Bank-116.5	0.00	-	-	-	-	-
					Total Discharge =	188.7

Notes:

1. Station numbers indicate fifteen equal increments of 7.4 feet across a stream width of 111.0 feet.
2. Velocity measurements (feet/second) were collected with a Marsh-McBirney, Inc. Flo-Mate, Model 2000 Portable Water Flow Meter.
3. Discharge calculations for the above table were calculated by multiplying Total Area by Average Velocity. The width of the river was divided into fifteen increments. Water depth measurements were collected at the midpoint of each increment. At depths less than a foot, velocity measurements were collected at 60% of the total depth only. At depths between one and two feet, velocity measurements were collected at 20% and 80% of the total depth. At depths greater than two feet, velocity measurements were collected at 20%, 60% and 80% of the total depth. Average velocity (if water depth was greater than two feet) equals the sum of the 20%, (2x60%) and 80% measurements divided by four. Average velocity at depths between one and two feet equals the sum of the 20% and 80% measurements divided by 2. Total area equals the depth times the width of each increment. The sum of the flow rates for each increment equals the Total Discharge.

					Total Discharge =	65.7

Notes:

1. Station numbers indicate fifteen equal increments of 2.5 feet across a stream width of 37.5 feet.
2. Velocity measurements (feet/second) were collected with a Marsh-McBirney, Inc. Flo-Mate, Model 2000 Portable Water Flow Meter.
3. Discharge calculations for the above table were calculated by multiplying Total Area by Average Velocity. The width of the river was divided into fifteen increments. Water depth measurements were collected at the midpoint of each increment. At depths less than a foot, velocity measurements were collected at 60% of the total depth only. At depths between one and two feet, velocity measurements were collected at 20% and 80% of the total depth. At depths greater than two feet, velocity measurements were collected at 20%, 60% and 80% of the total depth. Average velocity (if water depth was greater than two feet) equals the sum of the 20%, (2x60%) and 80% measurements divided by four. Average velocity at depths between one and two feet equals the sum of the 20% and 80% measurements divided by 2. Total area equals the depth times the width of each increment. The sum of the flow rates for each increment equals the Total Discharge.

NOTES:

1. Data were collected by GZA.

2. A positive flux rate indicates the surface water body is gaining water from the subsurface. A negative flux rate indicates the surface water body is loosing water to the subsurface.

APPENDIX E
DISCHARGE PERMIT AND ANALYTICAL DISCHARGE DATA

STATE OF CONNECTICUT
DEPARTMENT OF ENVIRONMENTAL PROTECTION

TEMPORARY AUTHORIZATION

I. Pursuant to Public Act No. 93-428 a Temporary Authorization to initiate, create, originate or maintain a discharge into the waters of the state is hereby granted to:

Envirite Corporation
198 Old Waterbury Road
Thomaston, CT 06787

to initiate, create, originate or maintain a discharge to the waters of the state at:

The Naugatuck River via a Discontinued Non-contact Cooling Water Discharge Outlet from the Above Facility.

II. This Temporary Authorization specifically allows the discharger to discharge Step Test and Pump Test Wastewater Contaminated with VOCs, Nutrients and Metals, to Determine Design Flows for a Remediation System.

III. This Temporary Authorization shall become effective on the date it is issued, and shall expire: 1) thirty (30) days after the date it is issued; 2) when the requirements for coverage under a general permit issued pursuant to section 22a-430b of the General Statutes have been satisfied; 3) upon issuance of an individual permit in accordance with Section 22a-430 of the Connecticut General Statutes as amended; or 4) immediately upon notification of a tentative determination to deny a permit, 5) upon final discontinuance of the discharge; whichever is sooner.

IV. A fee of $500.00 shall have been submitted BEFORE the date of issuance of this Authorization.

V. This Temporary Authorization is based upon the following documents:

A) An Application submitted by GZA GeoEnvironmental, Inc. on 11/30/94.

