INTRODUCTION

This report contains the results of electromagnetic induction surveys completed by the U.S. EPA, Region V, at HOD Landfill (HOD) in Antioch, Illinois, Lake County (see Figure 1). The surveys were conducted on March 16-17, 1987 at the request of Doug Yeskis, U.S. EPA, Technical Support Unit, and William Borchardt, Ecology and Environment, Field Investigation Team (FIT). The purpose of the surveys was to further characterize the local geology and hydrogeology.

THEORY

Electromagnetics

Electromagnetic induction measures the electrical conductivity of the ground. Geonics electromagnetic equipment consists of an alternating current transmitter coil that produces a time varying magnetic field (primary field), which, in turn, induces small eddy currents in the earth below the instrument. Each of these eddy current loops produce a secondary magnetic field which is proportional to the magnitude of the current flowing within that loop. The secondary magnetic field together with the primary magnetic field, are intercepted by a receiver coil and results in an output voltage which is, therefore, also linearly related to the subsurface conductivity. The unit of conductivity used is the millimho-per-meter (mmho/m).

Two types of electromagnetic equipment were utilized for this survey, Geonics EM31-D and Geonics EM34-3.

The transmitter and receiver coils of the EM31-D have a fixed intercoil spacing of 3.7 meters which yields and effective depth of exploration of approximately 6 meters.

The transmitter and receiver coils of the EM34-3 have a variable intercoil spacing of 10, 20 or 40 meters which can yield an effective depth of exploration from 7.5 to 60 meters. As the intercoil spacing increases, the depth of exploration increases.

Two depths of exploration are able to be measured for each intercoil spacing. With the coils aligned vertically (horizontal dipole mode) the maximum exploration depth is .75 x intercoil spacing. With the coils aligned horizontally (vertical dipole mode), the maximum exploration depth is 1.5 x intercoil spacing. However, when conductivity values are obtained with the coils aligned vertically (horizontal dipole), the relative contribution from material near surface is large and the response falls off monotonically with depth. When the coils are aligned horizontally (vertical dipole), the near surface material makes a very small contribution to the conductivity values obtained (McNeill, 1980).

According to Benson et. al. (1982), the conductivity value resulting from electromagnetic equipment is a composite and represents the combined effects of the thickness of soil or rock layers, their depths and the specific conductivity of the materials. The instrument reading represents a combination of these effects, extending from the surface to the depth range of the instrument. The resulting values are influenced more strongly by shallow materials than by deeper layers. However, contributions to the subsurface conductivity from highly conductive materials lying at greater depths may have a significant effect on the reading.

FIELD PROCEDURES

U.S. EPA and FIT selected, based on accessibility, two areas adjacent to HOD property for the electromagnetic survey. These two areas are identified on Figure 2. A grid was established at HOD by U.S. EPA and FIT immediately prior to initiation of the surveys. The grid size was selected based on the site area and the time allotted for the survey.

On the southeast side, ON 40E is located 58.5 feet north of the southeast corner of HOD's fence and 40 feet east of the eastern fence boundary. On the northwest side, 20N 0E is located 34 feet east of the northwest corner of HOD's fence and 20 feet north of the northern fence boundary.

Measurements of the electrical conductivity of the ground were obtained using electromagnetic induction equipment, Geonics EM34-3, utilizing the 10 meter and 20 meter coil spacings, and Geonics EM31-D. Both the horizontal and vertical dipole modes were utilized with both pieces of equipment (6 conductivity values were obtained at each grid point).

RESULTS

Appendix 1 lists the field data obtained at HOD utilizing the EM31-D and the EM34-3. The data was plotted and contoured and the results are attached as Figures 3 through 8, for the southeast side, and Figures 9 through 14, for the northwest side. Figure 1 is an 8-1/2" x 11" section of the U.S.G.S. topographic map for Antioch, Illinois-Wisconsin, 7.5 minute series. The site location is marked. Figure 2 is a copy of the base map of the site prepared by FIT, indicating major features of the site and approximate locations of the surveys. The approximate location of the old stream channel is marked on Figure 2.

