1 INTRODUCTION

This document presents the methodology and results of the evaluation of riverbank soil data at the Gasco Sediments Site for the potential presence of Oregon hot spots. This evaluation was conducted in support of the *Draft Engineering Estimate and Cost Analysis* (EE/CA) and generally followed the potential Oregon hot spot identification process outlined in the Oregon Department of Environmental Protection's (DEQ's) *Guidance for Identification of Hot Spots* (DEQ Hot Spot Guidance, DEQ 1998).

2 METHODS

2.1 Data Set

The riverbank soil dataset used in the potential Oregon hot spot screening is described in Appendix G. This dataset includes samples collected from locations ranging from 13 feet North American Vertical Datum (NAVD88) to the top of bank (see Figure 2-1) based on available survey information. Due to the highly armored nature of the Gasco and Siltronic riverbanks, data density within this zone is limited. For this reason, samples collected in very close proximity of the top of bank elevation (i.e., within approximately 5 feet) were also included in the dataset to provide additional data density. Note that Oregon hot spots in areas landward of the top of bank will be addressed as part of the upland feasibility study remedy evaluation. In addition, samples collected below the 13 feet NAVD88 contour were included in the riverbank soil data set to be consistent with DEQ direction in the "Draft Meeting Summary and Next Steps" document transmitted by Dana Bayuk of DEQ to Ben Hung of Anchor QEA in an email dated May 12, 2011 (DEQ 2011). However, these samples are located within the in-water portion of the Gasco Sediments Site. Sediment impacts in this area will be addressed consistent with the sediment remedy. Samples collected landward of the riverbank or below the 13 feet NAVD88 contour are indicated on Figure 2-1 (and subsequent figures) by a square symbol.

The data set was grouped into two categories by depth interval: 0- to 3.5-foot soils and 0- to 12-foot soils. The 0- to 3.5-foot depth category is approximated by using soil samples collected from the 0- to 5-foot depth intervals for locations sampled during the Gasco Sediments Site Data Gaps Investigation (Anchor QEA 2010) and samples collected from the 0- to 3.5-foot depth interval for all other locations. Refer to EE/CA Appendix A for additional detail on the Gasco Sediments Site Data Gaps Investigation. The 0- to 12-foot depth category consists of samples collected from the 0- to 12-foot depth interval for all locations.

2.2 Data Screen

The data were screened against potential Oregon hot spot screening levels for the Gasco Sediments Site chemicals of interest (COIs, as presented in Section 3.3 of the Statement of Work [SOW] attached to the Administrative Settlement Agreement and Order on Consent [AOC; Docket No. CERCLA 10-2009-0255]) presented on Tables 2-1 and 2-2. The screening was conducted on a point-by-point basis. This is a conservative approach for applying the human health screening levels and some of the ecological soil screening levels. These screening levels are more appropriately applied to exposure point concentrations calculated over larger

exposure areas, if those areas are known, for risk characterization purposes. These screening levels were derived generally following the DEQ Hot Spot Guidance, described as follows.

Table 2-1 presents the potential ecological Oregon hot spot screening levels derived from the following sources:

- Level II screening level values (SLVs) from Table 1 of the DEQ *Guidance for Ecological Risk Assessment* (DEQ 2001)
- U.S. Environmental Protection Agency (EPA) ecological soil screening levels (eco SSLs) from *EPA Ecological Soil Screening Levels for Zinc Interim Final* (EPA 2007c)
- EPA Region 5 ecological screening levels (ESLs) for soil from *Region 5 RCRA Ecological Screening Levels* (EPA2003)
- The alternative DEQ ecological soil screening level for dibenzofuran from a DEQ e-mail to NW Natural dated February 23, 2012
- The alternative cyanide ecological soil screening level from a October 31, 2011, memorandum from Taku Fuji and Kara Hitchko of Anchor QEA to Mr. Bayuk of DEQ entitled *Proposed Alternative Cyanide Screening Level*

Potential soil ecological hot spot screening levels were derived following DEQ hot spot guidance (DEQ 1988), which states that for non-threatened and endangered (non-T&E) species, the "highly concentrated" hot spot level is 50 times the screening benchmark value (SBV) or screening level value (SLV). As no T&E species have been identified as receptors for the Gasco upland exposure areas, this is the appropriate method to calculate soil highly concentrated "hot spot" levels. Therefore, for the DEQ SLVs that were derived based on the protection of individual T&E species receptors, which were already multiplied by a factor of five for screening of soil with no T&E receptors, an additional multiplier of ten was used to achieve a final multiplier of 50 consistent with DEQ Guidance. For the DEQ SLVs that were derived for the protection of populations (e.g., plant and invertebrate SLVs), these SLVs were multiplied by a factor of 50 consistent with DEQ Guidance. For chemicals without a DEQ SLV, the lowest of the screening levels shown on Table 2-1 was used for the potential hot spot screening. The 0- to 3.5-foot soil data were screened against the resulting list of potential ecological hot spot screening levels.

Table 2-2 presents potential human health Oregon hot spot screening levels derived from the following sources:

- Risk-based decision making (RBDM) risk-based concentrations (RBCs) from the DEQ Environmental Cleanup and Tanks Program table of *Risk-Based Concentrations for Individual Chemicals* (DEQ 2011)
- EPA regional screening levels (RSLs) for industrial soil from the EPA's *Regional Screening Level Summary Table* (EPA 2011)

Potential Oregon hot spot screening levels were derived from these sources by multiplying screening levels based on a carcinogenic endpoint by 100 and multiplying screening levels based on a non-carcinogenic endpoint by ten. This is because, per the DEQ hot spot guidance, hazard quotients (HQs, defined as result divided by screening level [without any multiplier applied to the screening level]) greater than 100 for carcinogenic endpoints and HQs greater than ten for a non-carcinogenic endpoint are indicative of potential human health hot spots.

Petroleum hydrocarbon RBCs were not included in the potential hot spot screen because they are based on mixtures. Note that a comparison of available petroleum hydrocarbon soil data to the RBCs indicates that no results exceed associated petroleum hydrocarbon RBCs. Refer to Appendix H for more detail on this comparison.

A single screening level for each COI was selected according to the following hierarchy: for 0- to 3.5 foot soils, the soil ingestion, dermal contact, and inhalation RBC for occupational workers was applied. For 0- to 12-foot soils, the lowest of the soil ingestion, dermal contact, and inhalation RBC for construction and excavation workers was applied. For all soils, the EPA RSL was applied for chemicals without an associated RBC.

3 RESULTS AND DISCUSSION

The results for the potential Oregon ecological hot spot, evaluation of 0- to 3.5-foot soil; potential human health Oregon hot spot, evaluation of 0- to 3.5-foot soil; and potential human health Oregon hot spot, evaluation of 0- to 12-foot soil are summarized below, presented in Tables 3-1, 3-2, and 3-3, and shown on Figures 3-1, 3-2, and 3-3.

3.1 Potential Ecological Hot Spots (Evaluation of 0- to 3.5-foot soil)

As presented in Table 3-1 and shown on Figure 3-1, one polycyclic aromatic hydrocarbon (PAH) was detected in soil samples at concentrations above potential ecological hot spot screening levels: naphthalene was detected in one location (GST-03) at concentrations above its associated potential hot spot screening level with a HQ of 110.

As shown on Figure 3-1, location GST-03 is located landward of the top of bank and is therefore outside of the Gasco Sediments Site. As described in Section 2.1, Oregon hot spots landward of the top of bank will be address as part of the upland feasibility study remedy evaluation (discussed in Section 1 of the EE/CA).

In addition, dibenzofuran was detected in five samples at concentrations above the DEQ SLV-based potential hot spot screening level. However, because all detected concentrations of dibenzofuran are below the DEQ's alternative screening level for dibenzofuran (85,000 micrograms per kilogram [µg/kg]), these exceedances are not considered indicative of potential ecological hot spots. These exceedances are not shown on Figure 3-1.

3.2 Potential Human Health Hot Spots (Evaluation of 0- to 3.5-foot soil)

As presented in Table 3-2 and shown on Figure 3-2, the concentrations of three PAHs were detected in samples at concentrations above potential human health hot spot screening levels for 0- to 3.5-foot soil.

- Benzo(a)pyrene was detected in six locations (GST-03, GST-05, SS-05, B-29, M-04-101, and MW-04-57) at concentrations above its associated potential hot spot screening level. The highest HQ for benzo(a)pyrene is 1,518.
- Benzo(a)anthracene and dibenzo(a,h)anthracene were detected in one location (GST-03) at concentrations above the associated potential hot spot screening level with HQs of 115 and 370, respectively.

The hot spot screening level exceedance at B-29 is considered indicative of a potential human health hot spot within the Gasco Sediment Site riverbank. As shown on Figure 3-2, station SS-05 is located below the 13 feet NAVD88 contour. Sediment impacts at this location will be addressed consistent with the sediment remedy. Stations GST-03, GST-05, M-04-101, and MW-04-57 (shown on Figure 3-2) are located landward of the top of bank and are therefore outside of the Gasco Sediments Site. Oregon hot spots landward of the top of bank will be addressed as part of the upland feasibility study remedy evaluation.

3.3 Potential Human Health Hot Spots (Evaluation of 0- to 12-foot soil)

As presented in Table 3-3 and shown on Figure 3-3, the concentrations of two analytes were detected in soil samples at concentrations above potential human health hot spot screening levels for 0- to 12-foot soil.

- Benzo(a)pyrene was detected in one location (GST-03) at a concentration above the associated potential hot spot screening level with a HQ of 195.
- Cyanide was detected in one location (P-5) at a concentration above the associated potential hot spot screening level, with a HQ 46.

As shown on Figure 3-3, stations GST-03 and P-5 are located landward of the top of bank and are therefore outside of the Gasco Sediments Site. Oregon hot spots landward of the top of bank will be addressed as part of the upland feasibility study remedy evaluation.

3.4 Summary and Discussion of Potential Hot Spots

In summary, the comparison of the riverbank soil data set to the screening levels in Tables 2-1 and 2-2 indicates the presence of a potential human health Oregon hot spot in the Gasco Sediments Site riverbank at one location, B-29, due to benzo(a)pyrene concentrations. The EE/CA remedial alternatives address the potential Oregon hot spots identified in riverbank areas (from 13 feet NAVD88 to the top of bank) through the application of both in-place and removal technologies. Refer to the EE/CA for more detail.

In addition, the screening of soil samples collected landward of the top of bank (outside of the Gasco Sediments Site) indicates the following additional potential hot spots:

- Potential ecological hot spot in 0- to 3.5-foot soil at location GST-03 due to naphthalene concentrations.
- Potential human health hot spots in 0- to 3.5-foot soil at locations GST-05, M-04-10, and

MW-04-57 due to benzo(a)pyrene concentrations.

- Potential human health hot spot in 0- to 3.5-foot soil at locations GST-03 due to benzo(a)pyrene, benzo(a)anthracene, and dibenzo(a,h,)anthracene concentrations.
- Potential human health hot spots in 0- to 12-foot soil at location GST-03 due to benzo(a)pyrene concentrations and at P-5 due to cyanide concentrations.

Oregon hot spots that are landward of the top of bank will be addressed consistent with the upland remedy feasibility study evaluations.

The potential hot spot screening level exceedance at station SS-05, located below the 13 feet NAVD88 contour, will be addressed consistent with the in-water sediment remedy. Refer to the EE/CA for more detail.

Table 2-1
Screening Levels for Potential Ecological Hot Spots

Notes:

[a] = 2,3,7,8 TCDD screening level used for PCB TEQ screening.

[b] = Potential hot spot screening level is multiplied by 10 to calculate a highly concentrated hot spot level because the NOAEL-based screening level was already multiplied by 5 (see associated notes).

[c] = Screening level is multiplied by 5 because the screening level is based on a NOAEL endpoint.

[1] = Refer to the source tables in the following footnotes for additional notes pertaining to the criteria listed in this table.

[2] = Potential hot spot screening levels were calculated generally following the DEQ's *Guidance for Identification of Hot Spots*, April 23, 1998. The following hiearchy was applied for selecting screening levels to be used in the potential hot spot evaluation: if a DEQ level II SLV was available, that value was used in the the potential hot spot evaluation. For chemicals without a DEQ SLV, the lowest of the screening levels shown on this table was used for potential hot spot screening. Consistent the DEQ guidance for non threatened and endangered species, an ultimate multiplier of 50 was used for all potential hot spot screening levels.

[3] = Values obtained fromEPA Ecological Soil Screening Levels for Zinc Interim Final (EPA 2007) (http://www.epa.gov/ecotox/ecossl/). Where more than one value is listed, then lowest is used for screening. A multiplier of 5 was applied to the bird and mammal screening levels.

[4] = Alternative DEQ screening level for dibenzofuran is from the DEQ e-mail to NW Natural dated February 23, 2012. This level is applied to carbazole as directed by DEQ. The screening level is multiplied by 5 because it is based on a NOAEL endpoint.

[5] = DEQ screening values from *Guidance For Ecological Risk Assessment*. Level 2 screening values. "Table 1 Screening Level Values for Plants, Invertebrates, and Wildlife Exposed to Soil and Surface Water" (DEQ revision 2001). When multiple values are listsed, the lowest was used. A multiplier of 5 was applied to the bird and mammal screening levels.

[6] = Alternative cyanide screening level is from the October 31, 2011, memorandum from Taku Fuji and Kara Hitchko of Anchor QEA to Dana Bayuk of DEQ entitled *Proposed Alternative Cyanide Screening Level*. The screening level is multiplied by 5 because it is based on a NOAEL endpoint.

[7] = EPA *Region 5 RCRA Ecological Screening Levels (ESLs) for Soil* (2003). Available at: http://www.epa.gov/reg5rcra/ca/pdfs/ecological-screening-levels-200308.pdf. Accessed March 21, 2012.

Acronyms:

µg/kg = microgram per kilogram
DEQ = Oregon Department of Environmental Quality
EPA = U. S. Environmental Protection Agency
ESL = ecological screening level
NOAEL = no observed adverse effect level
PCB = polychlorinated biphenyl
RCRA = Resource Conservation and Recovery Act
SLV = screening level value
Eco SSL = ecological soil screening level
TCDD = tetrachlorodibenzo-p-dioxin
TEQ = toxic equivalent quotient

Table 2-2
Screening Levels for Potential Human Health Hot Spots

Notes:

[a] = EPA RSL for Dichlorodiphenyldichloroethane used for screening.

[b] = EPA RSL for Dichlorodiphenyldichloroethylene used for screening.

[c] = EPA RSL for Dichlorodiphenyltrichloroethane used for screening.

[d] = 2,3,7,8 TCDD screening level used for PCB TEQ screening.

[e] = RBC not available because the constituent value for this pathway is greater than 100,000 mg/kg or 100,000 mg/l.

[f] = EPA RSL for endrin used for endrin ketone screening.

[g] = The dibenzofuran human health and ecological screening levels will be used for carbazole as directed by DEQ (DEQ email to NW Natural, February 23, 2012).

[1] = Refer to the source tables in the following footnotes for additional notes pertaining to the criteria listed in this table.

[2] = Potential hot spot screening levels were calculated generally following the DEQ's *Guidance for Identification of Hot Spots* , April 23, 1998. Screening levels were used for potential hot spot screening according to the following hierarchy: for 0- to 3.5-foot soils, the soil ingestion, dermal contact, and inhalation RBC for occupational workers was applied. For 0- to 12-foot soils, the lowest of the the soil ingestion, dermal contact, and inhalation RBC for construction and excavation workers was applied. For all soils, the EPA RSL was applied for chemicals without an associated RBC. A multiplier of 10 was used for screening levels derived from a non-cancer endpoint and a multiplier of 100 was applied to screening levels derived from a cancer endpoint.

[3] = EPA RSLs are from EPA RSL Summary Table November 2011 (EPA 2011a). Available at: http://www.epa.gov/region9/superfund/prg/. Accessed March 21, 2012.

[4] = RBDM RBCs are from DEQ Environmental Cleanup and Tanks Program table entitled "*Risk-Based Concentrations for Individual Chemicals,"* November 15, 2011 revision. Available at http://www.deq.state.or.us/lq/pubs/docs/RBDMTable.pdf. Accessed March 21, 2012.

Table 3-1
Potential Ecological Hot Spot Data Screen: 0- to 3.5-Foot Riverbank Soil

Notes:

Detected concentration is greater than potential hot spot screening level

Bold = Detected result

J = Estimated value

U = Compound analyzed, but not detected above detection limit

UJ = Compound analyzed, but not detected above estimated detection limit

R = Rejected

T = Result is the value of a total or calculation.

-- = Results not reported or not applicable

N = Normal Field Sample

a= the result is below the Oregon Department of Environmental Quality (DEQ) alternative screening level shown in Table 2-1 and therefore is not considered a potential hot spot based on this exceedance. Refer to Table 2-1 for additional detail.

The data set evaluated for potential ecological hot spots consists of soil samples collected from the 0- to 5- foot depth interval for locations sampled during the Gasco Sediments Site Data Gaps Investigation (GST-XX and GSM-XX locations) and soil samples collected from the 0- to 3.5- foot depth interval for all other locations shown. Refer to Appendix A for additional detail on the Gasco Sediments Site Data Gaps Investigation. Appendix G descrives the soil dataset screened.

Potential hot spot screening levels are presented on Table 2-1.

Soil samples were generally collected from locations between +13-foot NAVD88 and the top of bank.

Upland soil samples collected outside of the Gasco Sediments Site Area of Interest or below +13-foot NAVD88 were included in this evaluation for informational purposes. However, remedial decisions will not be made solely based on the evaluation of these upland samples.

Acronyms:

µg/kg = micrograms per kilogram

mg/kg = milligrams per kilogram

BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)

cPAH = carcinogenic PAH

cm = centimeters

DDD = Dichlorodiphenyldichloroethane

DDE = Dichlorodiphenyldichloroethylene

DDT = Dichlorodiphenyltrichloroethane

HPAH = high molecular weight polycyclic aromatic hydrocarbon

LPAH = low-molecular-weight PAH

LWG RA = Lower Willamette Group Risk Assessment

NAVD88 = North American Vertican Datum 1988

PCB = Polychlorinated biphenyl

Table 3-2
Potential Human Health Hot Spot Data Screen: 0- to 3.5-Foot Riverbank Soil

Notes:

Detected concentration is greater than potential hot spot screening level

Bold = Detected result

J = Estimated value

U = Compound analyzed, but not detected above detection limit

UJ = Compound analyzed, but not detected above estimated detection limit

R = Rejected

T = Result is the value of a total or calculation.

-- = Results not reported or not applicable

N = Normal Field Sample

a= the result is below the Oregon Department of Environmental Quality (DEQ) alternative screening level shown in Table 2-1 and therefore is not considered a potential hot spot based on this exceedance. Refer to Table 2-1 for additional detail.

The data set evaluated for 0- to 3.5- foot potential human health hot spots consists of soil samples collected from the 0- to 5- foot depth interval for locations sampled during the Gasco Sediments Site Data Gaps Investigation (GST-XX and GSM-XX locations) and soil samples collected from the 0- to 3.5- foot depth interval for all other locations shown. Refer to Appendix A for additional detail on the Gasco Sediments Site Data Gaps Investigation. Appendix G descrives the soil dataset screened.

Potential hot spot screening levels are presented on Table 2-2.

Soil samples were collected from locations between +13-foot North American Vertican Datum 1988 and the top of bank.

Upland soil samples collected outside of the Gasco Sediments Site Area of Interest were included in this evaluation for informational purposes. However, remedial decisions will not be made solely based on the evaluation of these upland samples.

Table 3-3
Potential Human Health Hot Spot Data Screen: 0- to 12-Foot Riverbank Soil

Notes:

Detected concentration is greater than potential hot spot screening level

Bold = Detected result

J = Estimated value

U = Compound analyzed, but not detected above detection limit

UJ = Compound analyzed, but not detected above estimated detection limit

R = Rejected

T = Result is the value of a total or calculation.

-- = Results not reported or not applicable

N = Normal Field Sample

The data set evaluated for 0- to 12- foot potential human health hot spots consists of soil samples collected from the 0- to 12- foot depth interval for all other locations shown. Appendix G descrives the soil dataset screened.

Potential hot spot screening levels are presented on Table 2-2.

Soil samples were collected from locations between +13-foot North American Vertican Datum 1988 and the top of bank.

Upland soil samples collected outside of the Gasco Sediments Site Area of Interest were included in this evaluation for informational purposes. However, remedial decisions will not be made solely based on the evaluation of these upland samples.

Acronyms:

µg/kg = micrograms per kilogram

mg/kg = milligrams per kilogram

BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)

cPAH = carcinogenic PAH

cm = centimeters

DDD = Dichlorodiphenyldichloroethane

DDE = Dichlorodiphenyldichloroethylene

DDT = Dichlorodiphenyltrichloroethane

HPAH = high molecular weight polycyclic aromatic hydrocarbon

LPAH = low-molecular-weight PAH

LWG RA = Lower Willamette Group Risk Assessment

PCB = Polychlorinated biphenyl

1 INTRODUCTION

This appendix presents the project data screen of Gasco Sediments Site data required under Section 3.4.1.2 of the Statement of Work (SOW) (Docket No. CERCLA 10-2009-0255). Pursuant to the SOW, available bulk sediment, riverbank soils, and water media chemistry data collected within the Gasco Sediment Site identified in the *Final Work Plan* (Anchor QEA 2010a; see Figure 1.2.1) were compared to ecological and human health screening levels and the screen results presented in data tables and on Geographic Information Systems (GIS) layers presented in Appendixes B and C, respectively, of the *Draft Project Area Identification and Data Gaps Report* (draft AIR; Anchor QEA 2010b).

Following its review of the Project AIR, the U.S. Environmental Protection Agency (EPA) provided comments on the screening levels in a May 4, 2009, memorandum. These comments were discussed during the June 3, 2010, monthly coordination meeting held between NW Natural, Siltronic, EPA, and the Oregon Department of Environmental Quality (DEQ). During this discussion, EPA stated that its pending comments on Risk Assessments on the Portland Harbor Superfund Site (Portland Harbor Site) *draft Portland Harbor RI/FS Remedial Investigation Report* (Integral et al. 2009) would affect the screening levels required for use in the Project AIR. In addition, NW Natural and DEQ were currently negotiating the upland risk assessment for the NW Natural "Gasco" property adjacent to the Gasco Sediments Site, which would also affect screening levels.

To facilitate incorporation of these pending screening level changes into the data screening of the existing dataset, EPA approved postponement of the revised data screening until the Portland Harbor Site draft RI comments are available and the upland risk assessment negotiations are complete. Because the results of the revised data screening would not affect delineation of the proposed initial Project Area and data gaps sampling, EPA also approved submittal of the *Final Project Area Identification and Data Gaps Report* (Project AIR) (Anchor QEA 2010a) without revision to the existing data screening.

This appendix presents the revised data screen. The revised data screen generally followed the methodology used in the draft AIR. Major revisions are as follows:

- Screening levels have been revised to be consistent with the Portland Harbor Site process and the Gasco upland risk assessment, and to incorporate the EPA comments provided in its February 3, 2010, comment letter. Refer to Attachment 1 to this appendix

for a detailed description of screening level revisions.

- The data screen has been revised to include data not available at the time of draft AIR development, primarily results from the Data Gaps Report (Appendix A to the draft Engineering Evaluation/Cost Analysis [EE/CA]) and the *Final Remedial Investigation Report, U. S. Government Moorings, Portland, Oregon* (U.S. Moorings RI; KTA and Tec 2010).

It is important to note that this data screening does not affect the Gasco Sediment Site remedy evaluation or decision making. This screening was completed for the sole purpose of complying with the data screening requirements set forth in the SOW. The data screening and evaluations performed in the EE/CA in accordance with the Portland Harbor Site process are used for evaluation of remedial alternatives for the Gasco Sediments Site.

1.1 Document Organization

The remainder of this document is organized into the following sections:

- Section 2 – Methods
- Section 3 – Results

The following attachments are attached to this document:

- Attachment 1 – Screening Level Revisions
- Attachment 2 – GIS layers (on CD)

2 METHODS

As described in Section 2.1, the SOW requires the screening of available data for samples collected within the Gasco Sediments Site (identified in the Final Work Plan, Anchor QEA 2010a) against ecological and human health risk-based screening levels consistent with the baseline risk assessment and draft final RI for the Portland Harbor Site. Only those chemicals of interest (COI) identified in Section 3.3 of the SOW were included in this data screening. The following subsections describe the screening process.

2.1 Screening Levels

The sediments, water, benthic toxicity, and soil screening levels used in this data screen are presented in Tables 2-1 through 2-4, respectively. Table 2-5 summarizes COIs without screening levels and Table 2-6 presents a matrix identifying the media to which each screening level was applied. Refer to Attachment 1 for additional detail.

