nitrite as nitrogen (N) was detected in one method blank. Table 6 presents the sample results that were qualified due to analyte concentrations in the method blank sample. The remaining blank samples were non-detect for the analytes of interest.

9. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for organic determinations were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. All surrogate recoveries were within the laboratory criteria with the exception of one sample for herbicide analysis. Table 7 presents the sample results that were qualified due to outlying surrogate recoveries.

10. Internal Standards (IS) Analyses

IS data were evaluated for all VOC, SVOC, PCB, Pesticide, and ICP/MS metals sample analyses.

10.1 Organics Analyses

To ensure that changes in the GC/MS and GC sensitivity and response do not affect sample analysis results IS compounds are added to each sample prior to analysis. All results are then calculated as a ratio of the IS responses.

The sample IS results were evaluated against the following criteria:

i) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard

ii) IS area counts must not vary by more than a factor of two (-50 percent to +100 percent) from the associated calibration standard

All organic IS recoveries and retention times met the above criteria.

10.2 Inorganic Analyses

IS elements were added to all samples prior to metals analysis by ICP/MS. Overall instrument stability and performance for metals analyses were monitored using the IS intensity data. IS recoveries were assessed using control limits of 60-125 percent.

All inorganic IS recoveries were within the acceptance limits.

11. Laboratory Control Sample Analyses

LCS or LCS/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

High LCS/LCSD recoveries and/or RPDs do not affect the associated non-detect sample results.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

11.1 Organic Analyses

The LCS or LCS/LCSD contained all compounds of interest or the compounds specified in the method. All LCS recoveries and RPDs were within the laboratory control limits demonstration acceptable analytical accuracy and precision.

11.2 Inorganic Analyses

The LCS or LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries and RPDs were within the control limits demonstrating acceptable analytical accuracy and precision.

12. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

If the original sample concentration is significantly greater than the spike concentration, the recovery is not assessed.

If only the MS or MSD recovery was outside of control limits, no qualification of the data were performed based on the acceptable recovery of the companion spike and the acceptable RPD. High MS/MSD recoveries and/or RPDs do not affect the associated non-detect sample results.

MS/MSD analyses were performed as specified in Table 1.

12.1 Organic Analyses

The MS/MSD samples were spiked with all compounds of interest or the compounds specified in the method. All percent recoveries and RPD values, if applicable, were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision.

12.2 Inorganic Analyses

The MS or MS/MSD samples were spiked with the analytes of interest, and the results were evaluated using the "Guidelines". All percent recoveries and RPD values, if applicable, were within the laboratory control limits, or did not warrant qualifications, and demonstrated acceptable analytical accuracy and precision.

13. ICP/MS Serial Dilution

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. A minimum of 1 per 20 investigative samples or at least 1 per analytical batch must be analyzed at a five-fold dilution. For samples with sufficient analyte concentrations (>50 times the method detection limit), the serial dilution results must agree within 10 percent of the original results.

A serial dilution was performed on each MS/MSD sample. All results met the criteria above.

14. ICP Interference Check Sample Analysis (ICS)

To verify that the laboratory has established proper inter-element and background correction factors, ICSs are analyzed. These samples contain high concentrations of aluminum, calcium, magnesium, and iron and are analyzed at the beginning and end of each sample analysis period. The ICSs are evaluated against recovery control limits in the "Guidelines" of 80 to 120 percent.

ICS analysis results were evaluated for all samples using the criteria in the "Guidelines". All ICS recoveries and results were acceptable.

15. Field QA/QC Samples

The field QA/QC consisted of seven trip blank samples and two field duplicate sample sets.

15.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, seven trip blanks were submitted to the laboratory for VOC analysis. Acetone and cis-1,2-dichloroethene were detected in the trip blank samples. Most associated sample results were non-detect or were significantly greater than the trip blank results and were not impacted. Table 8 presents the sample result that was qualified as non-detect due to analyte concentration in the trip blank sample.

15.2 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, two field duplicate sample sets were collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 50 percent for water samples. If the reported concentration in either the investigative sample or its duplicate is less than five times the reporting limit (RL), the evaluation criterion is one times the RL value for water samples.

All field duplicate results were within acceptable agreement demonstrating acceptable sampling and analytical precision.

16. Total versus Dissolved Results

Most dissolved metals results were less than the total results or were within the normal variability of the method (20%D).

17. Analyte Reporting

The laboratory reported detected results down to the laboratory's method detection limit (MDL) for each analyte adjusted for specific sample dilutions and volumes. Positive analyte detections less than the RL but greater than the sample-specific MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the sample specific MDL in Table 2.

18. Target Compound Identification

To minimize erroneous compound identification during organic analyses, qualitative criteria including compound retention time and mass spectra (if applicable) were evaluated according to the identification criteria established by the methods. The samples identified in Table 1 were reviewed. The organic compounds reported adhered to the specified identification criteria.

Pesticide and PCB analyses were performed using dual column analyses. All results showed good correlation between the two columns (<40 RPD).

19. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are acceptable with the specific qualifications and exceptions noted herein.