Several data points were eliminated from the contoured data maps (Figures 3 through 14) because of interference caused by man-made surficial objects. These data points and the known interference are listed:

Southeast survey area

60E 50N - powerline anchor on the ground at stake
Deleted from EM31-D and EM34-3 10 meter contour maps because of proximity of electromagnetic equipment to anchor

80E 50N - overhead powerlines directly above EM34-3 10 meter transmitter

Each location where readings were taken is designated on the contour maps (Figures 3 through 14) by a dot "." enclosed by a square with the conductivity reading obtained appearing to the right of the box. Following is a brief summary of the results obtained with the EM31-D and EM34-3 at HOD.

The northwest and southeast sides of HOD was surveyed to attempt to delineate a stream/gravel channel resulting from the stream which, in the past, ran through HOD property (see Figure 2). This stream has since been diverted around the landfill. This stream can be seen on the aerial photograph dated September 17, 1961, from the photographic report prepared for HOD, dated September, 1986. In addition, cross-sections provided for the Expanded Site Inspection (ESI) for HOD indicate a possible stream channel (see Figure 2.4, cross-section A-A', ESI). Therefore, an attempt will be made to identify a stream channel which may exist on the northwest and southeast sides of HOD property.

Benson, et. al., (1982) identifies the range of electrical conductivities for river sand and gravel to be .1 to 10 millimho/meter. However since conductivity values obtained by electromagnetic techniques is a composite (as explained in Theory, above), and the overlying and surrounding rock and soil contribute to conductivity values obtained at a location, it is expected that the silty clay and topsoil in this area will increase the overall apparent conductivity values of any sand/gravel unit which may be delineated.

The lowest conductivity values obtained on the southeast side occur approximately along the 200N line or at a slight angle (NW-SE) (see Figures 3 through 6). However, these changes are subtle. Notice that with increased depth of exploration (EM34-3, 20 meter coil spacing), the suspected "stream channel" becomes obscure.

On the northwest side the conductivity values increase and become very erratic with increased depth of exploration. The conductivity values exhibiting negative values are indicative of detection of a highly conductive object when utilizing electromagnetic equipment.

CONCLUSIONS

The lowest conductivity values obtained on the southeast side occur approximately along the 200N line, the approximate location is marked on Figures 3 through 6. This area, exhibiting the lowest conductivity values on the southeast side is the most likely location of an old sand/gravel channel. However, this is a subtle change in conductivity values. A sharp delineation between high (clay) and low (sand & gravel) apparent conductivity does not occur.

Figures 6 and 7, the contoured data for the EM34-3, 20 meter coil separation, do not clearly delineate this low conductivity occurrence. A possible explanation for this occurrence is that the depth of exploration of the 20 meter coil (15 meters-horizontal dipole mode, 30 meters-vertical dipole mode) exceeds the depth of the sand/gravel channel and is therefore producing conductivity values strongly related to the underlying, highly conductive, clay unit.

The data obtained on the northwest side exhibits characteristics indicative of buried materials of a highly conductive nature and therefore, it is not possible to delineate a stream channel - the highly conductive materials masks any subtle changes occurring in the underlying soil.

Since the negative values begin when utilizing the EM34-3, 10 meter intercoil spacing, vertical dipole mode, this highly conductive material appears to begin at a depth of 5.5 to 15 meters. The conductivity values obtained at shallower depths are still affected (increased) due to the highly conductive materials located at greater depths (see Theory, above).

FEB 13 RECD
1989

Additional Information on EM Survey at H.O.D. Landfill completed in March, 1987.

Doug Yeskis, Geologist
Technical Support Unit

File

Upon further review of the HOD Landfill EM geophysical report from the work completed March 16-17, 1987, missing information is provided. Unintentionally, the grid spacings were omitted, and therefore are provided by this memo. For the Southeast part of the survey, the lines running north-south are 20 feet apart and the grid lines that run east to west are 50 feet apart. The grid in the Northwest part of the site have the lines running east to west 10 feet apart, and the lines that run north to south are 50 feet apart. This information is shown in Figure 2 of the report.