VI. A. DEFINITIONS

The definitions of terms used in this Temporary Authorization shall be the same as the definitions contained in Section 22a-423 of the Connecticut General Statutes and Section 22a-430-3(a) of the Regulations of Connecticut State Agencies. In addition, the following definition(s) shall apply:

Any person who or municipality which initiates, creates, originates or maintains a discharge for which a temporary authorization is issued must comply with that authorization. If the source or activity generating the discharge for which an authorization is issued, is owned by one person or municipality but is leased or in some other way the legal responsibility of another person or municipality (the discharger) the discharger is responsible for compliance with any authorization issued by th

B. **SPECIAL CONDITIONS**

1) **DISCHARGE LIMITS**: The following limits shall not be exceeded at any time:

(a)

Pollutant Parameter	LIMITS Naugatuck River
Maximum Daily Flow	100,800 gallons per day
Total Volatile Organics - EPA Methods 8010 & 8020	see note (b) below
Copper, Total	"
Chromium, Total	"
Iron, Total	"
Manganese, Total	"
Nickel, Total	"
Zinc, Total	"
pH	6.0 - S.U.
Specific Conductance	see note (c) below
Total Suspended Solids	see note (c) below
Total Dissolved Solids	"
N as Ammonia	"
Lead, Total	"
N as Nitrate/Nitrite	"
Total Phosphorous	"

(b) Monitoring for these parameters shall be conducted as proposed in the application submitted by GZA GeoEnvironmental (at the end of the step test and at 12 hour intervals during the pump test). Within 6 hours of sampling, results shall be discussed with Donald Gonyea of the DEP Bureau of Water Management at 424-3827. If unavailable, results shall be discussed with Art Mauger at 424-3829, or Al Ladotsky at 424-3736. The discharge shall be discontinued upon verbal notification of the DEP.

(c) Monitoring for these parameters shall be conducted during the final sampling event, and submitted with the final monitoring report.

(d) For discharges through an outfall authorized by the Commissioner under a currently valid State or NPDES permit, the permit limits specified for that outfall shall not be violated at any time.

(e) Appearance
Discharges of water shall not contain a visible oil sheen, visible discoloration, or foaming, floating solids, or cause any such condition in the receiving water body. Visual observations shall be recorded and discussed with chemical monitoring results.

2) **TOXICITY**: The following protocol for monitoring discharge toxicity shall be followed:

(a) Toxicity monitoring shall be conducted on samples collected during the final sampling event for this Authorization. Results shall be submitted immediately upon receipt.

(b) Whole effluent testing will be conducted for acute toxicity following the protocols for static acute toxicity tests in "Methods for Measuring the Acute Toxicity of Effluents to Freshwater and Marine Organisms" (EPA 600/4-85/013).

(c) Neonatal Daphnia pulex (less than 24 hours old) and juvenile Pimephales promelas (30 +/- 5 days old) shall be used as test organisms.

(d) Test duration shall be 48 hours for D. pulex, and 96 hours for P. promelas.

3) DISCHARGE CONDITIONS: The following conditions shall be met:

(a) All lagoons, inlet and outlet structures, gates, valves, motors, pumps, and controls shall be designed and constructed to minimize short-circuiting of flow, vandalism and tampering.

(b) Erosion and sediment controls shall be utilized when necessary. These controls must comply with the standards set forth in the "Connecticut Guidelines for Soil Erosion and Sediment Control" (guidelines) as amended, available from the Connecticut Council on Water and Soil Conservation.

(c) Stabilization practices shall be implemented to ensure that existing vegetation is preserved where attainable and that disturbed portions of the site are stabilized. Stabilization practices may include but not be limited to: temporary seeding, permanent seeding, mulching, geotextiles, sod stabilization, vegetative buffer strips, protection of trees, preservation of mature vegetation, and other vegetative and non-structural measures as may be identified by the guidelines. Where construction activities have permanently ceased or have temporarily been suspended for more than thirty days, or when final grades are reached in any portion of the site, stabilization practices shall be implemented within seven days.

(d) Structural practices must be implemented to divert flows away from exposed soils, store flows or otherwise limit runoff and the discharge of pollutants from the site. Such practices include but may not be limited to silt fences, earth dikes, drainage swales, sediment traps, check dams, subsurface drains, pipe slope drains, level spreaders, storm drain inlet protection, rock outlet protection, reinforced soil retained systems, gabions, and temporary or permanent sediment basins. Unless otherwise specifically approved in writing, structural measures shall be installed on upland soils.

