1. Introduction

The United States Environmental Protection Agency (U.S. EPA) tasked the Superfund Technical Assessment and Response Team (START) contractor, Ecology and Environment, Inc. (E & E), under Technical Direction Document (TDD) S05-9609-023, to assess site conditions; threats to human health and the environment; and to present remedial options and costs for the Double A Metals site located in Chicago, Cook County, Illinois .

2. Background

2.1 Site Description

The Double A Metals site is an inactive aluminum foundry located at 3321 S. Pulaski Road, in Chicago, Cook County, Illinois (Figure 2-1). The site is located in an area of mixed industrial, commercial, and residential development. The site is bordered to the west by Pulaski Road, to the north by a rail line, and to the south and east by an unnamed service road. A Commonwealth Edison power plant is located south of the site and a City of Chicago recycling center is located to the east. The nearest residence is located on Pulaski Road, approximately 300 feet north of the site.

The site is located in a fenced area which covers approximately four acres (Figure 2-2). The site includes two main buildings connected in an "L" shape, a large front yard with a loading dock, and a back yard area. The site is not secured; the fence has several holes and the buildings contain graffiti, broken windows, and refuse.

The front and back yard areas contain large waste piles comprised of coarse slag. The waste piles vary in color and consistency. Some piles consist of brown material with rusted metal artifacts. Other piles are black with oxidized blue and white granules. One waste pile in the back yard appears to be fine-grained baghouse dust. The northern yard also contains four transformers which have been dismounted and stripped.

The loading dock is flooded with rainwater, and a sheen appears on the surface. It contains tires, propane tanks, drums, a fire extinguisher, and other debris. One drum is located at the southwest corner of the loading dock and eight drums are immediately northwest of the loading dock, next to the west building.

The west building is made of brick and contains four small rooms, one large room, an office area, and a partially closed area. The large room contains several piles of light gray material which has a very fine texture, similar to powder. This room also contains approximately 60 drums stacked on pallets. The small southwestern room contains six drums of volatile organic material and a large compressed air cylinder. The small southern room contains a tank and a drum. The small

southeastern room is filled with empty containers and debris. The office area on the west side of the main room contains debris and office furniture. The partially enclosed area contains approximately 20 bags of hydrated lime on a pallet. The small room on the east side of the west building contains three drums.

The east building is made of metal and glass, and contains one large room. Approximately 80 percent of the surface area in this building is covered with waste piles similar to those in the west building on the site. This building also contains scattered empty drums and a large oven.

2.2 Site History

The Double A Metals site is an inactive aluminum foundry. A Phase 1 Property Assessment of the site was prepared by Gabriel Laboratories of Chicago, Illinois, for Jepscor Metals of Dixon, Illinois, the parent company of Double A Metals. According to this document, operations related to the recovery of aluminum on site began in approximately 1965 by the H. Winter Metal Company. Between 1983 and 1990, the site was operated by the Jay Armstrong Metals Company. Double A Metals, a subsidiary of Jepscor Metals, operated the site for only a short period; operations ended in approximately 1991. Prior to aluminum recovery, the site was used as a truck garage and for manufacturing operations, which began in approximately 1917.

A Phase 2 Property Assessment of the site was completed in 1994 by Gabriel Laboratories. The assessment included 13 soil borings and sampling in areas where storage of fuel and lubricants was observed. Analytical results indicate that low levels of volatile organic compounds are present in on-site soils. The borings indicate that the site is underlain by black and gray clay.

3. Site Assessment

On October 7, 1996, START members Donovan Robin and Damon Sinars, conducted a site assessment of the Double A Metals site. START was accompanied by U.S. EPA On-Scene Coordinator (OSC) Charlie Gebien, and Ray Lechnen from the U.S. Coast Guard. The site health and safety plan was reviewed and signed by each, and a site reconnaissance was conducted. Refer to Appendix A for photographs taken during the site assessment.

Four drum samples (D-1 through D-4), seven waste pile samples (WP-1 through WP-7), one transformer sample (Tran-1), one insulation sample (Asbes-1), and one water sample (W-1) were collected (Figure 3-1).

Four of the 17 accessible drums were sampled. Air monitoring of headspace, location, and accessibility determined which drums were sampled. The approximately 60 stacked drums were not accessible. Sampling was conducted in level B protection using non-spark tools to open the drums and a drum thief to extract the material. The samples were dark brown in color and appeared to be petroleum-based materials.

