Notes

1. Locations for some wells/well points installed pre-1996 are approximate.
2. Wells N, O, R, P, and Q were installed in 1994 following an unleaded gasoline spill in the Main Terminal tank farm area; wells are designated as Phase III because of location.
3. Black and white reproduction of this color original may reduce its effectivness and lead to incorrect interpretation.

Notes

1. Wells LW003D and LW011D are not used for contouring because the water level data and increased silt content in the lower zone at these locations suggest that the water levels may not be analogous to water levels at other lower zone wells.
2. Groundwater levels measured on August 16, 2005.
3. Black and white reproduction of this color original may reduce its effectiveness and lead to incorrect interpretation.

Data Validation Report

TECHNICAL MEMORANDUM

LANDAU ASSOCIATES
ENVIRONMENTAL | GEOTECHNICAL | NATURAL RESOURCES

TO: Rebekah Brooks, Landau Associates

CC: Tom Roick, DEQ
Mark Chandler, Time Oil Co.
Patty Dost, Schwabe, Williamson & Wyatt
Mike Tischuk, Beazer East, Inc.

FROM: April Wallace and Anne Halvorsen, Landau Associates

DATE: October 24, 2005

RE: 3RD QUARTER 2005 GROUNDWATER MONITORING LABORATORY DATA QUALITY EVALUATION TIME OIL NORTHWEST TERMINAL

INTRODUCTION

This technical memorandum provides the results of a data quality evaluation for 70 groundwater samples and 9 trip blanks collected at the Time Oil Northwest Terminal August 15 through August 30, 2005, for the Phase II/III Remedial Investigation (RI) third quarter 2005 groundwater monitoring event. A data quality evaluation was performed for analysis of volatile organic compounds [VOCs; U.S. Environmental Protection Agency (EPA) Method 8260B]; benzene, toluene, ethylbenzene, and xylenes (BTEX; EPA Method 8260B); semivolatile organic compounds (SVOCs; EPA Method 8270C); total petroleum-range hydrocarbons (NWTPH-Dx and NWTPH-G); polycyclic aromatic hydrocarbons [PAH; EPA Method 8270 with selected ion monitoring (SIM)]; pentachlorophenol (PCP; EPA Method 8270 SIM); selected total and dissolved priority pollutant (PP) metals (EPA Methods 6020 and 7470A); dioxins and furans (EPA Method 1613B); methane gas [gas chromatography/flame ionization detector (GC/FID)]; chloride, sulfate, nitrate (EPA Method 300.0); sulfide (EPA Method 376.2); total organic carbon (TOC; EPA Method 415.1/5310C); and total dissolved solids (TDS; EPA Method 160.1).

Analyses of groundwater samples were performed by North Creek Analytical, Inc. (NCA) located in Beaverton, Oregon; and Pace Analytical Services, Inc. (Pace) located in Minneapolis, Minnesota. This data quality evaluation covers NCA data packages P5H0625, P5H0701, P5H0734, P5H0813, P5H0814, P5H0852, P5H0853, P5H1000, P5H1257, and Pace data packages 1018935, 1018937, and 1019376.

The data quality evaluation was performed in accordance with the revised quality assurance project plan (QAPP) contained in Appendix C of the *Phase III Remedial Investigation* work plan (Landau Associates 2001), and with applicable portions of the EPA *Contract Laboratory Program National Functional Guidelines for Organic Data Review* and *Contract Laboratory Program National Functional Guidelines for Inorganic Data Review* (EPA 1994a,b).

The evaluation considered the following elements:

- Chain-of-custody records
- Holding times
- Method and field trip blank results
- Surrogate spike recoveries
- Matrix spike and matrix spike duplicate (MS/MSD) results
- Laboratory control sample and laboratory control sample duplicate (LCS/LCSD) results
- Duplicate (laboratory and field) results
- Reporting limits
- Overall data quality and completeness.

Data validation qualifiers are added to sample results based on the evaluation of data quality. The absence of a data qualifier indicates that the datum is acceptable without qualification. Applicable data validation qualifiers are summarized in Table 1. The data quality evaluation is summarized below.

CHAIN-OF-CUSTODY RECORDS

Signed chain-of-custody (COC) records accompanied each data package. The laboratory received all samples in good condition. All requested analyses were performed with the following exceptions:

- The laboratory indicated that a shipping error occurred while transferring two samples from data packages P5H0734 and P5H0813 from the NCA Beaverton, Oregon, laboratory to its Anchorage, Alaska, laboratory. The samples were not delivered to the NCA Anchorage laboratory for methane analysis as requested due to this shipping error. No replacement samples were collected or submitted for methane analysis. Methane results are reported for one sample only from data package P5H1000 for the third quarter sampling event.

- Due to a login error at the laboratory, sample LW-1S in data package P5H0814 was not analyzed for gasoline-range hydrocarbons by NWTPH-Gx.

HOLDING TIMES

For all analyses and all samples, the time between sample collection, extraction, and analyses was determined to be within EPA- and project-specified holding times except as indicated below:

- One sample from data package P5H1000 was re-extracted for a second SVOC analysis 17 days outside of method-specific holding times. Due to low surrogate recovery in the original analysis, analytical results from the original analysis are reported because of similar sample results and are qualified as specified in the following Surrogate Spike Recoveries section. No further qualification of the data is necessary.

METHOD BLANK RESULTS

Method blanks were analyzed with each batch of samples for each analysis. No contamination was detected in any of the method blanks. No qualification of the data is necessary.

FIELD TRIP BLANK RESULTS

In accordance with the QAPP, field equipment rinsate blanks were not collected (all sampling equipment was dedicated and/or disposable, which eliminated the potential for cross contamination). Nine field trip blanks were collected and submitted for laboratory analysis of VOCs in data packages P5H0625, P5H0701, P5H0734, P5H0813, P5H0814, P5H0852, P5H0853, P5H1000, and P5H1257. No contamination was detected in any of the trip blanks. No qualification of the data is necessary.

SURROGATE SPIKE RECOVERIES

Surrogate spikes were performed with each organic analysis (or internal standards for dioxin/furan analysis). Recovery values for the surrogate spikes were within the current laboratory control limits, except as indicated below.

- Recoveries of the surrogate 4-Bromofluorobenzene (4-BFB) associated with the TPH-G analysis of several samples in data packages P5H0625, P5H0701, P5H0814, and P5F1257 were not within laboratory control limits. The laboratory indicated that the surrogate recoveries could not be accurately quantified due to interference from coeluting compounds or components. No qualification of the data is necessary.

- Recoveries of the surrogate 4-Bromofluorobenzene (4-BFB) associated with the TPH-G analyses of several samples in data packages P5H0734 and P5H0853 exceeded laboratory control limits. The laboratory indicated that the surrogate recoveries are outside control limits due to matrix interference. The gasoline results for these project samples are qualified as estimates (J), as indicated in Table 1.

- Recovery of the surrogate 1-Chlorooctodecane (1-COD) associated with the TPH-Dx analyses of two samples in data package P5H0734 and P5H1000 were below laboratory control limits. The laboratory indicated that the surrogate recovery is outside control limits due to matrix interference. The diesel and heavy oil results for these samples are qualified as estimates (J/UJ), as indicated in Table 1.

- Recovery of the surrogate 2,4,6-Tribromophenol (2,4,6-TBP) associated with the PCP analysis of data package P5H0853 was slightly greater than the laboratory control limits for one sample. PCP was nondetect for this sample. No qualification of the data is necessary.

- Recoveries of the two acid-fraction surrogates 2-Fluorophenol (2-FP) and 2,4,6-TBP associated with the SVOC analysis of one sample in data package P5H1000 were below laboratory control limits. In accordance with the EPA guidelines (EPA 1994a), all acid-

fraction compounds in the project sample are qualified as estimates (J/UJ), as indicated in Table 1.

- Recovery of the internal standard 2,3,7,8-TCDD-37C14 associated with the dioxin/furan analysis of one sample in data package 1019376 exceeded laboratory control limits. Because no associated target compounds were detected in the project sample, no qualification of the data is necessary.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) RESULTS

MS, MSD, and/or laboratory duplicate samples were performed for most analyses. Recoveries and RPDs for all project sample matrix spikes were within the project-specified control limits, except as indicated below:

- The MS and MSD recoveries for gasoline associated with the TPH-G gasoline-range organics analysis of data packages P5H0701 and P5H0814 were below laboratory control limits. The gasoline results for the project samples are qualified as estimates (UJ), as indicated in Table 1.

- The MS recovery associated with the TPH-Dx diesel-range organics analysis of data package P5H0814 was slightly below laboratory control limits. Because the MSD recovery was within control limits, and the RPD between the MS and MSD was acceptable, no qualification of the data is necessary.

LABORATORY CONTROL SAMPLE (LCS) RESULTS

At least one LCS (or blank spike sample) and/or laboratory control sample duplicate (LCSD) was analyzed with each batch of samples for each analysis. Recoveries and RPDs for the laboratory control samples and associated duplicates were within laboratory-specified control limits for all project samples, except as discussed below:

- The RPD between the LCS and LCSD for OCDD associated with the dioxin/furan analysis of data package 1019376 exceeded the laboratory control limit. The laboratory indicated that a slight high bias may exist for this compound. The OCDD concentration in the associated project sample has been qualified as an estimate (J), as indicated in Table 1.

FIELD DUPLICATE RESULTS

Four pairs of blind field duplicate samples (RW1/W, LW023D/X, LW038D/Y, and LW042S/Z) were collected during this sampling event and submitted for analysis. A project-specified control limit of 20 percent was used to evaluate the RPDs between the duplicate sample results, except when the sample results were within five times the reporting limit. In these cases, a project-specified control limit

of plus or minus the reporting limit was used. RPDs for all duplicate sample pairs submitted for analysis were within the control limits, except as indicated on Table 1 and discussed below:

- The RPD between the arsenic results for the total PP metals analysis of field duplicate pair RW1/W in data package P5H1257 exceeded the project-specified control limit. Results for this compound for samples RW1 and W are qualified as estimates (J), as indicated in Table 1.

REPORTING LIMITS

All project-specified reporting limits were met, except as indicated below:

- Project-specified reporting limits generally exceeded those defined in the QAPP for most semivolatile compounds and a few volatile compounds. The laboratory was notified and lower estimated limits were provided by the laboratory for PCP (see Table 1). The laboratory will resolve this issue for the fourth quarter 2005 sampling event.

- Reporting limits were raised for several analytes associated with the PAH analyses of data packages P5H0625, P5H0701, P5H0734, P5H0813, P5H0852, P5H0853, P5H1000, and P5H1257. The laboratory indicated that this was due to matrix interference or to dilution necessary for analysis. Project-specified reporting limits were exceeded for several samples from these packages. No qualification of the data is necessary.

- Reporting limits were raised for several analytes associated with the SVOC analyses of one sample from data package P5H0814. The laboratory indicated that this was due to matrix interference. Project-specified reporting limits were exceeded for one sample from this package. No qualification of the data is necessary.

- Project-specified reporting limits were raised for one sample analyzed for PAH from data packages P5H0734 and P5H0814. The laboratory indicated that this was due to limited sample quantity available for analysis. No qualification of the data is necessary.

- Project-specified reporting limits were exceeded for one sample analyzed for SVOC from data package P5H0701. The laboratory indicated that this was due to limited sample quantity available for analysis. No qualification of the data is necessary.

- Reporting limits were raised for a few samples analyzed for sulfide from data packages P5H0813, P5H0852, and P5H1000. The laboratory indicated that this was due to matrix interference. No qualification of the data is necessary.

- Project-specified reporting limit was exceeded for one sample analyzed for methane from data package P5H1000. The laboratory indicated that this was due to dilution necessary for analysis. No qualification of the data is necessary.

OTHER

Other factors which required evaluation of the data include the following:

- Detected diesel-range organics for several samples associated with the TPH-Dx analyses of data packages P5H0635, P5H0701, P5H0734, P5H0813, P5H0814, P5H0852, P5H0853, and P5H1000 were identified by the laboratory as having weathered diesel/heavy gas/light diesel components. No qualification of the data is necessary.

- The laboratory indicated that detected diesel-range organics for several samples associated with the TPH-Dx analyses of data packages P5H1000 and P5H1257 appear to be due to the overlap of gasoline-range hydrocarbons. No qualification of the data is necessary.

- Dioxin/furan analyses were subcontracted to Pace. Analytical results from data packages 1018935, 1018937, and 1019376 were acceptable without qualification unless otherwise discussed above.

- There was a discrepancy for most analytical results between the amount of significant digits reported on the final hard copies and the amount of significant digits reported in the electronic deliverables provided by the laboratory. The data on the final hard copies shows two significant digits. The data on the electronic deliverables was rounded to the nearest whole number. Therefore, the values shown on the final hard copies and the data shown on the final report tables do not exactly match due to a significant digit issue.

OVERALL DATA QUALITY AND COMPLETENESS

Data precision was evaluated through laboratory duplicates, field duplicates, matrix spike duplicates, and laboratory control samples duplicates. Data accuracy was evaluated through surrogate spikes, matrix spikes, and laboratory control samples. Based on this data quality evaluation, all of the data were determined to be acceptable and no data were rejected.

Because the methane and gasoline analyses were not performed for samples from data packages P5H0734, P5H0813, and P5H0814, as identified above, the completeness for this set of data is approximately 95 percent, which exceeds the project-specified goal of 90 percent.

U = Indicates the compound was analyzed for, but was not detected above the given reporting limit.
UJ = Indicates the compound was analyzed for; the given detection limit is an estimate.
J = Indicates the compound was analyzed for and positively identified; the given value is an estimate.

APPENDIX D

Summary of Modifications to Quarterly Groundwater Analysis Program

APPENDIX D
SUMMARY OF MODIFICATIONS TO QUARTERLY GROUNDWATER ANALYSIS PROGRAM

A summary of modifications to the Phase II RI quarterly groundwater monitoring program for the Time Oil Northwest Terminal in Portland, Oregon is presented below by the date of first implementation. A reference list for the modifications is included.

- ***Second Quarter 1998*** (Landau Associates 1998; DEQ 1998):
  - Annual sampling of east property wells LW-101S, LW-102S, LW-103S, and LW-104S
  - Elimination of 2-chloroethylvinylether from the volatile analyte list
  - Reduction of the suite of metals analyses to include only arsenic, chromium, copper, lead, nickel, and zinc
  - Quarterly analysis of only metals in well K and only chlorinated phenols and metals in well H
  - Elimination of PCB analysis
  - Annual analysis for major ions; quarterly analysis for chloride and dissolved oxygen.

- ***First Quarter 1999*** (Landau Associates 1999; Urbanowicz, K., 12 February 1999, personal communication):
  - Analysis of polycyclic aromatic hydrocarbons (PAHs) using analytical techniques that provide lower detection limits at upper zone wells LW-2S, LW-7S and LW-101S and at lower zone wells G1A, O, and LW-4D for the first quarter 1999 event only
  - Elimination of sampling at well J3.

- ***Second Quarter 2000*** (Landau Associates 2000a; DEQ 2000):
  - Elimination of dioxin/furan analyses.

- ***Third Quarter 2000*** (Landau Associates 2000b; Roick 2000):
  - Reduction of sampling frequency of wells H, L, and LW-5S from quarterly to annually.

- ***Second Quarter 2001*** (Landau Associates 2001a, 2001b; Roick 2001):
  - Reduction of the list of chlorinated phenols being analyzed by EPA Method 8040 to pentachlorophenol (PCP) only using EPA Method 8270 SIM
  - Reduction of the frequency of total petroleum hydrocarbon (TPH) analysis from quarterly to annually at upper zone wells J1 and LW-1S; lower zone wells B2, J2, LW-1D; and deep sand unit well LW-12D2. In addition, TPH analysis was eliminated for the following wells: upper zone wells D, L, LW-5S, LW-101S through -104S, and lower zone well LW-3D.

- ***First Quarter 2004*** (Landau Associates 2004; Roick 2005):
  - Elimination of eight wells from the Phase II sampling program for future events. These wells included five upper zone wells (H, K, L, LW-1S, and LW-5S), and three lower zone wells (O, R, LW-1D).

BZTO104(e)028135

- Reduction of the monitoring frequency for selected Phase II wells from quarterly to semiannually. These wells include: B1, B2, D, J1, J2, LW-3D, LW-4S, LW-4D, LW-11S, LW-11D, LW-13S, LW-14D, LW-17D, LW-18D, OX-1S through OX-8S, OX-8D, and RW-1. Semiannual sampling of these wells will be conducted in conjunction with the first and third quarter sampling of the Phase III wells.

SEDIMENT CHEMISTRY SURVEY DESCRIPTIONS

Historical and concurrent sediment chemistry data in the project database were compiled from several sources, including the U.S. Environmental Protection Agency (EPA), Oregon Department of Environmental Quality (DEQ), U.S. Army Corps of Engineers (USACE), Port of Portland, and numerous private parties. The database was queried to select data of known quality (Category 1 QA1 or QA2) since May 1997. Further, only Category 1 QA2 sediment data were queried for use in the risk assessments (dredged and capped samples were removed). An exception to this selection process was the query needed to evaluate upriver (i.e., above RM 11) sediment quality. In order to maximize the size of the data set, both Category 1 and Category 2 data since 1997 were selected. For surveys completed since May 1997 and meet the selection criteria above, specifics about each survey are provided in the summaries below.