2.2 Data Sources

The Site Characterization and Risk Assessment (SCRA) database developed for the Portland Harbor Site draft final RI (Integral et al. 2011) is the primary source of the data used in this screening. Additional data that were not included in the SCRA database and met the data quality requirements described in Section 2.2.2 (notably, the Data Gaps Investigation results provided in Appendix A of the EE/CA) were incorporated into this data screen. The original source documents for the data used for this screening are listed below:

- *Draft Source Control Evaluation Report, RPAC-Portland Site* (AMEC 2008)
- *NW Natural "Gasco" Site Draft Screening Level Nearshore Source Control Evaluation Results Report* (Anchor 2001)
- Public Review Draft Engineering Analysis/Cost Evaluation, Removal Action NW Natural "Gasco" Site" (Anchor 2005a)
- *Annual Data Evaluation Monitoring Report – Year 0 Long-Term Pilot Cap Monitoring* (Anchor 2007c)
- *Groundwater/NAPL Pilot Program Extraction Well and Performance Evaluation Design Report* (Anchor 2007f)
- *Offshore Investigation Report: NW Natural "Gasco" Site* (Anchor 2008b)
- *Annual Data Evaluation Monitoring Report – Year 1 Long-Term Pilot Cap Monitoring* (Anchor 2008d)

2.3 Data Quality Review and Categorization

In accordance with the SOW, existing chemistry data used in this screening were reviewed to establish whether the data achieve the Category 1 or Category 2 data categories requirements identified in the *Portland Harbor Programmatic Work Plan* (Integral et al. 2004). The categories were defined as:

- **Category 1.** Category 1 data are of known quality and are considered acceptable for use in decision making for the project. There is sufficient information on these datasets to confidently verify that the data, along with associated data qualifiers, accurately represent chemical concentrations present at the time of sampling.
- **Category 2.** Category 2 data are of generally unknown or suspect quality. The quality assurance and quality control (QA/QC) information shows that data quality is poor or suspect, or essential QA/QC data (e.g., surrogate recoveries, matrix spike/matrix spike duplicates) are either incomplete or lacking.

Project decisions will be based on analyses using Category 1 data that have had an EPA-approved level of data validation. Only Category 1 data were used in the data screening.

2.4 Analytes Screened

Only chemicals on the COC list in Section 3.3 of the SOW were included in this data screening. The project COC list is:

- Benzene, toluene, ethylbenzene, xylenes (BTEX)
- Polycyclic aromatic hydrocarbon (PAHs); naphthalene, acenaphthylene, acenaphthene, fluorene, phenanthrene, anthracene, fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzofluoranthenes, benzo(a)pyrene, indeno(1,2,3-c,d)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene), extended to include 2-methylnaphthalene
- Dibenzofuran and carbazole

- Cyanide (including total cyanide in sediment and total, available, and free forms in water samples)
- Zinc
- trichloroethene (TCE)
- cis-dichloroethylene (DCE)
- Trans- 1,2 dichloroethylene (trans-DCE)
- 1,1 dichloroethylene (1,1-DCE)
- Vinyl chloride
- Polychlorinated biphenyls (PCBs)
- Dichlorodiphenyltrichloroethanes (DDTs)
- dichlorodiphenyldichloroethanes (DDDs)
- dichlorodiphenyldichloroethylenes (DDEs)
- Diesel range hydrocarbons
- Residual range hydrocarbons
- Alpha-, beta- and gamma- benzene hexachlorides (BHCs)
- Endrin ketone

Table 2-7 presents the individual analytes that were included in the more general categories listed above (e.g., 4,4-DDT, which is one of the DDTs).

Several of the COCs were screened as both an individual analyte and as part of a calculated total. For example, benzo(a)pyrene was both screened against criteria specific to that individual analyte and included in a calculated result for total PAHs, where sufficient data exists to calculate a total PAH value. Calculated totals followed the summing rules applied to the Portland Harbor Risk Assessment and background dataset. The *draft Final Portland Harbor RI/FS Remedial Investigation Report* (Integral et al. 2011) describes the general summing rules and rules for including individual analytes in calculated totals, which are summarized below.

2.5 Summation Rules

The general summation rules for calculated totals are:

- Calculated totals are the sum of all detected concentrations with non-detected results for analytes included in the summation at one-half the detection limit.
- If none of the analytes are detected for a given sample, then the highest detection limit is used as the summation value.

Individual analytes were included in totals generally following the summing rules outlined in the Attachment F2 of the draft final Baseline Human Health Risk Assessment (BHHRA) of the *draft Final Portland Harbor RI/FS Remedial Investigation Report* (Integral et al. 2011) with the following exception. The draft Final BHHRA specifies that an individual analyte determined not to be present in the medium (according to the rules in Section 3.1 of the attachment), was not included in the sum. For the dataset in this AIR, all non-detects were included in summations at one-half the associated method detection limit (MDL; when available), regardless of whether the analyte was determined to be presence in the medium. The detection limit reported by the analytical laboratory was used when a MDL was not available. Individual analytes included in totals were as follows:

- *Total PCBs:* Sum of PCB Aroclors or PCB congeners. Total PCB Aroclors represent the sum of all reported Aroclors. Total PCB congeners represent the sum of all reported (up to 209) individual congeners. For this data screening, total PCB congeners were selected to represent total PCBs when available. If not available, total PCB Aroclors were selected.
- *PCB TEQs:* Toxic equivalency factors (TEFs) were used to calculate PCB toxic equivalency quotients (TEQs). Concentrations of congeners were multiplied by their TEFs to estimate toxicity of the congeners relative to 2,3,7,8-TCDD. Resulting concentrations were summed. TEFs are published by the World Health Organization for fish and birds (Van den Berg et al. 1998) and for mammals (Van den Berg et al. 2006).
- *Total DDx:* Total DDx is calculated from the six DDx compounds: 2,4′-DDD; 4,4′-DDD, 2,4′-DDE; 4,4′-DDE; 2,4′-DDT; and 4,4′-DDT. Total DDD were calculated with 2,4′-DDD and 4,4′-DDD; total DDE were calculated with 2,4′-DDE and 4,4′-DDE; and total DDT were calculated with 2,4′-DDT and 4,4′-DDT.
- *Total LPAHs:* Total low-molecular-weight PAHs (LPAHs) are the sum of 2-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, fluorene, naphthalene, and phenanthrene.
- *Total HPAHs:* Total high-molecular-weight PAHs (HPAHs) are the sum of fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzofluoranthene, benzo(a)pyrene, indeno(1,2,3,-c,d)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene.
- *Total PAHs:* Sum of the individual LPAHs and HPAHs.
- *Total cPAHs:* A benzo(a)pyrene (BaP) equivalent (BaPEq) concentration is calculated by multiplying the carcinogenic PAHs (cPAHs) by their respective potency equivalent factors (PEFs), and summing the resulting concentrations. PAHs classified as

carcinogenic are benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, BaP, indeno(1,2,3,-c,d)pyrene, and dibenzo(a,h)anthracene. PEFs were assigned according to EPA (1993) and are shown in Appendix A3 of the *draft Final Portland Harbor RI/FS Remedial Investigation Report* (Integral et al. 2011).

- *Total Xylene:* Sum of m,p-xylene, o-xylene, and xylene.

A minimum number of individual analytes for a given sample was required to be analyzed in order to complete the totals. These rules are provided in Table 2-8. Totals with less than the expected number of analytes but above the minimum number of analytes are qualified with an "A." For PCB TEQs, all analytes with TEFs were required in order to calculate a total.

2.6 Other Data Handling Rules

The following addition data handling rules were applied during the data screening process:

- Non-detects are considered to not exceed any screening level.
- Field duplicates were not included in the dataset.
- The N-qualifier signifies the presumptive evidence of an analyte; for metals, the matrix spike sample recovery is not within control limits, and for organics, the identification is tentative; the analyte exhibits low spectral match parameters but is present.
- The A and T qualifier is applied to all data when applicable. Table 2-8 shows when the A qualifier was added. The T-qualifier is applied when any type of calculation is applied. This includes summing totals, a result that is the average of lab repetitions, or field splits.

2.7 Data Selection and Grouping

The following sections describe the horizontal and vertical extents of the data included in the sediment, surface water, groundwater, transition zone water (TZW), and riverbank soil datasets, and methods used to group the data into sampling horizons (when media was grouped).

2.7.1 Sediment Data

For purposes of this screening, sediment is considered to be the riverbed material collected from location within the Gasco Sediments Site where the mudline elevation is less than or equal to 13 feet North American Vertical Datum of 1988 (NAVD88). Grab samples, sediment cores (all depths), and sediment trap data were included. Surface sediment, subsurface sediment, and

sediment trap sample locations included in the data screen are shown on Figures 2-1, 2-2, and 2-3, respectively.

Sediment data was separated into eight sample horizons (identified as Categories A through H). All elevations were referenced as depth below mudline. The categories were defined as follows:

- *Category A:* This sampling horizon includes data collected at depth intervals meeting the Portland Harbor Site definition of surface sediment that was identified as the 0 to 40-centimenter depth interval when querying data.
- *Category B:* This sampling horizon includes data collected within the 0- to 4-foot depth interval, excluding data that meets the Category A description.
- *Category C-F:* The category C, D, E, and F sampling horizons include data collected within the 4- to 8-foot, 8- to 12-foot, 12- to 16-foot, and 16- to 20-foot depth intervals, respectively.
- *Category G:* This sampling horizon includes data collected from depths greater than 20 feet.
- *Category H:* This sampling horizon includes samples considered representative of depth intervals that exceed 8 feet in length. These samples, which were labeled "long composites," were excluded from the above categories, regardless of the elevation where the sample was collected.

Samples collected at depth intervals that span more than one category and do not meet the Category H definition were grouped according to the following rules:

- The sample is associated with the horizon containing more than 50 percent of the sample.
- If a sample is equally split between two horizons, it is associated with the deeper horizon.

In addition, sediment trap data was handled separately, and is not grouped into the above-described sample horizons.

Select sediment data was excluded from the data screen as follows:

- Samples collected as part of the Gasco 2005 Removal Action in areas and at depth intervals where sediment was removed as part of the removal action, as documented in

the *Final Removal Action Completion Report (*Anchor 2006), were excluded from the sediment dataset.

- For stations where samples were collected during multiple sampling events in approximately the same location (i.e., co-located), data from the most recent event was screened. The older data were excluded from the sediment dataset.

2.7.2 TZW Data

The TZW dataset consists of pore water samples collected within the 0 to 38 centimeter interval of sediment in locations within the Gasco Sediments Site where the mudline elevation is less than or equal to 13 feet. TZW sample locations included in this screen are shown on Figure 2-4. This approach is consistent with the *draft Final Portland Harbor RI/FS Remedial Investigation Report* (Integral et al. 2011) Note, however, that the Lower Willamette Group (LWG) sampled the upper 30 centimeters of the sediment as an operational definition of this mixed layer, but in many cases it likely does not extend that deep. Therefore, the 0- to 38-centimeter interval is not necessarily considered representative of the mixing zone and the interval of exposure to people or aquatic organisms.

2.7.3 Groundwater Data

The groundwater dataset includes samples collected from within the Gasco Sediments Site as well as select soil samples collected in upland areas near the Gasco Sediments Site, but outside of the Gasco Sediments Site (i.e., samples just landward of the top of riverbank). The latter samples are included in the groundwater dataset to provide additional information on Gasco Sediments Site areas with low sample spatial density. Groundwater sample locations included in the screen are shown on Figure 2-5.

For the purposes of this screening, groundwater was separated into three depth intervals: fill, alluvial, and deep. Fill and alluvial groundwater samples collected from upland monitoring wells were delineated based on boring observations. In-water samples collected at an elevation below 100 feet NAVD88 were designated as "deep" samples. The remaining in-water samples were designated as "alluvial."

2.7.4 Riverbank Soil Data

The riverbank soil dataset includes samples collected from locations ranging from 13 feet NAVD88 to the top of bank based on available survey information. Due to the highly armored

nature of the Gasco and Siltronic riverbanks, data density within this zone is limited. For this reason, samples collected in very close proximity of the top of bank elevation (i.e., within approximately 5 feet) were also included in the dataset to provide additional data density. Note that areas landward of the top of bank will be addressed as part of the upland feasibility study remedy evaluation. In addition, samples collected below the 13 feet NAVD88 contour were included in the riverbank soil dataset to be consistent with DEQ direction in the "Draft Meeting Summary and Next Steps" document transmitted by Dana Bayuk of DEQ to Ben Hung of Anchor QEA in an e-mail dated May 12, 2011 (DEQ 2011). However, these samples are located within the in-water portion of the Gasco Sediments Site. Sediment impacts in this area will be addressed consistent with the sediment remedy.

The dataset was grouped into two categories by depth interval: 0- to 3.5-foot soils and 0- to 12-foot soils. The 0- to 3.5-foot depth category consists of soil samples collected from the 0- to 5-foot depth interval for locations sampled during the Gasco Sediments Site Data Gaps Investigation and samples collected from the 0- to 3.5-foot depth interval for all other locations. Refer to EE/CA Appendix A for additional detail on the Gasco Sediments Site Data Gaps Investigation. The 0- to 12-foot depth category consists of samples collected from the 0- to 12-foot depth interval for all other locations. Figures 2-6 and 2-7, respectively, show the 0- to 3.5-foot and 0- to 12-foot sample locations included in the data screen.

2.7.5 Surface Water Data

The surface water dataset consists of surface water samples collected that were either specifically collected to characterize the Gasco Sediments Site or were collected in the Willamette River from river mile (RM) 6.0 to 6.7. Figure 2-8 shows the location of surface water samples included in the data screen. The samples are grouped into the following three sampling horizons for the purposes of this data screening:

- Surface-depth (i.e., within a few feet of the water surface)
- Mid-depth
- Near-bottom (i.e., within a few feet of the river bottom)

It is important to note that these horizons are only intended to support this screening and may not be representative of actual exposures to either people or aquatic organisms that are the subject of water quality criteria. In the Portland Harbor Site process, for example, it has been agreed that for certain types of exposure assessments surface water should be evaluated using

vertically and horizontally integrated samples for comparison to water quality criteria and water Preliminary Remediation Goals (PRGs).

All surface water samples collected in the Gasco Sediments Site were included except for samples collected during the 2005 Removal Action construction. These construction data were not considered representative of normal ambient site conditions and were therefore omitted from the data screening. Samples from the 2005 Removal Action monitoring that were collected during development of the background conditions prior to construction were included in the dataset.

2.7.6 Benthic Toxicity Data

The benthic toxicity dataset consists of benthic toxicity data collected by the LWG and during the Data Gaps Investigation. Figure 2-9 shows the location of sediment stations for the bioassay results screened. As discussed in Appendix A of the EE/CA, the data gaps bioassay testing was conducted in two phases because the initial results for the midge bioassays were determined to be unsuitable for regulatory decision-making based on high variability within replicate test treatments and because the performance standards established for reference sediments were not met. Midge data from the first phase of data gaps tests is not included in this dataset for this reason. Refer to Anchor QEA's March 21, 2011, memorandum to EPA for additional detail on this issue.

3 RESULTS AND DISCUSSION

The data screen results are presented as follows:

- Tables 3-1 through 3-12 present summary statistics (such as number of samples, number of samples with a particular chemical detected, etc.) for the data by media and depth category.
- Tables 3-13 through 3-44 present the data screen results by media and depth category.
- Tables 3-45 through 3-47 present the benthic toxicity results.
- Figure 3-1 presents bioassay sample results.
- Attachment 2 presents GIS layers depicting the data screen results.

For tables 3-13 through 3-44 and the GIS layers, results above the associated screening levels are highlighted. The color of the highlight indicates the number of screening levels that were exceeded for the identified concentration, as defined in the table notes. The color coding scheme was maintained across all screened media to facilitate efficient cross-media exceedance count comparisons. Due to the number of screening levels used, separate data screening summary tables are provided for the human health, ecological, and background screening levels.

Bioassay results are presented in Tables 3-45 through 3-47 and on Figure 3-1. Refer to EE/CA Section 2.5.4 and EE/CA Appendix A for additional detail on the interpretation of these bioassay results.

Maps showing the screening level exceedances for each COI for each media within the identified depth intervals are provided in GIS layers in Attachment 2 in lieu of published maps. The GIS layers can be viewed by downloading ArcReader from http://www.esri.com/software/arcgis/arcreader/download.html. Locations with concentrations above the associated screening levels are highlighted on the maps and can be easily viewed and overlaid for various COIs within each media. Identical to the above-described results tables, the color of the highlight indicates the number of screening levels that were exceeded for the identified concentration, as defined in the table notes. The color coding scheme was maintained identical to the summary tables to maintain consistency across the table and figure highlights.

It is important to note that this data screening does not affect the Gasco Sediments Site remedy evaluation or decision-making. This screening was completed for the sole purpose of complying with the data screening requirements set forth in the SOW. The data screening and evaluations performed in the EE/CA in accordance with the Portland Harbor Site process are used for evaluation of remedial alternatives for the Gasco Sediments Site.

Table 2-1
Sediment Screening Levels[1]

Notes:

a = UPL not available, 95-percentile value used for screening this COI

c = EPA RSL for Dichlorodiphenyldichloroethane used for total Dichlorodiphenyldichloroethane screening.
d = EPA RSL for Dichlorodiphenyldichloroethylene used for total Dichlorodiphenyldichloroethylene screening.

e = EPA RSL for Dichlorodiphenyltrichloroethane used for total Dichlorodiphenyltrichloroethane screening.

f = Criteria for cPAH BaPEq used for Total cPAH screening.

g = No hill top number listed because the area-wide average in the Gasco Area of Interest is below the Portland Harbor PRG for this COI. A replacement value of 8.8 ug/kg was used in the hill topping routine.

h = Screening concentration for total polychlorinated biphenyls congeners used for total polychlorinated biphenyls screening.

I = Screening concentration for total polychlorinated biphenyls aroclors used for total polychlorinated biphenyls screening.

j = EPA RSL for xylene, mixture used for xylene screening.

k = Background level for total DDx - LWG case used for total DDx screening.

l = EPA RSL for polychlorinated biphenyls (high risk) used for total polychlorinated biphenyls screening.

m = Criteria for m-Xylene used for m,p-Xylene screening.

p = SQG for total polychlorinated biphenyls aroclors used for total polychlorinated biphenyls screening.

q = Background for total polychlorinated biphenyls congeners + aroclors used for total polychlorinated biphenyls screening

r = UPL not available, mean value used for screening this COI

u = HH Clam Consumption, high consumption rate 18 g/day, 10^-5, OC normalized. A replacement value of 5.9 mg/kg-OC was used in the hill topping routine.

v = HH HF Fisher Beach Sediment Direct Contact 10^-6 (cPAH). A replacement value of 423 ug/kg was used in the hill topping routine.

x = HH Adult Fish Consumption - Small Mouth Bass - Low IR - 10^-4. A replacement value of 29.5 ug/kg was used in the hill topping routine.

y = SLV for Dichlorodiphenyltrichloroethane used for Dichlorodiphenyltrichloroethane metabolite screening.

z = 2,3,7,8 Tetrachlorodibenxo-p-dioxin screening level used for polychlorinated biphenyl TEQ screening.

[1] = Refer to the source tables referenced in the following footnotes for additional notes pertaining to the criteria listed in this table.

[2] = BHHRA Screening Concentrations are from Table 2-11 of Draft BHHRA (Appendix F of the Portland Harbor RI/FS, Draft Final Remedial Investigation Report [Integral et al. 2011]).

[3] = BHHRA Screening Concentrations are from Table 2-9 of Draft BHHRA (Appendix F of the Portland Harbor RI/FS, Draft Final Remedial Investigation Report [Integral et al. 2011]).

[4] = Portland Harbor RALs are high and low RALs developed based on the August 23, 2011 Response to EPA August 11 2011 Alternatives Letter. From LWG to EPA (Private communication, EPA 2011)

[5] = EPA RSLs are from EPA Regional Screening Level (RSL) Summary Table November 2011 (EPA 2011a). Available at: http://www.epa.gov/region9/superfund/prg/. Accessed March 23, 2011.

[6] = BERA Screening Concentrations are from Tables 7-22, 8-12, 8-14, and 8-28 of Draft Final BERA (Appendix G of the Portland Harbor RI/FS, Draft Final Remedial Investigation Report [Integral et al. 2011]). The lowest screening level listed in these tables for each COI was selected.

[7] = SL2s are from SQV Report Final June 9, 2010. Table ES-1: Recommended Sediment Quality Guidelines. Development of Benthic SQVs for Freshwater Sediments in Washington, Oregon, and Idaho.

[8] = Surface sediment background UPLs are obtained from Table 7.3-5b. Upriver Surface Sediment Central Tendency and Upper Threshold Statistics, Dry Weight Concentrations, Primary Outliers Removed, from Portland Harbor RI/FS, Draft Final Remedial Investigation Report [Integral et al. 2011]. Criteria used are those with outliers excluded.

[9] = OC-eq surface sediment background UPLs are obtained from Table 7.3-6b. Upriver Surface Sediment Central Tendency and Upper Threshold Statistics, OC-Equivalent Dry Weight Concentrations, Primary Outliers Removed, from Portland Harbor RI/FS, Draft Final Remedial Investigation Report (Integral et al. 2011). Criteria used are those with outliers excluded.

[10] = Values from DEQ's Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment, Table A1a "Sediment Bioaccumulation Screening Level Values (SLVs) (DEQ 2007). Lowest population level value was used when multiple values are listed.

[11] = Benthic risk thresholds are from the Draft Final BERA (Appendix G of the Portland Harbor RI/FS, Draft Final Remedial Investigation Report [Integral et al. 2011]). The lowest screening level listed in these tables for each COI was selected.

Table 2-1
Sediment Screening Levels [1]

Acronyms:

BaPEq = Benzo(a)pyrene equivalent
BERA--Biological Ecological Risk Assessment
BHHRA--Biological Human Health Risk Assessment
COI = Contaminant of Interest
cPAH = Carcinogenic Polycyclic Aromatic Hydrocarbon
DDx = Sum of all six Dichlorodiphenyltrichloroethane isomers
DEQ = Oregon Department of Environmental Quality
DW-Dry Weight
EPA = U.S. Environmental Protection Agency
HF = high frequency
HPAH = High-mulecular-weight Polycyclic Aromatic Hydrocarbon
kg = kilogram
LOAEL = Lowest Observed Adverse Effect Level
LPAH = Low-molecular-weight Polycyclic Aromatic Hydrocarbon
LWG = Lower Willamette Group
LWR = Lower Willamette River
mg = milligram
NOAEL = No Observable Adverse Effect Level
OC = Organic Carbon
OC-Eq = Organic Carbon Equivalent
pMAX = Maximum Probability of Toxicity
RAL = Remedial Action Level
RI/FS = Remedial Investigation/Feasibility Study
RSL = Regional Screening Levels
SL = Screening Level
SL2 = Screening Level 2
SLV = Screening Level Value
SQG = Sediment Quality Guideline
SQV = Sediment Quality Value
TEQ = toxic equivalent quotient
ug = microgram (also µg)
UPL = Upper Percentile Limit

Table 2-2
Water Screening Levels[1]

Notes:

a = EPA RSL for Dichlorodiphenyldichloroethane used for sum Dichlorodiphenyldichloroethane screening.
b = EPA RSL for Dichlorodiphenyldichloroethylene used for sum Dichlorodiphenyldichloroethylene screening.
c = EPA RSL for Dichlorodiphenyltrichloroethane used for sum Dichlorodiphenyltrichloroethane screening.
d = DEQ RBDM RBC for Dichlorodiphenyldichloroethane (4-4' Dichlorodiphenyldichloroethane) used for sum Dichlorodiphenyldichloroethane screening.
e = DEQ RBDM RBC for Dichlorodiphenyldichloroethylene (4-4' Dichlorodiphenyldichloroethylene) used for sum Dichlorodiphenyldichloroethylene screening.
f = DEQ RBDM RBC for Dichlorodiphenyltrichloroethane (4-4' Dichlorodiphenyltrichloroethane) used for sum Dichlorodiphenyltrichloroethane screening.
g = EPA RSL for PCBs (low risk) used for total PCBs screening.
h = EPA RSL for xylene, mixture used for xylenes screening.
I = Criteria based on a dissolved zinc concentration.
j = Freshwater criteria for Dichlorodiphenyltrichloroethane and its metabolites used for Dichlorodiphenyldichloroethane, Dichlorodiphenyldichloroethylene, Dichlorodiphenyltrichloroethane screening.
k = National AWQC for total PCBs used for individual congeners and aroclors screening.
l = Human Health for consumption of water + organism criteria for 4,4'-Dichlorodiphenyldichloroethane used for sum Dichlorodiphenyldichloroethane screening.
m = Human Health for consumption of water + organism criteria for 4,4'-Dichlorodiphenyldichloroethylene used for sum Dichlorodiphenyldichloroethylene screening.
n = Human Health for consumption of water + organism criteria for 4,4'-Dichlorodiphenyltrichloroethane used for sum Dichlorodiphenyltrichloroethane screening.
o = Criteria for m-Xylene used for m,p-Xylene screening.
p = Background for total PCBs congeners used for total PCBs screening
q = Screening level for zinc is based on a hardness of 25 mg/l. From EPA. 2000. National Recommended Water Quality Criteria: 2002.
r = TRV based on dissolved criteria; TRV was compared to dissolved concentration.
s = Groundwater RBC not listed because the value exceeds the solubility limit.
t = Criteria based on free cyanide concentration.
u = 2,3,7,8 Tetrachlorodibenxo-p-dioxin screening level used for PCB TEQ screening.
v = Total DDx – sum of all six Dichlorodiphenyltrichloroethane isomers
w = 95 percentile used when UPL not available
x = Background value for PCB-156 & 157 used for screening.