Seven waste piles were sampled from both outside and inside the buildings. Location and appearance determined which piles were sampled to ensure obtaining all types of material. Sampling of the waste piles was conducted in level C protection. Samples were collected at 0 to 6 inches below the surface, using a stainless steel hand shovel and stainless steel bowl, to obtain a homogenized composite sample from six to ten locations within a waste pile.

One composite transformer-area sample was obtained while in level C protection. Liquid from the transformers and soil from the area was placed in the sample container. A large insulated oven was sampled for asbestos with a hand shovel, while in level C protection. One water sample was collected by dipping the container into various places of the flooded area of the loading dock while in level D protection.

The samples were picked up on October 9, 1996, by a representative of NET Midwest, Inc., of Bartlett, Illinois. Drum samples were analyzed for pH, flash point, volatile organic compounds, and polychlorinated biphenyls (PCBs). The water and waste pile samples were analyzed for total Resource Conservation and Recovery Act (RCRA) metals. The transformer area sample was analyzed for PCBs. The insulation was analyzed for asbestos.

4. Analytical Results

Analytical results indicate that the waste materials on site exceed U.S. EPA removal action levels or RCRA characteristics for hazardous wastes. Analytical results are summarized in Tables 4-1 and 4-2. The validated data package is presented in Appendix B.

The RCRA hazardous waste criteria (40 Code of Federal Regulations [CFR] Subsection [§] 261.24) for toxicity characteristics leaching procedure (TCLP) lead (waste code D008) is 5 milligrams per liter (mg/L). Four of the seven waste pile samples contained levels of TCLP lead in excess of this level, with the highest level, 28.2 mg/L, detected in sample WP-2. Five samples contained total lead at levels at or above the U.S. EPA removal action level of 500 milligrams per kilogram (mg/kg) for lead in industrial soils. Other metals were not detected at levels which require a removal action or at levels characteristic of a hazardous waste. Arsenic and barium were detected in the water sample (W-1) collected from the loading dock, at levels below the Safe Drinking Water Act Maximum Contaminant Levels for these elements.

The drum samples each contained volatile organic compounds classified as hazardous waste according to 40 CFR § 261.31. Xylene and ethylbenzene are classified by the RCRA waste code F003, and toluene is classified by the waste code F005.

The characteristic of an ignitable waste, as defined in 40 CFR § 261.21, is exhibiting a flash point less than 140° Fahrenheit (°F). The drum sample results indicated that the waste materials are not ignitable.

The characteristic of a corrosive waste, as defined in 40 CFR § 261.24, is a liquid exhibiting a pH less than or equal to 2, or greater than or equal to 12.5. The drum sample results indicated that the waste materials are not corrosive.

Polychlorinated biphenyls are regulated under the Toxic Substances Control Act (TSCA). PCBs were not detected in any samples. Asbestos is also regulated under TSCA; however, asbestos was not identified in the sample of material from the oven.

5. Discussion of Potential Threats

Conditions present at the Double A Metals site that warrant an appropriate removal action as set forth in paragraph (b) (2) of Section 300.415 of the National Oil and Hazardous Substances Contingency Plan (NCP) include:

- **Actual or potential exposure to nearby human populations, animals, or the food chain from hazardous substances or pollutants or contaminants.** Concentrations of TCLP lead up to 28.2 mg/L were detected in the waste pile samples collected from the Double A Metals site. These levels of TCLP lead exceed the maximum concentration for the toxicity characteristic of 5 mg/L.

  The Double A Metals site is located in an area with mixed commercial and residential development. The nearest residence is 300 feet north of the site. The site is not secure; there are holes in the perimeter fencing, and there is evidence of previous human intrusion in the building, such as graffiti, broken windows, and debris.

  The extent of exposure to lead is based on blood level testing. According to the Agency for Toxic Substances and Disease Registry (ATSDR), lead has been shown to affect virtually every organ and/or system in the bodies of both humans and animals. The most sensitive target organs of lead appear to be the nervous system, especially in children; the hematopoietic system; and the cardiovascular system. There is also evidence that lead can lead to kidney and immune system damage in humans and animals. Lead has also been proven to be carcinogenic in animals.