Other data from non-Lower Willamette Group (LWG) parties have also been included in either chemical distribution discussions (Section 6) or risk evaluations (Sections 8 and 9, Appendices F and G). These data include fish tissue data from EPA, the Oregon Department of Health Services (ODHS, and the Agency for Toxic Substances and Disease Registry (ATSDR), transition zone water (TZW) data from Siltronic, total suspended solids (TSS) data from the City of Portland, and seep data from Starlink Logistics (Outfall 22B). Of these surveys, only the TZW (for purposes of screening) and seep data have been used in risk assessment. The tissue and surface water data have been used to augment discussions of chemical distributions.

Each summary described herein includes information on the project objectives, sampling dates, sampling methods, sample types, and analyses for that survey. This information was obtained from the survey source document, and the reference is provided. Summary results (maximum and minimum concentrations) for selected chemicals in surface and/or subsurface sediments are also provided in each survey description. Minimum concentrations are reported as the lowest detected concentration or the reporting limit. Maximum concentrations are reported as the highest detected concentration, or, if all concentrations are undetected, the highest reporting limit. Total PCBs are Aroclors unless otherwise noted. Sampling locations for each Category 1 sediment survey can be found on Map 2.1-1 (surface sediments) and Map 2.1-3 (subsurface locations). As appropriate, the location of the maximum concentration is also provided.

Each data set was reviewed to characterize the quality of the data prior to entry in the database and to ensure that the data were appropriate for use in the RI/FS. Additional information on the data and review process is provided in Section 2 of this Comprehensive Round 2 Report or in the Programmatic Work Plan (Integral et al. 2004).

WLCGSG04. Draft Removal Action Completion Report, NW Natural "Gasco" Site Portland, OR (Prepared by Anchor Environmental L.L.C., January 2006).

This investigation consisted of the collection of surface sediment samples in order to characterize the post-dredge surface sediment at the "Gasco" Site in Portland, OR (RM 6.5). Anchor Environmental LLC collected the sediment samples on October 19, 2005, immediately following the completion of sediment removal and prior to cap placement.

Surface sediment samples were collected from 15 locations (RAA-PD01-05019 through RAA-PD01-05033) within the pilot cap and fringe cover areas. A rinsate blank and homogenization duplicate were collected and analyzed for the same analytes as the 15 sample locations. All sediment samples were analyzed for total organic carbon (TOC); total solids; grain size; benzene, toluene, ethylbenzene, and xylenes (BTEX); polycyclic aromatic hydrocarbons (PAHs); semivolatile organic compounds (SVOCs); total petroleum hydrocarbons (TPH); cyanide; and total metals.

Summary Data for Surface Samples.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	1.7	3.2 (RAA-17 RM 6.24)
Cadmium (mg/kg)	na	na
Copper (mg/kg)	14.1	28.6 (RAA-12 RM 6.25)
Lead (mg/kg)	3.47	26.1 (RAA-02 RM 6.33)
Mercury (mg/kg)	na	na
Zinc (mg/kg)	41.5	79.9 (RAA-14 RM 6.29)
TBT (µg/L)	na	na
bis(2-ethylhexyl)phthalate (µg/kg)	8.3 J	100,000 U (RAA-02 RM 6.33)
Total LPAH (µg/kg)	482.4 TA	12,230,000 TA (RAA-14 RM 6.29)
Total HPAH (µg/kg)	239.6 TA	6,583,000 TA (RAA-14 RM 6.29)
Total PCBs (µg/kg)	na	na
2,3,7,8,-TCDD (ng/kg)	na	na
Total DDT (µg/kg)	na	na
Dibenzofuran (µg/kg)	1.3 J	81,000 (RAA-14 RM 6.29)
4-Methylphenol (µg/kg)	10 U	5,000 U (RAA-02 RM 6.33)
Diesel range hydrocarbons (mg/kg)	17 J	51,000 (RAA-14 RM 6.29)
Xylenes (µg/kg)	1	32,000 (RAA-14 RM 6.29)

Notes: (The notes below apply to all tables in this appendix.)
na - Not analyzed.
A - Detected quantities of analytes added together as defined in WAC 173-204-320 for LPAH and HPAH, as in USACE et al. (2000) for DDT, and for all Aroclors or congeners for PCB.
B - Analyte found in associated blank.
E - Estimated because of the presence of interference.
G - Estimate is greater than value shown.
H - Holding time exceeded.
HPAH - High- molecular-weight polycyclic aromatic hydrocarbon.

J -Associated value is an estimate.
LPAH - Low-molecular-weight polycyclic aromatic hydrocarbon.
T - Value calculated or selected from multiple results.
TBT – Tributyltin.
U – Undetected at detection limit shown.
UA - All summed analytes undetected, high detection limit shown.
V - In diesel range but doesn't match diesel standard.
Z – Data qualifier indicating that characteristic profiles for petroleum hydrocarbon fuels and lubricants were not apparent.

WLCDRD05. Vol. 1 Dredge Material Management Plan Sediment Characterization Report, Lower Willamette River Federal Navigation Channel (Prepared by Tetra Tech EC Inc., January 2006).

Tetra Tech conducted this investigation for the USACE in order to characterize the Lower Willamette River Federal Navigational Channel (FNC) sediments from RM 0 to RM 11.6 that are planned for future dredging operations and that were not been previously characterized. This sediment characterization report will support the development of an integrated Dredged Material Management Plan (DMMP) and National Environmental Policy Act (NEPA) document for maintenance of the currently maintained FNC for the next 20 years. The chemical, physical, and biological data presented in this sediment characterization report will be used to evaluate sediment quality in sediment above the channel operating depths for determining appropriate disposal options when dredging becomes possible.

Tetra Tech personnel collected a total of 154 sediment samples, which included 72 sediment core samples, 79 grab samples, and 3 reference grab samples, from April 28 through May 27, 2005. The 72 subsurface sediment sample locations were chosen based on areas subject to future dredging and the 79 surface sediment locations were located adjacent to core locations to characterize potential "sloughing material" during dredging. The surface sediment samples were collected using an air-powered 0.2-m^2 van Veen grab sampler, capable of penetrating surface sediment down to 30 cm. The subsurface sediment samples were collected with a custom-built vibracorer. Each individual core was composited in its entirety up to the proposed dredge depth. A sample from the first 2 ft below the maximum dredging depth (-42 to-44 ft CRD) from each individual core was composited and archived. Because Tier III bioassay testing is required when sediment chemistry results exceed dredged material evaluation framework (DMEF) screening levels (SLs), a minimum of 4 L of sediment from each core location was collected in case it became necessary to conduct biological testing. The subsurface sediment cores were penetrated to -44 ft CRD. This enabled the samplers to take samples to the maintenance depth of –40 ft CRD, including the 2 ft advanced maintenance and a sample from the first 2 ft below the dredging maximum depth. The -42 to -44 ft CRD samples from each individual core were archived for possible future analysis.

All subsurface, surface, and reference sediment samples were analyzed for conventional parameters (ammonia as nitrogen, total sulfide, and TOC), metals, butyltins, TPH, SVOCs,

PAHs, phenols, selected chlorinated hydrocarbons, miscellaneous compounds, phthalates, pesticides, and PCBs. At selected locations, samples were anaylzed for chlorinated herbicides (10 locations including the 3 reference locations), dioxin/furans (13 locations and the 3 reference locations), butyltins in dry weight (11 locations including the 3 reference locations), and VOCs (21 locations including the 3 reference locations).

Summary Data for Subsurface Samples.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	2.04	12.6 (WR-VC-110 RM 10.4)
Cadmium (mg/kg)	0.126	1.23 (WR-VC-116 RM 10.7)
Copper (mg/kg)	16.2	523 J (WR-VC-110 RM 10.4)

WLCEMH04. Technical Memorandum ExxonMobil Beach Sediment Sheen Sample, Portland, OR (Prepared by Kleinfelder, September 2004).

This investigation consisted of surface sediment sampling during two separate investigations of an oily sheen at the Shore Terminal (ST) Services Portland Terminal (former ExxonMobil Portland Terminal). During a routine site inspection by ExxonMobil personnel in the fall of 2003, the appearance of sheen was noted on the beach in front of the facility. Again, on August 13, 2004, DEQ personnel observed sheen in two areas: one in a boomed area where ST has a stormwater discharge pipe and the other along the riverbank within pooled water and sands.

On October 6, 2003, Kleinfelder collected two composite samples (COMP1-100603 and COMP2-100603) of the beach material. The two sediment samples were analyzed for gasoline-, diesel-, and heavy-oil-range hydrocarbons. On August 13, 2004, Kleinfelder personnel collected two additional composite sediment samples (COMP-1-081304 and COMP-2-081304). The two sediment samples were analyzed for gasoline-, diesel-, and heavy-oil-range hydrocarbons.

WLCT4C04. Terminal 4 Early Action EE/CA Report Public Review Draft, Appendix E—Summary of Sediment Quality Characteristics, Port of Portland, Portland, OR (Prepared by Blasland, Bouck & Lee, Inc., May 2005).

Appendix E in the Terminal 4 EE/CA report presents an evaluation of the sediment data and sediment lithology, surface, under-pier, and subsurface sediment distributions of chemicals of potential concern; and a comparison of sediment data to sediment quality guidelines. The report defines surface sediment as sediment samples collected from 0 to 1 ft below mudline, and subsurface sediment collected 1 ft below the mudline. The Removal Action Area was separated into sub-areas in order to facilitate discussion on the sediment data. The subareas are Berth 401, Slip 1; Wheeler Bay, Slip 3; and North of Berth 414.

Historical sediment data presented in the Terminal 4 Early Action EE/CA work plan were compared to EE/CA sediment data collected as part of the Terminal 4 Early Action EE/CA. All of the historical data were acquired from the National Oceanic and Atmospheric Administration Query Manager 2.51 database for Terminal 4 of the Willamette River. The data comparison included the following compounds: metals, total PAHs, phthalates, ∑ DDTs, Total PCBs, TPH as diesel-range hydrocarbons (DRH), TPH as heavy-oil-range hydrocarbons, and TPH as gasoline-range hydrocarbons. Data were compared to determine whether similar compounds were detected in historical and EE/CA data, whether compounds were detected in similar locations in historical and EE/CA data, and whether the range of concentrations was similar between historical and EE/CA data.

WLCDRI03. Willamette River Federal Navigational Channel Operation & Maintenance Sediment Characterization Report Portland, OR (Prepared by Hart Crowser, June 2004).

Hart Crowser conducted this study for the USACE, Portland District, to characterize sediments proposed for dredging and to ensure residual sediments do not cause increased environmental risk. The USACE proposes to dredge up to 1,052,600 cy of sediments within the Willamette River FNC (RM 3, 8-10, 15, 23). Subsurface sediment coring was completed using a vibracorer at 53 locations between September 18 and 23, 2004. Reference sediment samples from two locations in the LWR were collected using an air-powered van Veen Grab sampler on September 25, 2003.

Subsurface sediment samples were collected from 53 locations (HC-VC-01 through HC-VC-53) and divided into 19 dredge prisms (CSS1 through CSS19) identified as Composite Sediment Samples (CSSs). All 19 CSSs and the two reference sediment samples (HC-REF-01 and HC-REF-02) were analyzed for conventional parameters (grain size, total volatile solids, total solids, ammonia, sulfide, and TOC), metals, TBT, SVOCs, PAHs, phenols, chlorinated hydrocarbons, phthalates, pesticides, and PCBs.

WLCGNG03. Gunderson, Inc. Area 2 - Sandy Beach Area Upland Source Evaluation (Prepared by Squier|Kleinfelder, February 2004).

Squier|Kleinfelder collected surface soil samples as part of the Area 2 Expanded Preliminary Assessment. Collections were performed on July 8, 2003. The stations were located on two sandy beaches in Area 2, which is also known as the Rail Car and Marine Barge Assembly Area. Samples were identified as A2GS-9 through A2GS-12. Samples were collected near the former launchways (A2GS-9 and A2GS-10) and near City of Portland Outfall 18 (A2GS-11 and A2GS-12).

Surface soil samples were collected with a decontaminated, stainless steel trowel. Samples were analyzed for petroleum hydrocarbons (gasoline range, diesel range, and heavy hydrocarbons), SVOCs (PAHs, phthalates, phenols), VOCs, PCBs, metals, and butyltins.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	10.8	79.6 (A2GS10)
Cadmium (mg/kg)	0.373 U	0.442U (A2GS09)
Copper (mg/kg)	52	400 (A2GS10)

* There were several samples with this maximum value.

WLCITC03. International Terminals Sediment Data Report Portland, OR (Prepared by Floyd Snider McCarthy, Inc., June 2003).

This investigation consisted of sediment sampling to provide sediment quality data to aid in dredge design so that the post-dredge surface can be considered acceptable at the International Terminals Slip. Berths 1 through 3 are located within the International Terminals Slip adjacent to the Burgard Industrial Yard, and Berths 4 and 5 are located on the river side of the facility.

Floyd Snider McCarthy personnel collected six cores from March 11-13, 2003, using the MudMole™ pneumatic core sampler. The sampler is made up of a 4-in.-square aluminum coring tube. Twenty core tubes, each 1 ft long, were used at all sampling locations. Cores SDC-SS01 and SDC-SS02 were located within Berths 4 and 5, and cores SDC-SS03 through SDC-SS06 were located within the International Terminals Slip.

Two composites per core were homogenized. One composite consisted of a section from the mudline to the bottom of the proposed dredge cut. The bottom section of the core consisted of the top section of sediment to be exposed by the proposed dredge cut. This section of the core sample was sectioned into 1-ft-long segments and submitted for analysis.

Subsurface Core ID	Berths	Composite Sample ID	Approximate Interval (Relative to CRD)	Interval Description
SDC-SS01	4 & 5	-000007	Surface to -38	Sample Depth is Surface to -42
		-007010C	-38 to -41	
		-010011	-41 to -42	
SDC-SS02	4 & 5	-000013	Surface to -36	Sample Depth is Surface to -42
		-013014	-36 to -37	
		-014015	-37 to -38	
		-015017C	-38 to-40	
		-017018	-40 to -41	
		-018019	-41 to -42	
SDC-SS03R2	1-3	-000001	Surface to -41	Sample Depth is Surface to -46
		-001002	-41 to -42	
		-002004C	-42 to -44	
		-004005	-44 to -45	
		-005006	-45 to -46	
SDC-SS04	1-3	-000008	Surface to -38	Sample Depth is Surface to -38

		-012013	-38 to -39	
		-013014	-39 to -40	
		-014016C	-40 to -42	
SDC-SS06	1-3	-000007	Surface to -38	Sample Depth is Surface to –43
		-007008	-38 to -39	
		-008010C	-39 to -41	
		-010011	-41 to -42	
		-011012	-42 to -43	

All composite sediment samples were analyzed for conventional parameters (grain size, total solids, TOC), metals, TBT, SVOCs, chlorinated pesticides, chlorinated hydrocarbons, and PCBs. Screening for PAHs was performed on core segments in order to characterize the post-dredge sediment surface quality. After the proposed station, SDC-SS07, was abandoned

due to poor recovery, it was determined that station SDC-SS06 could be considered representative of this area.

Summary Data for Subsurface Samples.

Parameter	Minimum	Maximum (Location)

WLCEAF02. Phase II Stage 1 & 2 In-River Groundwater and Sediment Investigation Report Volume 1 Report and Appendix A Portland, OR (Prepared by Integral Consulting, Inc., December 2003).

This investigation characterized the nature and extent of chemicals of interest (COIs) in groundwater and sediments that are downgradient of the existing monitoring well network, at the Arkema facility in Portland, OR (RM 8). The Phase II Stage 1 investigation was conducted from June 3-12, 2002, with seven boreholes (WB-1 through WB-7) advanced between Docks 1 and 2. The findings from the Stage 1 investigation were used as part of the criteria for choosing borehole locations for the Stage 2 investigation (WB-8 through WB-25). Eighteen boreholes were advanced during the Phase II Stage 2 investigation, which was conducted from February 17 through March 10, 2003.

Stage 1 subsurface sediment samples were collected using a square aluminum sediment sampler for the shallowest interval, and Geoprobe® Macrocore samplers for the deeper sediments. Boreholes WB-1 through WB-5 were advanced using a standard Geoprobe® push-probe rig. Due to a structural weight-load limitation on a portion of Dock 1, borehole WB-6 was advanced using a smaller Geoprobe® push-probe unit attached to the bed of a standard pickup truck. Borehole WB-7 was advanced on a narrow walkway on Dock 1 using a portable tripod Geoprobe® unit. Stage 2 subsurface sediment samples were advanced using

a Geoprobe® push-probe rig mounted on a barge. Most boreholes were advanced through a moon hole in the approximate center of the barge, and in shallow water areas the Geoprobe® rig was mounted on the back of the barge.

Sediments were continuously sampled for lithologic description and, where possible, were field screened for 4,4'-DDT using thin-layer chromatography (TLC) methods, VOCs using an organic vapor meter (OVM), and NAPL using Sudan IV® hydrophobic dye. A total of 174 samples, from both Stage 1 and Stage 2 sampling events, were field screened and 40 sediment samples were sent to an analytical laboratory for pesticide analysis. If a sufficient volume of sediment was collected, sediment cores were composited over approximate 2-ft intervals.

WLCOFJ02. Source Control Sediment Investigation for the City of Portland Outfalls, Portland, OR (Prepared by CH2M Hill, January 2004).

The purpose of this investigation was to evaluate sediment quality during dry weather conditions in the Willamette River at 18 combined sewer overflow (CSO) outfalls, within the Portland Harbor Superfund site, RM 5-10. These data will be used to identify City outfalls which may be serving as conduits for contamination from upland sources, to identify potential upland sources of contaminants, to guide source control efforts, and to identify data needs for evaluations of the Portland Harbor Superfund site under CERCLA.