[1] = Refer to the source tables in the following footnotes for additional notes pertaining to the criteria listed in this table.

[2] = RI Human Health Screening Criteria for Surface Water are from Table D3.3-1 of Appendix D of the *Draft Final Portland Harbor RI/FS Remedial Investigation Report* (Integral 2011c). Screening Evaluation of Surface Water Against Human Health Screening Criteria, Appendix D.

[3] = RI Human Health Screening Criteria for Surface Water are from Table D3.3-2 of Appendix D of the *Draft Final Portland Harbor RI/FS Remedial Investigation Report* (Integral 2011c).

[4] = EPA RSLs are from *EPA Regional Screening Level (RSL) Summary Table* November 2011 (EPA 2011a). Available at http://www.epa.gov/region9/superfund/prg/. Accessed March 23, 2011.

[5] = MCLs are from EPA 816-F-09-004, *National Primary Drinking Water Regulations* (EPA 2009).

[6] = Criteria are from *National Recommended Water Quality Criteria,* Office of Water, Office of Science and Technology, Updated 2009, Available from: http://water.epa.gov/scitech/swguidance/standards/current/index.cfm

[7] = RBDM RBCs are from DEQ Environmental Cleanup and Tanks Program table entitled "Risk-Based Concentrations for Individual Chemicals", November 15, 2011 revision, available at http://www.deq.state.or.us/lq/pubs/docs/RBDMTable.pdf. Accessed March 23, 2011.

[8] = The Upland RA Ecological Receptor Screening Levels presented follow the hierarchy presented in the screening level matrix attached to the letter from Jim Anderson of DEQ to Bob Wyatt of NW Natural regarding: “Summary of Agreements on the Remaining Uplands Risk Assessment Issues, NW Natural “Gasco” Site” dated January 5, 2012. This hierarchy states that the secondary criteria are only used when criteria are unavailable from the previous reference(s).

[9] = Oak Ridge National Laboratory's Tier II SCV values are from Suter, G.W. II, and Tsao, C.L. 1996. *Toxicological Benchmarks for Screening Potential Contaminants of Concern for Effects on Aquatic Biota* : 1996 Revision. ES/ER/TM-96/R2. Available at: http://www.esd.ornl.gov/programs/ecorisk/documents/tm96r2.pdf.

[10] = Screening values are from EPA, 2003, *Procedures for the Deribation of Equilibrium Partitioning Sediment Benchmarks for the Protection of Benthic Organisms: PAH Mixtures. Final Chronic Values for PAHs* . EPA-600-R-02-013, Table 3-4 "Toxicity of PAHs in Water Exposures".

[11] = Screening values are from EPA 2006, *EPA Region III BTAG, Freshwater Screening Criteria* .

[12] = Cyanide Screening level from Eisler, Ronald. 1991. *Cyanide Hazards to Fish, Wildlife, and Invertebrates: A Synoptic Review- U.S. Fish Wildlife Service* , Biol. Rep. 85(1.23).

[13] = DEQ Screening values are from Table 1 Screening Level Values for Plants, Invertebrates, and Wildlife Exposed to Soil and Surface Water from the *Guidance For Ecological Risk Assessment, Level 2 screening values, DEQ* December 2001. When multiple values existed, the lowest was used. A 5x multiplier was applied to bird and mammal SLVs.

[14] = Surface Water TRVs are from the *Draft Final of Portland Harbor RI/FS Remedial Investigation Report* "Table 6-2. Water TRVs for Surface Water COIs" of Draft Final BERA (Appendix G of the Baseline Ecological Risk Assessment Attachment 5 SLERA and Refined Screen [Winward Environmental LLC. July 1, 2011]

[15] = TZW TRVs are from *Draft of Portland Harbor RI/FS Remedial Investigation Report* "Table 7-2. Water TRVs for TZW COIs" of Draft BERA (Appendix G of the Baseline Ecological Risk Assessment Attachment 5 SLERA and Refined Screen [Winward Environmental LLC. July 1, 2011]

[16] = Background UPLs are from "Table 7.4-4a: Upriver Surface Water Upper Threshold Calculations, Total Concentration Basis, Outliers Removed" of *Draft Final Portland Harbor RI/FS Remedial Investigation Report* (Integral et al. 2011). Criteria used are those with outliers excluded.

[17] = '-- = RBC value not available

Table 2-2
Water Screening Levels[1]

Acronyms:

AWOC = Ambient Water Quality Criteria
BERA = Biological Ecological Risk Assessment
BHHRA = Biological Human Health Risk Assessment
BTAG = Biological Technical Assistance Group
CCC = Criterion Continuous Concentration
CMC = Criterion Maximum Concentration
COI = Chemical of Interest
cPAH = Carcinogenic Polycyclic Aromatic Hydrocarbon
CWA = Clean Water Act
DDx = Sum of all six Dichlorodiphenyltrichloroethane isomers
DEQ = Oregon Department of Environmental Quality
ESB = Equilibrium Partitioning Benchmarks
EPA = U. S. Environmental Protection Agency
GW = Ground Water
HPAH = High-molecular-weight Polycyclic Aromatic Hydrocarbon
JSCS = Joint Source Control Strategy
L = liter
LPAH = Low-molecular-weight Polycyclic Aromatic Hydrocarbon
LWR = Lower Willamette River
MCL = Maximum Contaminant Level
NRWQC = National Recommended Water Quality Criteria
PAH = Polycyclic Aromatic Hydrocarbon
RA = Risk Assessment
RBC = Risk-Based Concentrations
RBDM = Risk-Based Decision Making
RI/FS = Remedial Investigation/Feasibility Study
RI = Remedial Investigation
RSL = Regional Screening Level
SCV = Secondary Chronic Value
SDWA = Safe Drinking Water Act
SLERA = Screening Level Ecological Risk Assessment
SLV = Screening Level Value
TEQ = Toxic Equivalent Quotient
TRV = Toxicity Reference Value
TZW = Transition Zone Water
ug = microgram (also µg)
UPL = Upper Percentile Limit

Table 2-3
Benthic Toxicity Screening Criteria

	REV (L1) Threshold (%)	Low (L2) Threshold (%)	High (L3) Threshold (%)
Chironomus dilutus survival	93.9	84.5	75.1
Chironomus dilutu s biomass	91.0	81.9	72.8
Hyalella azteca survival	88.1	79.3	70.5
Hyalella azteca biomass	73.6	66.2	58.9

Notes:

[1] = Criteria obtained from Table 6-2 - Biological Effects Levels Based on the REV of the Draft Final BERA (Appendix G of the *Draft Final Portland Harbor RI/FS Remedial Investigation Report* [Integral et al. 2011b])

[2] = L1 = Level 1 (REV)

[3] = L2 = Level 2 (90 percent threshold)

[4] = L3 = Level 3 (80 percent threshold)

Acronyms:

BERA = Baseline Ecological Risk Assessment

REV = Reference Envelope Value

Table 2-4
Upland Soil Screening Levels[1]

Notes:

a = EPA RSL for Dichlorodiphenyldichloroethane used for screening.

b = EPA RSL for Dichlorodiphenyldichloroethylene used for screening.

c = EPA RSL for Dichlorodiphenyltrichloroethane used for screening.

d = EPA RSL for PCBs (high risk) used for PCB screening.

e = 2,3,7,8 TCDD screening level used for PCB Toxic Equivalent Quotient (TEQ) screening.

f = Dibenzofuran screening level used for carbazole as directed by DEQ (DEQ email to NW Natural, February 23, 2012).

g = EPA RSL for xylene, mixture used for xylenes screening.

h = RBC not available because value exceeds the limit of three-phase equilibrium partitioning.

I = RBC not available because the constituent value for this pathway is greater than 100,000 mg/kg or 100,000 mg/l.

j = Screening level for total PCB congeners used for total PCB screening.

k = Low-molecular Weight PAH (LPAH) - PAHs with 2 to 3 benzene rings.

l = High-molecular Weight PAH (HPAH) - PAHs with 4 to 7 benzene rings.

m = Eco-SSL for Dichlorodiphenyltrichloroethane and metabolites used for sum Dichlorodiphenyldichloroethane, Dichlorodiphenyldichloroethylene, and Dichlorodiphenyltrichloroethane screening, as well as screening of individual Dichlorodiphenyldichloroethane, Dichlorodiphenyldichloroethylene, and Dichlorodiphenyltrichloroethane isomers.

n = Screening level was multiplied by 5 because the screening level is based on a No Observed Adverse Effect Level (NOAEL) endpoint

[1] = Refer to the source tables in the following footnotes for additional notes pertaining to the criteria listed in this table

[2] = EPA RSLs are from EPA Regional Screening Level (RSL) Summary Table November 2011 (EPA 2011a). Available at: http://www.epa.gov/region9/superfund/prg/. Accessed March 22, 2012.

[3] = RBDM RBCs are from DEQ Environmental Cleanup and Tanks Program table entitled "*Risk-Based Concentrations for Individual Chemicals,"* November 15, 2011, revision, available at http://www.deq.state.or.us/lq/pubs/docs/RBDMTable.pdf. Accessed March 21, 2012.

[4] = JSCS Screening Level Values are from "Table 3-1 Screening Level Values for Soil/Stormwater Sediment, Stormwater, Groundwater, and Surface Water" of the *Portland Harbor Joint Source Control Strategy* (DEQ and EPA 2007 Revision).

[5] = The Upland Remedial Investigation (RA) ESLs presented follow the hierarchy presented in the screening level matrix attached to the letter from Jim Anderson of DEQ to Bob Wyatt of NW Natural regarding: "Summary of Agreements on the Remaining Uplands Risk Assessment Issues, NW Natural "Gasco" Site" dated January 5, 2012. This hierarchy states that the secondary criteria are only used when criteria are unavailable from the previous reference(s).

[6] = Values obtained from EPA Ecological Soil Screening Levels for Dichlorodiphenyltrichloroethane and Metabolites (EPA 2007), EPA Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) Interim Final (EPA 2007), and EPA Ecological Soil Screening Levels for Zinc Interim Final (EPA 2007) (http://www.epa.gov/ecotox/ecossl/). In cases where more than one level is listed, then the most conservative level is used for screening. A 5x multiplier was applied to the bird and mammal screening levels.

[7] = Alternative DEQ screening level for dibenzofuran is from the DEQ e-mail to NW Natural dated February 23, 2012. This level is applied to carbazole as directed by DEQ. The screening level is multiplied by 5 because it is based on a no observed adverse effect level (NOAEL) er

[8] = DEQ screening values from *Guidance For Ecological Risk Assessment*. Level 2 screening values. "Table 1 Screening Level Values for Plants, Invertebrates, and Wildlife Exposed to Soil and Surface Water" (DEQ revision 2001). When multiple values existed, the lowest was used. A 5x multiplier was applied to the bird and mammal screening levels.

[9] = Alternative cyanide screening level is from the October 31, 2011, memorandum from Mr. Fuji and Ms. Hitchko of Anchor QEA to Mr. Bayuk of DEQ entitled *Proposed Alternative Cyanide Screening Level*. The screening level is multiplied by 5 because it is based on a no observed adverse effect level (NOAEL) endpoint.

[10] = EPA *Region 5 RCRA Ecological Screening Levels (ESLs) for Soil* (2003). Available at: http://www.epa.gov/reg5rcra/ca/pdfs/ecological-screening-levels-200308.pdf. Accessed March 21, 2012.

Summary of Screening

Notes:

[1] BHHRA Screening Concentrations are from Tables 2-9 and 2-11 of Draft Final BHHRA (Appendix F of the *Draft Final Portland Harbor RI/FS Remedial Investigation Report* [Integral et al. 2011c]).
[2] RI Human Health Screening Criteria for Surface Water are from Table D3.3-1 of Appendix D of the *Draft Final Portland Harbor RI/FS Remedial Investigation Report* (Integral et al. 2011c).
[3] RI Human Health Screening Criteria for Surface Water are from Table D3.3-2 of Appendix D of the *Draft Final Portland Harbor RI/FS Remedial Investigation Report* (Integral et al. 2011c).
[4] BERA Screening Concentrations are from Tables 7-22, 8-12, 8-14, and 8-28 of *Draft Final BERA* (Appendix G of the *Draft Final Portland Harbor RI/FS Remedial Investigation Report* [Integral et al. 2011c]).
[5] SLERA Screening Concentrations are from Tables 6-2 and 7-2 from Attachment 5 of the *Draft Final BERA* (Appendix G of the *Draft Final Portland Harbor RI/FS Remedial Investigation Report* [Integral et al. 2011c]).
[6] Portland Harbor RALs from the August 23, 2011, Response to EPA August 11, 2011, Alternatives Letter from Lower Willamette Group to EPA (Private communication, EPA 2011).
[7] SQV screening levels are from SQV Report Final June 9, 2010. Table ES-1: Recommended Sediment Quality Guidelines. Development of Benthic SQVs for Freshwater Sediments in Washington, Oregon, and Idaho.
[8] EPA RSLs are from EPA RSL Summary Table November 2011 (EPA 2011a). Available at: http://www.epa.gov/region9/superfund/prg/.
[9] MCLs are from EPA 816-F-09-004, National Primary Drinking Water Regulations (EPA 2009) and NRWQC from EPA NRWQC for Priority Toxic Pollutants 2009.
[10] Upland RA criteria are applied consistent with current DEQ agreements for Gasco Site Uplands RA as memorialized in the letter from Jim Anderson of DEQ to Bob Wyatt of NW Natural regarding: "Summary of Agreements on the Remaining Uplands Risk Assessment Issues, NW Natural "Gasco" Site" dated January 5, 2012.
[11] Oak Ridge National Laboratory's Tier II SCV values were taken from Suter, G.W. II and Tsao, C.L. 1996. *Toxicological Benchmarks for Screening Potential Contaminants of Concern for Effects on Aquatic Biota: 1996 Revision*. Available at: http://www.esd.ornl.gov/programs/ecorisk/documents/tm96r2.pdf.
[12] EPA 2003 values from *Procedures for the Derivation of Equilibrium Partitioning Sediment Benchmarks (ESBs) for the Protection of Benthic Organisms: PAH Mixtures. Final Chronic Values for PAHs*. EPA-600-R-02-013, Table 3-4 "Toxicity of PAHs in Water Exposures". ES/ER/TM-96/R2. Available at: http://www.esd.ornl.gov/programs/ecorisk/documents/tm96r2.pdf.
[13] BTAG values from EPA 2006, EPA Region III BTAG, Freshwater Screening Criteria.
[14] Values obtained from *EPA Ecological Soil Screening Levels for DDT and Metabolites* (EPA 2007), *EPA Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) Interim Final* (EPA 2007), and *EPA Ecological Soil Screening Levels for Zinc Interim Final* (http://www.epa.gov/ecotox/ecossl/).
[15] Alternative cyanide screening level is from the October 31, 2011, memorandum from Mr. Fuji and Ms. Hitchko of Anchor QEA to Mr. Bayuk of DEQ entitled Proposed Alternative Cyanide Screening Level.
[16] EPA *Region 5 RCRA ESLs for Soil* (2003). Available at: http://www.epa.gov/reg5rcra/ca/pdfs/ecological-screening-levels-200308.pdf
[17] Alternative DEQ screening level for dibenzofuran is from the DEQ e-mail to NW Natrual dated February 23, 2012.
[18] RBDM RBCs for Individual Chemicals are from DEQ Risk-Based Decision Making for the Remediation of Petroleum-Contaminated Sites (DEQ 2009). http://www.deq.state.or.us/lq/rbdm.htm. Accessed November 18, 2011.
[19] Values from DEQ's *Guidance for Assessing Bioaccumulative Chemicals of Concern in Sediment*, Table A1a "Sediment Bioaccumulation Screening Level Values (SLVs)" (DEQ 2007).
[20] JSCS Screening Level Values are from "Table 3-1 Screening Level Values for Soil/Stormwater Sediment, Stormwater, Groundwater, and Surface Water" of the *Portland Harbor Joint Source Control Strategy* (DEQ and EPA 2007 Revision).
[21] DEQ SLVs are from Table 1 and 2 of the DEQ *Guidance For Ecological Risk Assessment* (DEQ revision 2001.)
[22] Eisler 1991. Cyanide screening level from Eisler, Ronald 1991. *Cyanide Hazards to Fish, Wildlife, and Invertebrates: A Synoptic Review*, U.S. Fish Wildlife Service, Biol. Rep. 85(1.23).
[23] Background levels obtained from Tables 7.3-5b, 7.3-6b, and 7.4-4a of the *Draft Final Portland Harbor RI/FS Remedial Investigation Report* (Integral et al. 2011).
[24] Benthic toxicity levels obtained from Table 6-2 of the *Draft Final BERA* (Appendix G of the *Draft Final Portland Harbor RI/FS Remedial Investigation Report* [Integral et al. 2011]).

Acronyms:
BERA = Baseline Ecological Risk Assessment
BHHRA = Baseline Human Health Risk Assessment
BTAG = Biological Technical Assistance Group
CWA = Clean Water Act
DEQ = Oregon Department of Environmental Quality
Eco-SSLs = EPA Ecological Soil Screening Levels
EPA = U.S. Environmental Protection Agency

Table 2-6
Summary of Screening

ESL = Ecological Screening Levels
FS = Feasibility Study
JSCS = Joint Source Control Strategy
LOAEL = Lowest observed adverse affect level
MCL = Maximum contaminant level
NOAEL = No observed adverse affect level
NRWQC = National Recommended Water Quality Criteria
PAH = Polycyclic Aromatic Hydrocarbon
RA = Risk Assessment
RAL = Remedial Action Levels
RBC = Risk-Based Concentrations
RBDM = Risk-Based Decision Making
RCRA = Resource Conservation and Recovery Act
REV = Reference Envelope Value
RI = Remedial Investigation
RSL = Regional Screening Levels
SDWA = Safe Drinking Water Act
SLERA = Screening-Level Ecological Risk Assessment
SSLs = Soil Screening Level
TRV = toxicity reference values
TZW = transition zone water

Table 2-7
Data Screening Analytes Listed by COC

COC	Data Screening Analytes
Zinc	Total Zinc Dissolved Zinc (water)
Cyanide	Total Cyanide Available Cyanide (water) Free Cyanide (water)
Diesel Range Hydrocarbons	Total Diesel Range Hydrocarbons
Residual Range Hydrocarbons	Total Residual Range Hydrocarbons
PAHs (Expanded list)	2-Methylnaphthalene Acenaphthene Acenaphthylene Anthracene Benzo(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(g,h,i)perylene Benzo(k)fluoranthene Chrysene Dibenzo(a,h)anthracene Fluoranthene Fluorene Indeno(1,2,3-cd)pyrene Naphthalene Phenanthrene Pyrene Carbazole Dibenzofuran Total LPAHs Total HPAHs Total PAHs Total cPAH
BHCs	Alpha-HCH Beta-HCH Delta-HCH Gamma-HCH (Lindane) Technical-grade HCH
DDDs	2,4'-DDD 4,4'-DDD Total DDD
DDEs	2,4'-DDE 4,4'-DDE Total DDE

Table 2-7
Data Screening Analytes Listed by COC

COC	Data Screening Analytes
DDTs	2,4'-DDT 4,4'-DDT Total DDT
--	Total DDx*
Endrin ketone	Endrin ketone
Polychlorinated Biphenyls	Available Individual PCB Aroclors Available Individual PCB Congeners Total PCBs aroclors Total PCBs congeners Total PCB TEQ
BTEX	Benzene Toluene Ethylbenzene m-Xylene p-Xylene m,p-Xylene o-Xylene Total Xylenes
1,1-Dichloroethene	1,1-Dichloroethene
Cis-1,2-Dichloroethene	Cis-1,2-Dichloroethene
Trans-1,2-Dichloroethene	Trans-1,2-Dichloroethene
Trichloroethene	Trichloroethene
Vinyl Chloride	Vinyl Chloride

Notes:
* Total DDx is the sum of isomers 2,4'-DDD, 4,4'-DDD, 2,4'-DDE, 4,4'-DDE, 2,4'-DDT, and 4,4'-DDT.

Table 2-8
Number of Analytes Required for Each Calculated Total

Chemical Name[1]	Expected Analytes	A' qualify (Limited)	Do Not Sum
Total PCBs Aroclors	7 or 9	<7	<2
Total PCB Congeners	209	<150	<100
Total DDx	6	<6	--
Sum DDD	2	<2	--
Sum DDE	2	<2	--
Sum DDT	2	<2	--
Total HPAHs	10	<10	<5
Total LPAHs	7	<7	<3
Total PAHs	17	<17	<10
Total Xylene	2	<2	--

Notes:
Table based on Table 2.1-5 of the *Draft Portland Harbor RI/FS Remedial Investigation Report* (Integral et. al 2009)

DDx = sum of 2,4'- and 4,4'-DDD, DDE, and DDT
HPAH = high molecular weight PAH
LPAH = low molecular weight PAH
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl

[1] = Sums and totals of chemicals are calculated.

Table 3-1
Summary Statistics - Surface Sediment (Category A)

Chemical Name	Number of Samples Analyzed	Number of Detections	Number of Non-Detections	Maximum Detection	Minimum Detection	Average Detection
Conventional Parameters (mg/kg)						
Cyanide, total	84	59	25	78.1	0.11	7.99
Metals (mg/kg)						
Zinc	128	128	0	429	38.6	116.2
PCB Aroclors (µg/kg)						
Aroclor 1016	105	0	105			
Aroclor 1221	105	0	105			
Aroclor 1232	105	0	105

Table 3-1
Summary Statistics - Surface Sediment (Category A)

Notes:
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
BaPEq = benzo[a]pyrene equivalents
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
BTEX = Benzene, Toluene, Ethylbenzene, Xylene
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LPAH = low-molecular-weight PAH
LWG = Lower Willamette Group
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
pct = percent
RA = Portland Harbor Site risk assessment
su = standard unit
TEQ = toxic equivalents quotient
TPH = Total Petroleum Hydrocarbons

Total Xylene (reported, not calculated)	7	3	4	330	4.4	124.13

Table 3-2
Summary Statistics - Sub-surface Sediment (Category B-G)

Chemical Name	Number of Samples Analyzed	Number of Detections	Number of Non-Detections	Maximum Detection	Minimum Detection	Average Detection
Trichloroethene (TCE)	347	25	322	1900000	0.14	88081.04
Vinyl chloride	347	10	337	4000	0.63	434.41

Table 3-2
Summary Statistics - Sub-surface Sediment (Category B-G)

Notes:
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LPAH = low-molecular-weight PAH
LWG = Lower Willamette Group
PAH = polycyclic aromatic hydrocarbon
pct = percent
RA = Portland Harbor Site risk assessment
su = standard unit
TEQ = toxic equivalents quotient
TPH = Total Petroleum Hydrocarbons

Table 3-3
Summary Statistics - Sediment Trap

Chemical Name	Number of Samples Analyzed	Number of Detections	Number of Non-Detections	Maximum Detection	Minimum Detection	Average Detection

Table 3-10
Summary Statistics-Surface Water
(Near-Surface Depth)

Notes:
µg/l = micrograms per liter
mg/kg = milligrams per kilogram
BaPEq = benzo[a]pyrene equivalents
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
BTEX = Benzene, Toluene, Ethylbenzene, Xylene
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LPAH = low-molecular-weight PAH
LWG = Lower Willamette Group
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
pct = percent
RA = Portland Harbor Site risk assessment
su = standard unit
TEQ = toxic equivalents quotient
TPH = Total Petroleum Hydrocarbons

Table 3-11
Summary Statistics-Surface Water
(Mid-depth)

Notes:
µg/l = micrograms per liter
mg/kg = milligrams per kilogram
BaPEq = benzo[a]pyrene equivalents
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
BTEX = Benzene, Toluene, Ethylbenzene, Xylene
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LPAH = low-molecular-weight PAH
LWG = Lower Willamette Group
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
pct = percent
RA = Portland Harbor Site risk assessment
su = standard unit
TEQ = toxic equivalents quotient
TPH = Total Petroleum Hydrocarbons

Notes:
µg/l = micrograms per liter
mg/kg = milligrams per kilogram
BaPEq = benzo[a]pyrene equivalents
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
BTEX = Benzene, Toluene, Ethylbenzene, Xylene
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LPAH = low-molecular-weight PAH
LWG = Lower Willamette Group
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
pct = percent
RA = Portland Harbor Site risk assessment
su = standard unit
TEQ = toxic equivalents quotient
TPH = Total Petroleum Hydrocarbons

Table 3-13
Existing Data Screening Table – Surface Sediment (Category A) Human Health

Notes:

Detected concentration is greater than 1 screening level
Detected concentration is greater than 2 screening levels
Detected concentration is greater than 3 screening levels
Detected concentration is greater than 4 screening levels
Detected concentration is greater than 5 screening levels
Detected concentration is greater than 6 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
Totals are calculated as the sum of all detected results and 1/2 the undetected result. If all are undetected results, the highest reporting limit value is reported as the sum.