(e) Structural practices shall be used to ensure that all dewatering wastewaters will not contain suspended solids in amounts which could reasonably be expected to cause pollution of waters of the state. Dewatering wastewaters shall be discharged in a manner which minimizes the discoloration of the receiving waters. Such practices may include but are not limited to: detention structures (including wet ponds), retention structures, flow attenuation by use of open vegetated swales and natural depressions; infiltration of runoff on-site; vegetated buffer strips; and sequential systems (which combine several practices).

(f) Velocity dissipation devices shall be placed at discharge locations and along the length of any outfall channel as necessary to provide a non-erosive velocity flow from the structure to a watercourse so that the natural physical and biological characteristics and functions are maintained and protected (e.g., maintenance of hydrologic conditions, such as the hydrodynamics present prior to the initiation of construction activities).

(g) Best Management Practices shall be implemented to ensure that no litter, debris, building materials, or similar materials are discharged to the waters of the state.

(h) Off-site vehicle tracking of sediments and the generation of dust shall be minimized.

(i) <u>For consistency with the Federal Resource Conservation and Recovery Act:</u>
Solid waste, including but not limited to contaminated soils or sludges, may be generated as a result of the remediation activity allowed by this Authorization. All waste generated must be disposed of in accordance with applicable federal, state and local law. Some or all of these wastes may be hazardous waste identified in accordance with Section 3001 of the Federal Resource Conservation and Recovery Act of 1976 (42 USC 6901 et seq.) or other wastes of special concern requiring Department approval prior to disposal. It is the responsibility of the authorized person or municipality to ensure that all wastes generated are properly identified and that all necessary Department approvals are secured prior to disposal of the wastes. For further information regarding solid waste management, please contact Patricia Gray of the Waste Engineering and Enforcement Division of the Department of Environmental Protection at (203) 566-4867.

(j) <u>For consistency with the Federal Clean Air Act</u>:
Air pollution, including but not limited to hazardous air pollutants, may be emitted as a result of the remediation activity allowed by this authorization. All air pollution

emitted must be analyzed to ensure compliance with all applicable federal, state and local laws including but not limited to sections 22a-174-1 (Definitions), 22a-174-3 (New Sources), and 22a-174-29 (Hazardous air pollutants) of the Regulations of Connecticut State Agencies and the National Emission Standards for Hazardous Air Pollutants (NESHAPs) in the Code of Federal Regulations (40 CFR Part 61). It is the responsibility of the authorized person or municipality to ensure that all air pollution emitted is properly identified and quantified, and that all necessary Department approvals are secured prior to emitting such pollutants. For further information, please contact the New Source Review Group, Bureau of Air Management, Department of Environmental Protection at (203) 566-8230.

4) <u>REPORTING REQUIREMENTS</u>:

(a) Upon completion of the pump test, monitoring results shall be submitted attached to the supplied form and certificationand submitted to the following address:

*Attention: DMR Processing
Bureau of Water Management, PERD
CT Department of Environmental Protection
79 Elm Street
Hartford, CT, 06106-5127

* Initial Screening results shall be directed to the attention of "Authorization Coordinator" in the Central Processing Unit (CPU). Subsequent monitoring results shall be directed to the attention of "DMR Processing" as indicated above.

(b) If a violation of any of the discharge limits included in this Authorization occurs <u>THE DISCHARGE MUST BE STOPPED IMMEDIATELY</u>, and written notification must be sent to the DEP/BWM/CPU within twenty-four hours. In this situation the discharge shall not be re-started without prior approval of the Commissioner. Monitoring results shall be reported on the attached form and "FAIL" shall be placed in the space provided. Failure to report as indicated above, may result in penalties.

(c) The discharger shall notify the DEP/BWM/CPU in writing of the date of final discontinuance of the discharge.

5) This Temporary Authorization shall be non-transferrable.