Surface sediment samples were collected between October 14 and 23, 2002 in the immediate vicinity of the outfalls and were generally spaced 50 to 100 ft apart. The type of sampling vessels used depended on sample station location characteristics. CH2M Hill personnel used either a 34-ft or a 28-ft shallow-draft vessel, and for locations where these two boats could not fit, a 12-ft steel-framed raft. Surface sediment (upper 15 cm) grab samples were collected using a stainless steel 0.1-m^2 van Veen grab sampler for most samples, and a 0.025-m^2 van Veen grab sampler when sampling from the smaller boat or river bottom conditions necessitated.

Physical characteristics of the sediment samples were described and recorded in the field notebook, and included sediment texture, color, presence, type, odor, grab penetration depth, sediment surface disturbance, and any obvious abnormalities. Analyses included the conventional parameters of percent moisture, grain size, and TOC, and chemical parameters including metals, SVOCs, organochlorine pesticides, heavy oil and diesel-range hydrocarbons, PCBs, and chlorinated herbicides at one sample location per outfall. Additionally, chlorinated herbicide samples were collected at all four sampling locations in the vicinity of Outfall 22B.

WLCMBI02. Surface Water, Sediment, and Groundwater Sampling Report, McCormick & Baxter Creosoting Company Site Portland, OR (Prepared by Ecology and Environment, Inc., February 2003).

The purpose of this sediment investigation was to define the baseline conditions during low water conditions, before the construction of a subsurface barrier wall and sediment cap; to assess the relationship between bulk sediment chemistry and pore water chemistry; and to evaluate the protectiveness of the cap. The sampling event took place from September 5 to 26, 2002 at the McCormick & Baxter Creosoting Company Site, Portland, OR (RM 7 and 8).

The sediment samples were collected by two EPA Region 10 teams (shore and dive teams). The shore team collected sediment samples in water shallower than 3 ft, and the dive team collected samples from within the river. Samples were obtained by coring with a hand auger inside of a PVC pipe. Ten sediment samples (SED-1 through SED-9, and EPA [SH] 6) and one QC sample (SED-51[5A]) were collected at the site. All 11 subsurface sediment samples were analyzed for mercury, PAHs, and pentachlorophenol.

WLCMRI02. Final Limited Sediment Investigation Report U.S. Government Moorings, Portland, OR (Prepared by URS, May 2003).

This investigation consisted of collecting surface and subsurface sediment samples in order to assess the chemical characteristics of the sediments within the U.S. Moorings berthing area and the approach channels where vessel maneuvering may resuspend sediments, and to

compare the results to downriver depositional sediment. The U.S. Moorings site is the homeport for the USACE hopper dredges and is located on the west bank of the Willamette River (RM 6.2).

URS Corporation staff collected the sediment samples from September 10 through 11, 2002. A gravity core sampler (barrel) and weight stand were staged on a boat deck attached to the hoist drop cable. General observations of the sediment core and material (grain size, gradations, odor, and the presence of NAPL) were recorded at each individual sample location. At a minimum, two cores per sample location were required to supply a sufficient volume of sediment to meet the analytical requirements. Three composite sediment samples, representing sediments from 0 to 3 ft below mudline, were collected from the potential scour areas: CS001 (Dock A), CS002 (Dock B), and CS003 (the downriver approach channel). Two composite sediment samples (CS004 and CS005) were collected from depositional areas downriver from the U.S. Moorings docks from the top 1-ft depth to represent recent sediment deposition. Five composite samples were submitted for chemical analysis of SVOCs, pesticides, PCBs, TBT, total metals, DRH, TOC, total cyanide, grain size, and total solids.

WLCOFH02. Source Control Pilot Project for the City of Portland Outfalls, Portland, OR (Prepared by CH2M Hill, August 2002).

The City of Portland initiated a pilot project to evaluate the impacts of stormwater discharge from City outfalls on sediment quality in the Willamette River. City outfalls M-1 and M-18 were selected as sediment sampling locations during the first phase of the pilot project. The purpose of the sampling was to determine whether chemical concentrations in sediment discharged from City outfalls warrant source investigation, identification, and control. In addition, information from sample analytical results was to be used to identify constituents of concern at these outfalls, which may be investigated further in a subsequent phase of the study.

Outfall M-1 is located in the Swan Island/Mocks Bottom basin or "lagoon." Outfall M-18 is located in the Guilds Lake Industrial Area, at the site of Gunderson Rail Services. Nine surface (0-15 cm) sediment samples were collected at both outfalls from locations spread in an array upstream, adjacent to, and downstream of each outfall. The samples were collected from August 20-22, 2002, either from a shallow-draft vessel (Boston Whaler) using a grab sampler or on foot in wading depths using hand tools. Analyses included the conventional parameters of percent moisture, total solids, TOC, and grain size, and chemical parameters including metals, SVOCs, organochlorine pesticides, herbicides, PCBs, and TPH.

The results for indicator chemicals are summarized in the following two tables. The first table summarizes results for samples collected off Outfall M-1; the second table summarizes results for samples collected off Outfall M-18. Results are reported on a dry-weight basis.

Summary Data for M-1 Surface Samples.

WLCMCB02. MarCom Expanded Preliminary Assessment, Portland, OR (Prepared by Parametrix, 2002).

Parametrix performed an Expanded Preliminary Assessment (XPA) at the MarCom facility in Portland in 2002. The purpose of an XPA is to determine whether a site has experienced or may experience a release that could endanger human health or the environment. In addition to upland soil and groundwater samples, three sediment samples were collected in the nearshore area of the Willamette River adjacent to the facility. The samples were collected 1) near the southern boundary of the site near a stormwater outfall (SED-1), 2) midway along the shoreline near a second stormwater outfall (SED-2), and 3) near the northern boundary of the site inshore of an active marineways facility (SED-3).

The sediment sampling was conducted on February 8, 2002. The samples were collected from a surface interval of 0-15 cm using a Peterson-type clamshell sampler. Analyses included percent solids, total metals, organotins, and PAHs. The results for indicator chemicals are summarized in the following table, reported on a dry-weight basis.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	7.39	105 (SED-2)
Cadmium (mg/kg)	0.397 U	0.5 U (SED-3)

WLCGXB02. Remedial Investigation Kinder Morgan Liquid Terminals, LLC, Linton Facility, Portland, OR (Prepared by KHM Environmental Management, Inc., October 2002).

This investigation consisted of two sediment samples (SED-1 and SED-3) collected along the base of the seawall in an apparent seep at Kinder Morgan Liquid (KML) Linnton Terminal in

Portland, OR (RM 4.5). The sediment samples were collected during field activities in January, February, and April of 2002 to assess the concentrations of COIs in nearshore areas.

The two surface sediment (0 to 6 in.) samples were collected using a hand shovel in the seep area along the riverbank. The sediment samples were analyzed for TPH in the gasoline, diesel, and heavy oil ranges;total BTEX and naphthalene; and total metals.

WLCT4L01. Dredged Material Characterization Study Marine Terminal 4, Slip 3 Portland, OR (Prepared by Hart Crowser, Inc., February 2002).

This investigation consisted of sediment sampling to characterize the quality of the newly exposed sediment in the Slip and the proposed dredge material for permitting and placement at a solid waste landfill, and to evaluate the potential water quality impacts associated with dredging operations. The target area for this sediment characterization study was Berth 410 at Terminal 4 Slip 3, located at approximately RM 5.

Hart Crowser, Inc. collected core samples on December 11 and 13, 2001. Sampling took place using a vibracorer deployed from the vessel, the *John B. Preston*. Three sediment cores (T4-VC-01, T4-VC-02, and T4-VC-03) were collected at Berth 410, depth-integrated up to the maximum removal depth of -42 ft CRD, and composited into T4-01-410-COMP, representing one dredged material management unit (DMMU). At each of the coring locations, between 1 and 4 ft of additional sediment was collected below the proposed dredge prism and tested or archived as discrete samples. These samples were catalogued as: subsample interval -42 to -43 ft CRD (T4-01-1A, T4-01-2A, and T4-013A, the "A" interval);

subsample interval -43 to -44 ft CRD (T4-01-1B, T4-01-2B, the "B" interval); and -44 to -45 ft CRD (T4-01-1C and T4-01-2C, the "C" interval).

The B and C intervals were analyzed for selected parameters, depending on the chemical testing results from the A interval. The composite sample (T4-01-410-COMP) and a duplicate of this sample (T4-01-Dup) and each discrete sample from the A interval were analyzed for: Lower Columbia River Management Area (LCMRA) metals, chlorinated pesticides, PCBs, SVOCs, TOC, and grain size (T4-410-COMP only). Samples T4-01-2B and T4-01-2C were analyzed for SVOCs and samples T4-01-1B, T4-01-1C, and T4-01-2B were analyzed for chlorinated pesticides and PCBs. In order to determine whether the dredged sediment would be designated as hazardous waste, sample T4-01-410-COMP and its duplicate were tested for toxicity characteristic leaching procedure (TCLP) metals, and sample T4-01-410-COMP and river supply water collected from the mouth of Slip 3 were submitted to the Hart Crowser Soils Lab to conduct the dredge elutriate test.

Subsurface sediment coring was proposed at two additional locations within the DMMU at Berth 411, but it was determined that no dredge prism existed, and no sediment core samples were collected.

Summary Data for Subsurface Samples.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	3.87	11.6 (T4-VC-03 RM 4.57)
Cadmium (mg/kg)	0.403	5.72 (T4-VC-03 RM 4.57)
Copper (mg/kg)	32.6	72.3 (T4-VC-03 RM 4.57)

WLLRSI01. Lower Willamette River Reference Area Study, U.S. Army Corps of Engineers, Portland, OR (Prepared by Hart Crowser, February 26, 2002).

This investigation was the second phase in the effort to identify potential reference sediment locations in the Willamette River as part of the USACE's effort to develop a DMMP for the waterway. The objective was to identify three reference areas representing fine-, medium-, and coarse-grained sediment in the LWR that could be used in biological testing.

This investigation consisted of comprehensive chemical and biological testing of three candidate reference sites:

Station	Approximate Location Description	Target Grain Size Range
HC-02	RM 15.5, near Ross Island	Coarse
HC-08	RM 18.8, east of Elk Rock Island	Fine
HC-10	RM 23.4, inside Cedar Island Cove	Medium

Surface sediment sampling was conducted on September 17, 2001, using an air-powered van Veen grab sampler. Sample intervals ranged from the surface to 30 cm. Samples were submitted for TOC, total volatile solids (TVS), selected VOCs, SVOCs, PAHs, phenols, phthalates, pesticides, PCBs, metals, and porewater butyltin analyses, as well as 10-day lethal and sublethal bioassays.

Five additional surface samples were collected from Cedar Island Cove to assess the range of grain sizes available at that location. These five samples were analyzed for grain size, TOC, and TVS only.

The grain sizes at the coarse, medium, and fine candidate locations consisted of fine sand, very sandy silt, and sandy silt, respectively. Organic content in these samples ranged from

0.42 to 1.77 percent. The results for indicator chemicals are summarized in the following table, reported on a dry-weight basis (except for porewater results).

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	2.7	4.3 (HC-08)
Cadmium (mg/kg)	0.07	0.18 (HC-08)
Copper (mg/kg)	15.4	50.9 (HC-08)
Lead (mg/kg)	5.24	12.6 (HC-08)
Mercury (mg/kg)	0.02	0.05 (HC-08)
Zinc (mg/kg)	49.7	96.8 (HC-08)
TBT (µg/L)	0.06	0.09 (HC-08)
bis(2-ethylhexyl)phthalate (µg/kg)	310 U	420 U (HC-08)
Total LPAH (µg/kg)	10.8 A	28.6 A (HC-10)
Total HPAH (µg/kg)	96.6 A	131 A (HC-10)
Total PCBs (µg/kg)	31 UA	42 UA (HC-08)
2,3,7,8-TCDD (ng/kg)	na	na
Total DDT (µg/kg)	0.73 A	14.6 A (HC-10)
Dibenzofuran (µg/kg)	16 U	21 U (HC-08)
4-Methylphenol (µg/kg)	7.3 J	16 U (HC-02)
Diesel range hydrocarbons (mg/kg)	na	na
Xylenes (µg/kg)	na	na

WLLRSH01. Willamette River Reference Area Study – Phase I Results and Recommendations for Phase II Sampling Locations, Portland, OR (Prepared by Hart Crowser, September 2001).

This investigation was the initial phase to identify potential reference sediment locations in the Willamette River as part of the USACE's plan to develop a DMMP for the waterway. The objective was to identify three reference areas representing fine-, medium-, and coarse-grained sediment in the LWR that could be used in subsequent biological testing.

Ten potential locations were selected. The station IDs and approximate river mile descriptions are listed in the table below.

Station	Approximate Location Description
HC-1	RM 15.7, upstream of East Island
HC-2	RM 15.5, near Ross Island
HC-3	RM 16.5, near downstream boundary of Riverview Cemetery
HC-4	RM 17.2, west side of channel
HC-5	RM 17.8, west side of channel upstream of Riverdale
HC-6	RM 18.75, no sample collected
HC-7	RM 18.9, west of Elk Rock Island
HC-8	RM 18.8, east of Elk Rock Island

Station	Approximate Location Description
HC-9	RM 23.1, downstream end of Cedar Island
HC-10	RM 23.4, inside Cedar Island Cove

Sampling took place on August 27, 2001. Surface (0-10 cm) grab samples were collected at each location and were wet-sieved in the field to identify general grain-size characteristics. Samples were then submitted for laboratory analyses of grain-size distribution, TVS, total solids, TPH, pesticides, and PCBs.

The results for indicator chemicals are summarized in the following table, reported on a dry-weight basis.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	na	na
Cadmium (mg/kg)	na	na
Copper (mg/kg)	na	na
Lead (mg/kg)	na	na
Mercury (mg/kg)	na	na
Zinc (mg/kg)	na	na
TBT (µg/kg)	na	na
bis(2-ethylhexyl)phthalate (µg/kg)	na	na
Total LPAH (µg/kg)	na	na
Total HPAH (µg/kg)	na	na
Total PCBs (µg/kg)	26 UA	40 UA (HC-10)
2,3,7,8-TCDD (ng/kg)	na	na
Total DDT (µg/kg)	1.3 UA	2 UA (HC-04, HC-10)
Dibenzofuran (µg/kg)	na	na
4-Methylphenol (µg/kg)	na	na
Diesel range hydrocarbons (mg/kg)	13 U	56 Z (HC-04)
Xylenes (µg/kg)	na	na

WLCCIF01. Results of Sediment Sampling and Analysis, Cargill Irving Elevator Terminal, Portland, OR (Prepared by Harding ESE, August 3, 2001).

This investigation consisted of sediment sampling to characterize material to be removed during maintenance dredging at the Cargill, Inc. (Cargill) Irving Elevator Terminal in Portland (RM 11.5). The material was addressed as a single DMMU located within the facility's berthing area.

Sediment sampling was conducted by Harding ESE on June 29, 2001. Four vibracore samples were collected within the DMMU: T01 (0-54 cm), T02 (0-109 cm), T03 (0-106 cm), and T04 (0-60 cm). Due to refusal, one of the cores did not achieve the entire proposed

dredging depth, including the 2-ft overdredge interval. From each core, the material within the proposed dredge prism depth interval was split between two samples: one representing the individual core, and one composite of the four cores representing the entire DMMU. The amount of material contributed to the composite from each core was proportional to its total length. All the samples were analyzed for conventional parameters (total solids, TVS, TOC, total sulfide, and ammonia), grain-size distribution, SVOCs, organoclorine pesticides, PCBs, organotins, and metals. The composite sample was also analyzed for porewater organotins. Samples T01, T04, and the composite sample later underwent bioassay testing.

The individual samples were generally composed of sands with silt; the organic carbon contents ranged from 0.4 to 0.82 percent. The composite material was predominantly sand with silt, having an organic content of 0.67 percent. The results for indicator chemicals are summarized in the following table, reported on a dry-weight basis (except for porewater results).

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	2.1	3.1 (T02)
Cadmium (mg/kg)	0.21	0.32 (T02)
Copper (mg/kg)	20.2	26.4 (T02)
Lead (mg/kg)	14.4	35 (T04)
Mercury (mg/kg)	0.03	0.05 (T02)
Zinc (mg/kg)	68.3	79.3 (T04)
TBT(µg/kg)	13	220 (T04)
TBT(µg/L)	--	0.06 (composite)
bis(2-ethylhexyl)phthalate (µg/kg)	180 U	220 J (T01)
Total LPAH (µg/kg)	135 A	346 A (T01)
Total HPAH (µg/kg)	441 A	3,457 A (T01)
Total PCBs (µg/kg)	13.4 A	130 A (T04)
2,3,7,8-TCDD (ng/kg)	na	na
Total DDT (µg/kg)	0.73 UA	2.42 A (T03)
Dibenzofuran (µg/kg)	4.2 J	12 J (T01)
4-Methylphenol (µg/kg)	16 J	54 (T02)
Diesel range hydrocarbons (mg/kg)	na	na
Xylenes (µg/kg)	na	na

WLCT0F01. Dredged Material Characterization Study, Marine Terminal 2, Berths 203-206, Marine Terminal 5, Berth 501, Portland, OR (Prepared by Hart Crowser, August 24, 2001).