Acronyms:
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
mg/kg-OC = milligrams per kilogram of organic carbon normalized
BaPEq = benzo[a]pyrene equivalents
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LWG = Lower Willamette Group
MQ = mean quotient
NA = not applicable
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Table 3-14
Existing Data Screening Table – Surface Sediment (Category A) Ecological

Notes:

	Detected concentration is greater than 1 screening level
	Detected concentration is greater than 2 screening levels
	Detected concentration is greater than 3 screening levels
	Detected concentration is greater than 4 screening levels
	Detected concentration is greater than 5 screening levels
	Detected concentration is greater than 6 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
Totals are calculated as the sum of all detected results and 1/2 the undetected result. If all are undetected results, the highest reporting limit value is reported as the sum.
NA = Not applicable, calculation based on sample and associated field duplicate

Acronyms:
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LWG = Lower Willamette Group
MQ = mean quotient
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Table 3-15
Existing Data Screening Table – Surface Sediment (Category A) Background

Notes:

Detected concentration is greater than 1 screening level

Detected concentration is greater than 2 screening levels

Detected concentration is greater than 3 screening levels

Detected concentration is greater than 4 screening levels

Detected concentration is greater than 5 screening levels

Detected concentration is greater than 6 screening levels

Bold = Detected result

J = Estimated value

U = Compound analyzed, but not detected above detection limit

UJ = Compound analyzed, but not detected above estimated detection limit

R = Rejected

T = Result is the value of a total or calculation

-- = Results not reported or not applicable

N = Normal Field Sample

Acronyms:

µg/kg = micrograms per kilogram

mg/kg = milligrams per kilogram

mg/kg-OC = milligrams per kilogram of organic carbon normalized

BaPEq = benzo[a]pyrene equivalents

BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)

cPAH = carcinogenic PAH

cm = centimeters

DDD = Dichlorodiphenyldichloroethane

DDE = Dichlorodiphenyldichloroethylene

DDT = Dichlorodiphenyltrichloroethane

HPAH = high molecular weight polycyclic aromatic hydrocarbon

LWG = Lower Willamette Group

MQ = mean quotient

NA = not applicable

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyls

RA = Portland Harbor Site risk assessment

TEQ = toxic equivalents quotient

Table 3-16
Existing Data Screening Table – Sub-surface Sediment (Category B-F) Background

Notes:
Detected concentration is greater than 1 screening level

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation.
-- = Results not reported or not applicable
N = Normal Field Sample
R = Rejected

Acronyms:
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
mg/kg-OC = milligrams per kilogram organic carbon normalized
BaPEq = benzo[a]pyrene equivalents
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LPAH = low-molecular-weight PAH
LWG = Lower Willamette Group
PCB = polychlorinated biphenyl
NA = not applicable
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient
TPH = Total Petroleum Hydrocarbons

Table 3-17
Existing Data Screening Table – Sub-surface Sediment (Category B-F) Human Health

Notes:

Detected concentration is greater than 1 screening level
Detected concentration is greater than 2 screening levels
Detected concentration is greater than 3 screening levels
Detected concentration is greater than 4 screening levels
Detected concentration is greater than 5 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation.
-- = Results not reported or not applicable
N = Normal Field Sample
R = Rejected

Acronyms:
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
BaPEq = benzo[a]pyrene equivalents
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LPAH = low-molecular-weight PAH
LWG = Lower Willamette Group
PCB = polychlorinated biphenyl
NA = not applicable
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient
TPH = Total Petroleum Hydrocarbons

Table 3-18
Existing Data Screening Table – Sub-surface Sediment (Category B-F) Ecological

Notes:

	Detected concentration is greater than 1 screening level
	Detected concentration is greater than 2 screening levels
	Detected concentration is greater than 3 screening levels
	Detected concentration is greater than 4 screening levels
	Detected concentration is greater than 5 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation.
-- = Results not reported or not applicable
N = Normal Field Sample
R = Rejected
NA = Not applicable, calculation based on sample and associated field duplicate

Acronyms:
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LPAH = low-molecular-weight PAH
LWG = Lower Willamette Group
PCB = polychlorinated biphenyl
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient
TPH = Total Petroleum Hydrocarbons

Notes:

Detected concentration is greater than 1 screening level

Detected concentration is greater than 2 screening levels

Detected concentration is greater than 3 screening levels

Detected concentration is greater than 4 screening levels

Detected concentration is greater than 5 screening levels

Bold = Detected result

J = Estimated value

U = Compound analyzed, but not detected above detection limit

UJ = Compound analyzed, but not detected above estimated detection limit

R = Rejected

T = Result is the value of a total or calculation

-- = Results not reported or not applicable

N = Normal Field Sample

Acronyms:

µg/kg = micrograms per kilogram

mg/kg = milligrams per kilogram

BaPEq = benzo[a]pyrene equivalents

BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)

cPAH = carcinogenic PAH

cm = centimeters

DDD = Dichlorodiphenyldichloroethane

DDE = Dichlorodiphenyldichloroethylene

DDT = Dichlorodiphenyltrichloroethane

HPAH = high molecular weight polycyclic aromatic hydrocarbon

LWG = Lower Willamette Group

MQ = mean quotient

NA = not applicable

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyls

RA = Portland Harbor Site risk assessment

TEQ = toxic equivalents quotient

Existing Data Screening Table - Sub-surface Sediment (Category G H) Ecological

Notes:

Detected concentration is greater than 1 screening level

Detected concentration is greater than 2 screening levels

Detected concentration is greater than 3 screening levels

Detected concentration is greater than 4 screening levels

Detected concentration is greater than 5 screening levels

Bold = Detected result

J = Estimated value

U = Compound analyzed, but not detected above detection limit

UJ = Compound analyzed, but not detected above estimated detection limit

R = Rejected

T = Result is the value of a total or calculation

-- = Results not reported or not applicable

N = Normal Field Sample

NA = Not applicable, calculation based on sample and associated field duplicate

Acronyms:

µg/kg = micrograms per kilogram

mg/kg = milligrams per kilogram

BaPEq = benzo[a]pyrene equivalents

BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)

cPAH = carcinogenic PAH

cm = centimeters

DDD = Dichlorodiphenyldichloroethane

DDE = Dichlorodiphenyldichloroethylene

DDT = Dichlorodiphenyltrichloroethane

HPAH = high molecular weight polycyclic aromatic hydrocarbon

LWG = Lower Willamette Group

MQ = mean quotient

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyls

RA = Portland Harbor Site risk assessment

TEQ = toxic equivalents quotient

Table 3-21
Existing Data Screening Table - Sub-surface Sediment (Category G H) Background

Notes:
Detected concentration is greater than 1 screening level

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
N = Normal Field Sample

Acronyms:
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
BaPEq = benzo[a]pyrene equivalents
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LWG = Lower Willamette Group
MQ = mean quotient
NA = not applicable
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Table 3-24
Existing Data Screening Table – Sediment Trap Background

Notes:
Detected concentration is greater than one screening level

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
T = Result is the value of a total or calculation.
-- = Results not reported or not applicable

Acronymns
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
BaPEq = Benzo(a)pyrene equivalent
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
cPAH = carcinogenic PAH
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
LWG = Lower Willamette Group
LPAH = low molecular weight polycyclic aromatic hydrocarbon
OC = organic carbon normalized
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Existing Data Screening Table - Riverbank Soils (0-3.5 foot) Human Health

Notes:

	Detected concentration is greater than 1 screening level
	Detected concentration is greater than 2 screening levels
	Detected concentration is greater than 3 screening levels
	Detected concentration is greater than 4 screening levels
	Detected concentration is greater than 5 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
N = Normal Field Sample

Acronyms:
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LPAH = low molecular weight polycyclic aromatic hydrocarbon
LWG = Lower Willamette Group
MQ = mean quotient
NA = not applicable
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Existing Data Screening Table - Riverbank Soils (0-3.5 foot) Ecological

Notes:

Detected concentration is greater than 1 screening level
Detected concentration is greater than 2 screening levels
Detected concentration is greater than 3 screening levels
Detected concentration is greater than 4 screening levels
Detected concentration is greater than 5 screening levels
Detected concentration is greater than 6 screening levels
Detected concentration is greater than 7 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
N = Normal Field Sample

Acronyms:
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LPAH = low molecular weight polycyclic aromatic hydrocarbon
LWG = Lower Willamette Group
MQ = mean quotient
NA = not applicable
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Notes:

	Detected concentration is greater than 1 screening level
	Detected concentration is greater than 2 screening levels
	Detected concentration is greater than 3 screening levels
	Detected concentration is greater than 4 screening levels
	Detected concentration is greater than 5 screening levels
	Detected concentration is greater than 6 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
N = Normal Field Sample

Acronyms:
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LPAH = low molecular weight polycyclic aromatic hydrocarbon
LWG = Lower Willamette Group
MQ = mean quotient
NA = not applicable
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Table 3-28
Existing Data Screening Table - Riverbank Soils (Sub-surface depth) Ecological

Notes:
Detected concentration is greater than 1 screening level
Detected concentration is greater than 2 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
N = Normal Field Sample

Acronyms:
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
cPAH = carcinogenic PAH
cm = centimeters
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
HPAH = high molecular weight polycyclic aromatic hydrocarbon
LPAH = low molecular weight polycyclic aromatic hydrocarbon
LWG = Lower Willamette Group
MQ = mean quotient
NA = not applicable
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Table 3-29
Existing Data Screening Table – TZW Human Health

Notes:

Detected concentration is greater than 1 screening level
Detected concentration is greater than 2 screening levels
Detected concentration is greater than 3 screening levels
Detected concentration is greater than 4 screening levels
Detected concentration is greater than 5 screening levels
Detected concentration is greater than 6 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
T = Result is the value of a total or calculation.
-- = Results not reported or not applicable

Acronyms:
µg/L = micrograms per liter
mg/L = milligrams per liter
cm = centimeters
LWG = Lower Willamette Group
RA = Portland Harbor Site risk assessment
TZW = transition zone water
Totals are calculated as the sum of all detected results and 1/2 the undetected result. If all are undetected results, the highest reporting limit value is reported as the sum.

Table 3-30
Existing Data Screening Table – TZW Ecological

Notes:
Detected concentration is greater than 1 screening level
Detected concentration is greater than 2 screening levels
Detected concentration is greater than 3 screening levels
Detected concentration is greater than 4 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
T = Result is the value of a total or calculation.
-- = Results not reported or not applicable

Acronyms:
µg/L = micrograms per liter
mg/L = milligrams per liter
cm = centimeters
LWG = Lower Willamette Group
RA = Portland Harbor Site risk assessment
TZW = transition zone water
Totals are calculated as the sum of all detected results and 1/2 the undetected result. If all are undetected results, the highest reporting limit value is reported as the sum.

Table 3-31
Existing Data Screening Table - Fill Groundwater Human Health

Notes:

Detected concentration is greater than one screening level

Detected concentration is greater than two screening levels

Detected concentration is greater than three screening levels

Detected concentration is greater than four screening levels

Detected concentration is greater than five screening levels

Bold = Detected result

J = Estimated value

U = Compound analyzed, but not detected above detection limit

R = Rejected

T = Result is the value of a total or calculation.

-- = Results not reported or not applicable

Acronyms:

µg/l = micrograms per liter

mg/l = milligrams per liter

cm = centimeters

LWG = Lower Willamette Group

RA = Portland Harbor Site risk assessment

Totals are calculated as the sum of all detected results and 1/2 the undetected result. If all are undetected results, the highest reporting limit value is reported as the sum.

Table 3-32
Existing Data Screening Table – Fill Groundwater Ecological

Notes:

Detected concentration is greater than one screening level

Detected concentration is greater than two screening levels

Detected concentration is greater than three screening levels

Detected concentration is greater than four screening levels

Detected concentration is greater than five screening levels

Detected concentration is greater than six screening levels

Detected concentration is greater than seven screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
R = Rejected
T = Result is the value of a total or calculation.
-- = Results not reported or not applicable

Acronyms:
µg/l = micrograms per liter
mg/l = milligrams per liter
cm = centimeters
LWG = Lower Willamette Group
RA = Portland Harbor Site risk assessment
Totals are calculated as the sum of all detected results and 1/2 the undetected result. If all are undetected results, the highest reporting limit value is reported as the sum.

Table 3-33
Existing Data Screening Table – Alluvial Groundwater Human Health

Notes:
Detected concentration is greater than one screening level
Detected concentration is greater than two screening levels
Detected concentration is greater than three screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
-- = Results not reported or not applicable

Acronyms:
µg/l = micrograms per liter
mg/l = milligrams per liter
cm = centimeters
LWG = Lower Willamette Group
RA = Portland Harbor Site risk assessment
Totals are calculated as the sum of all detected results and 1/2 the undetected result. If all are undetected results, the highest reporting limit value is reported as the sum.

Table 3-34
Existing Data Screening Table – Alluvial Groundwater Ecological

Notes:

	Detected concentration is greater than one screening level
	Detected concentration is greater than two screening levels
	Detected concentration is greater than three screening levels
	Detected concentration is greater than four screening levels
	Detected concentration is greater than five screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected

Acronyms:
µg/l = micrograms per liter
mg/l = milligrams per liter
cm = centimeters
LWG = Lower Willamette Group
RA = Portland Harbor Site risk assessment
Totals are calculated as the sum of all detected results and 1/2 the undetected result. If all are undetected results, the highest reporting limit value is reported as the sum.

Table 3-35
Existing Data Screening Table – Deep Groundwater Human Health

Notes:

Detected concentration is greater than one screening level

Detected concentration is greater than two screening levels

Detected concentration is greater than three screening levels

Bold = Detected result

J = Estimated value

U = Compound analyzed, but not detected above detection limit

UJ = Compound analyzed, but not detected above estimated detection limit

Acronyms:

µg/l = micrograms per liter

mg/l = milligrams per liter

cm = centimeters

LWG = Lower Willamette Group

RA = Portland Harbor Site risk assessment

Totals are calculated as the sum of all detected results and 1/2 the undetected result. If all are undetected results, the highest reporting limit value is reported as the sum.

Table 3-36
Existing Data Screening Table – Surface Water (Near-Surface Depth) Human Health

Notes:

Detected concentration is greater than 1 screening level
Detected concentration is greater than 2 screening levels
Detected concentration is greater than 3 screening levels
Detected concentration is greater than 4 screening levels
Detected concentration is greater than 5 screening levels
Detected concentration is greater than 6 screening levels
Detected concentration is greater than 7 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
N = Normal Field Sample

Acronyms:
µg/kg = micrograms per liter
mg/kg = milligrams per liter
ng/l = nanograms per liter
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
LWG = Lower Willamette Group
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Table 37
Existing Data Screening Table – Surface Water (Near-Surface Depth) Ecological

Notes:

	Detected concentration is greater than 1 screening level
	Detected concentration is greater than 2 screening levels
	Detected concentration is greater than 3 screening levels
	Detected concentration is greater than 4 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
N = Normal Field Sample

Acronyms:
µg/kg = micrograms per liter
mg/kg = milligrams per liter
ng/l = nanograms per liter
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
LWG = Lower Willamette Group
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Table 3-38
Existing Data Screening Table – Surface Water (Near-Surface Depth) Background

Notes:
Detected concentration is greater than 1 screening level

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
N = Normal Field Sample

Acronyms:
µg/kg = micrograms per liter
mg/kg = milligrams per liter
ng/l = nanograms per liter
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
LWG = Lower Willamette Group
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Table 3-39
Existing Data Screening Table – Surface Water (Mid-Depth) Human Health

Notes:

Detected concentration is greater than 1 screening level
Detected concentration is greater than 2 screening levels
Detected concentration is greater than 3 screening levels
Detected concentration is greater than 4 screening levels
Detected concentration is greater than 5 screening levels
Detected concentration is greater than 6 screening levels
Detected concentration is greater than 7 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
N = Normal Field Sample

Acronyms:
µg/kg = micrograms per liter
mg/kg = milligrams per liter
ng/l = nanograms per liter
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
LWG = Lower Willamette Group
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Table 3-40
Existing Data Screening Table – Surface Water (Mid-Depth) Ecological

Notes:

Detected concentration is greater than 1 screening level

Detected concentration is greater than 2 screening levels

Detected concentration is greater than 3 screening levels

Detected concentration is greater than 4 screening levels

Bold = Detected result

J = Estimated value

U = Compound analyzed, but not detected above detection limit

UJ = Compound analyzed, but not detected above estimated detection limit

R = Rejected

T = Result is the value of a total or calculation

-- = Results not reported or not applicable

N = Normal Field Sample

Acronyms:

µg/kg = micrograms per liter

mg/kg = milligrams per liter

ng/l = nanograms per liter

BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)

DDD = Dichlorodiphenyldichloroethane

DDE = Dichlorodiphenyldichloroethylene

DDT = Dichlorodiphenyltrichloroethane

LWG = Lower Willamette Group

PCB = polychlorinated biphenyls

RA = Portland Harbor Site risk assessment

TEQ = toxic equivalents quotient

Table 3-41
Existing Data Screening Table – Surface Water (Mid-Depth) Background

Notes:
Detected concentration is greater than 1 screening level

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
N = Normal Field Sample

Acronyms:
µg/kg = micrograms per liter
mg/kg = milligrams per liter
ng/l = nanograms per liter
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
LWG = Lower Willamette Group
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Table 3-42
Existing Data Screening Table – Surface Water (Near-Bottom Depth) Human Health

Notes:

Detected concentration is greater than 1 screening level

Detected concentration is greater than 2 screening levels

Detected concentration is greater than 3 screening levels

Detected concentration is greater than 4 screening levels

Detected concentration is greater than 5 screening levels

Detected concentration is greater than 6 screening levels

Detected concentration is greater than 7 screening levels

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
N = Normal Field Sample

Acronyms:
µg/kg = micrograms per liter
mg/kg = milligrams per liter
ng/l = nanograms per liter
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
LWG = Lower Willamette Group
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Table 3-43
Existing Data Screening Table – Surface Water (Near-Bottom Depth) Ecological

Notes:

Detected concentration is greater than 1 screening level

Detected concentration is greater than 2 screening levels

Detected concentration is greater than 3 screening levels

Detected concentration is greater than 4 screening levels

Bold = Detected result

J = Estimated value

U = Compound analyzed, but not detected above detection limit

UJ = Compound analyzed, but not detected above estimated detection limit

R = Rejected

T = Result is the value of a total or calculation

-- = Results not reported or not applicable

N = Normal Field Sample

Acronyms:

µg/kg = micrograms per liter

mg/kg = milligrams per liter

ng/l = nanograms per liter

BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)

DDD = Dichlorodiphenyldichloroethane

DDE = Dichlorodiphenyldichloroethylene

DDT = Dichlorodiphenyltrichloroethane

LWG = Lower Willamette Group

PCB = polychlorinated biphenyls

RA = Portland Harbor Site risk assessment

TEQ = toxic equivalents quotient

Table 3-44
Existing Data Screening Table – Surface Water (Near-Bottom Depth) Background

Notes:
Detected concentration is greater than 1 screening level

Bold = Detected result
J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
R = Rejected
T = Result is the value of a total or calculation
-- = Results not reported or not applicable
N = Normal Field Sample

Acronyms:
µg/kg = micrograms per liter
mg/kg = milligrams per liter
ng/l = nanograms per liter
BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
LWG = Lower Willamette Group
PCB = polychlorinated biphenyls
RA = Portland Harbor Site risk assessment
TEQ = toxic equivalents quotient

Notes:

[1] = Statistically different from the negative control response (one-tailed test, $p<0.05$)

[2] = Effect Level assignment was based on statistically significant differences ($p \leq 0.05$) between test and negative control sample responses, and comparison of the negative-control adjusted responses to reference thresholds developed for the U.S. Environmental Protection Agency (EPA) for application in the Baseline Ecological Risk Assessment (Windward 2011).

[3] = Test sediments were given a "Hit" designation if one toxicity endpoint (*Chironomus* survival or growth or *Hyalella* survival or growth) exceeded a Level 3 threshold, or two endpoints exceeded a Level 2 threshold (Anchor QEA 2012).

[4] = Initial bioassay reference samples.

[5] = Retest bioassay reference samples, locations U4Q1SG and U4Q2SG were retested.

Anchor QEA, LLC, 2012. Draft Feasibility Study. Prepared for the Lower Willamette Group. 2012.

Windward Environmental, LLC, 2011. Portland Harbor RI/FS. Appendix G: Baseline Ecological Risk Assessment. Prepared for the Lower Willamette Group. July 2011.

Notes:

[1] = Statistically different from the negative control response (one-tailed test, $p<0.05$)

[2] = Effect Level assignment was based on statistically significant differences ($p \leq 0.05$) between test and negative control sample responses, and comparison of the negative-control adjusted responses to reference thresholds developed for U.S. Environmental Protection Agency (EPA) for application in the Baseline Ecological Risk Assessment (Windward 2011).

[3] = Test sediments were given a "Hit" designation if one toxicity endpoint (*Chironomus* survival or growth or *Hyalella* survival or growth) exceeded a Level 3 threshold, or two endpoints exceeded a Level 2 threshold (Anchor QEA 2012).

[4] = Initial bioassay reference samples.

[5] = Retest bioassay reference samples, locations U4Q1SG and U4Q2SG were retested.

MEMORANDUM

To:	Sean Sheldrake, Project Coordinator EPA, Region 10 1200 Sixth Avenue, M/S ECL-111 Seattle, Washington 98101	**Date:**	May 11, 2012
From:	Ryan Barth, Anchor QEA	**Project:**	000029-02.28
Re:	Project Data Screening Levels and Response to EPA Comments on Draft Project Area Identification Report and Data Gaps QAPP, Gasco Sediments Cleanup Action (dated March 2010)		

This memorandum transmits for your review and approval the revised human health, ecological, and background screening levels and remedial action levels (RALs) for the project data screen detailed in Section 3.4.1.2 of the Statement of Work (SOW) (Docket No. CERCLA 10-2009-0255). Pursuant to the SOW, available bulk sediment, riverbank soils, and water media chemistry data collected within the Gasco Sediment Site Area of Interest (AOI) identified in the *Final Work Plan* (Anchor QEA 2009; see Figure 1.2.1) are required to be compared to the revised screening levels and the screen results presented in data tables and on GIS layers.

NW Natural and Siltronic Corporation (Siltronic) initially submitted proposed screening levels to the U. S. Environmental Protection Agency (EPA) for review and approval on January 13, 2010. NW Natural and Siltronic revised the screening levels to incorporate written comments provided by EPA on February 3, 2010, and received EPA approval to use the screening levels for the project data screen on February 26, 2010. Appendixes B and C of the *Draft Project Area Identification and Data Gaps QAPP* (Draft AIR) (Anchor QEA 2010a) present the data screen results using the reviewed screening levels.

Following its review of the Draft AIR, EPA provided additional comments on the revised screening levels in a May 4, 2009, memorandum. These comments were discussed during the June 3, 2010, monthly coordination meeting held between NW Natural, Siltronic, EPA, and The Oregon Department of Environmental Quality (DEQ). During this discussion, EPA stated that its pending comments on the draft Portland Harbor Site Risk Assessment (RA) would affect the screening levels required for use in the AIR. In addition, NW Natural and DEQ were currently negotiating the upland risk assessment for the NW Natural "Gasco" property adjacent to the

AOI, which would also affect screening levels. To facilitate incorporation of those pending screening level changes into the data screening of the existing data set, EPA approved postponement of the revised data screening until the Portland Harbor Site RA comments were available and the Gasco Upland RA negotiations were complete. The *Final Project Area Identification and Data Gaps QAPP* (Final AIR) (Anchor QEA 2010b) was developed without revision to the data screen and conditionally approved by EPA on September 8, 2010.

The *Draft Final Portland Harbor RI/FS Remedial Investigation Report* (Draft Final RI) (Integral et al. 2011c), including the Appendix F, the *Draft Final Baseline Human Health Risk Assessment* (Draft Final BHHRA) (Integral et al. 2011a) and Appendix G, the *Draft Final Baseline Ecological Risk Assessment* (Draft Final BERA) (Integral et al. 2011b), which incorporate the comments referenced by EPA during the previously referenced June 3, 2010, meeting, are now available. The Portland Harbor Site draft Feasibility Study (draft FS) RALs are also available. In addition, since the June 3, 2010, coordination meeting, NW Natural and DEQ have been in negotiation regarding screening levels to be used during the Gasco Upland RA. Although the final screening framework for the Gasco Upland RA is not yet available, the screening levels that DEQ transmitted to NW Natural in a letter dated January 5, 2012 (DEQ 2012) are not expected to undergo major revision and have been incorporated into the EE/CA data screening.

NW Natural and Siltronic have revised the screening levels consistent with the previously described documents and to incorporate the EPA's May 4, 2009 comments. Attachments 1 and 2 summarize these changes and present the revised screening levels. Attachment 1 is divided into the following three sections: the first section describes revisions to the screening levels based on the Portland Harbor Site process, the second describes revisions based on the Gasco Upland RA negotiations, and the final section provides NW Natural's and Siltronic's responses to EPA's May 4, 2009, comments on the screening levels. Attachment 2 contains six tables: revised Tables 2-1 through 2-6 of the Final AIR. Tables 2-1 through 2-4 contain screening levels for sediment, water, benthic toxicity, and soil, respectively. Table 2-5 identifies site chemicals of concern (COCs) without screening levels and Table 2-6 summarizes the screening levels to be used for each matrix (sediment, water, benthic toxicity, and soils). Note that AIR Table 10, which contains screening levels for subsurface sediment, has not been revised because the screening levels in this table are no longer used in the Portland Harbor Site process and will not be used in this data screen.