6) The discharger shall comply with the following Regulations of Connecticut State Agencies which are hereby incorporated into this Authorization, as if fully set forth herein:

1. <u>Section 22a-430-3:</u>
Subsection (b) General - subparagraph (1)(D) and subdivisions (2), (3), (4) and (5)

Subsection (c) Inspection and Entry
Subsection (d) Effect of a Permit - subdivisions (1) and (4)
Subsection (e) Duty to Comply
Subsection (f) Proper Operation and Maintenance
Subsection (g) Sludge Disposal
Subsection (h) Duty to Mitigate
Subsection (i) Facility Modifications, Notification - subdivisions (1) and (4)
Subsection (j) Monitoring, Records and Reporting Requirements -
subdivisions (1), (6), (7), (8), (9) and (11) (except subparagraphs (9)(A)(2), and (9)(C))
Subsection (k) Bypass
Subsection (m) Effluent Limitation Violations
Subsection (n) Enforcement
Subsection (o) Resource Conservation
Subsection (p) Spill Prevention and Control
Subsection (q) Instrumentation, Alarms, Flow Recorders
Subsection (r) Equalization

2. Section 22a-430-4:
Subsection (t) - Prohibitions
Subsection (p) - Revocation, Denial, Modification
Appendices

7) The following additional terms and conditions shall be complied with:

1. This Authorization is for the discharge of (A) pollutants in quantities and concentrations as specified in this Authorization; and (B) any substances resulting from the processes or activities described in this Authorization in concentrations and quantities which the Commissioner determines cannot reasonably be expected to cause pollution and will not adversely affect the operation of a POTW. However, the Commissioner may seek an injunction or issue an order to prevent or abate pollution, and may seek criminal penalties against a person who willfully or with criminal negligence causes or threatens pollution.

2. Discharge of any substance which is not from the processes or activities described in this Authorization shall be considered a violation of this Authorization unless it is authorized by an individual permit issued under Section 22a-430 of the General Statutes or a general permit issued under section 22a-430b of the General Statutes.

8) Within fifteen days after the date the discharger becomes aware of a change in any information submitted to the Commissioner under any registration or this Authorization, or that any such information was inaccurate or misleading or that any relevant information was omitted, the discharger shall submit the correct or omitted information in writing to the Commissioner.

9) Nothing in this Authorization shall relieve the discharger of other obligations under applicable federal, state and local law.

10) Any document, including but not limited to any notice, which is required to be submitted to the Commissioner under this Authorization by the discharger shall be signed by the discharger and by the individual or individuals responsible for actually preparing such document, each of whom shall certify in writing as follows: "I have personally examined and am familiar 3ith the information submitted in this document and all attachments and certify that based on reasonable investigation, including my inquiry of those individuals responsible for obtaining the information, the submitted information is true, accurate and complete to the best of my knowledge and belief, and I understand that any false statement made in this document or its attachments may be punishable as a criminal offense."

11) Any false statement in any information submitted pursuant to this Authorization may be punishable as a criminal offense under Section 22a-438 of the General Statutes or, in accordance with Section 22a-6, under Section 53a-157 of the General Statutes.

12) The Commissioner reserves the right to make appropriate revisions to this Temporary Authorization in order to establish any appropriate effluent limitations, schedules of compliance, or other provisions which may be necessary to adequately protect human health and the environment.

13) The Commissioner may order summary suspension of this Authorization in accordance with Section 4-182 of the Connecticut General Statutes.

Entered as a Temporary Authorization of the Commissioner of Environmental Protection.

NOTES:

"*Ave:*": the average of the values in the preceding rows.
"*StD:*": the standard deviation of the values in the preceding rows.
"**BBP-**": denotes a piezometer or stream gage location on Branch Brook
"**dl**" denotes the distance between the stream bottom and the center of its screened section
"**Gradient**": the difference in piezometric head normalized to the distance separating the measurements (dimensionless), only vertical gradients are shown in this table.
"**NR-**": denotes a piezometer or stream gage location on the Naugatuck River
"**#N/A**": data is not available

1. All measurements are recorded in feet
2. Depth-to-water measurements were obtained from within 0 75-inch galvanized steel piezometers using electronic water level meters Depth-to-stream-surface measurements were made using a rule held parallel to the outside of the steel piezometers and stream gages, or were read directly from the gages
3. The overburden aquifer was pumped continuously from 12.40 PM on December 20, 1994 until 09.30 AM on December 23, 1994 at 61 to 64 gallons per minute (gpm) The locations of the stream gaging points and the pump well location are shown on the Figures included within this report
4. No rain events occurred during the pumping period Intermittant rainfall occurred during the pumping recovery period between December 23 and December 27
5. Vertical groundwater piezometric head Gradients are expressed as positive for an upward flow potential.