15 - 16.5	9-11-19	Silty CLAY to clay, gray (10YR 5/1).
17.5 - 19	6-9-15	Silty CLAY, dark gray (5Y 4/1), some gravel.
25 - 26.5	6-8-7	6 in. silty SAND, dark gray (10YR 4/1), very fine to medium grained, very moist. 6 in. silty CLAY, dark gray (5YR 4/1), trace fine subangular gravel, moist.
30 - 31.5	20-12-20	GRAVEL, gray, some sand, 1 in. to 2 in. clasts, fine to medium pebbles, subangular to angular.
35 - 36.5	4-5-9	2 in. CLAY and GRAVEL, gray, fine to medium pebbles, gradational contact with lower clay. 12 in. CLAY, gray (10YR 5/1) some gravel, very tough, damp.
40 - 41.5	5-15-10	CLAY, gray (10YR 5/1), some gravel, very tough, damp.
45 - 46.5	7-3-12	6 in. clayey SILT, gray (10YR 5/1) damp. 10 in. silty CLAY, gray (10YR 5/1) some small pebbles, damp.
50 - 51.5	6-8-14	Silty CLAY, gray (10YR 5/1), trace pebbles, some silt to fine sand seams, damp.
55 - 56.5	8-12-16	Silty CLAY, gray, trace pebbles, trace silt seams, damp.
60 - 61.5	5-10-14	Silty CLAY, gray, as above.
65 - 66.5	7-10-12	CLAY, gray (10YR 5/1) with grayish brown (10YR 5/2) mottling, very plastic, tough, damp.
70 - 71.5	5-6-8	CLAY, as above, with increased mottling, microshears.
75 - 76.5	11-15-14	8 in. pebbly CLAY, gray, pebble content increasing downward, fine pebbles, very moist. 8 in. SAND, pinkish gray (7.5YR 6/2), fine to medium grained, well sorted, saturated. Upper contact is sharp.
80 - 81.5	7-18-23	9 in. pebbly CLAY, gray (10YR 5/1), saturated. 5 in. sandy CLAY, gray (5Y 5/1), 1 in. fine grained sand seam.

Project Name H.O.D. Landfill

Boring Well No. GW1D

Sample Depth (ft.)	Blow Count	Description
		4 in. pebbly SAND, light gray (10YR 6/1) medium to fine grained, moderately to poorly sorted, angular to rounded, saturated.
85 - 86.5	17-23-24	SAND, gray, medium grained, well sorted, trace coarse grains, angular to subrounded, varied lithology, quartz rich, saturated.
90 - 91.5	14-15-15	SAND, as above.
93		END OF BORING.

Project Name H.O.D. Landfill
Project No. F05-8702-124/FIL0141
ILD980605836

Date Prepared 1-12-88; rev. 5-3-89

Sample Depth (ft.)	Blow Count	Description
0 - 2.5		FILL, clay and gravel (paving material).
2.5 - 4	2-3-4	FILL, consists of general refuse (glass, cable, cans, etc.), saturated at 3.5 ft.
7.5 - 9	1-1-2	PEAT, black (5Y 2.5/1), moist.
11.5 - 13	15-12-4	3 in. silty CLAY, dark greenish gray (5GY 4/1), moist. 12 in. silty SAND, gray (5Y 6/1), very fine grained, saturated.
15.5 - 17	9-9-9	3 in. silty CLAY, gray (5Y 5/1), some organic rich silt seams, 0.5 in. saturated sand seam. 9 in. SAND and GRAVEL, gray (5Y 5/1), poor sorting (silt to gravel), subangular, unit fines upward.
20.5 - 22	19-15-14	SAND and GRAVEL, gray (5Y 5/1), poor sorting, subangular to angular, saturated.
25.5 - 27	15-13-12	SAND and GRAVEL, light brownish gray (10YR 6/2), poor sorting, subangular to subrounded, saturated.
30.5 - 32	14-19-37	SAND and GRAVEL, light brownish gray (10YR 6/2), 3 in. medium grained sand layer, some pebbles, trace clay, saturated.
35.5 - 37	12-19-25	SAND and GRAVEL, gray (5Y 5/1), medium to coarse grained with fine pebbles, poor sorting, angular to rounded, varied lithology, saturated.
40.5 - 42	7-8-13	Silty CLAY, dark gray (5Y 4/1), damp.
43 - 44.5	10-14-20	Silty CLAY, mottled, light brownish gray (2.5Y 6/2) to light yellowish brown (2.5Y 6/4), trace very fine pebbles, tough, damp.
50 - 51.5	6-14-27	8 in. silty CLAY, gray to brown, sand and pebble content increases toward bottom. 2 in. clayey SAND, mottled, fine grained, damp.
51.5 - 53	11-14-22	Silty CLAY, light gray to brown, 2 in. sand seam, some pebbles, damp.
53 - 55	9-23-14-17	Sandy CLAY, light gray to brown, silty, occasional fine sand seams, damp.
55 - 57	7-13-14-20	Silty CLAY, light gray to brown, some sand, trace fine pebbles, damp.
57 - 59	5-10-27-33	No recovery.
59 - 61	7-11-14-20	Silty CLAY, grayish brown (10YR 5/2), some silt seams, damp.
62.5 - 64	9-13-14	Interbedded silty CLAY and SAND seams, grayish brown (10YR 5/2), 1 in. sand seams are fine grained and saturated.
65 - 66.5	17-17-18	SILT, gray (10YR 5/1), saturated.
70 - 71.5	25-27-30	SAND, grayish brown (10YR 5/2), fine grained, well sorted, saturated.