Revised summary tables, data tables, and GIS layers presenting the screen results will be provided to EPA following approval of the revised screening levels.

ATTACHMENT 1A

Section 1 - Revisions based on the Portland Harbor Process

Revisions to screening levels based on the Portland Harbor process are listed as follows by matrix. Screening levels are presented in tables 2-1 through 2-4 of Appendix G to the draft Engineering Evaluation/Cost Analysis (EE/CA).

Sediment Screening Levels

NW Natural and Siltronic Corporation (Siltronic) revised the sediment screening levels as follows:

- The Baseline Human Health Risk Assessment (BHHRA) screening levels were updated, where necessary, to be consistent with the *Draft Final Baseline Human Health Risk Assessment* (Draft Final BHHRA) (Integral et al. 2011a).
- The Baseline Ecological Risk Assessment (BERA) screening levels were updated, where necessary, to be consistent with the *Draft Final Baseline Ecological Risk Assessment* (Draft Final BERA) (Integral et al. 2011b). In addition, the Draft BERA screening levels for mean quotient (MQ; 0.7) and maximum probability of toxicity (pMAX; 0.59) were added to Table 1.
- The Portland Harbor Preliminary Remediation Goal (PRG) based screening levels were replaced by a range representing the upper and lower remedial action level (RAL) values for the Portland Harbor Feasibility Study (FS), which were transmitted from the Lower Willamette Group (LWG) to the U.S. Environmental Protection Agency (EPA) in a letter dated August 23, 2011.
- The Lower Willamette River upriver surface sediment background levels were revised, where necessary, to be consistent with the *Draft Final Portland Harbor Remedial Investigation/Feasibility Study Report* (Draft Final RI; Integral et al. 2011c). NW Natural and Siltronic note that these screening levels were developed to be used on a site-wide surface weighted average concentration (SWAC) basis, and not for screening on a point-by-point basis. However, for this screening exercise, NW Natural and Siltronic will screen site data against these levels on a point-by-point basis.
- The hill-topped Lower Willamette River upriver surface sediment background levels were removed from Table 1 because they are no longer being used as screening levels for the Portland Harbor Site.

Water Screening Levels

NW Natural and Siltronic revised the water screening levels as follows:

- The BHHRA Screening Concentrations were replaced by the human health screening levels for surface water and transitional zone water (TZW) in tables D.3.3-1 and D.3.3-2 of Appendix D of the Draft Final RI (Integral et al 2011c).
- The background water concentrations were revised, where necessary, consistent with Table 7.4-4a of the Draft Final Portland Harbor RI.

Benthic Toxicity Screening Levels

NW Natural and Siltronic revised the benthic toxicity screening levels consistent with EPA methods presented in the *Benthic Toxicity Reanalysis Technical Memorandum* (Windward 2009).

Soil Screening Levels

No revision; soil screening levels were not affected by the Portland Harbor process.

Section 2 - Revisions Based on Gasco Upland Risk Assessment Negotiations

Revisions to screening levels based on the Gasco Upland Risk Assessment (RA) negotiations are listed as follows by environmental matrix. Screening levels are presented in tables 2-1 through 2-4 of Appendix G to the EE/CA.

Sediment Screening Levels

No revisions made, sediment screening levels were not part of the Gasco Upland RA negotiations.

Water Screening Levels

NW Natural and Siltronic revised the water screening levels to include screening levels for the fill and alluvial water bearing zone (WBZ) from the table entitled "Human Health, Ecological, and Source Control Screening Criteria" (Upland RA Screening Criteria Table) attached to the Oregon Department of Environmental Quality's (DEQ) January 5, 2012, letter to NW Natural (DEQ 2012). These screening levels were not previously listed on the table. The Gasco Upland RA WBZ screening levels are as follows:

Fill WBZ:

- Human health screening levels: DEQ risk-based concentrations (RBCs) occupational worker volatilization to indoor air; construction and excavation worker direct contact and volatilization to outdoor air (DEQ 2011).
- Ecological screening levels selected according to the following hierarchy:
    1. Lower of DEQ water screening level values (SLVs) for mammals, birds, invertebrates and plants (DEQ 2001)
    2. National Recommended Water Quality Criteria (NRWQC) (EPA 2009), adjusted to 25 milligrams per liter (mg/L) calcium carbonate for hardness dependent criteria
    3. Oak Ridge National Laboratory (ORNL) Tier II Chronic Values (Suter and Tsao 1996)
    4. Final Chronic Values (FCV) for polycyclic aromatic hydrocarbons (PAHs) (EPA 2003)
    5. EPA Region III Biological Technical Assistance Group (BTAG) Freshwater Screening Criteria (EPA 2006)
    6. Water SLV protective of wildlife to cyanide exposure from Eisler (1991) 50 milligrams per liter (mg/L)

Alluvial WBZ:

- Human health screening level: DEQ RBCs - occupational worker exposure (DEQ 2011)
- Ecological screening levels selected according to the following hierarchy:
    1. NRWQC (EPA 2009), adjusted to 25 mg/L calcium carbonate for hardness dependent criteria
    2. ORNL Tier II Chronic Values (Suter and Tsao 1996)
    3. FCV for PAHs (EPA 2003)
    4. EPA Region III BTAG Freshwater Screening Criteria (EPA 2006)

The screening levels and hierarchy provided above for the fill WBZ and Alluvial WBZ represent the current agreements with DEQ for the Gasco Upland RA. Note that the use of human health criteria for screening the Alluvial WBZ groundwater during the Gasco Upland RA is consistent with agreements reached with DEQ regarding the process to move forward with the risk assessment screening while DEQ and NW Natural resolve the conclusion of beneficial use determination (BUD) for deep alluvial groundwater at the Gasco property.

Benthic Toxicity Screening Levels

No revisions made; benthic toxicity screening criteria were not part of the Gasco Upland RA negotiations.

Soil Screening Levels

NW Natural and Siltronic revised the soil screening levels to include riverbank soil screening levels from the Upland RA Screening Criteria Table, when these screening levels were not already listed on the table. The riverbank screening levels are as follows:

Surface soil (0 to 3.5 feet):

- Human health screening levels selected according to the following hierarchy:
    1. DEQ RBCs - Occupational and construction worker direct contact and outdoor air volatilization pathways (EPA 2009)
    2. EPA Regional Screening Levels (RSLs) (EPA 2011)
- Ecological levels selected according to the following hierarchy:

    1. EPA Ecological Soil Screening Levels (Eco-SSLs) for low-molecular-weight polycyclic aromatic hydrocarbons (LPAHs) and high-molecular-weight polycyclic

aromatic hydrocarbons (HPAHs; soil invertebrates and mammals) (EPA 2007a)[1] and metals (plants, soil invertebrates, birds, mammals; EPA 2007b)

2. DEQ Terrestrial SLVs, direct contact and ingestion (terrestrial invertebrates, plants, mammals, and bird values) (DEQ 2001)[2]
3. EPA Region 5 soil Ecological Screening Levels (ESLs) direct contact and ingestion

- Alternative cyanide screening level (described below)
- Alternative dibenzofuran screening level (described below)

Ecological screening levels based on a no observed adverse effect level (NOAEL) endpoint are multiplied by five in accordance with DEQ risk assessment guidance.

Surface and subsurface soil:

- Human health screening levels selected according to the following hierarchy:
  1. DEQ RBCs - Construction & Excavation Worker direct contact and volatilization to outdoor air; Occupational Worker vapor intrusion and outdoor air (DEQ 2011)
  2. EPA RSLs (EPA 2011)

NW Natural and Siltronic continue to have concerns about the use of the EPA Region 5 soil ESLs for ecological soil screening. NW Natural and Siltronic's main concern regarding the use of EPA Region 5 SLVs are that the specific methods and assumptions used to derive these screening levels are not available and, therefore, NW Natural and Siltronic have no ability to evaluate the appropriateness of these screening levels for their intended use as requested by EPA. Where appropriate in accordance with the agreed-upon soil screening level hierarchy, the EPA Region 5 soil ESLs have been included as soil screening levels. The alternative mammalian ecological soil screening level proposed to DEQ for cyanide in the October 31, 2011 memorandum from Mr. Fuji and Ms. Hitchko of Anchor QEA to Mr. Bayuk of DEQ entitled "Proposed Alternative Cyanide Screening Level" is also included as a soil screening level.

[1] HPAH and LPAH SSLs are applied on an individual and total LPAH and total HPAH basis.
[2] Because threatened or endangered species are not presentment at the Gasco Site, a multiplier of five is applied to bird and mammal SLVs.

In addition, the soil screening levels include the alternative ecological screening level for dibenzofuran that that DEQ e-mailed to NW Natural on February 23, 2012. Per DEQ's correspondence, this screening level was also applied to carbazole.

In addition to the previously listed soil screening level changes, the definition of surface soil has been revised to be the 0 to 3.5 foot below ground surface (bgs) depth interval, consistent with the Gasco Upland RA definition.

Section 3 – Response to EPA's May 4, 2009, Comments:

This section presents a summary of responses by NW Natural and Siltronic to the EPA May 4, 2009, comments on the screening levels presented in the Draft Area Identification Report (AIR) (Anchor QEA 2010). For easier reference, EPA's original comments are provided in **bold** above NW Natural and Siltronic's response. Please note that Tables 2-2, 2-3, 2-4, and 2-5 referenced in the EPA comments were renumbered in the *Final Project Area Identification and Data Gaps Report* (Final AIR; Anchor QEA 2010) to Table 2-2, Table 2-3, Table 2-4, and Table 2-5 of Appendix G, respectively.

Table 2-2. Ecological Water Screening Table. Transition zone water and surface water toxicity reference values (TRVs) should be the same values. For example, a screening level value (SLV) is listed for cyanide in transition zone water, but not surface water. In addition, although Table 5-2 (Water TRVs for Surface Water) and Table 6-2 (Water TRVs for Transition Zone Water COIs) from the risk assessment are cited, it does not appear all SLVs were utilized to screen data for the AIR. The full list of SLVs is found in these tables, and Appendix G and Attachment 5 (SLERA and Refined Screen). The referenced sources of information also provide values for pesticides such as alpha, beta, and gamma HCH (Lindane); Endrin Ketone, PCB Aroclors, Total PCBs, carbazole, trans-1,2-dichlorethene, and vinyl chloride. For clarification and completeness, any SLVs not used for screening purposes in the AIR should be clearly identified.

Regarding specific analytes and/or chemical groups the following criteria should be used.

3. **Cyanide: The cyanide water criteria should be applied to free and total values.**
4. **PCBs: All PCBs, Aroclors, congeners, or Total PCBs, should be compared to the National Ambient Water Quality Criteria of 0.014 microgram per liter (ug/L). Acute water criteria should not be used.**
5. **DDTs: The ambient water quality criteria of 0.001 ug/L should be applied to each isomer as well as the total value for surface water and transition zone water. It is not clear from reviewing the table why this value is not applied to all the DDD, DDE and DDT isomers for surface water.**

NW Natural and Siltronic Response:

Response to comments on the use of screening level values (SLVs):

NW Natural and Siltronic screened surface water and TZW data against toxicity reference values (TRVs) in Table 6-22 and Table 6-26 (respectively) of the Draft BERA (Integral et al. 2009). This comment references TRVs used during the screening-level ecological risk assessment

(SLERA), an earlier step in the BERA process. A number of the chemicals of interest (COIs) included in the SLERA did not exceed their associated screening levels and thus were not screened in the BERA or have TRVs presented on BERA Tables 6-22 and 6-26. NW Natural and Siltronic believe that tracking those chemicals that earlier work has shown do not pose risk at the Portland Harbor Site is inconsistent with the Statement of Work (SOW) process.

Nevertheless, to facilitate completion of the Project AIR data screening, NW Natural and Siltronic have modified Table 2-2 to replace the BERA Table 6-22 and Table 6-26 SLVs with the SLERA TRVs referenced in the this EPA comment. Surface water data and TZW data has been screened against the values found in Table 5-2 and 6-2, respectively, of Attachment 5 to the *Draft Final Baseline Ecological Risk Assessment* (Draft Final BERA) (Integral et al. 2011b).

As discussed in the EPA comment, TRVs for certain chemicals are listed on only one of these tables (e.g., a TRV for cyanide is found on Table 6-2, "Water TRVs for TZW COIs", but not on Table 5-2, "Water TRVs for Surface Water COIs"). Consistent with the SLERA approach, SLERA TRVs for TZW will only be applied to TZW data and SLERA TRVs for surface water will only be applied to surface water data. NW Natural and Siltronic note that, although there is no SLERA TRV for cyanide in surface water data, surface water data is screened against several other cyanide screening levels, including NRWQC for protection of the aquatic life freshwater chronic screening level for cyanide, which is equal to the SLERA TRV value for TZW.

Response to comments on the use of criteria for cyanide:
NW Natural and Siltronic do not consider it appropriate to compare total cyanide data to free cyanide screening levels. A considerable amount of free cyanide data has been collected in sediments and upland media for the purpose of assessing risk associated with this chemical. NW Natural and Siltronic continue to disagree that any form of cyanide other than free cyanide measured at the actual point of exposure where organisms exist in surface water and TZW is indicative of in-water impacts, given that free cyanide is the true measure of actual bioavailable (and toxic) cyanide concentrations.

Consistent with this approach, criteria developed for total cyanide have been used to screen total, free, and available cyanide data while criteria developed for free cyanide have been used to screen free cyanide data only. Table 2-2 has been updated to reflect this approach.

Response to comments on the use of criteria for PCBs:
NW Natural and Siltronic understand this comment as a request to compare individual polychlorinated biphenyl (PCB) congener, individual Aroclor, and summed total PCB results to the National Ambient Water Quality Criterion for total PCBs, which is 0.014 micrograms per liter (µg/L). NW Natural and Siltronic applied this criterion to summed PCB results. NW Natural considers this to be a conservative approach, as the sum of the individual analytes (e.g., Aroclors, congeners) will not be less than the value of each individual analyte. Nevertheless, NW Natural has revised Table 2-2 to include the comparison of individual PCB congener and Aroclor results as well as summed total PCB results against water quality screening levels for total PCBs.

EPA has also requested that an acute water quality criterion for PCBs not be used in the screening. NW Natural and Siltronic consider this criterion to provide useful information regarding the presence of PCBs above acute toxicity concentrations. Nevertheless, to facilitate completion the Project AIR data screening, NW Natural and Siltronic modified the Table 2-2 to remove this criterion.

Response to comments on the use of criteria for DDTs:
NW Natural and Siltronic revised Table 2-2 to reflect that the National Ambient Water Quality Criterion for DDT and its metabolites have been applied to DDD, DDE, and DDT isomers, as well as summed DDD, DDE, DDT, and total DDx.

In addition to the described Table 2-2 revisions, The EPA RSL screening levels were updated to be consistent with the EPA's June 2011 RSL list.

Table 2-4, Uplands Soil Screening Level Table. For many PAHs, DEQ's risk-based concentration (RBC) table indicates that excavation worker, volatilization to outdoor air, and leaching to groundwater values are not provided because the values are greater than saturation or a maximum value of 100,000 milligrams per kilogram (mg/kg). This information (>sat or >max) should be provided in the table rather than leaving the table blank (implying that the RBC has not been evaluated).

Regarding Ecological Upland Soil Screening Values, two sets of screening values are included in Table 2-4:

1. **Sediment Toxicity Values, as represented by DEQ Joint Source Control Strategy (JSCS) values which are based on MacDonald Probable Effects Concentration (PEC) values.**
2. **Sediment Bioaccumulation Values are represented by 2001 bioaccumulation values that have since been replaced by DEQ's 2007 sediment bioaccumulation guidance. The 2001 values are based on the lowest allowable concentration in water for exposure to a piscivorous bird (Great Blue Heron) or piscivorous mammal (mink). DEQ's 2007 value for DDT in sediment is 0.00034 mg/kg for protection of bird egg for Total DDx, and 0.0013 mg/kg dietary bird. Furthermore, the bioaccumulation values for fluoranthene and pyrene are 37 mg/kg and 1.9 mg/kg from DEQ's 2007 guidance. These values should replace the outdated proposed values.**

Labeling this column "Upland Soil and Sediment" is misleading since all the values represent sediment toxicity data. Values for protection of riparian and upland receptors such as plants, invertebrates, shrew and birds should also be included.

NW Natural and Siltronic Response:

Response to EPA comment on the DEQ's RBCs:

NW Natural and Siltronic revised Table 2-4 to indicate when a DEQ RBC is not provided because the value is greater than saturation or a maximum value of 100,000 milligrams per kilogram (mg/kg).

Response to EPA comments on the Ecological Upland Soil Screening Values:

NW Natural and Siltronic revised Table 2-4 consistent with the July 17, 2007, revision of the Joint Source Control Strategy Table 3-1. Note that the sediment bioaccumulation number for total DDT was revised to 0.33 micrograms per kilogram (µg/kg) to be consistent with this table and is the only bioaccumulation screening level value provided for this set of chemicals. In addition, NW Natural and Siltronic revised the title for column containing the Joint Source Control Strategy (JSCS) Table 3-1 screening levels to "Upland Soil / Stormwater Sediment," to be consistent with the title of the column that contains these values in JSCS Table 3-1.

Regarding EPA's request for values for the protection of riparian and upland receptors, please refer to Section 2 and to NW Natural and Siltronic's response to EPA's request for additional values for Table 2-4, provided as follows. These sections detail values for the protection of riparian and upland receptors that were added to Table 2-4.

Regarding the use of DEQ's 2007 sediment bioaccumulation guidance, NW Natural and Siltronic do not agree that these are appropriate screening values for upland soils for this project. Per the SOW, soils along the riverbank are being screened to address upland issues pertaining to: 1) potential sources to the river; and 2) potential upland risks consistent with the upland RA and FS process. Regarding sources, it is NW Natural and Siltronic's understanding that DEQ policy has, and continues to be, to screen bank soils against values contained in JSCS Table 3-1. NW Natural and Siltronic agree that the sediment bioaccumulation values in Table 2-4 will be updated consistent with the July 19, 2007, JSCS Table 3-1. However, NW Natural and Siltronic are unclear that DEQ's current policy is to use other values from the 2007 sediment bioaccumulation guidance in JSCS screening efforts. Regarding upland risks, per the following responses, NW Natural and Siltronic agree to add relevant upland soils risk screening values consistent with the negotiated agreements between NW Natural and DEQ for the uplands portion of the site.

Additional values for Table 2-4: Similar to human health RBCs for upland soil, upland soil values should also be used from the ecological risk assessment to represent riparian and upland exposure. In addition, it will reduce significantly the COCs in Table 2-5 that are identified as being "without screening levels." The following hierarchy for selection of upland ecological soil values is recommended.

1. **EPA Eco SSLs, available at http://www.epa.gov/ecotox/ecossl/: These are the most up to date national soil screening levels, and include metals, DDT and isomers and Total LPAH and Total HPAH values. These soils screening numbers are available for different trophic levels including plants, invertebrates, birds and mammals. The lowest value available from the set of SLVs should be used for screening.**
    a. **Zinc: 46 mg/kg**
    b. **DDT and metabolites (applied as a total and to each isomer): 0.021 mg/kg**
    c. **Total HPAH (based on shrew): 1.1 mg/kg**
    d. **Total LPAH (based on shrew): 100 mg/kg**
2. **EPA Region 5 Soil Screening Level Values: Values are available for water, sediment and soil. However, the values presented below are for soil only, and should be included in addition to sediment values. These values are relevant toxicity and bioaccumulation values based on the shrew. These values are available at http://www.epa.gov/reg5rcra/ca/ESL.pdf.**
    a. **Cyanide: 1.33 mg/kg**

b. **Alpha-HCH: 0.0994 mg/kg**
c. **Beta-HCH: 0.00398 mg/kg**
d. **Delta-HCH: 9.94 mg/kg**
e. **Gamma-HCH (Lindane): 0.005 mg/kg**
f. **Technical-grade HCH: 0.005 mg/kg**
g. **Total PCBs: 0.000332 mg/kg**
h. **Dioxin TEQ (to 2,3,7,8-TCDD): 2E-7 mg/kg**
i. **PCB TEQ: 2E-7 mg/kg**
j. **2-Methynaphalene: 3.24 mg/kg**
k. **Acenapthene: 6820 mg/kg**
l. **Acenapthylene: 6820 mg/kg**
m. **Anthracene: 1480 mg/kg**
n. **Benzo(a)anthracene: 5.21 mg/kg**
o. **Benzo(a)pyrene: 1.52 mg/kg**
p. **Benzo(b)fluoranthene: 59.8 mg/kg**
q. **Benzo(g,h,i)perylene: 11.9 mg/kg**
r. **Benzo(k)fluoranthene: 14.8 mg/kg**
s. **Chrysene: 4.73 mg/kg**
t. **Dibenzo(a,h)anthracene: 18.4 mg/kg**
u. **Fluoranene: 122 mg/kg**
v. **Fluorene: 122 mg/kg**
w. **Indeno(1,2,3-cd)pyrene: 109 mg/kg**
x. **Napthalene: 0.0994 mg/kg**
y. **Phenanthrene: 45.7 mg/kg**
z. **Pyrene: 78.5 mg/kg**

3. **DEQ Soil Screening Levels (2001). These values have been superseded by the new EPA Eco SSLs, and since they do not include the bioaccumulation pathway are not as representatives as (1) and (2) above. However, they are still relevant to address incidental ingestion of soil only for chemical of interest (COIs).**
    a. **Dibenzofuran: 0.002 mg/kg**

NW Natural and Siltronic Response:

Response to EPA requests to include EPA Eco-SSLs in Table 2-4

NW Natural and Siltronic revised Table 2-4 to include the EPA Eco-SSLs for Zinc, DDT and metabolites, total HPAH, and total LPAH.

Response to EPA requests to include EPA Region 5 Soil Screening Levels in Table 2-4
As mentioned in NW Natural and Siltronic's previous responses to comments on Table 2-4 in Section 2, NW Natural and Siltronic continue to have concerns with the use of the EPA Region 5 soil ESLs for ecological soil screening. NW Natural and Siltronic's main concern regarding the use of EPA Region 5 SLVs are that the specific methods and assumptions used to derive these screening levels are not available and, therefore, NW Natural and Siltronic have no ability to evaluate the appropriateness of these screening levels for their intended use as requested by EPA. However, to facilitate completion of the Project AIR data screening, NW Natural and Siltronic have included EPA Region 5 soil ESLs in Table 2-4 where appropriate in accordance with the soil screening level hierarchy presented in the "Human Health, Ecological, and Source Control Screening Criteria" (Upland RA Screening Criteria Table) attached to the Oregon Department of Environmental Quality's (DEQ) January 5, 2012, letter to NW Natural (DEQ 2012).

Response to EPA requests to include the DEQ Soil Screening Level (2001) for Dibenzofuran in Table 2-4
NW Natural and Siltronic revised Table 2-4 to include the alternative ecological screening level for dibenzofuran that that DEQ e-mailed to NW Natural on February 23, 2012 as discussed in Section 2. This revision is consistent with the current Gasco Upland RA agreements between NW Natural and DEQ.

In addition to the above-described Table 2-4 revisions, The EPA RSL screening levels were updated consistent with the EPA's June 2011 RSL list.

Table 2-5, Summary of COCs without Screening Levels. The comments to Table 2-4 reduce the number of COCs listed in this table. Additionally, the Total PCB TEQ concentration should be compared to the value above for 2,3,7,8-TCDD. Recommendations for sources of information regarding additional screening values are provided below by media.

1. **Endrin Ketone, Soil: Use Endrin or Endrin Aldehyde as a surrogate (0.0101 mg/kg from EPA Region 5).**
2. **Total LPAHs and Total HPAHs, Soil: Use EPA Eco-SSLs.**
3. **DDT, DDD, DDE and Total DDX, Soil: Use national EPA soil screening levels applied to each isomer and Total DDX.**
4. **DDT, DDD, DDE and Total DDX, Sediment: Use values in DEQ's bioaccumulation guidance, available at**

(http://www.deq.state.or.us/lq/pubs/docs/cu/GuidanceAssessingBioaccumulative.pdf).

5. **Total PCB TEQ, Soil: Use acceptable soil value for 2,3,7,8-TCDD in soil (2E-7 mg/kg).**
6. **Delta HCH, Water: There is a value presented in Table 5-2 (Appendix G, Attachment 5) for Surface Water COIs or 0.08 ug/L using gamma HCH as a surrogate.**
7. **PCB TEQ, Water: PCP TEQ should be compared to an acceptable level of 2,3,7,8-TCDD in water. That value is 0.00001 ug/L, ambient water quality criteria, USEPA 1993.**
8. **Diesel Range and Residual Range Hydrocarbons, Water and Sediment: Use EPA's water and sediment SLVs for total petroleum hydrocarbons (TPH); please see attached memorandum with values.**

NW Natural and Siltronic Response:

Response to EPA request to screen Total PCB Toxics Equivalent Quotient (TEQ) against 2,3,7,8-TCDD

NW Natural and Siltronic updated Tables 2-1, 2- 2, and 2-4 to screen total PCB TEQ against 2,3,7,8-TCDD screening levels.