Hart Crowser conducted this study for the Port of Portland prior to maintenance dredging at three berthing areas at the Port's Marine Terminal 2 (Berths 204-206), and one berthing area at Marine Terminal 5 (Berth 501). Terminal 2 is located on the west side of the Willamette River at RM 10, and Terminal 5 is located along the east bank of the river at RM 1. The

information gained from this investigation was to be used to determine the quality of the dredged material for management options, the quality of the effluent from dredged material dewatering, and the quality of the dredged material leachate that would percolate into the aquifer underlying the rehandling facility. No dredging was planned at Berth 203 at the time of this study, but the data were collected for use in evaluating future dredging options.

Subsurface sediment vibracore samples were collected at Terminal 2, Berths 203-206, on June 28-29, 2001, and at Terminal 5, Berth 501, on June 27-28, 2001. Ten cores were collected at Terminal 2, and nine cores were collected at Terminal 5. Recovered core depths ranged from 5.5 to 9 ft below the mudline (BML). The cores were segregated into two DMMUs at both Terminal 2 (Berth 203 and Berths 204-205) and Terminal 5 (Berth 501-Barge and Berth 501-Face). The cores in each DMMU were divided into three intervals and composited to form representative samples, as outlined in the following table.

Facility	DMMU	Composite Sample ID	Approximate Interval	Interval Description
Terminal 2	Berth 203	T2-01-1A	0-121 cm	Proposed dredging depth (including 2 ft overdredge)
		T2-01-1B	121-152 cm	1 ft below dredge prism
		T2-01-1C	152-182 cm	1-2 ft below dredge prism
	Berths 204-206	T2-01-2A	0-152 cm	Proposed dredging depth (including 2 ft overdredge)
		T2-01-2B	152-182 cm	1 ft below dredge prism
		T2-01-2C	182-210 cm	1-2 ft below dredge prism
Terminal 5	Berth 501-Barge	T5-01-1A	0-152 cm	Proposed dredging depth (including 2 ft overdredge)
		T5-01-1B	152-182 cm	1 ft below dredge prism
		T5-01-1C	182-210 cm	1-2 ft below dredge prism
	Berth 501-Face	T5-01-2A	0-182 cm	Proposed dredging depth (including 2 ft overdredge)
		T5-01-2B	182-210 cm	1 ft below dredge prism
		T5-01-2C	210-240 cm	1-2 ft below dredge prism

The "A" samples from each DMMU were submitted for analysis of conventional parameters, SVOCs, chlorinated pesticides, PCBs, metals, and porewater TBT. Elutriate (dewatered fluid) from T2-01-2A was analyzed for TSS, turbidity, TBT, chlorinated pesticides, and PCBs. Initially, the "B" and "C" samples from each DMMU were frozen pending potential future analysis. Samples T2-01-1B and T2-01-1C were later analyzed for pesticides and PCBs based on elevated concentrations in T2-01-1A.

The Terminal 2 "A" composites were composed primarily of sandy silt, while the Terminal 5 "A" composites were composed of sand and silty sand. Organic carbon content ranged from 0.17 to 3.04 percent. The results for indicator chemicals in the sediment samples are summarized in the following table, reported (except porewater TBT) on a dry-weight basis.

Summary Data for Subsurface Samples.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	1.8	3 (T2-01-2A, T5-01-2A)
Cadmium (mg/kg)	0.09	0.51 (T5-01-2A)
Copper (mg/kg)	8.8	30.1 (T2-01-2A)
Lead (mg/kg)	3.38	19.8 (T5-01-2A)
Mercury (mg/kg)	0.02	0.14 (T2-01-1A)
Zinc (mg/kg)	37.9	112 (T2-01-1A)
TBT (µg/L)	0.02 U	0.07 (T5-01-2A)
bis(2-ethylhexyl)phthalate (µg/kg)	270 UJ	380 UJ (T2-01-2A)
Total LPAH (µg/kg)	73 A	308 A (T2-01-1A)

Xylenes (µg/kg)	na	na

WLCCPF01. Chevron Willbridge Terminal Dock Sediment Sampling, Portland, OR (Prepared by PNG Environmental, 2001).

PNG Environmental performed sediment sampling to characterize sediment prior to maintenance dredging in the vicinity of the Chevron Willbridge Terminal dock, located on the west side of the Willamette River at approximately RM 7.8.

Samples were collected at five stations on June 6-7, 2001: two in the slip north of the dock, and three in the slip south of the dock. The sample IDs and intervals at each of these stations are summarized in the table below. Only the uppermost interval collected at each station contained the sediment proposed for dredging.

Station (Location)	Sample ID	Sample Interval
SD0101 (Head of northern slip)	SD-1-S1C	91-183 cm
	SD-1-39-Foot	183-213 cm
	SD-1-41-Foot	213-244 cm
SD0102 (Northern slip)	SD-2-S1C	0-30 cm
	SD-2-39-Foot	30-61 cm
	SD-2-41-Foot	61-91 cm
SD0103 (Head of southern slip)	SD-3-S1C	0-152 cm
	SD-3-39-Foot	152-183 cm
	SD-3-41-Foot	183-213 cm

Station (Location)	Sample ID	Sample Interval
SD0104 (Southern slip)	SD-4-S1C	0-91 cm
	SD-4-39-Foot	91-122 cm
	SD-4-41-Foot	122-152 cm
SD0105 (Southern slip)	SD-5-SD1C	0-30 cm
	SD-5-39-Foot	30-61 cm
	SD-5-41-Foot	61-90 cm

The samples were analyzed for ammonia/nitrogen, sulfide, total solids, TVS, VOCs, SVOCs, PAHs, DRH, pesticides, PCBs, and total metals. Porewater from these samples was analyzed for butyltins. The results for indicator chemicals in surface and subsurface samples are summarized in the following tables. Except for porewater TBT, the results were reported on a dry-weight basis. In surface sediment samples, maximum concentrations of all chemicals were found in Sample SD-5-SD1C.

Summary Data for Surface Samples.

Parameter	Minimum	Maximum

WLCGSD01. NW Natural "Gasco" Site, Draft Screening Level Nearshore Source Control Evaluation Results Report, Portland, OR (Prepared by Anchor Environmental, L.L.C., July 2001).

The purpose of this investigation was to characterize nearshore river conditions adjacent to the NW Natural "Gasco" site in order to validate groundwater model results and determine whether site groundwater was an ongoing source of river water and sediment contamination.

On April 10-11, 2001, nine sediment vibracore samples were collected from a research vessel along two transects that ran perpendicular from the Gasco site shoreline. Four cores were collected along the first transect located offshore of the tar pond area, and five cores were collected along the second transect located approximately 500 ft northwest of the first. Samples were collected from the cores at three depth intervals: 0-10 cm, 10-20 cm, and 30-40 cm. All samples were analyzed for TOC, total solids, six metals, cyanide, BTEX, PAHs, and sulfides.

Organic carbon content ranged from 0.18 to 8.76 percent. Results for indicator chemicals in surface and subsurface samples are summarized in the following tables. All results are reported in dry weight.

WLCMBA01. Sediment Remedial Design Final Sampling Data Summary Report, McCormick & Baxter Creosoting Company, Portland, OR (Prepared by Ecology and Environment, Inc., February 2001).

Ecology and Environment (E&E) conducted sediment sampling on behalf of DEQ to support the remedial design for contaminated sediment at the McCormick & Baxter Creosoting Company's Portland facility, located at approximately RM 7. Phase I of the remedial design sampling was conducted in October 1999. Phase II sampling was performed in January and February 2001 to address data gaps identified during Phase I, including the delineation of the lateral extent of contamination and parameters necessary for permeability modeling.

On January 5 and 8, 2001, surface sediment samples were collected at 29 locations offshore of the McCormick & Baxter facility, and one sample was collected at an upstream reference location at RM 24. The samples were collected from a sampling interval of 0-15 in. using a PVC plastic sampling tube deployed by divers. Two replicates were required at each station: one was submitted for grain-size distribution and PAH analyses, and the other was submitted for toxicity testing.

Subsurface sediment samples were collected on February 5, 2001 at three locations offshore of the facility. The samples were obtained from cores collected from 0 to 10 ft using a Shelby® tube and piston sampler. Porewater samples from the sediment cores were submitted for dissolved organic carbon and SVOC analyses. Sediment from the cores was collected for NAPL extraction to be used in the physical testing required for sediment cap permeability modeling. Samples of light NAPL, dense NAPL, and river water were also collected to provide data for cap permeability modeling.

The surface sediment samples displayed a range of grain sizes, but were generally finer than the Phase I samples. Fines in Phase II samples ranged from 0 to 93 percent. The results for indicator chemicals in the surface samples are summarized in the following table. All results were reported in dry weight. The results of the sediment porewater analyses from this investigation were not available at the time of the E&E report.

WLCGAL00. Preliminary Assessment and Dredging Sampling Results, Goldendale Alumina Unloading Facility, Phase II Sampling, Portland, OR (Prepared by CH2M Hill, March 2001).

Following maintenance dredging at the Goldendale Alumina Company (GAC) dock in October 2000, sediment sampling was conducted as part of a preliminary assessment (PA) of the GAC facility. The PA was performed by GAC, as requested in DEQ's strategy recommendation for the site.

Three surface (0-30 cm) sediment samples were collected on December 21, 2000 and analyzed for PAHs. Two of the samples (Post Dredge 1 and Post Dredge 2) were collected from within the dredged area and one (UP Outfall) was collected near a stormwater outfall. A stormwater sample was subsequently collected in January 2001 to assess whether stormwater near the site was contributing to PAHs detected in sediments near the dock. No PAHs or oil and grease constituents were detected in the stormwater.

The analytical results of indicator chemicals in the three Phase II sediment samples are summarized in the following table. The maximum concentrations were all detected in sample Post Dredge 2. All results are reported on a dry-weight basis.

WLCOSJ00. Pre-remedial Investigation Field Activities Data Report, Oregon Steel Mills, Inc. (OSM), Portland, OR (Prepared by Exponent, February 2001).

Exponent performed this pre-remedial investigation at the OSM Portland mill in October 2000. The facility is located at approximately RM 3. Field activities included upland subsurface soil and groundwater sampling near a former oil sump, and sediment sampling in the vicinity of stormwater outfalls along the Willamette River.

Sediment sampling was conducted on October 10-11, 2000. Surface (0-10 cm) samples were collected from four stations in the vicinity of each of two outfalls (Outfalls 001 and 003) that drain the property. In addition, two surface samples were collected 100 ft apart near both the upstream and downstream property boundaries. Deeper samples were obtained at two additional stations near Outfall 003 using a coring device or a shovel. Deeper samples could not be obtained near Outfall 001 due to refusal. The sample locations, IDs, and intervals are summarized in the table below:

Location	Sample ID	Interval
Near northern property boundary	SD0001	0-10 cm
	SD0002	0-10 cm
Outfall 003	SD0003	0-10 cm
	SD0004	0-10 cm
	SD0005	0-10 cm
	SD0006	0-10 cm
	SD0007 (dup of SD0006)	0-10 cm
	SD0014	0-30 cm
	SD0015	0-30 cm
	SD0016	0-60 cm
Outfall 001	SD0008	0-10 cm
	SD0009	0-10 cm
	SD0010	0-10 cm
	SD0011	0-10 cm
	SD0014	0-10 cm
	SD0015	0-10 cm
	SD0016	0-10 cm
Near southern property boundary	SD0012	0-10 cm
	SD0013	0-10 cm

All sediment samples were analyzed for priority pollutant metals, SVOCs, PCBs, TOC, and grain size. Samples SD0015 and SD0016 were also analyzed for TPH.

The sediment samples were composed primarily of sands and gravels. Fines content in the samples ranged from approximately 3 to 8 percent. Organic content ranged from less than 0.05 to 1.91 percent. The results for indicator chemicals in the sediment samples are summarized in the following table. All results were reported in dry weight.

WLCWTI00. Revised 60-inch Storm Sewer Interim Remedial Actions Report, Tosco Willbridge Terminal, Portland, OR (Prepared by KHM Environmental Management, Inc., May 2002).

KHM Environmental Management performed subsurface investigations and interim remedial actions at the Tosco Willbridge Terminal facility, which is located on the west bank of the Willamette River at RM 8. These activities were performed to address the seepage of petroleum hydrocarbons from bedding/backfill materials associated with a 60-in.-diameter storm sewer. The storm sewer is owned by the City of Portland, but crosses the Tosco terminal between Front Avenue and the river. The primary goal of the interim remedial activities was to assess the extent of separate-phase hydrocarbons (SPH) in the vicinity of the storm sewer, and eliminate SPH seepage to the Willamette. Remedial goals also included removal of the affected sediment adjacent to the outfall.

The investigation included the collection of groundwater and soil/sediment samples in the vicinity of the outfall as well as the installation of various engineering controls to contain and reduce the SPH seepage. Four sediment/soil samples were collected near the Willamette River low-water line on either side of the storm sewer outfall, using hand tools such as shovels or trowels. The samples were collected on September 21, 2000 within a 6-in. interval beginning at the sand/silt interface, which ranged from approximately 0.5 to 1 ft below the ground surface (bgs). On September 21-22, 2000, nine additional soil/sediment samples were collected from test pits excavated in the outfall area to determine the area of

sediment impact and calculate the volume of material that would require removal. Test pit samples were collected directly from the excavator bucket at depth intervals ranging from 61 to 229 cm bgs.

All soil/sediment samples were analyzed for hydrocarbon identification and TPH (as diesel and heavy oil). One test pit sample was also analyzed for VOCs and RCRA metals for disposal characterization. Results for indicator chemicals in LWR samples are summarized in the following table, reported on a dry-weight basis. Based on the analytical results of the soil/sediment samples in the vicinity of the outfall, a permit was requested from the USACE for excavation of the affected area.

WLCAYH00. Expanded Preliminary Assessment Data Report, Union Pacific Railroad (UPRR) Albina Yard, Portland, OR (Prepared by Jacobs Engineering, November 2000).

Jacobs Engineering performed an XPA of the Union Pacific Railroad (UPRR) Albina Yard site in August 2000. The purpose of the XPA was to determine whether the site had experienced or might experience a release that could endanger human health or the environment per Oregon's Revised Statutes (ORS Chapter 465.200). The XPA included the collection of soil, groundwater, and surface water samples, as well as six sediment samples. Four of these samples were collected from the Willamette River, while the remaining two were collected from storm drains. The river sediment sampling station locations were described as follows:

Station	Location
SD-01	Upstream of Albina Yard, northwest of Fremont Bridge, sediment quality presumably unaffected by site activities (baseline sample)
SD-02	Near Outfall #2, draining stormwater runoff from the southeastern portion of UPRR site
SD-03	Near Outfall #1, draining stormwater runoff from the central portion of UPRR site
SD-04	Near Outfall #3, draining stormwater runoff from the northwestern portion of UPRR site

Both surface and subsurface sediment samples were collected. Surface samples were collected from the top 20 cm using a single grab with a 0.1-m^2 van Veen sampler. Subsurface sediment samples were collected using a 2-in.-diameter gravity corer configured with a 3-ft barrel. Sample recovery was difficult at most locations given the steeply sloped bottom and the amount of riprap and debris present. Three core samples were collected: SD-1D (30-60 cm), SD-2D (30-69 cm), and SD-4D (30-60 cm). Efforts to collect a subsurface core at station SD-3 were abandoned after several attempts failed to retrieve any sample volume.

Samples were analyzed for TPH, SVOCs, metals, TBT, PCB Aroclors, and TOC. Organic carbon content ranged from 0.93 to 2.60 percent. Results for indicator chemicals in surface and subsurface samples are summarized in the following tables. All results were reported in dry weight.

Summary Data for Surface Samples.

WLCMFH00. Expanded Preliminary Assessment Data Report, Marine Finance Site, Portland, OR (Prepared by Jacobs Engineering, November 2000).

Jacobs Engineering performed an XPA of the Marine Finance Site from August 7-10, 2000, under DEQ's Orphan Site Account. The purpose of the XPA was to determine whether a release that could endanger human health or the environment had occurred or may occur at the site per ORS Chapter 465.200.

In addition to soil sample collection, sediment samples were collected from six locations as part of the XPA. Stations were identified as SD-1 through SD-6 and were situated as follows:

Station	Location
SD-1	Seep pool in northern portion of site northwest of Mark Even Construction
SD-2	Northwest and downstream of Mark Even Construction dock near area of known runoff
SD-3	North and downstream of the middle dock
SD-4	North and downstream of Hendren Towboat
SD-5	Adjacent to Hendren Towboat site
SD-6	100 ft upstream of Hendren Towboat as a "baseline" sample

Both surface ("S" sample suffix) and subsurface ("D" sample suffix) sediment samples were collected. Surface samples were collected from the top 20 cm using a single grab at all six locations. Subsurface sediment samples were collected using a 2-in.-diameter gravity corer configured with a 3-ft barrel. Sample recovery was difficult at most locations given the steeply sloped bottom and the amount of riprap and debris present. Only three core samples were collected: SD-4D (30-54 cm), SD-5D (30-54 cm), and SD-6D (30-66 cm).

Samples were analyzed for TPH, SVOCs, metals, TBT, PCB Aroclors, and TOC. Organic carbon content ranged from 0.92 to 4.37 percent. Results for indicator chemicals are presented in the following table. All results were reported in dry weight.

WLCT1F00. Marine Terminal 1 Baseline Investigation Final Report, Port of Portland, Portland, OR (Prepared by Striplin Environmental Associates, August 2000).