- **Hazardous substances or pollutants or contaminants in drums, barrels, tanks, or other bulk storage containers, that may pose a threat of release.** The drum samples contained ethylbenzene, toluene, and xylene; which are constituents of hazardous wastes from non-specific sources under RCRA. The drums are in poor condition and have no secondary containment. The site is not secure; unauthorized persons could enter the site and come into contact with drummed materials.

- **High levels of hazardous substances or pollutants or contaminants in soils largely at or near the surface, that may migrate.** The waste piles and drums on site do not have adequate primary or secondary containment. Precipitation and wind could spread the waste material throughout the site, and to the subsurface and off-site areas.

- **Threat of fire or explosion.** Improper handling or vandalism of propane cylinders or drums on site could result in a fire or explosion.

6. Removal Cost Estimate

Conditions observed at the Double A Metals site warrant a removal based upon the presence of lead in waste piles and solvents in drums. The options for the removal action for this cost estimate include overpacking and off-site disposal of the drums, and either on-site stabilization of the waste pile material or off-site stabilization of this material; in each case the stabilized waste will be disposed off site.

6.1 General Assumptions

- The removal action will include removal of approximately 3,000 cubic yards (4,380 tons) of lead-contaminated waste piles, approximately 17 drums of petroleum-based materials mixed with water, and approximately 25,000 gallons of oily water.
- The removal action will require approximately 19 days and $832,402 to complete off-site treatment of the waste pile material, or will require approximately 20 days and $416,502 for on-site treatment of the waste pile material.
- The removal will be conducted by an Emergency Response Cleanup Services (ERCS) contractor.
- One U.S. EPA OSC and one START member will be on site during the removal action.
- One armed security guard will be on site 24-hours per day for the duration of the project.
- No cost for lease or rental of land for the project is expected.
- RCMS cost projection defaults include a 15% contractor contingency.

6.2 Health and Safety

A Health and Safety Plan will be prepared by ERCS and START prior to beginning work at the site. It is assumed that an ERCS industrial hygienist will be on site for approximately three days to oversee site operations and conduct personal air sampling, in order to determine lead and noise exposure levels during operations inside the buildings. High-volume air sampling will also be

conducted to determine if removal activities spread particulates to off-site areas.

6.3 Site Preparation

Preparation of the site for the removal action will consist of establishing support services and equipment, securing the site, and clearing the working areas of debris and standing water. This phase will take one to two days.

- Support facilities to be brought on site will include one 40-foot office trailer for U.S. EPA/START, one 40-foot office/decon trailer with showers for ERCS, one 20-foot equipment storage trailer, and two modular bathrooms. It is assumed that the cost to establish telephone, electrical, and plumbing services for the support facilities will be minimal, based on the proximity of such services to the site.

- Non U.S. EPA-owned support equipment will consist of two computers with printers, one fax machine, and one copier.

- The fence around the site will be repaired, a new gate will be installed, and razor wire will be installed at the top of the fence.

- The water in the loading dock (approximately 25,000 gallons) will be pumped into tank cars and disposed off site as oily water.

6.4 Drum and Cylinder Disposal

Approximately 80 drums were observed on site during the site assessment. Seventeen of these drums were accessible and contained petroleum-based materials or residues of these materials. The remaining drums were inaccessible. Removal of the 17 accessible drums will consist of overpacking and off-site disposal. The remaining drums will be inspected and sampled to determine if removal is necessary, those drums which do not contain hazardous wastes will be left on site.

Approximately 15 cylinders labeled as propane or argon were located on site. These cylinders will be inventoried and returned to the supplier, or otherwise removed from the site for reuse or disposal.

6.5 Off-Site Treatment

For this operation, end-dump trailers will be loaded with waste pile material and weighed on site. The material will be transported to an off-site facility for treatment and disposal in a RCRA-permitted landfill (Appendix C).

- A single wheel loader with a 2.5 cubic yard bucket will be used to gather and load the waste piles in the front yard. Two smaller wheel loaders will be used to move waste pile material from inside and behind the buildings to a staging area prior to being loaded onto a trailer using the larger loader.

- It is assumed that removal of the waste pile material from the building will be performed at level B due to high lead levels and the possibility of kicking up dust during the operation. A plastic tank with a sump pump and ordinary hose and sprayer will be used to control dust levels inside the building.