Responses to numbered EPA comments on Table 2-4

Comment 1 – Endrin ketone in soil

As discussed in NW Natural's response to EPA comments on Table 2-4, NW Natural does not believe that the EPA Region 5 soil ESLs are appropriate for the Upland RA process. Nevertheless, to facilitate completion the Project AIR screening task, NW Natural and Siltronic have added the Region 5 soil ESL for Endrin to Table 2-4 as a surrogate for Endrin Ketone.

Comment 2 – Total LPAH and total HPAH in soil; Comment 3 – DDT and metabolites in soil

NW Natural and Siltronic revised Table 2-4 to include the EPA Eco-SSLs for Zinc, DDT and metabolites, total HPAH, and total LPAH to Table 2-4. In addition, NW Natural agrees to use the EPA RSLs for sum DDE, DDD, and DDT to screen the individual DDE, DDD, and DDT isomers, respectively. An EPA RSL for total DDx is not available.

Comment 4 – DDT and metabolites in sediment

NW Natural and Siltronic revised Table 2-1 to include the DEQ's bioaccumulation values for DDT and metabolites. The bird egg population value of 0.34 ug/kg was added to this table.

Comment 5 – Total PCB TEQ in soil, Comment 7 – Total PCB TEQ in water
The EPA does not provide the source for the screening level for 2,3,7,8-TCDD in soil referenced in this comment; therefore, NW Natural and Siltronic were unable to evaluate the technical merit for using this level. However, as described above, NW Natural and Siltonic updated Table 2-4 to include 2,3,7,8-TCDD screening levels, including one level, the JSCS Table 3-1 bioaccumulation level of 9.1×10^{-9} mg/kg, that is, lower than the screening level listed in this comment. Total PCB TEQ in soil data will be screened against these screening levels.

Regarding 2003 Ambient Water Quality Criteria listed in this comment, NW Natural and Siltronic do not agree to include screening levels from the 2003 Ambient Water Quality Criteria because this list has been superseded by the *National Recommended Water Quality Criteria for Priority Toxic Pollutants* (EPA 2009). However, NW Natural and Siltronic include several 2,3,7,8-TCDD screening levels from the 2009 NRWQC list in Table 2-2 and will screen total PCB TEQ in water data against these values.

Comment 6 – Delta HCH in water
NW Natural and Siltronic revised Table 2-2 to include the SLERA Table 5-2 screening level for gamma-HCH as a surrogate screening level for delta-HCH in surface water.

Comment 7 – TPH SLVs in water
The specific methods used for the derivation of the TPH SLVs in water were not sufficiently documented or referenced to allow NW Natural to appropriately review the approach for TRV development or allow NW Natural to reproduce the resulting TRVs. It is difficult to follow the information contained in this document. For example, one of the derivation equations (Equation 10) is missing, and several references to tables in the document are either incorrect or the referenced table is missing. Additional documentation and justification of the TRV development methods is necessary to evaluate the appropriateness of these TRVs for their intended use as requested by EPA. No changes were made to Table 2-2.

Table 2-6, Summary of Screening Levels for Preliminary Area Identification. The surface water and transition zone water TRVs presented in the Draft BERA have several COCs identified without screening level values. It should also be noted the review of the Draft BERA is relevant to the in-water project area identification process as follows:

1. **The "Final Benthic SQGs" indicated here state they include the EPA 2009 thresholds, but the LWG analysis using these thresholds does not include the Hyaella growth**

endpoint, and would not be considered appropriate. In addition, the floating point model (FPM) for which these sediment quality guidelines (SQGs) are based has not been reviewed in its entirety and major aspects related to the validity of the model have still not been resolved. To address these concerns, national SQGs should be used as an additional line of evidence for screening. A good compilation of sediment screening values is available from JSCS Table 3-1 or the EPA Region 5 website at http://www.epa.gov/reg5rcra/ca/ESL.pdf

   a. **Zinc: No value is presented in the table because zinc was not included in the FPM. Therefore, a PEC should be used as 460 mg/kg instead of the proposed value from the Calcasieu-calculated number.**

2. **The "Benthic Toxicity Thresholds" are incorrect as presented in the cited *Benthic Toxicity Reanalysis Technical Memorandum*. The correct thresholds should be presented as directed in EPA correspondence.**
3. **"DEQ Criteria" and "JSCS Screening Level Values" are not inclusive of all pathways relevant to evaluating ecological risk, including riparian and upland plant, invertebrate, mammalian and avian receptors.**

NW Natural and Siltronic Response:

Response to EPA's comments on Sediment Quality Guidelines (SQGs) and request to use national SQGs:

NW Natural and Siltronic replaced the SQGs from the *Benthic Toxicity Reanalysis Technical Memorandum* (Windward 2009) from Table 2-1 with SQGs from Sediment Quality Value (SQV) *Report Final June 9, 2010. Table ES-1: Recommended Sediment Quality Guidelines. Development of Benthic SQVs for Freshwater Sediments in Washington, Oregon, and Idaho*.

Response to EPA's comments regarding the benthic toxicity thresholds:

As described previously in Section 1, NW Natural and Siltronic revised Table 2-3 consistent with the EPA methods presented in the *Benthic Toxicity Reanalysis Technical Memorandum* (Windward 2009).

Response to EPA's comments regarding ecological risk:

Please see the response to EPA comments on Table 2-4.

Table 2-7. Summary of Project AIR Screening by SOW Requirement. Similar to comments to Table 2-6, the following information should be noted.

1. **Page 1 through 3: Many of these lines of evidence are currently being reviewed and worked through as a part of the risk assessment. Of particular concern is the use of sediment values from output of the floating percentile model. Using these values is not recommended at this time. Other sediment lines of evidence such as PECs should be considered.**
2. **Page 4: Identification of the need for soils remediation work supports inclusion of appropriate screening level values for soil in the screening step (see comments to Table 2-4 above). Although appropriate human health upland soil screening levels are included here, ecological soil screening numbers are absent. As discussed above, the only values listed are for sediment (see comment on Table 2-4 for a list of soil values).**

NW Natural and Siltronic Response:

Please see the response to EPA comments on Table 2-4 and Table 2-6.

Table 2-10. Subsurface Sediment Screening Table. NW Natural should clarify that the screening value for PCB-126 is a surrogate for the PCB TEQ. Also, the justification for choosing three times the PRG for defining exceedances at depth should be explained.

NW Natural and Siltronic Response:

This table has been removed because the criteria in the table are no longer being used in the Portland Harbor process.

1 INTRODUCTION

This document presents the methodology and results of the evaluation of riverbank soil at the Gasco Sediments Site conducted in support of the *Draft Engineering Estimate and Cost Analysis* (EE/CA) for the Site. NW Natural and the Oregon Department of Environmental Quality (DEQ) recently agreed (DEQ 2012) on the screening levels for 0- to 3.5-foot soils, based on ecological and human health endpoints, and for 0- to 12-foot soils, based on human health endpoints shown on DEQ's January 5, 2012 Matrix of Screening Levels. This evaluation was generally conducted following the screening process outlined in that matrix.

2 METHODS

2.1 Dataset

The riverbank soil dataset used in the riverbank screening is described in Appendix G. This dataset includes samples collected from locations ranging from 13 feet North American Vertical Datum (NAVD88) to the top of bank (see Figure 2-1) based on available survey information. Due to the highly armored nature of the Gasco and Siltronic riverbanks, data density within this zone is limited. For this reason, samples collected in very close proximity of the top of bank elevation (i.e., within approximately five feet) were also included in the dataset to provide additional data density. Note that areas landward of the top of bank will be addressed as part of the upland feasibility study remedy evaluation. In addition, samples collected below the 13 feet NAVD88 contour were included in the riverbank soil data set to be consistent with DEQ direction in the "Draft Meeting Summary and Next Steps" document transmitted by Dana Bayuk of DEQ to Ben Hung of Anchor QEA in an e-mail dated May 12, 2011 (DEQ 2011). However, these samples are located within the in-water portion of the Gasco Sediments Site. Sediment impacts in this area will be addressed consistent with the sediment remedy. Samples collected landward of the riverbank or below the 13 feet NAVD88 contour are indicated on Figure 2-1 (and subsequent figures) by a square symbol.

The dataset was grouped into two categories by depth interval: 0- to 3.5-foot soils and 0- to 12-foot soils. The 0- to 3.5-foot depth category consists of soil samples collected from the 0- to 5-foot depth interval for locations sampled during the Gasco Sediments Site Data Gaps Investigation and samples collected from the 0- to 3.5-foot depth interval for all other locations. Refer to EE/CA Appendix A for additional detail on the Gasco Sediments Site Data Gaps Investigation (Anchor QEA 2010). The 0- to 12-foot depth category consists of samples collected from the 0- to 12-foot depth interval for all other locations.

2.2 Data Screen

The data were screened against riverbank screening levels for the Gasco Sediments Site chemicals of interest (COIs, as presented in Section 3.3 of the Statement of Work [SOW] attached to the Administrative Settlement Agreement and Order on Consent [AOC; Docket No. CERCLA 10-2009-0255]) presented on Table 2-1. The screening was conducted on a point-by-point basis. However, this is a conservative approach for applying the human health screening levels and some of the ecological soil screening levels. These screening levels are more appropriately applied to exposure point concentrations calculated over specific exposure areas, if those areas

have been identified, for risk characterization purposes. These human health and ecological screening levels were derived generally following the DEQ matrix (DEQ 2012), described as follows.

Table 2-1 presents the riverbank human health soil screening levels derived from the following sources:

- Risk-based Decision Making (RBDM) Risk-based Concentrations (RBCs) are from DEQ Environmental Cleanup and Tanks Program table entitled "Risk-Based Concentrations for Individual Chemicals," November 15, 2011, revision, available at http://www.deq.state.or.us/lq/pubs/docs/RBDMTable.pdf and accessed March 21, 2012.
- U.S. Environmental Protection Agency (EPA) Regional Screening Levels (RSLs) are from the EPA Summary Table dated November 2011 (EPA 2011), available at: http://www.epa.gov/region9/superfund/prg/, and accessed March 22, 2012.
- The Upland Remedial Assessment (RA) Ecological Screening Levels (ESLs) presented follow the hierarchy presented in the screening level matrix attached to the letter from Jim Anderson of DEQ to Bob Wyatt of NW Natural regarding: "Summary of Agreements on the Remaining Uplands Risk Assessment Issues, NW Natural "Gasco" Site" dated January 5, 2012. This hierarchy states that the secondary criteria are only used when criteria are unavailable from the previous reference(s).

Table 2-1 presents the riverbank ecological soil screening levels (Eco-SSLs) derived from the following sources:

- EPA Eco-SSLs for low molecular weight polycyclic aromatic hydrocarbons (LPAHs), high molecular weight polycyclic aromatic hydrocarbons (HPAHs), and metals available at: http://www.epa.gov/ecotox/ecossl/
- DEQ Level II Terrestrial Screening Level Values (SLVs) available at: http://www.deq.state.or.us/lq/pubs/docs/cu/GuidanceEcologicalRisk.pdf
- EPA Region 5 Resource Conservation and Recovery Act (RCRA) Ecological Screening Levels for Soil available at: http://epa.gov/region05/waste/cars/pdfs/ecological-screening-levels-200308.pdf

The hierarchy of ESLs follows that provided in the letter from Jim Anderson of DEQ to Bob Wyatt of NW Natural regarding: "Summary of Agreements on the Remaining Uplands Risk Assessment Issues, NW Natural "Gasco" Site" dated January 5, 2012.

A single screening level for each COI was selected according to the following hierarchy:

- 0- to 3.5-foot soils, ecological receptor: the lowest of Upland RA ecological receptor screening levels was applied to screen for ecological exceedances.
- 0- to 3.5-foot soils, human health: the lowest of the occupational worker, construction worker, and volatilization to outdoor air RBCs was applied. If an RBC is not available for a COI, the data were screened against the EPA RSL (if available).
- 0- to 12-foot soils, human health: the lowest of the construction worker, excavation worker, volatilization to outdoor air, and vapor intrusion into buildings RBCs was applied. If an RBC is not available for a COI , the data were screened against the EPA RSL (if available).

3 RESULTS AND DISCUSSION

The results for the riverbank ecological evaluation of 0- to 3.5-foot soil, riverbank human health evaluation of 0- to 3.5-foot soil, and riverbank human health evaluation of 0- to 12-foot soil, are summarized below and in Tables 3-1, 3-2, and 3-3. The locations of screening level exceedances are shown on Figures 3-1, 3-2, and 3-3.

3.1 Riverbank Ecological Receptor (Evaluation of 0- to 3.5-foot Soil)

As presented in Table 3-1 and shown on Figure 3-1, the concentrations of 25 chemicals were detected in soil samples at concentrations above riverbank soil ecological receptor screening levels:

- Zinc was detected in 2 out of 12 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor (defined as the result divided by the screening level) for zinc was 1.93.
- Total cyanide was detected at 3 out of 25 locations at concentrations above its associated soil ecological receptor screening level. The highest exceedance factor for total cyanide was 8.42.
- 2-Methylnaphthalene was detected at 1 out of 12 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for 2-methylnaphthalene was 2.24.
- Acenaphthene was detected at 1 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for acenaphthene was 1.14.
- Acenaphthylene was detected at 1 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for acenaphthylene was 3.45.
- Anthracene was detected at 1 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for anthracene was 4.14.
- Benzo(a)anthracene was detected at 7 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for benzo(a)anthracene was 56.36.
- Benzo(a)pyrene was detected at 10 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for benzo(a)pyrene was 74.55.

- Benzo(b)fluoranthene was detected at 8 out of 17 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for benzo(b)fluoranthene was 38.00.
- Benzo(g,h,i)perylene was detected at 10 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for benzo(g,h,i)perylene was 61.82.
- Benzo(k)fluoranthene was detected at 5 out of 17 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for benzo(k)fluoranthene was 9.07.
- Chrysene was detected at 9 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for chrysene was 72.73.
- Dibenzo(a,h)anthracene was detected at 4 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for dibenzo(a,h)anthracene was 18.18.
- Fluoranthene was detected at 9 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for fluoranthene was 110.91.
- Fluorene was detected at 1 out of 29 locations at concentrations above its associated riverbank screening level. The highest exceedance factor for fluorene was 2.72.
- Indeno(1,2,3-c,d)pyrene was detected at 9 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for indeno(1,2,3-c,d)pyrene was 41.82.
- Total HPAH was detected at 17 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for total HPAH was 690.91.
- Total LPAH was detected at 3 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for total LPAH was 48.28.
- Naphthalene was detected at 1 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for naphthalene was 7.59.
- Phenanthrene was detected at 1 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for phenanthrene was 26.21.

- Pyrene was detected at 13 out of 29 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for pyrene was 181.82.
- Endrin ketone was detected at 1 out of 12 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for endrin ketone was 8.32.
- Sum dichlorodiphenyltrichloroethane (DDD) was detected at 1 out of 12 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for sum DDD was 1.33.
- Total DDx[1] was detected at 1 out of 12 locations at concentrations above its associated riverbank soil ecological receptor screening level. The highest exceedance factor for total DDx was 1.71.

Refer to Figure 3-1 for the locations of these riverbank screening level exceedances.

Dibenzofuran was detected in 2 out of 12 samples at concentrations above its associated riverbank screening level. However, because all detected concentrations of dibenzofuran are below the DEQ's alternative screening level for dibenzofuran (85,000 micrograms per kilogram [µg/kg]), these exceedances are not considered indicative of ecological riverbank screening level exceedances. These exceedances are also not shown on Figure 3-1.

3.2 Riverbank Human Health Receptor (Evaluation of 0- to 3.5-foot Soil)

As presented in Table 3-2 and shown on Figure 3-2, the concentrations of eight chemicals were detected in soil samples at concentrations above riverbank human health screening levels for 0- to 3.5-foot soil.

- Benzo(a)anthracene was detected at 12 out of 29 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for benzo(a)anthracene was 114.81.
- Benzo(a)pyrene was detected at 20 out of 29 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for

[1] DDx is the sum of all six dichlorodiphenyltrichloroethane isomers (2,4′-dichlorodiphenyldichloroethane, 4,4-dichlorodiphenyldichloroethane, 2,4′-dichlorodiphenyldichloroethylene, 4,4-dichlorodiphenyldichloroethylene, 2,4′-dichlorodiphenyltrichloroethane, and 4,4′-dichlorodiphenyltrichloroethane).

benzo(a)pyrene was 1,518.52.

- Benzo(b)fluoranthene was detected at 10 out of 17 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for benzo(b)fluoranthene was 77.41.
- Benzo(k)fluoranthene was detected at 1 out of 17 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for benzo(k)fluoranthene was 1.85.
- Chrysene was detected at 1 out of 29 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for chrysene was 1.6.
- Dibenzo(a,h)anthracene was detected at 16 out of 29 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for dibenzo(a,h)anthracene was 370.37.
- Indeno(1,2,3-c,d)pyrene was detected at 13 out of 29 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for indeno(1,2,3-c,d)pyrene was 85.19.
- Naphthalene was detected at 1 out of 29 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for naphthalene was 9.57.

Refer to Figure 3-2 for the locations of these riverbank screening level exceedances.

3.3 Riverbank Human Health Receptor (Evaluation of 0- to 12-foot Soil)

As presented in Table 3-3 and shown on Figure 3-3, the concentrations of seven chemicals were detected in soil samples at concentrations above riverbank screening levels for 0- to 12-foot soil.

- Total cyanide was detected at 1 out of 36 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for total cyanide was 46.21.
- Naphthalene was detected at 3 out of 39 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for naphthalene was 15.15.
- Benzo(a)anthracene was detected at 5 out of 39 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for benzo(a)anthracene was 14.76.

- Benzo(a)pyrene was detected at 19 out of 39 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for benzo(a)pyrene was 195.24.
- Benzo(b)fluoranthene was detected at 8 out of 27 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for benzo(b)fluoranthene was 9.95.
- Dibenzo(a,h)anthracene was detected at 10 out of 39 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for dibenzo(a,h)anthracene was 47.62.
- Indeno(1,2,3-c,d)pyrene was detected at 9 out of 39 locations at concentrations above its associated riverbank human health screening level. The highest exceedance factor for indeno(1,2,3-c,d)pyrene was 10.95.

Refer to Figure 3-3 for the locations of these riverbank screening level exceedances.

Table 2-1
Screening Levels for Riverbank Soil[1]

Notes:

[a] = EPA RSL for dichlorodiphenyldichloroethane used for screening.

[b] = EPA RSL for dichlorodiphenyldichloroethylene used for screening.

[c] = EPA RSL for dichlorodiphenyltrichloroethane used for screening.

[d] = EPA RSL for PCBs (high risk) used for PCB screening.

[e] = 2,3,7,8 TCDD screening level used for PCB Toxic Equivalent Quotient (TEQ) screening.

[f] = Dibenzofuran screening level used for carbazole as directed by DEQ (DEQ email to NW Natural, February 23, 2012).

[g] = EPA RSL for xylene, mixture used for xylenes screening.

[h] = RBC not available because value exceeds the limit of three-phase equilibrium partitioning.

[i] = RBC not available because the constituent value for this pathway is greater than 100,000 mg/kg or 100,000 mg/l.

[j] = LPAH - PAHs with 2 to 3 benzene rings.

[k] = HPAH - PAHs with 4 to 7 benzene rings.

[l] = Eco-SSL for dichlorodiphenyltrichloroethane and metabolites used for sum dichlorodiphenyldichloroethane, dichlorodiphenyldichloroethylene, and dichlorodiphenyltrichloroethane screening, as well as screening of individual dichlorodiphenyldichloroethane, dichlorodiphenyldichloroethylene, and dichlorodiphenyltrichloroethane isomers.

[m] = Screening level was multiplied by 5 because the screening level is based on a No Observed Adverse Effect Level (NOAEL) endpoint

[1] = Refer to the source tables in the following footnotes for additional notes pertaining to the criteria listed in this table

[2] = EPA RSLs are from EPA Regional Screening Level (RSL) Summary Table November 2011 (EPA 2011). Available at: http://www.epa.gov/region9/superfund/prg/. Accessed March 22, 2012.

[3] = RBDM RBCs are from DEQ Environmental Cleanup and Tanks Program table entitled "*Risk-Based Concentrations for Individual Chemicals,"* November 15, 2011, revision, available at http://www.deq.state.or.us/lq/pubs/docs/RBDMTable.pdf. Accessed March 21, 2012.

[4] = The Upland Risk Assessment (RA) ESLs presented follow the hierarchy presented in the screening level matrix attached to the letter from Jim Anderson of DEQ to Bob Wyatt of NW Natural re: "Summary of Agreements on the Remaining Uplands Risk Assessment Issues, NW Natural "Gasco" Site," dated January 5, 2012. This hierarchy states that the secondary criteria are only used when criteria are unavailable from the previous reference(s).

[5] = Values obtained from EPA Ecological Soil Screening Levels for Dichlorodiphenyltrichloroethane and Metabolites (EPA 2007), EPA Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) Interim Final (EPA 2007), and EPA Ecological Soil Screening Levels for Zinc Interim Final (EPA 2007) (http://www.epa.gov/ecotox/ecossl/). In cases where more than one level is listed, then the most conservative level is used for screening. A 5x multiplier was applied to the bird and mammal screening levels.

[6] = Alternative DEQ screening level for dibenzofuran is from the DEQ e-mail to NW Natural dated February 23, 2012. This level is applied to carbazole as directed by DEQ. The screening level is multiplied by 5 because it is based on a no observed adverse effect level (NOAEL) endpoint.

[7] = DEQ screening values from *Guidance For Ecological Risk Assessment* . Level 2 screening values. "Table 1 Screening Level Values for Plants, Invertebrates, and Wildlife Exposed to Soil and Surface Water" (DEQ revision 2001). When multiple values existed, the lowest was used. A 5x multiplier was applied to the bird and mammal screening levels.

[8] = Alternative cyanide screening level is from the October 31, 2011, memorandum from Mr. Fuji and Ms. Hitchko of Anchor QEA to Mr. Bayuk of DEQ entitled *Proposed Alternative Cyanide Screening Level* . The screening level is multiplied by 5 because it is based on a no observed adverse effect level (NOAEL) endpoint.

[9] = EPA *Region 5 RCRA Ecological Screening Levels (ESLs) for Soil* (2003). Available at: http://www.epa.gov/reg5rcra/ca/pdfs/ecological-screening-levels-200308.pdf. Accessed March 21, 2012.

Data were screened according to the hierarchy in the screening level matrix attached to the letter from Jim Anderson of DEQ to Bob Wyatt of NW Natural regarding: "Summary of Agreements on the Remaining Uplands Risk Assessment Issues, NW Natural "Gasco" Site" dated January 5, 2012. When more than one screening level was indicated, the lowest level was used for the riverbank screen.

Acronyms

DDx = Sum of all six dichlorodiphenyltrichloroethane isomers (2,4′-dichlorodiphenyldichloroethane, 4,4-dichlorodiphenyldichloroethane, 2,4′-dichlorodiphenyldichloroethylene, 4,4-dichlorodiphenyldichloroethylene, 2,4′-dichlorodiphenyltrichloroethane, and 4,4′-dichlorodiphenyltrichloroethane).
DEQ = Oregon Department of Environmental Quality
Eco-SSL = Ecological Soil Screening Level
EPA = U.S. Environmental Protection Agency
HPAH = High-molecular-weight polycyclic aromatic hydrocarbon
kg = kilogram
LPAH = Low-molecular-weight polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
RA = Risk Assessment
RBC = Risk-Based Concentrations
RBDM = Risk-Based Decision Making
RCRA = Resource Conservation and Recovery Act
RSL = Regional Screening Level
SLV = Screening Level Value
SSL = Soil Screening Level
TCDD = 2,3,7,8-Tetrachlorodibenzo-p-Dioxin
TEQ = Toxic Equivalent Quotient
µg = microgram

Table 3-1
Data Screen: Ecological Receptor 0- to 3.5-Foot Riverbank Soil

Notes:

Detected concentration is greater than riverbank ecological screening level

Bold = Detected result

J = Estimated value

U = Compound analyzed, but not detected above detection limit

UJ = Compound analyzed, but not detected above estimated detection limit

R = Rejected

T = Result is the value of a total or calculation

-- = Results not reported or not applicable

N = Normal Field Sample

a= the result is below the Oregon Department of Environmental Quality (DEQ) alternative screening level shown in Table 2-1. Refer to Table 2-1 for additional detail.

The dataset evaluated for riverbank ecological receptor exceedances consists of soil samples collected from the 0- to 5- foot depth interval for locations sampled during the Gasco Sediments Site Data Gaps Investigation (GST-XX and GSM-XX locations) and soil samples collected from the 0- to 3.5- foot depth interval for all other locations shown. Refer to Appendix A for additional detail on the Gasco Sediments Site Data Gaps Investigation. Appendix G describes the for soil data compared.

Riverbank screening levels are presented on Table 2-1 of Appendix H.