APPENDIX F
QUALITY ASSURANCE/QUALITY CONTROL PROGRAM

APPENDIX F
QUALITY ASSURANCE/QUALITY CONTROL PROGRAM

1.0 QUALITY ASSURANCE/QUALITY CONTROL

1.1 DATA COLLECTION

1.1.1 Objectives

The objective of the QA/QC Plan for this project was to ensure the collection of representative, defensible data for site characterization and risk characterization purposes. This was accomplished through the use of appropriate sample collection and handling procedures, documentation of sampling and analytical methods, and the use of QA/QC protocols to assess results. These measures are discussed further below.

1.1.2 Sampling Protocols

Sampling protocols are designed to ensure the collection of a sample representative of site conditions. Samples were collected and handled in such a way as to minimize physical or chemical changes, and preserve their environmental conditions. Each sample was labeled with a distinct identification code that indicated the sampler's initials, sampling date, matrix, and sample location. This code is described on Table F-1.

Soil Sampling: Soil samples were characterized in the field using the Burmeister Classification System and recorded on the boring logs. Soil samples were collected using a split-spoon sampler as described in Appendix C. Soil samples were transferred to laboratory provided glass jars using dedicated disposable sampling gloves and tongue depressors.

Soil samples were screened for organic compounds in the field using a portable photoionization detector (PID). After partially filling the inorganics or semi-volatile sample jar with soil, aluminum foil was tightly wrapped over the jar opening and the jar was allowed to equilibrate for several minutes. Next, the PID tip was inserted through the foil, into the air space above the soil. PID readings were recorded on the boring logs. Between readings, the PID was allowed to pump ambient air to return to background levels. The PID was calibrated according to manufacturer's specifications at the start of each day. Calibration records were maintained to track the performance of each instrument.

Groundwater Sampling: Groundwater samples were collected with individual pre-cleaned stainless steel bailers. Dedicated equipment (bailers, rope, filters, etc.) were used whenever practical to prevent cross-contamination between sample locations. Sample collection procedures and relevant data, such as water level readings and pH measurements, were recorded on sample logs to document the sample. Field instruments (pH and conductance meters) were calibrated on a daily basis.

Surface Water Sampling: Surface water from the Naugatuck River and Branch Brook were collected by hand. Samplers worked from downstream to upstream locations to prevent interferences such as sediment disturbances.

1.1.3 Sample Handling and Chain-of-Custody

All samples were stored on ice or refrigerated immediately after collection. At the end of each day, a chain-of-custody form was prepared to document the samples collected, intended analysis, and to track the samples during shipment to the laboratory. The chain of custody included the following information: sample identification, sample date, sampler's name, analytical parameters, sample matrix, and any notes regarding the sample containers, preservatives, etc. All samples were shipped on ice with the chain-of-custody form via laboratory courier.

1.1.4 QA/QC Procedures

Blanks: Three types of QA/QC blanks were collected to assess whether contamination of samples occurred during the collection, handling or transportation of samples. All blanks were prepared using laboratory provided Type II water as a source of uncontaminated water. Trip blanks were collected to check for contamination of samples during sample handling. Field blanks were collected to check for contamination between sample collection and the transfer of samples to the appropriate container. Equipment blanks were collected to check for contamination caused by inadequate decontamination of sample collection equipment.

Trip blanks were maintained during each day groundwater and/or surface water were sampled for organic parameters. They were filled prior to the start of the day's sampling, and were carried in the sample cooler with the day's samples. Field blanks were collected during each day of groundwater sampling. Field blanks consisted of Type II water poured directly into the appropriate sample vials while in the field.

Equipment blanks were collected during every day of groundwater, soil and/or sediment sampling. Equipment blanks consisted of Type II water passed over/through clean sampling equipment, then into the appropriate sample vials. Blanks were preserved using the same preservatives used in actual samples. Blanks were analyzed for the parameters specified in Section 33 of the RFI Work Plan.