SEA conducted a study to establish baseline sediment quality conditions in the vicinity of the Port of Portland's Marine Terminal 1 South between RM 10 and 11. Sampling was conducted on June 23, 2000.

Surface (0 to 10 cm) sediments from nine stations were sampled using a 0.1-m^2 double van Veen grab sampler deployed from a 28-ft sampling vessel. Each sample represented two replicate grabs that were necessary to collect adequate volume. Seven stations (T1S-02 through T1S-08) were located offshore of Berths 104, 105, and 106, and the remaining two were located upstream (T1S-09) and downstream (T1S-01) of the berth areas to assess impacts stemming from potential sources beyond the Terminal 1 property boundaries.

The samples were analyzed for TOC, grain-size distribution, VOCs, total sulfides, SVOCs, pesticides, PCBs, and metals, and porewater was analyzed for TBT. The samples were generally fine-grained; fines content ranged from approximately 27 to 66 percent. Organic content ranged from 1.4 to 2.65 percent. The results for indicator chemicals are summarized in the following table.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	3.3	5.5 (T1S-06)
Cadmium (mg/kg)	0.16	0.26 (T1S-03)
Copper (mg/kg)	30.1 N	57.2 N (T1S-01)
Lead (mg/kg)	10.7	20.8 (T1S-01)
Mercury (mg/kg)	0.04	0.56 (T1S-09)
Zinc (mg/kg)	75.5 N	114 N (T1S-01)
TBT (µg/L)	0.05 UX	0.05 UX
bis(2-ethylhexyl)phthalate (µg/kg)	140	310 (T1S-08)
Total LPAH (µg/kg)	20 UA	157 A (T1S-09)
Total HPAH (µg/kg)	20 UA	410 A (T1S-09)
Total PCBs (µg/kg)	14 A	41 A (T1S-01)
2,3,7,8-TCDD (ng/kg)	na	na

Parameter	Minimum	Maximum (Location)
Total DDT (µg/kg)	1.8 A	6.7 A (T1S-09)
Dibenzofuran (µg/kg)	20 U	20 U
4-Methylphenol (µg/kg)	120 U	120 (U)
Diesel range hydrocarbons (mg/kg)	na	na
Xylenes (µg/kg)	2 U	10 U (T1S-06)

X – See case narrative.

WLCGAF00. Dredging Sampling Results, Goldendale Alumina Unloading Facility, Phase I Sampling, Portland, OR (Prepared by CH2M Hill, March 2001).

Phase I of this investigation consisted of sampling to characterize sediments proposed for removal during maintenance dredging at GAC's Portland Unloading Facility dock (RM 11). The results of previous sampling of the material conducted in 1999 by CH2M Hill had indicated that chemical concentrations in the material were below screening levels for aquatic disposal, but DEQ requested additional sampling to characterize the material for disposal at Ross Island.

Five surface (0-30 cm) sediment samples were collected on June 12, 2000 from the proposed dredging area near the facility's dock. The sampling was performed by David Evans and Associates using a ponar clamshell sampler deployed from a boat. The samples were analyzed for grain-size distribution, conventional parameters (ammonia as nitrogen, total sulfide, TOC), VOCs, SVOCs, organochlorine pesticides, PCBs, butyltins, and metals. Three of the samples were selected by GAC and DEQ for bioassays.

The samples were primarily composed of silt with very fine sand. Organic content ranged from 1.91 to 2.47 percent. The results for indicator chemicals are summarized in the following table. The results (except porewater TBT) are reported on a dry-weight basis.

Parameter	Minimum	Maximum
Arsenic (mg/kg)	2.9	3.8
Cadmium (mg/kg)	0.16	0.17
Copper (mg/kg)	31.6	34
Lead (mg/kg)	11.5	13.3
Mercury (mg/kg)	0.2 U	0.2 U
Zinc (mg/kg)	68.5	73.1
TBT (µg/L)	6.3	36
bis(2-ethylhexyl)phthalate (µg/kg)	95	2,700
Total LPAH (µg/kg)	12 A	2,948 A

WLCRIL99. Site Investigation Report, Port of Portland Confined Dredged Material Disposal, Ross Island Facility, Portland, Oregon (Prepared by Hart Crowser, November 30, 2000).

Hart Crowser conducted a site investigation at the Ross Island Confined Dredged Material Disposal Facility to determine whether dredged material from Port facilities, which was placed at Ross Island, posed a risk to human health or the environment. In addition to groundwater and surface water sampling, Hart Crowser collected samples of lagoon sediment.

Surface (0-10 cm) sediment samples were collected at 34 locations during November 16-19,1999. These included 29 locations within the lagoon, Holgate Slough, and the adjacent Willamette River (Samples HC-SS01 through HC-SS31); two upstream background samples (HC-SS32 and HC-SS33); and three reference samples in the Columbia River (HC-REF1, HC-REF2, HC-REF3). Surface samples were collected using a van Veen grab.

Subsurface sediment samples were collected at 19 locations within Ross Island Lagoon (seven in disposal cells and 12 near the cells to assess slope stability) during November and December 1999. Borings ranged from 18 to 94.5 ft below mudline; sampling intervals ranged from approximately 4.4-26 ft to 15.5-59 ft. Subsurface samples were collected using a hollow-stem auger, split-spoon sampler, Gus sampler, and Hart sampler.

Samples were analyzed for TOC, grain size, metals, SVOCs, VOCs, PCBs, DDT, and TPH. Some samples were also analyzed for porewater TBT. Organic carbon in surface sediments ranged from 0.12 to 1.9 percent. Results for surface sediment samples and subsurface samples are provided below in separate tables. Results are reported in dry weight.

WLR0499; WLR1199. Willamette River Sediment Sampling Evaluation (Prepared by U.S. Army Corps of Engineers, June 1999 and March 2000).

USACE collected sediment cores during two sampling surveys in the Willamette River to characterize sediments prior to maintenance dredging to determine whether sediments were suitable for open, in-water disposal.

In the first survey, a total of nine sediment cores representing three DMMUs were collected on April 29, 1999. The sediment represented by the April samples exceeded the Dredged Material Evaluation Framework screening levels and required additional chemical and biological testing. Therefore, a second survey was conducted. Five additional sediment cores were collected on November 29, 1999, from five of the nine locations sampled in April. In addition, a fourth DMMU was added and three additional cores collected from a shoal at RM 11.

DMMU	RM	Location	Station (WLR0449, April)	Station (WLR1199, November)
1	2+10	East edge of navigation channel off Oregon Steel Mill dock	WR-VC01A WR-VC02A	WR-VC02N
2	9 to 9+35	Shoal on west edge of navigation channel	WR-VC03A WR-VC04A	WR-VC05N
3	8+30 to 8+50	Navigation channel in front of Texaco dock	WR-VC05A WR-VC06A WR-VC07A WR-VC08A	WR-VC03N WR-VC04N
4	11	Shoal in navigation channel.	Not sampled	WR-VC06N WR-VC07N WR-VC08N

The depth interval for all samples was 0-8 ft. At stations WR-VC08 (April), WR-VC06 (November), and WR-VC07 (November), the bottom interval (approximately 8-12 ft) was also analyzed. Cores were collected using a vibracorer.

The subsurface samples were analyzed for conventionals, metals, SVOCs, PCBs, pesticides, and herbicides. Some samples were also analyzed for dioxin/furans and porewater organotins. Organic carbon ranged from 0.37 to 2.4 percent. Results for indicator chemicals are presented in the following table. All results were reported in dry weight.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	2.4 J	5 (WR-VC06N)
Cadmium (mg/kg)	0.17 J	0.41 J (WR-VC02N)

Parameter	Minimum	Maximum (Location)

WLCT5K99. Sediment Characterization at Marine Terminal 5, Barge Berth 501 and Berth 503, Portland, OR (Prepared by Hart Crowser, 1999).

The purpose of this investigation was to characterize sediment to be dredged for navigational maintenance at Port of Portland's Terminal 5, located between RM 1 and RM 2. Three DMMUs were defined for this project: DMMU T501-Face (located along the offshore side of Berth 501); DMMU T501-Barge (the barge berth area inshore of Berth 501); and DMMU T503 (along Berth 503).

Vibracore samples were collected on November 18, 1999 from five locations: two within DMMU T501-Face, one from DMMU T501-Barge, and two from DMMU T503. Whole cores from DMMU T501-Face and DMMU T503 were homogenized to form one representative sample for each respective unit. Sampled intervals ranged up to 182 cm (approximately 6 ft) below the mudline. The samples were submitted for the analysis of particle size, total solids, TVS, TOC, ammonia, metals (including mercury), SVOCs, pesticides, PCBs, total sulfides, and biological assays. Porewater was analyzed for TBT.

The results for indicator chemicals are summarized in the following table. Sediment analytical results are reported in dry weight. The maximum concentrations for all analytes except TBT were detected in the composite sample from Berth 503. The maximum TBT concentration was detected in the composite sample from Berth 501. The DMMUs associated with these analytical results have since been dredged.

Summary Data for Subsurface Samples.

Parameter	Minimum	Maximum

WLCRIJ99. Baseline Sediment Characterization, In-Water Clear Zone Sampling Results, Ross Island Lagoon (Prepared by Landau Associates, January 24, 2000).

Landau conducted an investigation to evaluate sediment quality in the in-water clear zone of a mined area prior to reclamation.

Surface sediments (0-10 cm) were sampled in eight locations in the in-water clear zone (CZ01 to CZ08). Porewater samples from four of the eight locations were also analyzed. In addition, three surface sediment samples were collected in the vicinity of a previously sampled location (SVS-18, located in a 1998 breach area) to verify previously reported concentrations. Stations SVS-18-R1 and SVS-18-R2 were near the original station SVS-18; three grab samples from along the toe of the slope were composited into one sample for analysis (SVS-18-COMP). All samples were collected October 26-28, 1999, using an Ekman grab sampler.

Sediment samples were analyzed for TOC, grain size, metals, SVOCs, pesticides, PCBs, and organotins. Porewater samples were analyzed for organotins. Organic carbon ranged from 1.01 to 1.58 percent. Sediments were composed predominantly of silt and clay. Results for indicator chemicals in surface sediments are presented in the following table. All results were reported in dry weight.

Summary Data for Subsurface Samples.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	2.7	6.6 (CZ06)

WLCRIV99. Phase I Remedial Investigation, Ross Island Sand & Gravel Co. (Prepared by Landau Associates, September 20, 2000).

Landau collected sediment samples to provide supplemental data for a remedial investigation (RI) of the Ross Sand & Gravel site. The overall objective of the RI was to collect data in conjunction with other site investigations to provide an indication of the nature and extent of contamination at the site and to focus subsequent RI study components.

Four surface sediment samples were collected in October 1999. Two samples (PA01 and PA02) were collected within Ross Island lagoon, and two samples (PA03 and PA04) were collected within Holgate Slough. These surface samples were collected from the top 10 cm of sediment. In addition, 41 subsurface sediment samples from 15 borings within the lagoon were collected during November and December 1999. These included two samples from the 0-1 cm depth interval. The subsurface samples were collected in conjunction with a Port of Portland investigation (see WLCRIL99). Sampling methods were not reported in the Phase I RI report (Landau 2000), but the Port reported that subsurface samples were collected using a hollow-stem auger, split-spoon sampler, Gus sampler, and Hart sampler.

Surface samples were analyzed for TOC, grain size, metals, SVOCs, VOCs, pesticides, PCBs, hydrocarbons, and organotins. Organic carbon in surface sediments ranged from 1.44

to 1.69 percent. Results for indicator chemicals in surface sediments are presented in the following table. All results were reported in dry weight.

Summary Data for Surface Samples.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	3	7.7 (G06A)
Cadmium (mg/kg)	0.08 U	0.234 (PA01)
Copper (mg/kg)	24.8	55.6 (PA01)
Lead (mg/kg)	11.8	27.8 (G06A)
Mercury (mg/kg)	0.04	0.18 (PA01, PA02)
Zinc (mg/kg)	72.5	191 J (G06A)
TBT (µg/kg)	0.4 J	11 (PA01)
bis(2-ethylhexyl)phthalate (µg/kg)	100 U	180 (G06A)
Total LPAH (µg/kg)	11 A	55A (G06A, PA02)
Total HPAH (µg/kg)	77 A	442 A (G05)
Total PCBs (µg/kg)	5 A	8 A(PA03)
2,3,7,8-TCDD (ng/kg)	na	na
Total DDT (µg/kg)	0.9 A	2.3 A (PA03)
Dibenzofuran (µg/kg)	1 J	3 J (PA02)

WLCGXV99. Environmental Site Assessment, GATX Terminals Corporation Linnton Terminal (Prepared by KHM Environmental Management, December 1999).

KHM Environmental Management conducted an investigation to provide baseline petroleum hydrocarbon data in subsurface soils at the Linnton Terminal and sediments in the adjacent Willamette River.

A total of eight sediment samples were collected at four locations on October 8, 1999. Stations S-1 and S-2 were located near sump outfalls. Stations S-3 and S-4 were located in the river adjacent to the facility. One surface (0-10 cm) and one subsurface (30-40 cm) sample were collected at each location. Samples were collected using a core-type sampler.

Samples were analyzed for TOC, grain size, ammonia, metals, SVOCs, VOCs, pesticides, and PCBs. Organic carbon ranged from 0.2 to 1.5 percent. Results for surface sediment samples and subsurface samples are provided below in separate tables. Results are reported in dry weight.

WLCMBJ99. Sediment Remedial Design Final Sampling Data Summary Report, McCormick & Baxter Creosoting Company, Portland, OR (Prepared by Ecology and Environment, Inc., February 2001).

Ecology and Environment conducted sediment sampling on behalf of DEQ to support the remedial design for contaminated sediment at the McCormick & Baxter Creosoting Company's Portland facility, located at approximately RM 7.

Phase I of the remedial design sampling was conducted in October 1999 and included surface water and sediment sampling. Thirty-nine sediment samples were collected within approximately 300-400 ft of the facility shoreline, from a mudline depth interval of 0-6 in. Four reference samples were collected at approximately RM 18, 22, 23, and 24. Samples were collected using a ponar grab sampler deployed from a sampling platform or vessel. Samples were composited from three replicate grabs on average, although up to 12 grabs were required at one location to acquire sufficient sample volume. The samples were submitted for grain-size distribution, arsenic, pentachlorophenol, PAHs, and toxicity analyses. Selected samples were analyzed for dioxins/furans.

The sediment samples were composed primarily of sands, which ranged from 72.67 to 100 percent of sample material. Results for indicator chemicals are summarized in the following table. All results were reported in dry weight.

Parameter	Minimum	Maximum
Arsenic (mg/kg)	2.9	11.7

WRWSI98. Portland Harbor Sediment Investigation, Multnomah County, Oregon (Prepared by Roy F. Weston, Inc., May 1998).

This Portland Harbor sediment investigation was performed for EPA as part of a site inspection. The EPA site inspection process evaluates actual and potential environmental hazards for purposes of identifying remedial action priorities. The Portland Harbor sediment investigation was conducted between RM 3.5 and 9.5. The purpose of the investigation was to provide a screening level evaluation of sediment contamination within this portion of the LWR.

The following surface sediment, subsurface sediment, and porewater samples were collected and evaluated:

- 150 surface (0-10 cm) sediment samples
- 28 sediment porewater samples
- 37 subsurface sediment cores.

Surface sediment samples were collected using a stainless-steel, modified 0.1-m^2 van Veen grab sampler. Between one and four grabs were retrieved at each station to provide adequate

volumes of sediment for testing. Subsurface samples were collected with a 5-ft gravity corer (3-in. diameter). Core lengths ranged from 1.8 to 4.6 ft and averaged 3.2 ft. Stations SD001-SD151 were located in nearshore areas along both the western and eastern shores. Samples with the suffix "PW" were porewater samples. Subsurface sediment sample identifiers used the "A" suffix.

Sediment samples were generally analyzed for grain size, TOC, metals, and SVOCs. A subset of sediment samples was also analyzed for pesticides and PCBs, titanium, herbicides, organotins, and dioxins/furans. Porewater samples were analyzed for metals and butyltins. Results for surface and subsurface sediment samples are provided below in separate tables. Sediment chemistry results are reported in dry weight. Porewater results are reported in mg/L (wet weight).

TOSCO99. January 1999 Sediment Sampling Results for Tosco Portland Terminal (Prepared by Exponent, April 29, 1999).

Exponent conducted a sediment investigation at the Tosco Portland Terminal to determine whether sediments proposed for dredging were acceptable for unconfined, open-water disposal.

Sediment cores were collected on January 20-22, 1999, at six locations in the dredged area adjacent to the facility. Cores were composited into two samples for analysis. Core sample intervals ranged from 0-4 to 0-6.8 ft in DMMU 1, and from 0-8 to 0-11 ft in DMMU 2. Cores were collected using a 4-in.-diameter vibracorer with polyethylene (i.e., LEXAN®) core liners.

Samples were analyzed for conventional parameters, metals, SVOCs, PCBs, and pesticides. Organic carbon ranged from 1.97 to 2.24 percent, and samples contained greater than 80 percent fine-grained material. Results for indicator chemicals are presented in the following table. All results were reported in dry weight.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	4 G	5 G (DMMU 1)
Cadmium (mg/kg)	1 U	1 U (DMMU 1 & 2)

Parameter	Minimum	Maximum (Location)
Copper (mg/kg)	44	46 (DMMU 1)
Lead (mg/kg)	21	29 (DMMU 1)

WLRELF99. Elf Atochem Acid Plant Area Remedial Investigation Interim Data Report (Prepared by Exponent, June 1999).