Acronyms:

µg/kg = micrograms per kilogram

mg/kg = milligrams per kilogram

BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)

cm = centimeters

DDD = dichlorodiphenyldichloroethane

DDE = dichlorodiphenyldichloroethylene

DDT = dichlorodiphenyltrichloroethane

HPAH = high molecular weight polycyclic aromatic hydrocarbon

LPAH = low-molecular-weight PAH

PCB = polychlorinated biphenyl

Table 3-2
Data Screen: Human Health 0- to 3.5-Foot Riverbank Soil

Notes:

Detected concentration is greater than riverbank human health screening level

Bold = Detected result

J = Estimated value

U = Compound analyzed, but not detected above detection limit

UJ = Compound analyzed, but not detected above estimated detection limit

R = Rejected

T = Result is the value of a total or calculation.

-- = Results not reported or not applicable

N = Normal Field Sample

The dataset evaluated for 0- to 3.5- foot potential human health riverbank exceedances consists of soil samples collected from the 0- to 5- foot depth interval for locations sampled during the Gasco Sediments Site Data Gaps Investigation (GST-XX and GSM-XX locations) and soil samples collected from the 0- to 3.5- foot depth interval for all other locations shown. Refer to Appendix A for additional detail on the Gasco Sediments Site Data Gaps Investigation. Appendix G describes the for soil data screened.

Riverbank screening levels are presented on Table 2-1 of Appendix H.

Acronyms:

µg/kg = micrograms per kilogram

mg/kg = milligrams per kilogram

BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)

cm = centimeters

DDD = dichlorodiphenyldichloroethane

DDE = dichlorodiphenyldichloroethylene

DDT = dichlorodiphenyltrichloroethane

PCB = polychlorinated biphenyl

Table 3-3
Human Health 0- to 12-Foot Riverbank Soil

Notes:

Detected concentration is greater than riverbank human health screening level

Bold = Detected result

J = Estimated value

U = Compound analyzed, but not detected above detection limit

UJ = Compound analyzed, but not detected above estimated detection limit

R = Rejected

T = Result is the value of a total or calculation.

-- = Results not reported or not applicable

N = Normal Field Sample

The dataset evaluated for 0- to 12- foot potential human health riverbank screening consists of soil samples collected from the 0- to 12- foot depth interval for all other locations shown. Appendix G describes the for soil data screened.

Riverbank screening levels are presented on Table 2-1 of Appendix H.

Acronyms:

µg/kg = micrograms per kilogram

mg/kg = milligrams per kilogram

BHC = Benzene hexachloride, synonym with HCH (Hexachlorocyclohexane)

cm = centimeters

DDD = dichlorodiphenyldichloroethane

DDE = dichlorodiphenyldichloroethylene

DDT = dichlorodiphenyltrichloroethane

PCB = polychlorinated biphenyl

NOTES:
1. Screening results are presented in Tables 3-1, 3-2, and 3-3 in Appendix H.
2. The data set screened consists of soil samples collected from the 0- to 5- foot depth interval for locations sampled during the Gasco Sediments Site Data Gaps Investigation (GST-XX and GSM-XX locations) and soil samples collected from the 0- to 3.5- foot depth interval for all other locations shown. Refer to Appendix A for additional detail on the Gasco Sediments Site Data Gaps Investigation.
3. Refer to Table 2-1 in Appendix H for riverbank screening levels.
4. Dibenzofuran screening level exceedances are not shown because all dibenzofuran results are below the DEQ alternative screening level for dibenzofuran of 85.0 milligrams per kilogram. Refer to Table 2-1 in Appendix H for additional details.

1 INTRODUCTION

This appendix describes a modeling evaluation of the effectiveness of chemical and dense non-aqueous phase liquid (DNAPL) isolation caps conducted to support the draft Engineering Evaluation/Cost Analysis (EE/CA) for the Gasco Sediments Site (Site). Of the six remedial alternatives being evaluated in the draft EE/CA, four (Alternatives 2a, 2b, 3, and 4) include capping or sediment removal followed by capping in portions of the area being considered for remediation (i.e., the interim Project Area). The purpose of the modeling described herein was to identify the properties of a chemical isolation cap (e.g., thickness and sorption characteristics) that would be needed to address dissolved phase contaminant transport such that applicable risk-based criteria would be met at the cap's surface. The methods used in this modeling are generally consistent with the screening-level evaluation that was conducted to evaluate cap effectiveness as part of the Portland Harbor Superfund Site draft Feasibility Study (Portland Harbor draft FS; see Appendix Hc of Anchor QEA 2012).

2 CHEMICAL DISSOLVED PHASE MIGRATION

The following subsections describe the methods used to perform the steady state and transient cap modeling and modeling results.

2.1 Methodology

The subsections below provide a brief summary of the methods used in this evaluation, including descriptions of how the portion of the interim Project Area being considered for capping was divided into sub-areas for the purposes of modeling (Section 2.1); the model framework (Section 2.2); the setup and input parameters used in the model (Section 2.3); and the general approach used to apply the model and how the results were used to assess cap effectiveness (Section 2.4).

2.1.1 Identification of Cap Modeling Sub-areas

To account for varying conditions across the interim Project Area, the modeling evaluation was performed separately for different sub-areas, which were delineated as follows. First, the spatial extents of capping or dredge/cap areas associated with Alternatives 2a, 2b, 3, and 4 were combined to produce a generalized cap footprint, recognizing that the differences in the overall cap and dredge/cap areas among these three alternatives are relatively small. Then, this generalized cap footprint was divided into smaller areas for modeling based on the following two considerations:

- **Spatial distribution of groundwater velocity:** The hydraulic control and containment (HC&C) system proposed for the Gasco and Siltronic properties has been designed based on a groundwater flow model (MODFLOW) that computes groundwater fluxes to and from the river under operation of the HC&C system (Anchor QEA et al. 2012). As discussed in Section 5.4.1 of the draft EE/CA, the flow model is calibrated to both upland gradient data as well as offshore piezometer data. Consequently, the model projections of future groundwater velocities are expected to be accurate. The model predicts hydraulic gradient and groundwater flow reversals within the sediments over a large portion of the interim Project Area. Results from the MODFLOW predictions were used to identify portions of the cap footprint that are expected to have downward flow (downwelling areas) versus those that would have upward flow (upwelling areas) because modeling of contaminant transport in a cap is directly dependent on advective velocity.
- **Contaminant distributions:** As discussed in Section 2.5.1.1 of the draft EE/CA, the

primary chemicals of interest (COIs) at the Site are polycyclic aromatic hydrocarbons (PAHs), which were represented in the modeling by benzo(a)pyrene (BaP) and naphthalene, consistent with the contaminant fate and transport modeling conducted for the draft EE/CA (see Appendix E). Furthermore, there are regions of the interim Project Area within which risk-based criteria are exceeded for volatile organic compounds (VOCs) including benzene, trichloroethylene (TCE), and TCE's degradation byproducts, represented by cis-1,2-dichloroethene (DCE) and vinyl chloride (see Section 2.5.5 in draft EE/CA). Thus, the zones within the generalized capping footprint in which VOCs were delineated to be at levels of concern were also considered in delineation of modeling areas.

Figure 2.1.1-1 shows the division of the generalized capping footprint within the interim Project Area into five modeling subareas. The largest area, referred to as Center (D), covers most of the capping footprint within the interim Project Area and is predicted to contain downward groundwater velocities under operation of the HC&C system. Adjacent to the Center (D) area are two small areas (Area 1 and Area 2) that were identified to detectable transition zone water (TZW) concentrations of chlorinated VOCs. These areas are also characterized by downward groundwater velocities. The remaining two modeling areas (referred to as Upstream [U] and Downstream [U]) were delineated as areas outside the influence of the HC&C system, in which upward groundwater flow is predicted; these areas are located upstream and downstream of the Center (D) area.

2.1.2 Model Framework

The one-dimensional models that simulate contaminant transport within a sediment cap developed by Dr. Danny Reible at the University of Texas were used for this evaluation. These models simulate the fate and transport of contaminants (dissolved and sorbed phases) under the processes of advection, diffusion/dispersion, biodegradation, bioturbation/bioirrigation, and exchange with the overlying surface water. Two versions of the Reible capping models were used in this assessment: a steady state version (Lampert and Reible 2009) and a transient version (Go et al. 2009) that performs time-variable simulations. These models have been used to support the evaluation and design of sediment caps at numerous sites around the United States (e.g., Parsons and Anchor QEA 2012).

2.1.3 Model Setup and Inputs

2.1.3.1 Model Layers

The cap being evaluated in the draft EE/CA consists of an erosion protection (armor) layer placed atop a layer of base cap (chemical isolation) material. Figure 5.4-1 in draft EE/CA shows that the erosion protection layer may also be placed atop a filter layer that overlies the base cap material (assumed to occur in the wave zone area depicted in Section 4.5.3.1 of the draft EE/CA). The purpose of the erosion protection layer is to maintain the cap material in place by resisting erosive forces such as river flow, waves and prop wash. This erosion protection layer normally has some limited sorptive capacity and also provides for some added separation distance from the contaminated sediments, which limits diffusive flux of contaminants by reducing the concentration gradient within the overall cap. However, for the purposes of the chemical isolation modeling, the erosion protection layer was conservatively assumed to not contribute to chemical isolation. Therefore, the cap profile simulated in the model consisted of 12 inches of isolation material. The modeling conservatively assumes an infinite mass of contaminant is present beneath the isolation layer. The upper portion of the cap comprises the bioturbation zone (Lampert and Reible 2009), which is the depth over which benthic mixing processes are anticipated to occur. The bioturbation zone thickness was taken to be 10 centimeters (cm) for this evaluation, consistent with the Portland Harbor draft FS evaluations, which were based on literature and standard practice for cap design (Appendix Hc of Anchor QEA 2012).

2.1.3.2 Model Input Parameters

The input parameters used in the cap modeling assessment are listed in Table 2.1.3.2-1, along with the sources from which they were derived. Many of the parameters are the same as those used in the Portland Harbor draft FS capping evaluation (Appendix Hc of Anchor QEA 2012), several of which are either literature-based, chemical-specific properties (such as partition coefficients) or typical values recommended for capping evaluation/design from Reible (2012). Two of the key model input parameters used in this evaluation are based on site-specific information from the interim Project Area: 1) the porewater concentration underlying the cap; and 2) the groundwater Darcy velocity. Details on how these two inputs were developed are provided in the following two subsections.

2.1.3.2.1 Underlying Porewater Concentrations

The underlying porewater concentration defines the source term (boundary condition) in the model and represents the concentration of each COI within the sediment beneath the cap. The porewater concentration of each modeling area was defined based on samples collected at

depths considered representative of conditions that would be present following cap placement. These sample depths were defined based on TZW samples collected from depths of 0 to 10 feet below the sediment/water interface (which would be representative of conditions for a cap placed at grade) and from groundwater samples collected from depths of 20 to 30 feet (which would be representative of conditions in which there was 20 feet of sediment removal prior to capping). The porewater concentrations used for each modeling area were then conservatively defined based on the maximum concentration from the TZW/groundwater data from within these depth intervals within the given area. The initial porewater concentrations associated with each modeling area and contaminant are presented in Table 2.1.3.2.1-1; these values indicate that of the five model areas, Center (D), and the Area 2 VOCs area generally have the highest concentrations.

2.1.3.2.2 Groundwater Darcy Velocity

As described above, anticipated large-scale variations in groundwater velocity within the interim Project Area associated with the limits of the HC&C system capture zone (i.e., regions of upwelling versus downwelling) were used to delineate the major modeling areas (Upstream [U], Center [D], Downstream [U]) used in this evaluation. The Darcy velocity used to characterize each of these areas in the modeling was based on a spatial average of the values predicted by the MODFLOW model over the boundaries of each area. A spatial average was judged to be an appropriately conservative value for use in this evaluation because: 1) a number of conservative assumptions were made during development and use of the MODFLOW model during design of the HC&C system (Anchor QEA et al. 2012); and 2) each model area is already conservatively characterized by use of the maximum concentration measured within the area. For the two smaller model areas (Area 1 VOCs and Area 2 VOCs; Figure 2.1.1-1) that correspond to the localized regions of detectable concentrations of chlorinated VOCs, the Darcy velocity was specified based on a spatial average calculated over a smaller region that encompasses both areas. Darcy velocities used in the cap evaluations are presented in Table 2.1.3.2.1-1. As shown in the table, the downwelling velocities in the Center (D) and Area 1 and Area 2 VOCs areas were similar, at approximately -50 cm/year, while the upwelling velocity in the Upstream (U) area (170 cm/year) was approximately 2.5 times higher than in the Downstream (U) area (70 cm/year).

2.1.4 Model Application Approach

Based on the setup and input values described above, the model was used to predict sorbed-phase and porewater concentrations within the cap. To evaluate cap effectiveness, the model

results were compared to performance criteria, which consisted of 1) sediment-based criteria consistent with those used in the Portland Harbor draft FS (Appendix Hc of Anchor QEA 2012); and 2) water quality-based criteria as identified in the Portland Harbor Baseline Ecological Risk Assessment (Windward 2011). Model-predicted sorbed-phase concentrations within the cap's 10-cm bioturbation zone (which characterizes benthic exposure) were compared to the sediment-based criteria; concentrations at the bottom of the bioturbation zone were conservatively used in these comparisons, consistent with the Portland Harbor draft FS. For the water quality-based criteria, model-predicted porewater concentrations at the cap surface (defined based on a depth of 1 cm) were used because these criteria are applicable to surface water.

For the cap effectiveness evaluation, the steady-state model was initially used to assess whether a 1-foot-thick chemical isolation cap composed of sand would meet the performance criteria. These steady-state evaluations were conducted for each of the six modeled chemicals (i.e., BaP, naphthalene, benzene, TCE, DCE, and vinyl chloride) within each of the five model areas discussed above. For cases where the model predicted that a 1-foot sand cap would not meet the performance criteria at steady-state, a secondary evaluation of an amended cap was conducted, in which the transient model was used to estimate the amount of sorptive amendment within a 1-foot cap that would be needed to meet the performance criteria throughout a 100-year simulation period.

2.2 Model Results

The results of the steady-state modeling for a 1-foot-thick cap are presented in Table 2.1.3.2.1-1. This table contains, for each modeling area and chemical, the initial porewater concentrations and upwelling velocities used in the model, the performance criteria, and the steady-state concentrations calculated by the model in porewater and the sorbed phase within the cap surface. Table 2.1.3.2.1-1 shows that under steady-state conditions, a 1-foot sand cap would be effective for modeling areas within the HC&C capture zone (i.e., negative/downward groundwater velocities), which include the Center (D) and Area 1 and Area 2 VOCs areas. However, in modeling areas Upstream (U) and Downstream (U), in which upward groundwater velocities are anticipated, the steady-state concentrations of BaP and naphthalene exceed the performance criteria and, therefore, additional simulations with the transient model were conducted for these cases to evaluate the performance of an amended cap.

The transient modeling was performed by iteratively increasing the effective organic carbon fraction (foc) of the 1-foot-thick chemical isolation material until the performance criteria were met throughout the 100-year model simulation period. The transient modeling indicated that naphthalene was the driving contaminant, which was expected due to its greater mobility than BaP (i.e., the partition coefficient of naphthalene is nearly three orders of magnitude lower than that of BaP; Table 2.1.3.2-1). The results from the transient modeling, which are presented in Table 2.2-1, suggest that for both the sediment- and surface water-based performance criteria, the foc needed to amend a 1-foot-thick sand cap is approximately 20 percent to 25 percent in the Upstream (U) area, and twice that (40 percent) in the Downstream (U) modeling area. Based on studies that measured partitioning of PAHs to organoclay (Reible et al. 2011), the equivalent amounts of organoclay that would produce the same effective sorptive capacity as these foc values were calculated to be 10 percent by weight (approximately 6 pounds per square foot [lb/sf]) for the Upstream (U) area and 15 percent by weight (approximately 10 lb/sf) for the Downstream (U) area (Table 2.2-1). These percent by weight organoclay amendments are within the typical range used for capping applications.

3 DNAPL MIGRATION

As discussed in Section 4.4.1 of the draft EE/CA, portions of the interim Project Area contain sediments with substantial product (as defined in Section 3.6.2.1 of the Scope of Work [SOW]), some of which contain DNAPL at variable depths below the sediment surface. Active caps that focus on the adsorption of DNAPL may be applicable in these areas.

An estimate of the DNAPL mobility and migration rate is required for evaluating effectiveness of a sorbent cap and for identifying remedial design requirements. The amount of mobile DNAPL that could migrate to the cap should not exceed the adsorbent capacity of the cap within the target service life of the cap. The bioturbation zone above the cap should remain free of DNAPL, and DNAPL-related chemical concentrations should be protective of ecological receptors for the 100-year service life (the assumption for the draft EE/CA) of the cap.

For DNAPL to mobilize, the DNAPL must be present in an amount that exceeds the DNAPL residual saturation. Residual saturation in a DNAPL-water-soil combination is defined as a ratio between the threshold volume of DNAPL and the volume of pore space in sediment above which DNAPL will flow (i.e., water displaces DNAPL) when external forces are applied. For coal tar based DNAPL, residual saturation has been reported to range from approximately 8 to 23 percent (EPRI 2004). This means that about 8 to 23 percent of the available pore space is occupied by DNAPL. Other forms of DNAPL have reported residual saturations outside this range.

Both tar and DNAPL have been identified at variable depths below mudline in the initial Project Area, as summarized in Tables 4.4.1-1 and 4.4.1-2 in draft EE/CA and Figure 3.0-1 (DNAPL can be conservatively designated as visual observations of liquid substantial product identified in the legend). The shown depth intervals in Figure 3.0-1 are the deepest depth interval where substantial product was identified. Tables 4.4.1-1 and 4.4.1-2 show that in some areas the DNAPL is present in the surface extending to some depth below mudline and in other areas the DNAPL is only present at depth with overlying DNAPL-containing materials. Tar is a solid and not mobile[1], and is therefore not considered to have the potential capacity to migrate to shallow sediment or the water column. Therefore, capping evaluations do not need to be

[1] By definition for the draft EE/CA, tar is identified through visual observations of solid or mostly solid product materials and therefore cannot migrate in liquid form.

designed to account for and protect against tar migration. DNAPL observations are summarized in Section 3.1.

The active cap considered for managing dissolved organic compounds in groundwater may also require additional capacity for potential adsorption of mobile/migrating DNAPL identified within the interim Project Area. A summary of the DNAPL characteristics identified through review of all core and boring logs, examples of sediment caps that have been constructed at other sites with DNAPL, and results of an active cap that was constructed as part of the 2005 Removal Action in an area with observed DNAPL is provided in the following subsections.

3.1 Summary of DNAPL Observations in Interim Project Area

The amount of DNAPL observed in sediment samples was described as ranging from light sheen to observations of a higher amount of DNAPL in the sample (i.e., saturated sediment, liquid DNAPL, product, etc.). Liquid DNAPL was typically described in terms of color (black to brown) and relative viscosity (less viscous to viscous). Several lines of evidence suggest that DNAPL, although present in the interim Project Area, is not actively seeping or migrating to the surface of sediments or surface water. These lines of evidence include:

- Much of the DNAPL is located at depths below the top 3 feet of sediment, and has not been observed to migrate into the shallow sediment overlying the deeper DNAPL (i.e., areas are showing natural recovery and burial of DNAPL by incoming cleaner sediments; see Section 5.1 in the draft EE/CA).
- Unlike some other manufactured gas plant or creosote sites, seeps of DNAPL have not been observed along the Gasco Sediments Site shoreline in hundreds of site visits by various private and public entity staff over the last 15 years, even during inspections during periods of extreme low water.
- Widespread sheens (a common feature at sites that have ongoing underwater seeps and require sorbent capping) are not commonly observed at the Gasco Sediments Site. Some periodic and spotty sheens have been observed over the years along the shoreline at the Gasco and Siltronic property line. However, extensive documentation and photographic inspections of these sheens (Anchor QEA 2010) indicate these tend to be spotty (rather than continuous) in nature and most clearly related to periodic physical disturbance (such as wave action) of the shallow shoreline sediments rather than active unassisted migration.
- No DNAPL was observed in offshore piezometers installed at the Gasco Sediments Site.

- No DNAPL seepage has been observed into the hydraulic low spot developed just channelward of the 2005 Removal Action, an area of some of highest incidence of product observations prior to that removal. Long-term diver monitoring of this area was performed several times per year for four years with the express objective of visual monitoring for potential DNAPL seepage and no such seepage was identified.

Figure 3.0-1 depicts the locations where substantial product was identified within the interim Project Area. Only two cores (locations GTC-10 and C11-D) with DNAPL (designated as liquid substantial product on the figure) were identified in the Upstream (U) positive groundwater flux area. In all other areas within the substantial product boundary, the upland groundwater source control system will provide downwelling of groundwater away from the cap and surface water.

3.2 Summary of Sorbent Cap Placement at DNAPL Sites

Sorbent caps have been installed and have been functioning successfully, containing DNAPL at numerous sites (see Table 5.5.1.2-1 in the draft EE/CA). These sites have sediment DNAPL that is usually more mobile and migrates to shallow sediment and surface water to a greater extent than has been observed at the Gasco Sediments Site. Many of the sites listed in Table 5.5.1.2-1 of the draft EE/CA have used reactive core mats or bulk adsorbents. Consequently, both the conditions at the Gasco Sediments Site and experience at other sites, including within Portland Harbor at the McCormick and Baxter site, indicate that areas of DNAPL can be effectively capped using absorbent cap amendments or similar technologies.

Further evaluation of DNAPL mobility, potential migration rates, and sorbent capacity of candidate cap materials would be needed to confirm an appropriate sorbent cap design. Based on experience at other sites, it is likely the active cap for management of dissolved phase contaminants in groundwater could be supplemented to achieve both dissolved phase treatment and DNAPL containment consistent with the remedial action objectives.

3.3 Summary of Sorbent Cap Placed for 2005 Removal Action

A reactive core mat using organoclay was installed in a portion of the nearshore area addressed during the Early Action described in Section 2.2.5 of the draft EE/CA. The 2005 Removal Action Completion Report (Anchor 2006) contains a detailed description of the reasons why EPA required the placement of a reactive core mat along a small portion of the shoreline adjacent to

the 2005 Early Action remedial footprint and construction techniques. In summary, following removal along the toe of slope portion of the remedial footprint, some localized areas of DNAPL was encountered. Due to this finding, NW Natural installed a reactive core mat along the entire toe of slope removal area to minimize the potential migration of DNAPL to sediments and surface water. As part of 2005 Removal Action post-construction monitoring requirements, approximately monthly visual observations has been conducted of this portion of the shoreline from late 2005 to the present. This monitoring has shown that the reactive core mat has remained in place and controlled the releases of any potential sheen from the underlying sediment (i.e., no sheens were observed during post removal action monitoring).

3.4 Consolidation and Gas Ebullition-induced DNAPL Migration

Design of active caps intended to minimize DNAPL migration should also consider potential consolidation or gas ebullition-induced DNAPL migration. Per the matrix in Table 5.5.1.2-1 of the draft EE/CA, these are the primary two forces expected to cause a potential for upward migration of DNAPL through a cap. Given the DNAPL is heavier than water, by definition, upward movement due to density issues is not possible. The only other potential force for DNAPL migration would be upward groundwater movement through a cap. As described in Section 3.1, there are only two cores within the Upstream (U) upwelling area that contain DNAPL. The upland groundwater source control system will provide downwelling of groundwater away from the cap and surface water in throughout the remainder of the initial Project Area.

Consolidation-induced DNAPL mobilization is of most concern during and shortly after cap construction. Consolidation of fine-grained, cohesive sediment can occur in the short term following cap construction or in the longer term as sediment deposits over the area and increases the weight on top of the sediment (Ma et al. 2010). Cap construction occurs relatively rapidly and is controlled by placing the cap in multiple thin layers. The gradual application of weight allows for slow buildup and release of pore pressure, minimizing potential DNAPL mobilization. Longer-term consolidation associated with sedimentation is similarly unlikely to significantly mobilize DNAPL, because of slow increase and release of pore pressure. Per Table 5.5.1.2-1 in the draft EE/CA, caps have been successfully placed avoiding significant consolidation-induced DNAPL migration at numerous sites, indicating such caps can likely be designed at the Gasco Sediments Site. To determine exact cap requirements, remedial design would need to include modeling of consolidation under a cap based on laboratory

measurements of DNAPL properties and estimated consolidation properties of Gasco Sediments Site sediment.

Gas ebullition can mobilize DNAPL and result in movement of DNAPL vertically upward, contrary to the normal downward movement of the denser than water DNAPL. Gas bubbles form as a result of degradation of organic materials (Barabas et al. 2009) and vaporization of DNAPL constituents (Ma et al. 2010). Ebullition generally occurs in shallow sediments where temperatures are relatively higher, and pressures are relatively lower, both conditions conducive to sediment gas formation. Ebullition is dependent on sediment temperature (and therefore, to seasonal fluctuation) and hydrostatic pressure. Gas bubbles modify the sediment by increasing the porosity and creating channels for migration of bubbles that also transport DNAPL. As the gas bubble migrates through the sediment, DNAPL can adhere to the gas bubble surface and be transported to surface water. This mode of transport has been observed at sites such as Island End River in Boston Harbor in Massachusetts; the Pine Street Barge Canal in Burlington, Vermont; Stryker Bay in Duluth, Minnesota; and Bangor Landing in Bangor, Maine.