12.5 - 14	8-6-11	SAND and GRAVEL, dark gray, medium to coarse grained sand, some fine to medium pebbles, wet to saturated.
17.5 - 19	10-9-10	SAND and GRAVEL, gray, medium to coarse grained subangular sand, some fine to medium rounded pebbles, saturated.
22.5 - 24	10-8-10	SAND and GRAVEL, gray, medium to coarse grained subangular sand, some fine to coarse rounded pebbles, some organics, saturated.
27.5 - 29	3-5-8	Pebbly CLAY, grayish brown (10YR 5/2), some silt, damp.
30 - 32.5	------	Silty CLAY.
32.5 - 34	23-8-8	CLAY, gray, some silt, trace pebbles, 3 in. layer of medium to coarse grained sand to coarse pebbles, poorly sorted, saturated.
34 - 36	8-9-14-17	No recovery.
36 - 38	7-10-14-17	Silty CLAY, dark grayish brown (10YR 4/2), trace fine pebbles, damp.
38 - 40	6-10-14-15	Silty CLAY, as above.
40 - 42	6-10-13-18	Silty CLAY, as above.
42 - 44	7-17-13-20	Silty CLAY, dark gray (10YR 4/1), some fine pebbles, 1 in. silt seam, damp.
45 - 46.5	8-13-14	Silty CLAY, weak red (2.5YR 4/2), some small pebbles, damp.
47.5 - 49	4-6-8	CLAY, weak red (2.5YR 4/2), mottled, some silt, damp.
50 - 51.5	6-6-9	CLAY, dark gray (5Y 4/1), damp.
52.5 - 54	4-5-6	CLAY, dark gray (5Y 4/1), some silt, damp.
55 - 56.5	6-7-8	CLAY, dark gray (5Y 4/1), trace fine pebbles, trace sand, damp.
60 - 61.5	6-11-19	Clayey SILT, dark gray (5Y 4/1), trace fine gravel, moist.
65 - 66.5	11-12-21	No recovery.
70 - 71.5	8-33-40	9 in. clayey SILT, gray, damp to saturated. 6 in. SAND, gray, fine grained, saturated.

Project Name H.O.D. Landfill Boring Well No. GW4D

Sample Depth (ft.)	Blow Count	Description
75 - 76.5	13-8-31	Interbedded SILT and CLAY layers (1/8 in. to 3 in. thick), grayish brown (2.5Y 5/2), some fine pebbles, saturated to moist, respectively.
80 - 81.5	12-28-30	SAND, fine to medium grained, some silt seams, saturated.
85 - 86.5	17-23-25	No recovery.
90 - 91.5	25-30-47	8 in. SAND, fine to medium grained, saturated. 8 in. CLAY, grayish brown (2.5Y 5/2), dense, some sand, damp.
95 - 96.5	36-46-61	4 in. SAND, medium to fine grained, well sorted, subangular to rounded, mixed lithology, saturated. 7 in. CLAY, dark gray, trace silt seam, sand dike along subvertical fracture. 3 in. clayey SILT, saturated.
100 - 101.5	19-19-23	SAND, light gray, fine to medium grained with scattered coarse grains, some pebbles, subangular to rounded, trace clay rip-up clasts, saturated.
103 - 104.5	27-27-27	SAND, light gray, fine to medium grained, saturated.
104.5		END OF BORING.