The purpose of this investigation was to identify and delineate the nature and extent of COIs in soil, groundwater, and sediments related to the former DDT manufacturing facility. Sediments were collected from six riverbank (RB) and six offshore (OS) stations adjacent to the Elf Atochem site.

Riverbank samples were collected on November 23-24, 1998. Riverbank sediment samples were collected from 0-10 cm using a stainless-steel spoon, and from >10 cm using a titanium drive corer. Coring depths to the 90-cm target depth could be achieved at only one station (RB-6). Subsurface refusal limited penetration to 35 cm or less at stations RB-1, RB-2, RB-3, RB-4, and RB-5. Surface sediments and sediment core samples were analyzed for SVOCs, VOCs, TOC, and grain size.

Offshore sediment samples were collected on January 19-20, 1999. Offshore sediments were collected with either a Livingston® gravity corer or with a vibracorer. Sediment cores were sampled for a surface interval (0-10 cm) and a deeper interval (either one 20-cm interval, or, at two stations, an entire 10-to90-cm interval). Sediment samples were analyzed for SVOCs, VOCs, organochlorine pesticides, TOC, and grain size. Results for indicator chemicals in surface and subsurface samples are presented in the following tables. All results were reported in dry weight.

WLRWTF98. Remedial Investigation Report, Willbridge Facility (Prepared by KHM Environmental Management, December 2000).

KHM Environmental Management conducted an RI of the Willbridge Facility. The purpose of the RI was to determine the need for remedial action. Information was collected to interpret subsurface conditions, evaluate potential human health and ecological risk, and to evaluate characteristics relevant to identifying potential hot spots of contamination. Soil, groundwater, surface water, and sediment samples were collected.

A total of 13 river sediment locations were sampled December 17-18, 1998. Nine stations were located along the site-river interface, two stations were located upstream outside the dock embayment, and two stations were located downstream outside the dock embayment. The draft RI report stated that surface samples were collected from the top 24 in. of sediment at all 13 locations. Sediment was collected using a stainless-steel sediment corer with 3-in.-diameter barrel and slide hammer.

Samples were analyzed for BTEX, PAHs, and metals. Some samples were also analyzed for SVOCs, VOCs, and organochlorine pesticides. Results for indicator chemicals are presented in the following table. All results were reported in dry weight.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	1.22	6.53 G (TOS-SD5)
Cadmium (mg/kg)	0.651	5.79 (TOS-SD5)

PPTLDT24. Sediment Characterization Study Marine Terminal 2, Berths 203-206, Port of Portland (Prepared by Hart Crowser, March 1999).

Hart Crowser conducted a pre-maintenance dredging sediment characterization at Terminal 2 on the Willamette River for the Port of Portland. Maintenance dredging was proposed at Berths 203, 204, 205, and 206 to remove sediment that had accumulated above navigational depths. Sub-tidal sediment cores (5.5 to 6 ft in depth) were collected at five offshore stations to characterize two DMMUs. Two cores in Berth 203 (HC-VC-04 and HC-VC-05) were composited to characterize one DMMU, and three cores from Berths 204-206 (HC-VC-01, HC-VC-02, and HC-VC-03) were composited to characterize a second DMMU.

Subsurface sediment samples were collected on September 15, 1998. The method by which the cores were collected was not described in the report. Sediment cores were sectioned and composited from 0 to -3 ft. Sediment samples were analyzed for metals, SVOCs, VOCs, TBT, pesticides, PCBs, TOC, ammonia, sulfides, TVS, total solids, and grain size.

Results for indicator chemicals in surface and subsurface samples are presented in the following tables. All results were reported in dry weight.

Summary Data for Subsurface Samples.

Parameter	Minimum	Maximum
Arsenic (mg/kg)	1.4 G	2 G

WLCT4J98. Remedial Investigation Report Terminal 4, Slip 3 Sediments, Port of Portland (Prepared by Hart Crowser, April 2000).

Hart Crowser conducted an RI of Terminal 4, Slip 3 sediments for the Port of Portland. The RI study area consisted of sediments located upriver at the Pier 5 Willamette River Dock, Slip 3, and Wheeler Bay immediately downriver and adjacent to Slip 3. The purpose was to delineate the extent of contamination and to evaluate potential risks to the Willamette River environment and to human health posed by contaminants in river sediments. Sub-tidal surface sediments (0-10 cm) were collected at 44 offshore stations. Nine subsurface samples were collocated with surface sampling stations.

Surface sediment samples were collected on October 12-15, 1998, using a hydraulic grab sampler, and sub-sampled using stainless-steel instruments. Surface sediments were analyzed for pencil pitch, diesel, metals, SVOCs, VOCs, pesticides (on a limited subset of samples), TOC, and grain size.

Subsurface sediment samples were collected on October 12, 1998, using a vibracorer. Sediment cores were sampled for a top layer (0 to 2 ft), a bottom layer (-2 to -4 ft), and a deeper layer (-4 to -6 ft). Subsurface sediment samples were analyzed for pencil pitch, diesel, metals, SVOCs, VOCs, pesticides (on a limited subset of samples), TOC, and grain size.

Results for indicator chemicals in surface and subsurface samples are presented in the following tables. All results were reported in dry weight.

WLCT0I98. Sediment Characterization Study of Local Sponsors' Berths, Columbia and Willamette River Navigation Channel Deepening, Longview and Kalama, Washington and Portland, Oregon (Prepared by Hart Crowser, February 1999).

The purpose of this investigation was to provide preliminary dredge prism characterization for the dredging of the Columbia and Willamette navigation channels. Two sub-tidal sediment cores were collected at each DMMU identified in the project area. Cores were collected for the proposed dredge prisms at Berth 501, Terminal 6, Berth 401, and the Irving Street Terminal at the Port of Portland; the Harvest States Grain Terminal and the Peavey Grain Terminal at the Port of Kalama; and the Longview Grain Terminal at the Port of Longview. Twelve surface grab samples were also collected from deeper water locations in the Willamette River.

Subsurface sediment cores were collected using a vibracorer on September 14-17, 1998. Sediment cores were sectioned and composited from 0 to -3 ft and -3 to -5 ft. Sediment samples were analyzed for metals, SVOCs, VOCs, TBT, pesticides, PCBs, TOC, ammonia, sulfides, TVS, and total solids.

Surface sediment samples were collected on September 14-15, 1998. The report does not specifically describe the method by which the samples were collected, other than to say they were "grab samples." In addition, no description of the grab sub-sampling scheme was presented. Surface sediment samples were analyzed for metals, SVOCs, VOCs, TBT, pesticides, PCBs, TOC, ammonia, sulfides, TVS, and total solids.

Organic carbon content ranged in the core composites from 0.05 to 1.63 percent, and in the grab samples from 0.65 to 2.27 percent. Results for indicator chemicals in surface and subsurface samples are presented in the following tables. All results were reported in dry weight.

Summary Data for Surface Samples.

WLCITH98. International Terminals-Sediment Sampling Event, Memorandum Draft, Portland, OR (Prepared by Schnitzer Steel Products Company, December 1998).

This investigation consisted of surface (10.2 to 12.5 cm) sediment sampling to determine whether sample SD012, collected by Roy F Weston in 1997, is representative of sediment quality near the International Terminal (IT) facility and to establish baseline sediment quality within the slip. The IT property is located at 12005 North Burgard in Portland, OR near RM 4.

Two sediment samples (SD-11 and SD-12) were collected using a $0.1m^2$ van Veen grab sampler on August 18, 1998. The sediment samples were analyzed for total solids, TOC, grain size, total metals, butyltins, organochlorine pesticides, and semivolatile organic compounds.

PSYSEA98. Portland Shipyard Sediment Investigation Data Report (Prepared by Striplin Environmental Associates, Inc., November 1998).

The purpose of this investigation was to characterize surface and subsurface sediment quality in the vicinity of the Portland Shipyard, develop site-specific sediment quality criteria, and to identify potential sources of contamination.

Sub-tidal sediments were collected at 52 surface and 23 subsurface locations. Surface samples were collected from the top 10 cm of the sediment. Subsurface core samples represented sediments composited over approximate 4-ft intervals (0 to -4 ft, -4 to -8 ft, and -8 to -12 ft). All sediments were collected over a 3-week period beginning on March 31, 1998.

Surface sediment samples were collected from March 31 through April 7, and on April 16, 1998, using a hydraulic grab sampler, and sub-sampled using stainless-steel instruments. Surface sediments were analyzed for selected metals, SVOCs, TOC, total solids, and grain size. All but five samples were analyzed for porewater TBT and ammonia. Selected stations were analyzed for pesticides, and VOCs.

Subsurface sediment samples were collected from April 14-16, 1998, using a vibracorer. Subsurface sediment samples for 15 cores were analyzed in 4-ft intervals for metals, SVOCs, PCBs, TOC, and grain size. Additionally, two cores were analyzed at 1-ft intervals for selected total metals, bulk TBT, and grain size.

Results for indicator chemicals in surface and subsurface samples are presented in the following tables. All results were reported in dry weight.

PSYD&M97. Results of Sediment Investigation to Identify Chemicals in the Vicinity of the Portland Shipyard (Prepared by Dames & Moore, 1998).

In November 1997 and January 1998, Dames & Moore collected three subsurface (DM-20 and DM-24C1 and DM-24C2) and five surface (DM-1, DM-9, DM-16, DM-18, and DM-22) sediment samples in the Portland Shipyard area. Stations DM-12, DM-16, and DM-21 were located in Swan Island Lagoon. Surface samples were collected from the top 10 cm. Subsurface sample cores ranged from 106 to 198 cm in depth. The remaining stations were located within the drydock area of the shipyard. No project narrative, including objectives, methods, or sampling gear, is provided. All samples were analyzed for heavy metals, SVOCs, PCBs, and TOC.

Results for indicator chemicals in surface samples are presented in the following tables. All results were reported in dry weight.

WRD&M98. Results of Sediment Investigation to Identify Chemicals in the Vicinity of the Portland Shipyard (Prepared by Dames & Moore, 1998).

In January 1998, Dames & Moore collected surface sediment samples from 12 stations in the vicinity of the Portland Shipyard. No project narrative, including objectives, methods, or sampling gear, is provided.

Stations were identified as DM-A through DM-L. All stations were located along the eastern shore between RM 7 and RM 11. Stations DM-A, DM-B and DM-C were located at RM 10.7; stations DM-D, DM-E, and DM-F were located at RM 9.9; DM-G was located at RM 9; DM-H was located at RM 8.3, DM-I and DM-J were located off Triangle Park at RM 7.7; and DM-K and DM-L were located off the McCormick & Baxter Site at RM 7. Surface samples were collected from the top 10 cm. All samples were analyzed for heavy metals, SVOCs, PCBs and TOC.

Results for indicator chemicals in surface samples are presented in the following tables. All results were reported in dry weight.

Summary Data for Surface Samples.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	2.88	5.86 (DM-B)

WLCT4J97. Sediment Characterization Study Terminal 4, Berth 416, Port of Portland (Prepared by Hart Crowser, March 1998).

The purpose of this investigation was to characterize sediment in the proposed maintenance dredging area in Terminal 4, Berth 416 in order to assess the quality of the proposed dredge prism and to determine appropriate dredged sediment disposal options. The dredge prism was divided into two separate DMMUs. Two sub-tidal sediment cores were collected within the prism for each DMMU. Two separate samples from cores HC-VC-102 and HC-VC-103 were submitted to characterize one DMMU, and a composite of cores HC-VC-104 and HC-VC-105 was submitted to characterize a second DMMU.

The methods by which the cores were collected, processed, and sub-sampled were not described in the report. Sediment from throughout the entire length of the cores was homogenized for each sample. Subsurface sediment samples were analyzed for metals, SVOCs, pesticides, PCBs, TBT, TOC, ammonia, sulfides, TVS, and total solids.

Organic carbon content ranged from 1.28 to 3.14 percent. Results for indicator chemicals in subsurface samples are presented in the following tables. All results were reported in dry weight.

Summary Data for Subsurface Samples.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	3.38 J	4.66 J (C104105)

RIEDEL97. Baseline Sediment Assessment (Prepared by Maul Foster & Associates, November 20, 1997).

Maul Foster & Associates completed two phases of work supporting Triangle Park's purchase of the former Zidell property, located immediately south of the McCormick & Baxter site. The first phase of work had no supporting data report, only a summary table and associated laboratory report. Data with the survey code, RIEDEL96, were collected in this first phase of work on August 30, 1996. The second phase of work, RIEDEL97, is reported in the Baseline Sediment Assessment, dated November 20, 1997.

In the first phase of work, divers collected seven cores (SED-1 through SED-7) by pushing 2.5-ft-long Shelby tubes into the sediment. Core lengths ranged from 0.6 to 1.6 ft. Stations were located nearshore, extending from the southern property boundary (SED-1) to the northern property boundary (SED-7). Samples were analyzed for metals, PCBs, and butyltins. Indicator chemical results (dry weight) are summarized below.

RIEDEL96 Summary Data for Surface Samples.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	4	35 (SED-4)
Cadmium (mg/kg)	1 U	1 U

Parameter	Minimum	Maximum (Location)
Copper (mg/kg)	na	na
Lead (mg/kg)	20 U	60 (SED-4)
Mercury (mg/kg)	na	na
Zinc (mg/kg)	na	na
TBT (µg/kg)	3 U	32,000 (SED-4)
bis(2-ethylhexyl)phthalate (µg/kg)	na	na
Total LPAH (µg/kg)	na	na
Total HPAH (µg/kg)	na	na
Total PCBs (µg/kg)	100 UA	200 UA (several samples)
2,3,7,8-TCDD (ng/kg)	na	na
Total DDT (µg/kg)	na	na
Dibenzofuran (µg/kg)	na	na
4-Methylphenol (µg/kg)	na	na
Diesel range hydrocarbons (mg/kg)	na	na
Xylenes (µg/kg)	na	na

In the second phase of work, Maul Foster & Associates collected eight cores using an impact corer and generally split the cores into surface samples (0-15 cm) and from one to five subsurface samples of various lengths. The longest core length was approximately 15 ft (up to 460 cm). Stations were distributed around the dock and pilings. Phase II sediment samples were analyzed for limited metals, limited SVOCs (including PAHs), and butyltins. Results for surface sediment samples and subsurface samples are provided below in separate tables. Results are reported in dry weight.

WLR0797. Results of July 1997 Willamette River Sediment Study (Prepared by U.S. Army Corps of Engineers, Portland District).

This Willamette River sediment study for a proposed channel deepening project is composed of laboratory data sheets for theUSACE, Portland District. No project narrative, including objectives, methods, sampling interval(s), or sampling locations, is provided. However, sediment chemistry data are provided for 18 surface sediment samples (including three composites and two field duplicates) and 34 subsurface sediment core samples (eight of which are field duplicates).

Surface sediment samples were collected on July 24-25, 1997, from the 0- to 10-in. depth interval. Surface sediments were analyzed for metals, SVOCs, TBT, DDT, PCBs, TVS, total solids, TOC, and grain size.

Subsurface sediment samples were collected from July 22-25, 1997. Core depths ranged from 6 to 20 ft. Sediment cores were sampled for layers of varying thickness. Subsurface sediment samples were also analyzed for the same parameters as for surface sediment.

Results for indicator chemicals in surface and subsurface samples are presented in the following tables. All results were reported in dry weight.

WLCASF97. Assessment of the Nature of PAH in Surface Sediments along the Southwestern Shore of Portland Harbor Superfund Site, Portland, OR (Prepared by Battelle, 2002).

This investigation consisted of surface sediment sampling to characterize the nature of PAHs in surface sediments along the southwestern shore of the Portland Harbor Superfund Site. Sediment sampling occurred from RM 4 to 9, including areas close to the Willbridge Area, Time-ExxonMobil-ARCO Terminals, BP (ARCO), Phillips Petroleum (Tosco), ChevronTexaco, and Time Oil, (collectively referred to as the Light Products Study Group; LPSG). The primary objective of this study was to use detailed chemical "fingerprinting" techniques to assess the nature and concentration of PAHs that occur within the Study Area.

Battelle Laboratory collected surface sediment (0 to 10 cm) from June 11 through June 13, 1997. Samples were collected using a 0.1-m^2 van Veen grab sampler, and 39 samples were collected. Thirty-six samples, including two field replicates and one trip blank, were analyzed. Most sediment samples collected represented 6 to 8 in. of penetration, except for stations in the Willbridge area (S-001 to S-013), which achieved penetration depths of 4 in. or less due to a clay substrate that prevented full penetration with the van Veen grab sampler. All samples were analyzed for TPH, PAHs, biomarkers, grain size, and TOC. Each of the sediment extracts was quantitatively analyzed in order to provide both concentration data and a fingerprint of the C_{27}-C_{35} pentacyclic triterpanes and C_{27}-C_{29} regular steranes and rearranged steranes. Also, qualitative distributions of the alkylcyclohexanes and C_{13}-$_{17}$ sesquiterpanes were also obtained.

WLCT4E97. Sediment Characterization Study River Terminal 4, Slip 3 Willamette River, Portland OR (Prepared by Hart Crowser, August 1997)

This investigation consisted of sediment sampling in order to characterize material to be removed during routine maintenance dredging at Terminal 4, Slip 3, Berth 410 and 411, RM 5, to maintain berth elevation of -40 ft below CRD. This investigation also determined the suitability of sediment for in-water disposal at the Morgan Bar disposal site. Sediments unacceptable for in-water disposal would be disposed of at an approved confined location.