Gas ebullition has not been observed to extensively exist at the Gasco Sediments Site during the various long-term visual monitoring events and construction activities that have been completed. However, this potential DNAPL migration path should be considered an uncertainty until additional information can be collected during design to fully assess the potential for gas ebullition and associated DNAPL migration. As with consolidation-induced migration, caps have been successfully placed at DNAPL sites with gas ebullition, indicating such caps can likely be designed here even if ebuliation is identified as a pertinent factor. If the Gasco Sediments Site is found to have a high potential for this type of ebullition movement, the potential for DNAPL migration can be addressed in remedial design by including features such as gas venting under the cap or using permeable materials that allow passage of gas but capture DNAPL.

4 SUMMARY

One-dimensional models were used to simulate chemical transport within caps that are being evaluated for the Gasco Sediments Site interim Project Area as part of the draft EE/CA. A conservative approach for specifying model inputs was used; it included specification of maximum measured porewater/groundwater concentrations within the interim Project Area and use of model predictions (using conservative model input parameters) of groundwater velocities under future operation of the HC&C system based on conservative assumptions.

Results of steady-state modeling indicated that a 1-foot sand cap would be effective in meeting risk-based performance criteria at the cap's surface over a majority of the interim Project Area (i.e., the portion in which the HC&C system is expected to produce downward groundwater flux). Figure 5.4-1 of the draft EE/CA shows the two conceptual cap sections assumed. The Armored Cap B section has a minimum 1-foot sand cap and the Armored Class 200 section has a minimum 1.5-foot sand cap (i.e., 6-inch base cap and 12-inch filter layer). Transient modeling was used to estimate the sorptive capacity of 1-foot caps needed to meet criteria throughout a 100-year simulation period within the portions of the interim Project Area capping footprint that are predicted to contain upward groundwater flux. The model results indicated that these areas would require amended caps containing 6 to 10 lb/sf of organoclay.

DNAPL has been observed at variable depths within portions of the interim Project Area and only within one area exhibiting groundwater upwelling that will not be controlled by the upland groundwater source control system. Other potential DNAPL migration pathways at the Gasco Sediments Site include consolidation-induced and/or gas ebullition-induced DNAPL migration. There are number of cleanup site throughout the country and in Portland Harbor that have successfully placed active sediment caps that are designed to contain DNAPL migration through these pathways. The 2005 Removal Action included the placement of a reactive core mat at the Gasco Sediments Site with organoclay and long-term monitoring has shown the mat has remained in place and no sheen releases have been observed. The exact cap requirements for areas where these pathways may exist would be further evaluated during the remedial design.

NOTES:
1. Arrow indicates direction of flow of river.
2. Horizontal datum is NAD83 HARN Oregon State Plane North, Intl. Feet.
3. Vertical datum is NAVD88.
4. Aerial imagery from July 2007.
5. Review of the core logs at the locations designated as Inconclusive Substantial Product provided insufficient information to confirm the presence of substantial product using the definition in the Statement of Work (e.g., stained sediments noted in an interval but no thickness provided).
6. The designated depths of substantial product are the deepest depth of substantial product observed in the core/boring log. Shallower depths may not contain substantial product.
7. Locations designated as containing liquid substantial product contain liquid substantial product in at least one depth interval. These locations may also contain non-liquid substantial product and the shown deepest depth interval designation may be driven by either liquid substantial or non-liquid substantial product.
8. Per the SOW, the definition of substantial product does not apply landward of the top of the riverbank. The shown top of riverbank borings were screened against the SOW substantial product definition solely to support evaluation of substantial product in the riverbank.

1 PURPOSE AND ORGANIZATION

This appendix presents the tools and approaches that were used to develop opinion of probable sediment remediation cost estimates for the draft Engineering Evaluation/Cost Analysis (EE/CA) alternatives. Consistent with the EE/CA, all costs provided in the tables and text of this appendix will be based on a net present value analysis, unless otherwise explicitly stated.

U.S. Environmental Protection Agency (USEPA) guidance (2000) was followed to develop the cost estimates. This guidance was supplemented with professional judgment where appropriate in estimating daily costs and production rates. Sevenson Environmental Services (SES), which completed the 2005 Removal Action, prepared the cost estimate. Professional judgment drew on recently completed Portland area projects including the Gasco 2005 Removal Action (Anchor 2006), and Terminal 4 Phase I Removal Action (Anchor Environmental 2008). The cost work was completed consistent with the Portland Harbor Site draft Feasibility Study (Portland Harbor draft FS) (Anchor QEA 2012) whenever possible. In providing opinions of probable construction cost, there is no control over the cost or availability of labor, equipment or materials, or over market condition or the Contractor's method of pricing, and opinions of probable construction costs are made on the basis of professional judgment and experience.

Table 1-1 shows the total net present value cost by alternative. All costs are present day costs except for long-term monitoring and maintenance costs, which are net present value costs. Table 1-2 shows quantities and provides discounted and non-discounted costs by alternative. Table 1-3 presents the detailed probable cost estimate prepared by SES. Two costs are prepared for each alternative reflecting the high and low removal volumes, with the exception of Alternative 2a which includes no removal.

The remainder of this appendix discusses the method for building up unit costs for the different construction elements.

It should be noted that the technologies presented in the cost estimate are representative of possible technologies that will eventually be implemented. As final design proceeds and more site specific information is gathered, the selected technologies will be refined.

2 UNIT COST DEVELOPMENT

This section presents the following:

- Construction tasks used as the basis for developing costs
- Methods used for developing quantities for the different construction tasks
- Cost approach used for each construction task

2.1 Construction Tasks

There are a number of common tasks for all of the cost estimates, as well as construction tasks specific to each unique remediation technology. This section describes both the common and unique construction tasks.

2.1.1 Direct and Indirect Cost Elements

The costs are broken into direct and indirect construction tasks. The common elements that are used to build up the cost estimates are as follows:

2.1.1.1 Direct Construction Tasks

- **Mobilization/demobilization:** The costs associated with mobilizing and demobilizing personnel and equipment is assumed to be a lump sum estimate based on professional experience.
- **Specific technology:** Subsection 2.1.2 describes each technology, the tasks required, and the associated costs in more detail.
- **Mitigation**: In areas where the surface elevation and/or texture are modified from the existing condition due to remedial actions, there may be a mitigation cost associated with the modification. The 404 of the EE/CA discusses the anticipated mitigation acreage ranges based on work done in the Portland Harbor draft FS (Anchor QEA 2012). Based on this review anticipated mitigation acreages are predicted to range from 0.4 to 1.8 acres. The Portland Harbor draft FS (Anchor QEA 2012) estimated mitigation cost ranges from $350,000 to $2.2 million per acre. Therefore, the potential range of mitigation costs used for this EE/CA ranges from $150,000 to $4 million.

2.1.1.2 Indirect Construction Tasks

- **Project management and design**. The costs associated with completing the remedial

design are assumed to be 5 percent of the direct construction costs.

- **Construction management and daily oversight.** During construction, personnel and equipment will be required to monitor the construction activities for quality assurance. Staffing is assumed to include an office project manager, support staff, and four field representatives (one field manager and three technicians). Costs are assumed to be 3 percent of the direct construction costs.
- **Daily agency oversight and project management**. USEPA will also be providing oversight to monitor personnel and equipment during construction. Costs are estimated from historical agency oversight costs experienced by Lower Willamette Group (LWG) to date. Costs are assumed to be 5 percent of the direct construction costs.
- **Engineering support during construction.** During construction, personnel will be required to provide engineering support as issues arise and to support the construction management. Staffing is assumed to cover an office project engineer and support and a resident engineer and support. Costs are assumed to be a lump sum based on professional experience.
- **Special insurance and bonding.** The costs associated with special insurance and bonding are assumed to be 2 percent of the direct construction costs.

2.1.1.3 *Contingency*

EPA (2000) states that contingencies for alternatives screening and/or detailed analysis of alternatives can be as high as 50 percent. This EE/CA assumes a contingency of 25 percent of the total direct construction costs.

2.1.1.4 *Long-term Monitoring and Maintenance*

Each technology has an assumed unique cost needed for long-term monitoring of that technology. Long-term maintenance costs are developed for appropriate technologies. Long-term monitoring and maintenance assumptions include the following:

- Monitoring for monitored natural recovery (MNR) and engineered caps occurs in years 1 through 10, 15, 20, 25, and 30
- Monitoring for dredge areas occurs in years 1 through 5, 10, 15, 20, 25, and 30
- Long-term maintenance of 5 percent of the total cap areas in years 5 and 10 after construction
- Long-term maintenance of 5 percent of the MNR area with 50 percent of the area being covered with an engineered cap

2.1.2 *Specific Technology Cost Elements*

Six different technologies were evaluated for cost including:

- Monitored natural recovery[1]
- Enhanced monitored natural recovery
- Engineered cap
- Engineered active capping
- In situ treatment
- Full removal and residuals cover
- Partial removal and engineered cap
- Disposal

2.2 Quantity Estimates for Each Construction Task

Quantities were determined for each of the technologies using the following approaches:

- **Capping**: Volumes and weights are determined assuming the different typical sections presented in Figure 2-1 multiplied by the corresponding area of the Sub-Sediment Management Area (Sub-SMA) in question. Allowances for overplacement are presented in Figure 2-1. Confined and/or underpier areas are differentiated from open water areas by physical characteristics. Final cap sections and extents will be refined as part of final design.
- **Dredging and Disposal**: Methods of volume determination area discussed in Section 4.7 of the EE/CA. Confined areas or areas with water-side access were differentiated from open water areas by physical characteristics. As discussed in more detail below, the assumed process option for residuals management is one additional pass and placement of a residuals cover. Other process option assumptions for residuals management, such as multiple cleanup passes, could significantly affect volumes, dredging duration, and overall costing approaches in this appendix.

[1] There are no construction-related direct costs associated with MNR.

2.3 Cost Approach for Each Construction Task

Material prices were obtained from vendors or suppliers. Unit prices are developed by taking the ratio of daily construction costs to the daily production rates. Daily construction costs are developed from the following sources:

- Material pricing obtained from local vendors and suppliers
- Estimates from similar projects
- Professional experience

Estimated daily production rates are based on professional judgment and site conditions (such as water depth, site access, dredge cuts, or cap thicknesses).

Specific assumptions used to develop costs for each technology are presented in the following subsections.

2.3.1 Monitored Natural Recovery

The costs associated with MNR are for long-term monitoring as there are no construction costs. Long-term monitoring net present value costs were developed using the monitoring types, event frequencies, and number of samples presented in Section 2.1.1 above.

2.3.2 Capping

Direct construction costs for capping were developed using the following assumptions:

- Armor cap material varies depending on the level of erosive force the cap is resisting (Figure 2-1 shows the different types of armoring)
- Base cap material is placed mechanically
- Armor material is placed mechanically
- No physical water quality control measures are assumed to be needed during cap placement, but operational BMPs are included in the production rates
- Equipment needed is assumed to consist of derrick rig and clam bucket, material scow, tug, and work boats
- Capping long-term monitoring net present value costs are developed using the parameters presented in section 2.1.1 above

Final cap sections and extents will be determined as part of final design.

2.3.3 Active Capping

The assumptions used to develop the direct construction costs for active capping are almost identical to the capping costs presented above. The only difference is the placement of an organoclay mat prior to cap placement or mixture of bulk organoclay in the base cap material. Assumptions used for the organoclay placement are:

- Debris removal will take place prior to mat placement
- Active capping long-term monitoring net present value costs are developed using the parameters presented in Appendix T of the Portland Harbor draft FS (Anchor QEA 2012)

The actual amounts and types of materials used in active caps will be determined as part of final design.

2.3.4 Full Removal and Residuals Cover

Direct construction costs for dredging are developed using the following assumptions:

- Debris within the dredge area will be removed prior to dredging.
- Piling or floating docks (i.e., light structures) within the dredge area will be removed prior to dredging and placed back after dredging. For Alternative 5, costs associated with demolition and replacing the existing heavy pier structure are included.
- Alternative 5 includes the removal and replacement of the Gasco dock as well as installation of a rigid containment barrier (i.e., sheetpile wall).
- Silt curtains or sheetpile water quality control structures are used as discussed in the EE/CA for certain alternatives in addition to operational BMPs are included in the production rates provided below.
- Dredging will be completed with a clamshell bucket.
- Residuals management for the cost estimate is assumed to include one additional 6-inch residuals dredge pass and a 6-inch residuals cover over dredge areas where dredge cuts are equal to the full depth of impact. Where dredge cuts are less than the full depth of impact, an engineered cap is assumed to be constructed.
- Dredged material will be placed onto a barge and hauled to a centrally located offloading facility (for transloading to upland disposal facility transportation) or to an in-water combined disposal facility (CDF) located within Portland Harbor.

- Equipment needed is assumed to consist of a derrick rig and clam bucket, material scow, and work boat.

Removal long-term monitoring net present value costs are developed using the parameters presented in section 2.1.1 above.

2.3.5 Partial Removal and Engineered Cap

Direct construction costs for partial removal and engineered cap are developed using the following assumptions:

- For removal-related activities, all of the direct removal cost assumptions described in Section 2.3.4 apply.
- For capping-related activities, all of the direct removal cost assumptions described in Section 2.3.2 apply.

Removal and capping long-term monitoring net present value costs are developed using the parameters presented in section 2.1.1 above.

2.3.6 Disposal

A range of disposal options for both upland and in-water are presented to bracket the likely costs for disposal of sediments. Upland disposal estimates assume sediment offloading at a) transload facility outside of the harbor, similar to what was used in the Gasco Time Critical Removal Action (Gasco TCRA). Although this approach is different than assumed in the Portland Harbor draft FS, the costs should be comparable to the Portland Harbor draft FS approach of using a centrally located transload facility with rail shipment.
The upland disposal costs will be based on the following assumptions:

- A Subtitle D transportation and disposal.
- In limited cases, Subtitle C transportation and disposal.

As an EECA level assumption, in-water disposal costs use the CDF costs presented in Appendix K of the Portland Harbor draft FS (Anchor QEA 2012). This assumption will be revised in remedial design to explore the potential alternatives to CDF disposal including confined aquifer disposal (CAD).

2.4 Institutional Controls

As stated in Section 6.3.9 of the EE/CA, a detailed institutional control plan is not proposed, because there are too many design level issues to integrate at the EE/CA level. Consequently, institutional control costs were estimated based on Appendix K of the Portland Harbor draft FS (Anchor QEA 2012).

5	2	6,000	11,000	17,000	254,000

Riverbank Geomembrane Material Quantities

Alternative	Riprap and Debris/Vegetation Removal (acres)	Geomembrane Placement (square feet)	Bedding Sand - 1 foot thick (tons)	Filter Sand - 1 foot thick (tons)
2a	2	88,700	5,000	5,000
2b	2	88,700	5,000	5,000
3	2	90,800	6,000	6,000
4	2	107,300	6,000	6,000
5	3	142,700	8,000	8,000

Active Capping Treatment Material Quantities

Alternative	Organoclay Mat Area (square feet)	Underpier Bulk Organoclay (tons) (10)	Non-underpier Bulk Organoclay Coverage in Square Feet	Non-Underpier Bulk Organoclay (tons) (11)
2a	50,000	4	101,000	388
2b	50,000	4	101,000	388
3	1,300	4	101,000	390
4	1,300	4	116,000	375
5	0	0	58,000	153

Import Material Quantity Assumptions

Engineered Cap in Wave Zone - ODOT 200				Engineered Cap in Non-Wave Zone - Armor Cap B			
	Base Sand Layer	Filter Layer (7)	Armor Layer		Base Sand Layer	Filter Layer	Armor Layer
Thickness (ft)	1	1.5	2.5	Thickness (ft)	1.50	0.00	0.75
tons/cy	1.5	1.8	1.8	tons/cy	1.50	1.50	1.80

Notes:
[1] = Using the LWG Preferred Method for determining dredge volumes
[2] = Residuals dredge volume assumes one, 12-inch dredge pass in dredge and cover areas only.
[3] = Percentage within sheetpile wall:
Bank Material: Aprroximately 95%, all bank volume is inside the sheetpile wall boundary, with the exception of the volume Bank Material near Cross Section E-E'.
Non-Bank Material: 30% - this includes all sub-SMAs in Open Water, Limited Access, and Under Structure Areas (all areas inside the sheetpile footprint).
[4] = Armored Cap B section
[5] = Armored Cap Class 200 section
[6] = Residuals cover volume assumes a 6-inch cover.
[7] = Same Gradation as armor Layer of Armored Cap B
[8] = Engineered Cap Quantites are calculated estimated using the area between the crest of the slope (typically El. +30) and the edge of the project boundary (El. +13).
[9] = Backfill quantities generally assume a 3H:1V grade from the crest of the existing slope, extending down to the base of the dredge prism. Backfill quantities assume 1.5 Tons per cubic yard. Engineered Capping for sideslopes below El. 13 is included in the non-bank area.
[10] = Assumes 1.6 pouds per square foot application rate.
[11] = Assumes 5 pounds/square foot application rate at Siltronics; 10 pounds/square foot application rate at Gasco

Table 1-3
Summary of Contractor Remedial Alternative Probable Cost Estimates

Task		Alternative 2a		Alternative 2b		Alternative 3		Alternative 4		Alternative 5

6 **Miscellaneous Construction-Related Direct Costs**											
Short-Term Water Quality Monitoring		$ 1,750,000	$ 1,750,000	$ 1,750,000	$ 1,750,000	$ 1,750,000	$ 1,750,000	$ 1,750,000	$ 1,750,000	$ 1,750,000	$ 1,750,000
Habitat and other Mitigation		$ 350,000	$ 4,000,000	$ 350,000	$ 4,000,000	$ 350,000	$ 4,000,000	$ 350,000	$ 4,000,000	$ 350,000	$ 4,000,000
Tenant Disruption Cost		$ -	$ -	$ -	$ -	$ -	$ -	$ -	$ -	$ -	$ -
	Subtotal	$ 2,100,000	$ 5,750,000	$ 2,100,000	$ 5,750,000	$ 2,100,000	$ 5,750,000	$ 2,100,000	$ 5,750,000	$ 2,100,000	$ 5,750,000
Total Direct Capital Costs		$ 15,460,000	$ 19,110,000	$ 42,148,000	$ 75,852,000	$ 54,808,000	$ 95,758,000	$ 82,752,000	$ 129,564,000	$ 163,321,000	$ 234,633,000
Construction Contingency (25%)		**$ 3,865,000**	**$ 4,778,000**	**$ 10,537,000**	**$ 18,963,000**	**$ 13,702,000**	**$ 23,940,000**	**$ 20,688,000**	**$ 32,391,000**	**$ 40,831,000**	**$ 58,659,000**
Indirect Construction Costs											
Project Design											
Project Management & Design[2]		$ 773,000	$ 773,000	$ 2,107,000	$ 3,793,000	$ 2,740,000	$ 4,788,000	$ 4,137,000	$ 6,478,000	$ 8,166,000	$ 11,732,000
	Subtotal	**$ 773,000**	**$ 773,000**	**$ 2,107,000**	**$ 3,793,000**	**$ 2,740,000**	**$ 4,788,000**	**$ 4,137,000**	**$ 6,478,000**	**$ 8,166,000**	**$ 11,732,000**
Project Development Construction Costs											
Construction Management and Daily Oversight[3]		$ 464,000	$ 464,000	$ 2,107,000	$ 3,793,000	$ 2,740,000	$ 4,788,000	$ 4,137,000	$ 6,478,000	$ 8,166,000	$ 11,732,000
Daily Agency Oversight and Project Management[4]		$ 773,000	$ 773,000	$ 1,265,000	$ 2,276,000	$ 1,644,000	$ 2,873,000	$ 2,483,000	$ 3,887,000	$ 4,900,000	$ 7,039,000

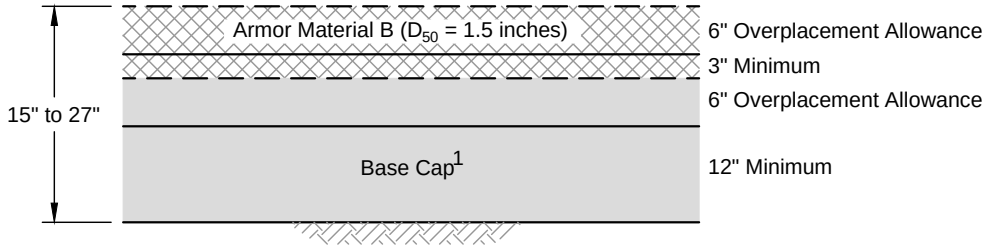
Table 1-3
Summary of Contractor Remedial Alternative Probable Cost Estimates

Task		Alternative 2a		Alternative 2b		Alternative 3		Alternative 4		Alternative 5	
		Low Cost Option	High Cost Option	Low Cost Option	High Cost Option	Low Cost Option	High Cost Option	Low Cost Option	High Cost Option	Low Cost Option	High Cost Option
Sevenson Construction Management and Project Management Team[5]		$ 928,000	$ 928,000	$ 2,529,000	$ 4,551,000	$ 3,288,000	$ 5,745,000	$ 4,965,000	$ 7,774,000	$ 9,799,000	$ 14,078,000
Engineering Support During Construction[6]		$ 500,000	$ 500,000	$ 500,000	$ 500,000	$ 500,000	$ 500,000	$ 500,000	$ 500,000	$ 500,000	$ 500,000
Special Insurance, Bonding[7]		$ 310,000	$ 310,000	$ 843,000	$ 1,517,000	$ 1,096,000	$ 1,915,000	$ 1,655,000	$ 2,592,000	$ 3,267,000	$ 4,693,000
	Subtotal	**$ 2,975,000**	**$ 2,975,000**	**$ 7,244,000**	**$ 12,637,000**	**$ 9,268,000**	**$ 15,821,000**	**$ 13,740,000**	**$ 21,231,000**	**$ 26,632,000**	**$ 38,042,000**
Total Indirect Capital Costs		**$ 3,748,000**	**$ 3,748,000**	**$ 9,351,000**	**$ 16,430,000**	**$ 12,008,000**	**$ 20,609,000**	**$ 17,877,000**	**$ 27,709,000**	**$ 34,798,000**	**$ 49,774,000**
Total Capital Costs		**$ 23,073,000**	**$ 27,636,000**	**$ 62,036,000**	**$ 111,245,000**	**$ 80,518,000**	**$ 140,307,000**	**$ 121,317,000**	**$ 189,664,000**	**$ 238,950,000**	**$ 343,066,000**

Acronyms:
CDF = confined disposal facility
CAD = confined aquatic disposal
CY = cubic yards
LS = lump sum
ODOT = Oregon Department of Transportation
SF = square feet

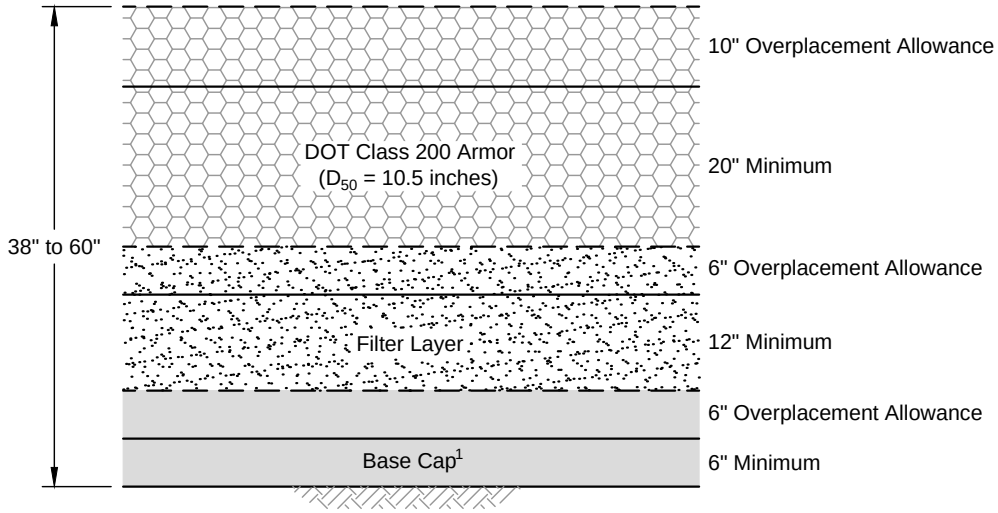
Notes
[1] 1 = Engineer's Opinion of Probable Cost is based on professional experience and regional rates on similar cleanup projects around the United States. Costs are presented in 2012 dollars.
[2] Project Management & Design2 costs are assumed to be 5 percent of the Total Direct Construction Costs.
[3] Construction Management and Daily Oversight3 costs are assumed to be 5 percent of the Total Direct Construction Costs.
[4] Daily Agency Oversight and Project Management4 costs are assumed to be 3 percent of the Total Direct Construction Costs.
[5] Sevenson Construction Management and Project Management Team5 costs are assumed to be 6 percent of the Total Direct Construction Costs.
[6] Engineering Support During Construction6 costs are assumed to be of the Total Direct Construction Costs.
[7] Special Insurance, Bonding7 costs are assumed to be 2 percent of the Total Direct Construction Costs.

FIGURES



Armored Cap B

Not to Scale



Armored Cap Class 200

Not to Scale

1. Active materials, including either an organoclay mat or bulk organoclay, may be necessary in some areas. See report for more details.