Project HOD Landfill Job No. _____

Location of Project _____

Description of Soil Low Plasticity Clay with fine to coarse gravel, Sample No. HOD 6 W3I-3 55ft to 57.5 ft.

Tested by ARB Date of Testing _____

Sample Dimensions: Diam. 7.46 cm; Area 43.72 cm²; Ht. 12.065 cm

Wt. soil + pan Init. _____ g Vol. _____ cm³

Wt.soil + pan Final _____ g Unit wt. _____ kN/m³

Wt. of Sample _____ g

Constant Head

Test data *Test data used*

Test No.	t, s	Q, cm³	T, °C	Test No.	t, s	Q, cm³	T, °C

PIEZOMETER TEST ANALYSIS

For Unconfined Aquifer (Hvorslev method)

Site:

Location: ANTIOCH IL

Test No. HOD3S

TDD #: F05-8702-124

Waste Site No.: IL0141

Static Water Level: 7.99 ft

Initial Head (start of test): 8.59 ft

Radius of Casing: .083 ft

Radius of Screen: .083 ft

Length of Screen: 5 ft

Permeability of Aquifer: 8.761638E-04 ft/sec

TIME	HEAD(h)	(H-h/H-HO)
1.4	8.59	1
1.6	8.520001	.8833339

PIEZOMETER TEST ANALYSIS

For Confined Aquifer (Cooper curve matching method)

Site: HOD LANDFILL

Location: ANTIOCH IL

Test No. HOD4D

TDD #: F05-8702-124

Waste Site No.: FIL0141

Static Water Level: 42.47 ft

Initial Head (start of test): 44.14 ft

Radius of Casing: .083 ft

Radius of Screen: .083 ft

Length of Screen: 5 ft

Transmissivity of screened zone: 1.771891E-04 sq. ft/sec

Storage Coefficient: .1

PRIMARY PUMP TEST CALCULATIONS

HANTUSH - JACOB METHOD CALCULATIONS

	leakance (r)	S Ft	t/r^2 ($\frac{day}{Ft^2}$)	$1/u$	$L(u,r)$	b' Ft	r Ft.
GW 1D	.5	.53	9.8×10^{-9}	1	1	68.10	3460
GW 4D	.05	.54	3.6×10^{-9}	1	1	52.50	400
GW 3D	.13	1.02	2.75×10^{-9}	1	1	29.50	100
GW 6D	.05	.30	2.2×10^{-9}	1	1	26.25	1150
GW 2D	.07	.44	5.4×10^{-9}	1	1	82.75	750

Eq.

$$T = \frac{Q}{4\pi s} L(u,v) \qquad T = \frac{(gpm)(min/day)(1.0)}{4\pi (Ft)(7.48\ gal/Ft^3)}$$