- It is assumed that each end-dump trailer will carry 22 tons (15 cubic yards) of waste material.

- Transportation will cost approximately $600 per load. Disposal will cost approximately $95 per ton. These prices are based on estimates received from Peoria Disposal Company, of Peoria, Illinois; Waste Management, Inc., of West Chester, Illinois; and Wayne Disposal Inc., of Belleville, Michigan (Appendix D).

6.6 On-Site Treatment

For this operation, a pugmill and associated equipment will be operated on site. A mixture of Portland cement and fly ash will be used to stabilize the hazardous waste pile material, which will be transported and disposed off site as nonhazardous waste (Appendix E).

- A mixture of 10% Portland cement and 5% fly ash by volume will be used as a stabilizing agent.

- The pugmill will process 300 cubic yards of waste pile material per day.

- The ERCS equipment and labor to be utilized for loading the stabilized material will be the same as described for off-site treatment.

- Transportation will cost approximately $218 per 15-cubic-yard load. Disposal will cost approximately $24 per ton (Appendix F).

The data quality assurance (QA) review of four liquid waste samples and one soil sample collected from the Double A Metals site is complete. The samples were collected on October 7, 1996, by the Superfund Technical Assessment and Response Team (START) contractor, Ecology and Environment, Inc. (E & E). The samples were submitted to NET, Inc., Bartlett, Illinois. The laboratory analyses were performed according to the United States Environmental Protection Agency (U.S. EPA) Solid Waste 846 Method 8080.

Sample Identification

START Identification No.	Laboratory Identification No.
D01	378478
D02	378479
D03	378480
D04	378481
Tran-1	378490

Data Qualifications:

I. Sample Holding Time: Acceptable

The samples were collected on October 7, 1996, extracted on October 10, 1996, and analyzed on October 23, 1996. This

recycled paper

is within the 14-day holding time limit, from collection to extraction, and 40-day limit from extraction to analysis.

II. Instrument Performance: Acceptable

The chromatographic resolution was adequate in the standard and sample chromatograms. Surrogate retention times were consistent in the samples and standards.

III. Calibrations:

• Initial Calibration: Acceptable

A five-point initial calibration was performed prior to analysis. The percent relative standard deviations (%RSDs) between response factors were less than 20% for all PCBs.

• Continuing Calibration: Acceptable

The percent differences of the response factors were less than 15% for all PCBs.

IV. Blank: Acceptable

A method blank was analyzed with the sample. No target compounds or contaminants were detected in the blank.

V. Compound Identification: Not Applicable

There were no detected PCBs in the samples.

VI. Additional QC Checks: Acceptable

The recoveries of the surrogates used in the samples were within acceptable laboratory limits.

VII. Overall Assessment of Data for Use: Acceptable

The overall usefulness of the data is based on criteria for QA Level II as outlined in the Office of Solid Waste and Emergency Response (OSWER) Directive 9360.4-01 (April 1990), Data Validation Procedures, Section 7.0, PCBs. Based upon the information provided, the data are acceptable for use.

The data quality assurance (QA) review of four liquid waste samples collected from the Double A Metals site is complete. The samples were collected on October 7, 1996, by the Superfund Technical Assessment and Response Team (START) contractor, Ecology and Environment, Inc. (E & E). The samples were submitted to NET, Inc., Bartlett, Illinois. The laboratory analyses were performed according to the United States Environmental Protection Agency (U.S. EPA) Solid Waste 846 Method 8240.

Sample Identification

START Identification No.	Laboratory Identification No.
D01	378478
D02	378479
D03	378480
D04	378481

Data Qualifications:

I. Sample Holding Time: Acceptable

The samples were collected on October 7, 1996 and analyzed on October 17, 1996. This is within the 14-day holding time limit.

recycled paper

II. Gas Chromatography/Mass Spectrometry (GC/MS) Tuning: Acceptable

GC/MS tuning to meet ion abundance criteria using bromofluorobenzene (BFB) were acceptable and samples were analyzed within 12 hours of BFB tuning.

III. Calibrations:

• Initial Calibration: Qualified

A five-point initial calibration was performed prior to analysis. All average response factors were greater than 0.05 except acrolein; therefore, the nondetect values for this compound have been flagged "R", as required. The percent relative standard deviations (%RSDs) between response factors were less than 30% for all detected target compounds.