Subsurface sediment sampling was conducted by Hart Crowser on May 4, 1997 using a vibracorer. Six cores were collected at approximately 100-ft intervals along a transect parallel to the dock face (HC-VC-01 through HC-VC-06). This provided two cores in each of the three DMMUs. The two cores from each DMMU were composited. Sediment cores at each location were collected from the sediment-water interface down to an elevation of -41.0 ft. The location of Sediment Samples HC-VC-01 and HC-VC-02 were moved closer to the face of the pier at the request of the USACE.

Subsurface Core ID	DMMU	Composite Sample ID	Approximate Interval	Interval Description
HC-VC-01	T4/1	HC-T4-01	0-4 ft	Proposed dredging depth (including 1-ft overdredge)
HC-VC-02				
HC-VC-03	T4/2	HC-T4-02	0-5 ft	Proposed dredging depth (including 1-ft overdredge)
HC-VC-04				
HC-VC-05	T4/3	HC-T4-03	0-5 ft	Proposed dredging depth (including 1-ft overdredge)
HC-VC-06				

All sediment samples were analyzed for metals, butyltins, phenols, LPAHs, HPAHs, chlorinated hydrocarbons, phthalates, miscellaneous extractables, PCBs, pesticides, and conventional parameters (grain size, percent solids, TVS, TOC, total sulfides, and ammonia).

At the request of the USACE, archived sediment samples collected from below the proposed dredge prism were submitted for the analysis of PAHs, TOC, cadmium, lead, and zinc.

WLCWQH99. Investigation of the Distribution of Organochlorine and Polycyclic Aromatic Hydrocarbon Compounds in the Lower Columbia River Using Semipermeable Membrane Devices, Portland, OR (Prepared by USGS, 1999).

Organochlorine compounds and PAH compounds are of concern because they can have important biological consequences at concentrations below the detection limits associated with conventional water-sampling techniques. The authors used semipermeable membrane devices (SPMDs) to sample water and achieved sub-part-per-quintillion detection limits. The SPMDs were deployed during low-flow conditions in 1997 and high-flow conditions in 1998, at nine mainstem sites and seven sites near the mouths of tributaries. Streambed sediment samples were collected at three sites in the Lower Columbia River. One of the sediment sample stations was at the mouth of the Willamette River. Sediment samples were processed by wet sieving through a 63-µm stainless steel sieve with site water. The sediment samples were placed in 1-qt methanol-rinsed glass containers, and shipped on ice to the laboratory for analyses.

Sediments were analyzed for polychlorinated dibenzo-p-dioxins, polychlorinated dibenzofurans, PCBs, organochlorine pesticides and related transformation products, and PAHs. Minimum and maximum concentrations are as follows:

WLCZDI00. Remedial Action Record of Decision Zidell Waterfront Property DEQ Northwest Region Voluntary Cleanup Program (Prepared by Oregon Department of Environmental Quality, June 2005).

DEQ prepared the record of decision (ROD), which presents the selected remedial action for the waterfront property owned by ZRZ Realty Company (Zidell) between RM 13 and 15. The remedial action addresses the presence of metals, PAHs, PCBs, and TBT and its degradation products in contaminated soil and/or sediment at the Zidell waterfront site.

The nature and extent of contamination found during the Willamette River sediment investigations included the sampling and analysis of 72 bulk sediment and 21 pore water samples. The COIs included in the analytical testing included PCBs, PAHs, metals, butyltins, and TPH. An additional investigation was conducted to characterize the contaminant distribution in the riverbank to support development of remedial alternatives for the feasibility study. A total of 28 transects were surveyed along the bank and soil samples were collected at elevations of approximately 13 ft and 24 ft City of Portland (COP) and analyzed for metals, PAHs, PCBs, and organotins. Four rounds of sampling were conducted to collect sediment samples from the Willamette River adjacent to the facility. Surface sediment is defined as sediment collected from the biologically active zone (to a depth of 30 cm below mudline). Subsurface sediment samples were collected at depths ranging from 1 to 10 ft below mudline.

WLCRIF01. Staff Report Proposed Remedial Action for Ross Island Sand and Gravel, Portland, OR (Prepared by Oregon Department of Environmental Quality, September, 2005).

DEQ prepared this report, which summarizes the more detailed information presented in the RI/FS reports prepared by DEQ in November 9, 1999. The Ross Island Sand and Gravel site is located on Ross and Hardtack Islands at approximately RM 15.

More than 70 surface sediment samples were collected and analyzed from the Ross Island Lagoon during the first and second phases of the investigation, which were completed by Ross Island Sand and Gravel. Phase I sediment data were entered into the project database under the survey code of WLCRIV99. The Port of Portland also conducted Phase I studies; data are provided under survey code WLCRIL99. In terms of Phase II data, the LWG uploaded data from surface sediment samples collected from two locations: the eastern channel outside of Ross Island Lagoon and upstream of Ross Island. The minimum and maximum concentrations reported in Phase II (i.e., samples collected outside of Ross Island Lagoon) are summarized in the following table.

Summary Data for Surface Samples.

Parameter	Minimum	Maximum (Location)
Arsenic (mg/kg)	2.19	3.69 (HS-1 RM 14)
Cadmium (mg/kg)	0.258 U	0.339 U (HS-1 RM 14)
Copper (mg/kg)	18.8	32 (HS-1 RM 14)
Lead (mg/kg)	7.13	9.86 (HS-1 RM 14)

WLTASE03. ODHS/EPA/ATSDR Fish Contaminant Study (Prepared by ODHS, USEPA and ASTDR, 2003).

This study was conducted by the Oregon Department of Health Sciences (ODHS), EPA, and ATSDR. The results presented in the following tables are from fish tissue collected by the Oregon Department of Fish and Wildlife (ODFW) and EPA from three species: sturgeon, Chinook salmon, and the Pacific lamprey. Sturgeon were collected using a set line, Chinook salmon were collected from the Clackamas Fish Hatchery using dip nets, and Pacific lamprey were collected at Willamette Falls using unknown methods. All concentrations shown are in wet weight.

Sturgeon Fillet without Skin (Collected August 11-13 and August 25-27, 2003).

WLCSLH01. Supplemental Investigation Report, Siltronic TZW Data (Prepared by Maul Foster & Alongi, Inc., September 8, 2005).

In 2004, Mual Foster and Alongi, Inc. (MFA) completed an in-river investigation of the lateral and vertical extent of trichloroethylene (TCE) and its degradation products in TZW and deeper groundwater. At DEQ's direction, the investigation also included data collection

for in-river impacts related to manufactured gas plants (MGPs). TZW samples (collected from 1-2 ft below mudline) were collected from eight locations between September 30, 2004 and October 29, 2004. The samples were collected with direct-push (Geoprobe®) equipment deployed from a barge, and using a peristaltic pump with dedicated (i.e., single-use) tubing. The TZW samples were analyzed for VOCs, PAHs, cyanide, and DRH. Surface sediment and deeper soil samples, along with deep groundwater samples, were also collected. The results were reported to DEQ, EPA, and its partners in a letter to Matt McClincy dated February 1, 2005 (re: Results of In-River Investigation).

In 2005, MFA completed a supplemental in-river investigation that completely delineated the lateral and vertical extent of TCE and its degradation products in TZW and deeper groundwater. At DEQ's direction, the investigation also included data collection for MGP-related impacts in the river. TZW samples (collected from 0-1 ft below mudline) were collected from 41 locations between May 9, 2005 and June 1, 2005. The samples were collected with direct-push (Geoprobe®) equipment deployed from a barge, and using a peristaltic pump with dedicated (i.e., single-use) tubing. The TZW samples at all locations were analyzed for VOCs. Thirteen TZW samples were also analyzed for PAHs, cyanide, and metals (unfiltered). Deep groundwater samples and surface water samples were also collected. The results were reported to DEQ, EPA, and its partners in MFA's Supplemental Investigation Report (September 8, 2005).

Summary Data for TZW Samples.

City of Portland Bureau of Environmental Services (BES) TSS Data (Sanders, D. 2006. Personal communication [compact disk of City of Portland BES Watershed Program data set, Portland, OR] provided to K. Pine, Integral Consulting Inc.).

These data are not included in the project database.

This investigation consisted of surface water monitoring conducted for characterization of the Willamette Rive as part of the BES watershed program. From February 1992 through March 2006, 2,520 TSS grab sub-samples were collected from RM 1.1 to 20.0. Samples were collected by means of a peristaltic pump at a depth of 10 ft from the surface from the eastern, middle, and western locations along a river transect and composited in one sample container.

Parameter	Minimum (Location/Date)	Maximum (Location/Date)
TSS (mg/L)	0.4 (Morrison St. Bridge 11/17/93) (Tryon Creek Bridge 12/28/93) (Morrison St. Bridge 10/5/94)	243 (Morrison St. Bridge 11/20/96)

WLCRPI04. Outfall 22B:

Remaining Remedial Investigation Technical Memorandum RPAC – Portland Site (Prepared by AMEC Earth & Environmental, Inc., February 4, 2003).

Remaining Remedial Investigation Technical Memorandum Addendum North Doane Lake Investigation RP – Portland Site (Prepared by AMEC Earth & Environmental, Inc., July 9, 2004).

Draft Outfall 22B Storm Sewer Sampling Report RP - Portland Site (Prepared by AMEC Earth and Environmental, Inc., March 24, 2005).

AMEC Earth and Environmental, Inc. (AMEC) collected and analyzed samples of outfall discharge water at City of Portland Outfall 22B as part of ongoing RI and monitoring studies

on behalf of Rhone-Poulenc Agro Chemicals (RPAC)/Starlink Logistics Inc. (SLLI) and under the direction of DEQ. Discharge water was sampled during non-stormwater events using a peristaltic pump with the sampling inlet located at a point in the middle of the exiting stream of water. Sample bottles were filled directly with no composite sampling. Laboratory analyses for all samples included pesticides, herbicides, dioxins and furans, VOCs, SVOCs, metals (including mercury), TSS, pH, anions, alkalinity, and hardness.

A total of five water samples (included in the summary data below) were collected during the following studies: Outfall 22B Storm Sewer Sampling, Sept. 3, 2004 (WLCRPI04OF22B040923); Remaining Remedial Investigation, Aug. 13, 2002 (WLCRPI04OF22B020813); and three other samples for which direct documentation is not available, collected on July 18, 1995, Apr. 18, 1994, and Oct. 1, 1993. These samples are mentioned in the Draft Outfall 22B Storm Sewer Sampling Report (AMEC 2003), but no detailed field sampling procedures were given. This outfall is due to be monitored annually by AMEC according to the Post-Characterization Groundwater Monitoring Plan (PCGMP, AMEC 2004).

COMPREHENSIVE ROUND 2 SITE CHARACTERIZATION SUMMARY AND DATA GAPS ANALYSIS REPORT

APPENDIX A2
SCRA DATABASE AND DATA MANAGEMENT

(SCRA Database Provided on Accompanying CD)

February 21, 2007

Prepared for
The Lower Willamette Group

Prepared by
Integral Consulting Inc.

1.0 INTRODUCTION

This appendix presents the site characterization and risk assessment (SCRA) database and the data management rules used to reduce the SCRA data set into the Nature and Extent data set used to present information in Sections 6.0 and 11.3 of the Comprehensive Round 2 Data Report. Further reduction and refinement of the SCRA data set was developed and completed by Kennedy/Jenks (Appendix F) and Windward Environmental (Appendix G) for risk analyses. The data management rules (including data reduction, data usability, and data quality) used to develop the SCRA dataset are described in Section 2.0 of the Comprehensive Round 2 Data Report.

2.0 SCRA DATABASE

Integral's LWG project database contains all of the data reported by the analytical laboratories. This includes field and lab replicates, lab dilutions, results for the same analyte from multiple analytical methods (SW8270 and SW8270-SIM, for example), and laboratory QA samples such as matrix spikes, surrogates, and method blanks. The data handling rules described in *Guidelines for Data Averaging and Treatment of Non-detected Values for the Round 1 Database* (Kennedy/Jenks et al. 2004) were used to create a data set for the SCRA data users that was simpler: the data set contained only one result per analyte per sample and excluded all of the laboratory QA results. This involved creating a SCRA database that excluded lab QA results, contained only the most appropriate dilution result and analytical method for each analyte, and contained the average of laboratory replicates. For purposes of reporting, both LWG and non-LWG data were combined into one SCRA database. Guidelines provided in Kennedy/Jenks et al. (2004) were consistently applied to all data sets. The resulting SCRA database is provided on CD accompanying this appendix.

3.0 NATURE AND EXTENT SCRA DATA SET

The data management rules used to refine the SCRA database for purposes of reporting the nature and extent of chemicals in the Study Area are described in this section.

3.1 CALCULATED TOTALS

Calculated totals were created for analytes evaluated on the basis of summed concentrations. The calculated totals include: total polychlorinated biphenyl (PCB) Aroclors, total PCB congeners, total polycyclic aromatic hydrocarbon (PAH), total low-molecular-weight PAH (LPAH), total high-molecular-weight PAH (HPAH), total DDD, total DDE, total DDT, total 4,4'-DDx, total DDx, total chlordanes, total endosulfans, total xylenes, total benzene + toluene + ethylbenzene + xylene (BTEX), total fines, total petroleum hydrocarbons (TPH), and total dioxins + furans (PCDD/F). All totals were T qualified to indicate that the values were manipulated values (i.e., summed or selected).

3.1.1 Summation Rules

Calculated totals are the sum of all detected concentrations. If all of the analytes were not detected, then the highest reporting detection limit was the selected value for the calculated total and the total was U-qualified to indicate the lack of detected values.

Results for all analytes were not always available for totals. Refer to Appendix C for all of the individual values and analytes that were used for the totals in each sample. In some cases, too few of the analytes were available to calculate a total. For example, some transition zone water samples were only analyzed for naphthalene, so total PAH and LPAH were not calculated.

3.1.2 Calculated Totals

Total PCBs were calculated as total PCB Aroclors and as total PCB congeners. Total PCB Aroclors represented the sum of Aroclors. Total PCB congeners represented the sum of the individual congeners.

Total LPAHs were calculated with the concentrations for 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, fluorene, naphthalene, and phenanthrene. Total HPAHs were calculated with the concentrations for fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzofluoranthenes, benzo(a)pyrene, indeno(1,2,3,-c,d)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene. Total PAHs were calculated with the concentrations of the individual LPAHs and HPAHs.

Total DDx were calculated with the concentrations of the six DDx compounds: 2,4′-DDD; 4,4′-DDD; 2,4′-DDE; 4,4′ DDE; 2,4′-DDT; and 4,4′-DDT. Total 4,4'-DDx were calculated with the three 4,4'-DDx compounds: 4,4'-DDD; 4,4'-DDE; and 4,4'-DDT. Total DDD were calculated with 2,4′-DDD and 4,4′-DDD, total DDE were calculated with 2,4′-DDE and 4,4′-DDE, and total DDT were calculated with 2,4′-DDT and 4,4′-DDT.

Total chlordanes were calculated as the sum of the following compounds: cis-chlordane, trans-chlordane, oxychlordane, cis-nonachlor, and trans-nonachlor.

Total endosulfans were calculated as the sum of alpha-endosulfan, beta-endosulfan, and endosulfan sulfate.

Total xylenes were calculated as the sum of m,p-xylene and o-xylene.

BTEX were calculated as the sum of benzene, toluene, ethylbenzene, and xylenes.

Total fines were calculated as the sum of all silt and clay grain-size fractions passing U.S. standard sieve #230 (0.0625 mm openings).

Total petroleum hydrocarbons were calculated as the sum of diesel-range hydrocarbons, residual-range hydrocarbons, and gasoline-range hydrocarbons.

Total PCDD/F were calculated as the sum of dioxin and furan homologs: tetrachlorodibenzo-p-dioxins, pentachlorodibenzo-p-dioxins, hexachlorodibenzo-p-dioxins, heptachlorodibenzo-p-dioxins, octachlorodibenzo-p-dioxin, tetrachlorodibenzofurans, pentachlorodibenzofurans, hexachlorodibenzofurans, heptachlorodibenzofurans, and octachlorodibenzofuran.

3.2 CALCULATION OF TOXICITY EQUIVALENTS

3.2.1 Calculation of PCB Congener TEQs

PCB congener toxic equivalents (TEQs) were calculated using the World Health Organization (WHO) consensus toxic equivalency factor (TEF) values for mammals (Van den Berg et al. 1998). TEQs were calculated as the sum of each congener concentration multiplied by the corresponding TEF value. When the congener concentration was reported as nondetected, then the TEF was multiplied by zero.

3.2.2 Calculation of Dioxin and Furan TEQs

Dioxin and furan TEQs were calculated using the WHO consensus TEF values for mammals (Van den Berg et al. 1998). The TEQ was calculated as the sum of each congener concentration multiplied by the corresponding TEF value. When the congener concentration was reported as nondetected, then the TEF was multiplied by zero.

3.3 SIGNIFICANT FIGURES

The laboratories provided results in electronic text files. The text values were maintained in the database so that the number of significant figures provided by the labs would not be lost by either the addition or removal of trailing zeros. For example, if the lab file contained 1.0, then that text string would be maintained to avoid conversion to either 1.00 or 1. In some cases, the lab reported value appeared to have only one significant figure (1, for example). But a minimum of two significant figures was assumed for all results, which was consistent with the standard reporting requirements of analytical laboratories.

During calculations, such as averaging replicates or summing for totals, all significant figures were carried through the calculation. The final result was then rounded to the smallest number of significant figures found in the values used in the calculation. For example: 7010 + 105 + 20.8 = 7135.8, and with three significant figures equals 7140.