Zinc (dissolved)	µg/L	--	--	--
General Chemistry				
Cyanide (total)	mg/L	--	--	--
Chloride	µg/L	--	--	--
Nitrate (as N)	µg/L	--	--	--
Nitrite (as N)	µg/L	--	--	--
Sulfate	µg/L	--	--	--
Fumigant				
1,2-Dibromo-3-chloropropane (DBCP)	µg/L	0.0086 U	0.0086 U	0.0086 U
1,2-Dibromoethane (Ethylene dibromide)	µg/L	0.0087 U	0.0087 U	0.0087 U

Notes:

BTEX - Benzene, Toluene, Ethylbenzene and Xylene
PCBs - Polychlorinated Biphenyls
J - Estimated concentration
U - Not detected at the associated reporting limit
UJ - Not detected; associated reporting limit is estimated
-- - Not applicable

Table 3

Analytical Methods
Vertical Aquifer Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
January and February 2019

Parameter	Method	Matrix	Holding Time	
			Collection to Extraction (Days)	Collection or Extraction to Analysis (Days)
Volatile Organic Compounds (VOCs)	SW-846 8260B	Water	-	14
Fumigants	SW-846 8011	Water	-	14
Semi-Volatile Organic Compounds (SVOCs)	SW-846 8270C	Water	7	40
Organochlorine Pesticides	SW-846 8081A	Water	7	40
Polychlorinated Biphenyls (PCBs)	SW-846 8082A	Water	up to one year	40
Chlorinated Herbicides	SW-846 8151A	Water	7	40
Total & Dissolved Metals	SW-846 6020	Water	-	180
Mercury	SW-846 7470A	Water	-	28
Anions	EPA-MCAWW 300.0	Water	-	28 Nitrate and Nitrite - 48 hours
Total Cyanide	SW-846 9012A	Water	-	14

Notes:

%D - Percent difference
UJ - Not detected; associated reporting limit is estimated
VOCs - Volatile Organic Compounds

Table 6

Qualified Sample Results Due to Analyte Concentrations in the Method Blanks
Vertical Aquifer Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
January and February 2019

Parameter	Analyte	Analysis Date	Blank Result *	Sample ID	Original Result	Qualified Result	Units
General Chemistry	Nitrite (as N)	01/30/2019	14.6	GW-38443-012919-JC-219	61 J	61 U	µg/L
				GW-38443-012919-JC-220	57 J	57 U	µg/L

Notes:

* - Blank result adjusted for sample factors where applicable
U - Not detected at the associated reporting limit
J - Estimated concentration
N - Nitrogen

Table 7

Qualified Sample Data Due to Outlying of Surrogate Recoveries
Vertical Aquifer Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
January and February 2019

Parameter	Sample ID	Surrogate	Surrogate % Recovery	Control Limits % Recovery	Analyte	Qualified Result	Units
Herbicides	GW-38443-011419-JC-001	2,4-Dichlorophenylacetic acid	18	26-122	2,4,5-T	0.57 UJ	µg/L
					2,4,5-TP (Silvex)	0.43 UJ	µg/L
					2,4-Dichlorophenoxyacetic acid (2,4-D)	2.2 UJ	µg/L

Notes:

UJ - Not detected; associated reporting limit is estimated

Table 8

Qualified Sample Data Due to Analyte Concentrations in the Trip Blanks
Vertical Aquifer Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
January and February 2019

Parameter	Blank Date (mm/dd/yyyy)	Analyte	Blank Result	Associated Sample ID	Original Result	Qualified Result	Units
VOCs	02/20/2019	cis-1,2-Dichloroethene	0.16 J	GW-38443-022019-JC-225	0.57 J	0.57 U	µg/L

Notes:

U - Not detected at the associated reporting limit
J - Estimated concentration
VOCs - Volatile Organic Compounds

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Total organic carbon (TOC)	ug/L	-	-	-	-	-	-	-	-	-	-	-

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Total organic carbon (TOC)	ug/L	-	-	-	-	-	-	-	-	-	-	-

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Total organic carbon (TOC)	ug/L	-	-	-	-	-	-	-	-	-	-	-

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Total organic carbon (TOC)	ug/L	-	-	-	-	-	-	-	-	-	-	-

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Total organic carbon (TOC)	ug/L	-	-	-	-	-	-	-	-	-	-	-

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Parameters	**Units**											
Hardness	ug/L	-	-	-	-	-	-	-	-	-	-	-
Nitrate (as N)	ug/L	-	-	-	-	-	-	-	-	-	-	-
Nitrite (as N)	ug/L	-	-	-	-	-	-	-	-	-	-	-
Sulfate	ug/L	-	-	-	-	-	-	-	-	-	-	-
Sulfide (acid soluble)	ug/L	-	-	-	-	-	-	-	-	-	-	-
Total organic carbon (TOC)	ug/L	-	-	-	-	-	-	-	-	-	-	-

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Total organic carbon (TOC)	ug/L	-	-	-	-	-	-	-	-	-	-	-

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Total organic carbon (TOC)	ug/L	-	-	-	-	-	-	-	-	-	-	-

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Total organic carbon (TOC)	ug/L	-	-	-	-	-	-	-	-	-	-	-

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Total organic carbon (TOC)	ug/L	-	-	-	-	-	-	-	-	-	3000	4000	-	-

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Total organic carbon (TOC)	ug/L	-	-	-	-	-	7000	11000	-	-	-	-	-	-	-	-

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Total organic carbon (TOC)	ug/L	-	-	-	-	-	-	-	-	-	4000	-	-	-	-	-	-	-

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.

Total organic carbon (TOC)	ug/L	-	-	-	-	-	2000	-	-	-	-	-	-	-	-

Notes:
- The reported result may be a coelution of 3-Methylphenol and/or 4-Methylphenol.
B - Value is real, but above instrument detection limit and below contract-required detection limit (Inorganics).
B - Compound is found in the associated blank as well as in the sample (Organics).
D - Result was obtained from the analysis of a dilution.
E - This flag identifies compounds whose concentrations exceed the calibration range of the GC/MS instrument.
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - Indicates there is a greater than 25% difference for detected concentrations between two GC columns. The lower of the two values is reported.
R - Rejected.
U - Non-detect at associated value.
UJ - Not detected; associated reporting limit is estimated.
- - Not applicable.