$$S = 4T \frac{t/r^2}{1/u}$$

$$\frac{K'}{b'} = 4T \frac{v^2}{r^2} = \frac{S(v^2/u)}{t}$$

K' = hydraulic conductivity of confining bed
b' = thickness of confining bed

GW 1D

$$T = \frac{(550\ g/min)(1440\ min/day)(1.0)}{4\pi\ (.53\ Ft.)(7.48\ g/Ft^3)}$$

$$= 15{,}900\ Ft^2/day$$

$$S = 4(15{,}900\ Ft^2/day) \cdot \frac{(9.8 \times 10^{-9}\ day/Ft^2)}{1}$$

$$= 6.23 \times 10^{-4}$$

$$\frac{K'}{b'} = 4(15{,}900\ Ft^2/day) \cdot \frac{(.5)^2}{(3460\ Ft)^2}$$

$$= 0.0013\ day^{-1}$$

$$K' = (.0013\ day^{-1})(68.10\ Ft) = .089\ \frac{Ft}{day}$$

GW 4D

$$T = \frac{550(1440)(1.0)}{4\pi\ (.54)(7.48)}$$

$$= 15{,}600\ Ft^2/day$$

$$S = 4(15{,}600)(3.6 \times 10^{-9})$$

$$= 2.25 \times 10^{-4}$$

$$K' = 4(15{,}600) \cdot \frac{(.05)^2}{(400)^2} \cdot 52.50$$

$$= .051\ Ft/day$$

GW3d

$$T = \frac{(550)(1440)(1.0)}{4\pi(102)(7.48)}$$

$$= 8260 \text{ Ft}^2/\text{day}$$

$$S = 4(8260)(2.75 \times 10^{-7})$$

$$= .0091$$

$$= 4(8260)\frac{(.13)^2}{(100)^2}(29.50)$$

$$= 1.65 \text{ Ft/day}$$

GW6D

$$T = \frac{550(1440)(1.0)}{4\pi(.30)(7.48)}$$

$$= 28,100 \text{ Ft}^2/\text{day}$$

$$S = 4(28,100)(2.2 \times 10^{-9})$$

$$= 2.47 \times 10^{-4}$$

$$K' = 4(28100)\frac{(.05)^2}{(1150)^2}(26.25)$$

$$= .0056 \text{ Ft/day}$$

GW2D

$$T = \frac{550(1440)(1.0)}{4\pi(.44)(7.48)}$$

$$= 19,100 \text{ Ft}^2/\text{day}$$

$$S = 4(19,100)(5.4 \times 10^{-9})$$

$$= 4.12 \times 10^{-4}$$

$$K' = 4(19100)\frac{(.07)^2}{(750)^2}(82.75)$$

$$= .055 \text{ Ft/day}$$

SUMMARY TABLE

	T (Ft²/day)	S	K' (Ft/day)

Ratio Method Notes

HODGW3a - 3i

$$\frac{S'}{S} = \frac{0.151}{2.90} = 0.052 \qquad t = 500 \text{ min}$$

$$t_D = \frac{Tt}{S r^2}$$

T and S cannot be determined due to partial penetration effects.

HODGW6d - 6i

$t = 1000$ min $= .694$ day

$$\frac{S'}{S} = \frac{.12}{1.44} = 8.33 \times 10^{-2}$$

$$t_D = \frac{Tt}{S r^2} = \frac{28{,}100\ (.694)}{2.47 \times 10^{-4}\ (1150)^2} = \frac{19{,}500}{327} = 59.6$$

$t_D' = 2.6 \times 10^{-1}$ (from Fig. 3)

$$\alpha' = \left[r^2/t\right] t_D' = \left[(11.7)^2/.694\right] .26 = 51.28 \ \frac{ft^2}{day} \text{ (DIFFUSIVITY OF CLAY)}$$

$$K' = \alpha'(S_s')$$

S_s' value is not known

HOD GW 6d - 6i

$t = 500$ min $= .347$ day

$$\frac{S'}{S} = \frac{.02}{1.29} = 1.55 \times 10^{-2}$$

$$t_D = \frac{Tt}{Sr^2} = \frac{28{,}100\ (.347)}{(2.47 \times 10^{-4})(1150^2} = 29.85$$

$$t_D' = 1.1 \times 10^{-1} \quad \text{(from Fig. 3)}$$

$$\alpha' = \left(\frac{r^2}{t}\right) t_D' = \left[(11.7)^2/.347\right] .11 = 43.39 \quad ft^2/day$$

Image well Analysis

$$r_i = r_r \sqrt{\frac{t_i}{t_r}}$$ law of times

r_i = radius of image well
r_r = radius of obs. well
t_i = time of S_i after boundary takes effect
t_r = time of S_r (random) before boundary takes effect
S_i = drawdown

	GW 6d	GW 2d	GW 1d

* Top of inside casing. (All water levels were measured with a steel tape.)

** The graph time corresponds to the time axes presented in Figures 4-11 through 4-23.

*** Water level measurements for well GW3S represent fluctuations recorded using a USGS-owned Microswitch pressure transducer (datum = 0.00).

* Datum = 0.000.
-- Data not available.
--- Not applicable.
\+ Indicates a rise in water level.
\- Indicates a drop in water level.

Note: All water level changes were measured by data loggers, except well GW3I, which was measured with a steel tape.