• Continuing Calibration: Acceptable

The percent differences of the response factors were less than 25%, as required for detected target compounds except for the following:

Compound	%D
acetone	59.6
4-methyl-2-pentanone	26.3

Since these compounds were not detected in the samples, qualification is not required.

IV. Blank: Acceptable

A method blank was analyzed with the samples. No target compounds or contaminants were detected in the blank.

V. Internal Standards: Acceptable

The areas of the internal standards in the samples were within -50% to +100% of the associated calibration check standard. The retention time of the internal standard was within the 30-second control limit.

VI. Compound Identification: Acceptable

The mass spectrum and retention time of the detected compound matched those of the standards.

VII. Additional QC Checks: Acceptable

The recoveries of the surrogates used in the samples and blank were within laboratory-established guidelines.

VIII. Overall Assessment of Data for Use: Acceptable

The overall usefulness of the data is based on criteria for QA Level II as outlined in the Office of Solid Waste and Emergency Response (OSWER) Directive 9360.4-01 (April 1990), Data Validation Procedures, Section 5.0, VOAs By GC/MS analysis. Based upon the information provided, the data are acceptable for use, with the above-stated qualifications.

Data Qualifiers and Definitions:

R - The sample results are rejected (analyte may or may not be present) due to gross deficiencies in quality control criteria. Any reported value is unusable. Resampling and/or reanalysis is necessary for verification.

SUBJECT: Inorganic Data Quality Review for Resource Conservation and Recovery Act (RCRA) Metals, Double A Metals, Chicago, Cook County, Illinois

REFERENCE: Project TDD S05-9609-023 Analytical TDD S05-9610-803
Project PAN 6P2301SIXX Analytical PAN 6CAC01TA

The data quality assurance (QA) review of one water sample and seven solid samples collected from the Double A Metals site is complete. The samples were collected on October 7, 1996, by the Superfund Technical Assessment and Response Team (START) contractor, Ecology and Environment, Inc. (E & E). The samples were submitted to National Environmental Testing, Inc. (NET), Bartlett, Illinois, for analyses. The laboratory analyses were performed according to the U.S. EPA solid Waste 846 Methods 6010, 7060 (for arsenic), 7421 (for lead), 7470 (for mercury), 7471 (for mercury in water), 7740 (for selenium), and 7760 (for silver).

Data Qualifications:

I. Sample Holding Time: Acceptable

The samples were collected on October 7, 1996, and analyzed on October 17, 18, and 21, 1996. This is within the six month holding time limit (28 days for mercury).

II. Calibration:

- Initial Calibration: Acceptable

  Recoveries for the initial calibration verification were within 90 to 110% (80 to 120% for mercury), as required.

- Continuing Calibration: Acceptable

  All analytes included in the continuing calibration verification standard were within 90 to 110% (80 to 120% for mercury), as required.

III. Blanks: Acceptable

Calibration and preparation blanks were analyzed with each analytical batch. No target analytes were detected in the blanks. At least one blank was analyzed for each 20 samples.

IV. Interference Check Samples (ICSs): Acceptable

ICSs were analyzed and recoveries were acceptable.

V. Overall Assessment of Data for Use: Acceptable

The overall usefulness of the data is based on criteria for QA Level II as outlined in the Office of Solid Waste and Emergency Response (OSWER) Directive 9360.4-01 (April 1990) Data Validation Procedures, Section 3.0, Metallic Inorganic Parameters. Based upon the information provided, the data are acceptable for use.

SUBJECT: Miscellaneous Data Quality Review for pH, Flash Point, and Asbestos, Double A Metals, Chicago, Cook County, Illinois

REFERENCE: Project TDD S05-9609-023 Analytical TDD S05-9610-803
Project PAN 6P2301SIXX Analytical PAN 6CAC01TA

The data quality assurance (QA) review of four liquid waste samples and one insulation sample collected from the Double A Metals site is complete. The samples were collected on October 7, 1996, by the Superfund Technical Assessment and Response Team (START) contractor, Ecology and Environment, Inc. (E & E). The samples were submitted to NET, Inc., Bartlett, Illinois. The laboratory analyses were performed according to the United States Environmental Protection Agency (U.S. EPA) Solid Waste 846 Method 9040 for pH, and EPA method 1010 for flash point. The asbestos analysis was analyzed in accordance with EPA 40 CFR, Part 763, Appendix A to subpart F.

recycled paper

Data Qualifications:

I. Sample Holding Time: Acceptable

The samples were collected on October 7, 1996 and analyzed on October 15 for pH, October 18 for flash point, and October 14, 1996 for asbestos. The Office of Solid Waste and Emergency Response (OSWER) Directive 9360.4-01 (April 1990) does not provide holding times for these parameters.