4.0 QUALIFIER DEFINITIONS

The following qualifier definitions are applied to data contained in the SCRA database.

Qualifier	Qualifier Definition
B	Analyte found in associated blank.
E	Estimated because of interference or exceeds instrument range.
EG	Combined qualifier.
G	Estimate is greater than value shown.
GB	Combined qualifier.
GH	Combined qualifier.
H	Holding time exceeded.
J	Estimated value.
JB	Combined qualifier.
JK	Combined qualifier.
JP	Combined qualifier.
JT	Combined qualifier.
JV	Combined qualifier.
K	Peak detected but not meet QC.
L	Value is less than the maximum shown.
N	Presumptive evidence of a compound.
NJ	Combined qualifier.
NJT	Combined qualifier.
NT	Combined qualifier.
P	GC/HPLC criteria exceeded RPD>40% (>25% CLP pests)
R	Rejected.
RT	Combined qualifier.
T	Result derived or selected from >1 reported value.
T*	Detected below quantification limit shown.
U	Analyte was analyzed for but not detected.
UB	Combined qualifier.
UE	Combined qualifier.
UG	Combined qualifier.
UGH	Combined qualifier.
UH	Combined qualifier.
UI	Combined qualifier.
UIJ	Combined qualifier.
UJ	Combined qualifier.
UJP	Combined qualifier.
UJT	Combined qualifier.
UM	Combined qualifier.
UP	Combined qualifier.
UT	Combined qualifier.
UX	Combined qualifier.
V	In diesel range but doesn't match diesel standard.

Qualifier	Qualifier Definition
X	Recovery less than 10%.
Z	Fingerprint does not resemble petroleum product.
*	Sample not analyzed for 2,4'-DDx isomer, so 4,4'-DDx isomer may be used as surrogate for total of 2,4'- and 4,4'-DDx.

Table 1: DEQ Milestone Report
Controlling Confirmed or Suspected Upland Sources of Contamination to Portland Harbor

Note: Sites in this table are listed in order of their position alongside the Willamette River, or the "River Mile" associated with their location; the River Mile indicates distance from the Willamette River's confluence with the Columbia River.

= Shading indicates that upland source control work has been completed at the site.
= Orange indicates that the site is a high priority, or potentially high priority for source control.
= Yellow indicates that the site is a medium priority, or potentially medium priority for source control.
= Green indicates that the site is a low priority, or potentially low priority for source control.

Confirmed or suspected Sources of contamination to the river								Source Control Evaluation (SCE)								Source Control Decisions (SCDs) and Status of Source Control Measures (SCMs)								
Site information					Project status							Basis for determination that source control is needed												
Site name	ECSI #	River mile	Address	DEQ PM	Type of agreement directing source control	Project status	Date last modified (m-d-y)	Potential contaminant migration pathway	Status of SCE	Major SCE tasks to be completed	Schedule for completing SCE	Pathway determination	Pathway priority level	Site priority level	Status of EPA review of SCE decision	Source control alternatives evaluation and schedule (m-y)	Selected SCMs	Status of EPA review of SCM selection decision	SCM activities completed to date (m-y)	Mass or volume of contaminants controlled	Proposed SCM activities to be done and schedule (m-y)	Date SCM completed (m-y)	Status of EPA review of completed SCM	Operaton and maintenance requirements

Table 1: DEQ Milestone Report
Controlling Confirmed or Suspected Upland Sources of Contamination to Portland Harbor

= Shading indicates that upland source control work has been completed at the site.
= Orange indicates that the site is a high priority, or potentially high priority for source control.
= Yellow indicates that the site is a medium priority, or potentially medium priority for source control.
= Green indicates that the site is a low priority, or potentially low priority for source control.

Confirmed or suspected Sources of contamination to the river								Source Control Evaluation (SCE)								Source Control Decisions (SCDs) and Status of Source Control Measures (SCMs)

Table 1: DEQ Milestone Report
Controlling Confirmed or Suspected Upland Sources of Contamination to Portland Harbor

= Shading indicates that upland source control work has been completed at the site.
= Orange indicates that the site is a high priority, or potentially high priority for source control.
= Yellow indicates that the site is a medium priority, or potentially medium priority for source control.
= Green indicates that the site is a low priority, or potentially low priority for source control.

Table 1: DEQ Milestone Report
Controlling Confirmed or Suspected Upland Sources of Contamination to Portland Harbor

= Shading indicates that upland source control work has been completed at the site.
= Orange indicates that the site is a high priority, or potentially high priority for source control.
= Yellow indicates that the site is a medium priority, or potentially medium priority for source control.
= Green indicates that the site is a low priority, or potentially low priority for source control.

Confirmed or suspected **Sources** of contamination to the river								Source Control Evaluation (SCE)								Source Control Decisions (SCDs) and Status of Source Control Measures (SCMs)								
Site information					Project status							Basis for determination that source control is needed

Notes:
* - In cases where samples were not analyzed for 2,4'-DDx compounds, the 4,4 isomer results may used in this report as a surrogate for the sum of 2,4 and 4,4 DDx concentratio
B - Analyte detected in method blank
E - Estimated.
G - Estimate is greater than value shown
H - Holding time exceeded
J - The associated numerical value is an estimated quantity
M - Mean.
N - Presumptive evidence of presence of material; identification of the compound is not definitiv
P - GC/HPLC criteria exceeded RPD>40% (>25% CLP pesticides)
T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available re
U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation lim
X - Recovery less than 10%.
Z - Fingerprint does not resemble petroleum product

BZTO104(e)028286

Table C1-2. Summary Statistics for All Analytes, Subsurface Sediment, Study Area (≤ 13ft NAVD 88; RM 2-11).

					Detected Concentrations					Detected and Nondetected Concentrations				
Analyte	**Units**	**#**	**# Detected**	**% Detected**	**Minimum**	**Maximum**	**Mean**	**Median[a]**	**95th[a]**	**Minimum (full DL)**	**Maximum (full DL)**	**Mean (half DL)**	**Median (half DL)[a]**	**95th (half DL)[a]**

Notes:

[a] - This value was selected from an ascending ranked list of all results. Where n = the number of samples, the actual sample result corresponding to the rand of the closest integer to n * 0.95 (95th percentile) or n * 0.50 (median) is presented.
* - In cases where samples were not analyzed for 2,4'-DDx compounds, the 4,4 isomer results may used in this report as a surrogate for the sum of 2,4 and 4,4 DDx concentrations.
B - Analyte detected in method blank.
E - Estimated.
G - Estimate is greater than value shown.
H - Holding time exceeded.
J - The associated numerical value is an estimated quantity.
M - Mean.
N - Presumptive evidence of presence of material; identification of the compound is not definitive.
P - GC/HPLC criteria exceeded RPD>40% (>25% CLP pesticides).
T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other
U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.
X - Recovery less than 10%.
Z - Fingerprint does not resemble petroleum product.

BZTO104(e)028294

Table C1-3a. Summary Statistics for All Analytes, Surface Sediment, Study Area Riparian Zone (13ft-22ft NAVD 88; RM 2-11).

					Detected Concentrations					Detected and Nondetected Concentrations				
Analyte	Units	#	# Detected	% Detected	Minimum	Maximum	Mean	Median[a]	95th[a]	Minimum (full DL)	Maximum (full DL)	Mean (half DL)	Median[a] (half DL)	95th[a] (half DL)

Notes:

[a] - This value was selected from an ascending ranked list of all results. Where n = the number of samples, the actual sample result corresponding to the rank of the closest integer to n * 0.95 (95th percentile) or n * 0.50 (median) is presented.
* - In cases where samples were not analyzed for 2,4'-DDx compounds, the 4,4 isomer results may used in this report as a surrogate for the sum of 2,4 and 4,4 DDx concentrations.
B - Analyte detected in method blank.
E - Estimated.
G - Estimate is greater than value shown.
H - Holding time exceeded.
J - The associated numerical value is an estimated quantity.
M - Mean.
N - Presumptive evidence of presence of material; identification of the compound is not definitive.
P - GC/HPLC criteria exceeded RPD>40% (>25% CLP pesticides).
T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are
U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.
X - Recovery less than 10%.
Z - Fingerprint does not resemble petroleum product.

Notes:

[a] - This value was selected from an ascending ranked list of all results. Where n = the number of samples, the actual sample result corresponding to the rank of the closest integer to n * 0.95 (95th percentile) or n * 0.50 (median) is presented.
* - In cases where samples were not analyzed for 2,4'-DDx compounds, the 4,4 isomer results may used in this report as a surrogate for the sum of 2,4 and 4,4 DDx concentrations.
B - Analyte detected in method blank.
E - Estimated.
G - Estimate is greater than value shown.
H - Holding time exceeded.
J - The associated numerical value is an estimated quantity.
M - Mean.
N - Presumptive evidence of presence of material; identification of the compound is not definitive.
P - GC/HPLC criteria exceeded RPD>40% (>25% CLP pesticides).
T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in
U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.
X - Recovery less than 10%.
Z - Fingerprint does not resemble petroleum product.

Notes:

[a] - This value was selected from an ascending ranked list of all results. Where n = the number of samples, the actual sample result corresponding to the rank of the closest integer to n * 0.95 (95th percentile) or n * 0.50 (median) is presented.

* - In cases where samples were not analyzed for 2,4'-DDx compounds, the 4,4 isomer results may used in this report as a surrogate for the sum of 2,4 and 4,4 DDx concentrations.

B - Analyte detected in method blank.

E - Estimated.

G - Estimate is greater than value shown.

H - Holding time exceeded.

J - The associated numerical value is an estimated quantity.

M - Mean.

N - Presumptive evidence of presence of material; identification of the compound is not definitive.

P - GC/HPLC criteria exceeded RPD>40% (>25% CLP pesticides).

T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results

U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.

X - Recovery less than 10%.

Z - Fingerprint does not resemble petroleum product.

Notes:

[a] - This value was selected from an ascending ranked list of all results. Where n = the number of samples, the actual sample result corresponding to the rank of the closest integer to n * 0.95 (95th percentile) or n * 0.50 (median) is presented.

* - In cases where samples were not analyzed for 2,4'-DDx compounds, the 4,4 isomer results may used in this report as a surrogate for the sum of 2,4 and 4,4 DDx concentrations.

B - Analyte detected in method blank.

E - Estimated.

G - Estimate is greater than value shown.

H - Holding time exceeded.

J - The associated numerical value is an estimated quantity.

M - Mean.

N - Presumptive evidence of presence of material; identification of the compound is not definitive.

P - GC/HPLC criteria exceeded RPD>40% (>25% CLP pesticides).

T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other

U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.

X - Recovery less than 10%.

Z - Fingerprint does not resemble petroleum product.

BZTO104(e)028305

Notes:

[a] - This value was selected from an ascending ranked list of all results. Where n = the number of samples, the actual sample result corresponding to the rand of the closest integer to n * 0.95 (95th percentile) or n * 0.50 (median) is presented.
* - In cases where samples were not analyzed for 2,4'-DDx compounds, the 4,4 isomer results may used in this report as a surrogate for the sum of 2,4 and 4,4 DDx concentrations.
B - Analyte detected in method blank.
E - Estimated.
G - Estimate is greater than value shown.
H - Holding time exceeded.
J - The associated numerical value is an estimated quantity.
M - Mean.
N - Presumptive evidence of presence of material; identification of the compound is not definitive.
P - GC/HPLC criteria exceeded RPD>40% (>25% CLP pesticides).
T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results
U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.
X - Recovery less than 10%.
Z - Fingerprint does not resemble petroleum product.

Notes:

[a] - This value was selected from an ascending ranked list of all results. Where n = the number of samples, the actual sample result corresponding to the rand of the closest integer to n * 0.95 (95th percentile) or n * 0.50 (median) is presented.
* - In cases where samples were not analyzed for 2,4'-DDx compounds, the 4,4 isomer results may used in this report as a surrogate for the sum of 2,4 and 4,4 DDx concentrations.
B - Analyte detected in method blank.
E - Estimated.
G - Estimate is greater than value shown.
H - Holding time exceeded.
J - The associated numerical value is an estimated quantity.
M - Mean.
N - Presumptive evidence of presence of material; identification of the compound is not definitive.
P - GC/HPLC criteria exceeded RPD>40% (>25% CLP pesticides).
T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other
U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.
X - Recovery less than 10%.
Z - Fingerprint does not resemble petroleum product.

Notes:

[a] - This value was selected from an ascending ranked list of all results. Where n = the number of samples, the actual sample result corresponding to the rand of the closest integer to n * 0.95 (95th percentile) or n * 0.50 (median) is presented.
* - In cases where samples were not analyzed for 2,4'-DDx compounds, the 4,4 isomer results may used in this report as a surrogate for the sum of 2,4 and 4,4 DDx concentrations.
B - Analyte detected in method blank.
E - Estimated.
G - Estimate is greater than value shown.
H - Holding time exceeded.
J - The associated numerical value is an estimated quantity.
M - Mean.
N - Presumptive evidence of presence of material; identification of the compound is not definitive.
P - GC/HPLC criteria exceeded RPD>40% (>25% CLP pesticides).
T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results
U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.
X - Recovery less than 10%.
Z - Fingerprint does not resemble petroleum product.

Notes:

[a] - This value was selected from an ascending ranked list of all results. Where n = the number of samples, the actual sample result corresponding to the rand of the closest integer to n * 0.95 (95th percentile) or n * 0.50 (median) is presented.
* - In cases where samples were not analyzed for 2,4'-DDx compounds, the 4,4 isomer results may used in this report as a surrogate for the sum of 2,4 and 4,4 DDx concentrations.
B - Analyte detected in method blank.
E - Estimated.
G - Estimate is greater than value shown.
H - Holding time exceeded.
J - The associated numerical value is an estimated quantity.
M - Mean.
N - Presumptive evidence of presence of material; identification of the compound is not definitive.
P - GC/HPLC criteria exceeded RPD>40% (>25% CLP pesticides).
T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results
U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.
X - Recovery less than 10%.
Z - Fingerprint does not resemble petroleum product.

Notes:

[a] - This value was selected from an ascending ranked list of all results. Where n = the number of samples, the actual sample result corresponding to the rand of the closest integer to n * 0.95 (95th percentile) or n * 0.50 (median) is presented.
* - In cases where samples were not analyzed for 2,4'-DDx compounds, the 4,4 isomer results may used in this report as a surrogate for the sum of 2,4 and 4,4 DDx concentrations.
B - Analyte detected in method blank.
E - Estimated.
G - Estimate is greater than value shown.
H - Holding time exceeded.
J - The associated numerical value is an estimated quantity.
M - Mean.
N - Presumptive evidence of presence of material; identification of the compound is not definitive.
P - GC/HPLC criteria exceeded RPD>40% (>25% CLP pesticides).
T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other
U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.
X - Recovery less than 10%.
Z - Fingerprint does not resemble petroleum product.

Notes:
[a] - This value was selected from an ascending ranked list of all results. Where n = the number of samples, the actual sample result corresponding to the rand of the closest integer to n * 0.95 (95th percentile) or n * 0.50 (median) is presented.
J - The associated numerical value is an estimated qu
N - Presumptive evidence of presence of material; identification of the compound is not definitiv
T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results (e.g., for parameters reported by multiple methods) for the Round 2 data
U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation lim

Notes:
[a] - This value was selected from an ascending ranked list of all results. Where n = the number of samples, the actual sample result corresponding to the rand of the closest integer to n * 0.95 (95th percentile) or n * 0.50 (median) is presented.
G - Estimate is greater than value shown.
J - The associated numerical value is an estimated quant
N - Presumptive evidence of presence of material; identification of the compound is not definitive.
P - GC/HPLC criteria exceeded RPD>40% (>25% CLP pesticides).
T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results (e.g., for parameters reported by multiple methods) for the Round 2 data.
U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.

Notes:

J - The associated numerical value is an estimated quantity.

T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results (e.g., for parameters reported by multiple methods) for the Round 2 data.

U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.

Notes:
J - The associated numerical value is an estimated quantity.
T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results
U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.

Notes:

J - The associated numerical value is an estimated quantity.

N - Presumptive evidence of presence of material; identification of the compoun

T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results (e.g., for parameters reported by multiple methods) for the Round 2 data.

U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.

Notes:

J - The associated numerical value is an estimated quantity.

N - Presumptive evidence of presence of material; identification of tl

T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results (e.g., for parameters reported by multiple methods) for the Round 2 data.

U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.

Notes:

J - The associated numerical value is an estimated quantity.

N - Presumptive evidence of presence of material; identification of t

T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results (e.g., for parameters reported by multiple methods) for the Round 2 data.

U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.

Notes:

J - The associated numerical value is an estimated quantity.

N - Presumptive evidence of presence of material; identification

T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results (e.g., for parameters reported by multiple methods) for the Round 2 data.

U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.

Notes:

J - The associated numerical value is an estimated quai

N - Presumptive evidence of presence of material; ider

T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results (e.g., for parameters reported by multiple methods) for the Round 2 data.

U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.

Notes:
J - The associated numerical value is an estimated quantity.
N - Presumptive evidence of presence of material; identification of the comp
T - The associated numerical value was mathematically derived (e.g., from summing multiple analyte results such as Aroclors, or calculating the average of multiple results for a single analyte). Also indicates all results that are selected for reporting in preference to other available results (e.g., for parameters reported by multiple methods) for the Round 2 data.
U - The material was analyzed for, but was not detected. The associated numerical value is the sample quantitation limit.