Duplicates: Field duplicates were collected to evaluate sampling precision. Each duplicate consisted of one sample split into two aliquots. A list of duplicate sample identifications is provided on Table F-2. Split spoon samples were divided vertically, and were not premixed. Duplicates for volatile organic analysis were also not mixed. Other samples were mixed prior to dividing between two sets of sample vials.

Field duplicate samples were collected at 10 percent of the sample locations for each sample matrix (soil, sediment, water). Duplicates were assigned individual sample numbers and sent to the laboratory for analysis as independent samples or "blind duplicates". An

effort was made to collect the duplicate samples from 10 percent of the locations in each specific area of the site and each matrix. This was not possible in some areas due to the lack of additional samples for duplicates. For example, duplicate samples of the soils and concrete samples from locations F-01 through F-05 were not collected due to lack of sample.

Interlaboratory duplicates were collected at two percent of the sampling locations. These samples were shipped to an independent State certified laboratory for analysis to evaluate the accuracy of the data generated by the primary analytical laboratories.

1.2 LABORATORY ANALYSIS

Analyses were performed by various laboratories during this study. Each of these laboratories observed similar QA/QC measures, such as laboratory blanks, matrix spikes and duplicates. Each of the laboratories also submitted documentation packages including chromatograms for all samples and standards. Individual QA/QC procedures are discussed below.

1.2.1 Duplicates

Laboratory duplicates were performed on one sample per batch (approximately 5 to 10% of the total) for each analysis. Laboratory duplicates were prepared by the laboratory from an individual sample. The duplicates were typically conducted on spiked samples to ensure positive results for comparison. Laboratory duplicates provide a means of assessing analytical precision.

1.2.2 Spiked Samples

All samples submitted for organic analyses were spiked with surrogate compounds. Surrogates are chemically similar to the analytes of interest. A percent recovery was calculated for each surrogate, indicating what fraction of the added compound was detected. Optimally, 100% of the spiked compound is detected. The analysis is considered acceptable of the percent recovery is within a range based on historic method performance. Samples were re-analyzed when spike recoveries were unacceptable. This frequently indicates a sample matrix effect, due to conditions such as high organic matter content.

1.2.3 Data Evaluation and Corrective Action

The laboratory was responsible for the evaluation of laboratory QA/QC measures and implementation of corrective action. This includes re-analyzing samples for which duplicate analyses or spike recoveries were not within acceptable limits.

Duplicate analyses were evaluated based on the relative percent difference (RPD) between analytical results for the two runs. Acceptable RPDs are generally below 30%, although acceptable ranges vary with medium and analytical method. Duplicate results were tabulated and reported, and samples re-analyzed if necessary.

Spike recoveries were evaluated by comparison of the percent recovery (%R) to an acceptable range. The %R is an indicator of analytical accuracy, and is optimally 100%. Samples with recoveries outside acceptable limits were re-analyzed. However, some sample matrices may cause poor spike recoveries that do not show improvement with re-analysis.

1.2.4 Deliverables

Laboratory reports included copies of chain-of-custody forms, laboratory notebook pages, instrument readouts for all samples and standards, and results summary pages. This information was also supplied for all relevant QA/QC runs, including blanks, matrix spikes, and matrix spike duplicates.

TABLE F-1
SAMPLE IDENTIFICATION KEY
Envirite Facility
Thomaston, Connecticut

Each sample was assigned a unique identifier in the following general format:

Sample ID:	ABC	940101	SL	L03	A
Section:	1	2	3	4	5

SECTION	FORMAT	IDENTIFIES
1	ABC	Sampler's Initials
2	940101	Date of Sample Collection
3	SL	Sample Medium: SL = Soil SD = Sediment SW = Surface Water WP = Waste Pile Material PZ = Piezometer
4	L03	Sample location numbered sequentially within each subarea: L = Landfill W = Waste Pile R = Roadway Areas F = Storage and Treatment Facility T = Underground Spill Containment Tanks G = General Facility D = Drywell B = Background BB = Branch Brook (sediment) NR = Naugatuck River (sediment) BW = Branch Brook (water) NW = Naugatuck River (water)
5	A	Sample Depth