II. Calibrations: Acceptable

The pH meter was checked for accuracy prior to sample analysis with three pH standards (4.00, 7.02, and 10.06). The results were acceptable with the maximum percent difference received was 3.5% for the pH 4 standard.

The flash point of xylene was determined prior to sample analyses, with an acceptable result.

III. Overall Assessment of Data for Use: Acceptable

The overall usefulness of the data is based on criteria for QA Level II as outlined in Data Validation Procedures, Section 9.0, Generic Data Validation Procedures as stated in OSWER Directive 9360.4-01 (April 1990). Based upon the information provided, the data are acceptable for use.

DATE: December 19, 1996

TO: Donovan Robin, START Project Manager, E & E, Chicago, Illinois

FROM: Lisa Graczyk, START Chemist, E & E, Chicago, Illinois

THROUGH: Dave Hendren, START Analytical Services Manager, E & E, Chicago, Illinois

SUBJECT: Inorganic Data Quality Review for Toxicity Characteristic Leaching Procedure (TCLP) Lead and Chromium, Double A Metals, Chicago, Cook County, Illinois

REFERENCE: Project TDD S05-9609-023 Analytical TDD S05-9610-803
Project PAN 6P2301SIXX Analytical PAN 6CAC01TA

The data quality assurance (QA) review of seven solid samples collected from the Double A Metals site is complete. The samples were collected on October 7, 1996, by the Superfund Technical Assessment and Response Team (START) contractor, Ecology and Environment, Inc. (E & E). The samples were submitted to National Environmental Testing (NET), Inc., Bartlett, Illinois, for analyses. The laboratory analyses were performed according to the U.S. EPA Solid Waste 846 Methods 1311 for TCLP, and 6010 for lead and chromium analysis.

Data Qualifications:

I. Sample Holding Time: Acceptable

The samples were collected on October 7, 1996, and analyzed on November 7, 1996. This is within the six month holding time limit.

II. Calibration:

- Initial Calibration: Acceptable

Recoveries for the initial calibration verification were within 90 to 110%, as required.

- Continuing Calibration: Acceptable

All analytes included in the continuing calibration verification standard were within 90 to 110%, as required.

III. Blanks: Acceptable

Calibration and preparation blanks were analyzed with each analytical batch. No target analytes were detected in the blanks.

IV. Interference Check Samples (ICSs): Acceptable

ICSs were analyzed and recoveries were acceptable.

V. Overall Assessment of Data for Use: Acceptable

The overall usefulness of the data is based on criteria for QA Level II as outlined in the Office of Solid Waste and Emergency Response (OSWER) Directive 9360.4-01 (April 1990) Data Validation Procedures, Section 3.0, Metallic Inorganic Parameters. Based upon the information provided, the data are acceptable for use.

Message

Thank you for the opportunity to present the attached budgetary estimate. If you have any questions or if I can be of any assistance to you, please call me at (309) 688-7595 ext. 218. Thanks.

Peoria Disposal Company

November 21, 1996

Mr. Donavan Robbins
Ecology & Environment
33 N. Dearborn
Suite 900
Chicago, IL 60602

Dear Mr. Robbins:

Thank you for giving us the opportunity to present the enclosed budgetary estimate. In addition to providing the specific services indicated in our estimate, we pledge to conduct our services in a manner which assures your satisfaction.

This budgetary estimate is representative of costs typically associated with a project of this type. However, once firm disposal options, waste volume and handling methods are decided we request the opportunity to provide a competitive quotation. This estimate is subject to revision pending receipt of more specific site and/or waste information. Our competitive pricing may be less or more than this budgetary estimate depending upon the final information provided.

As always, I will be happy to discuss any questions you or your colleagues may have regarding this budgetary estimate or any of our services. We look forward to being of service in meeting this and other environmental needs.

Sincerely,
PEORIA DISPOSAL COMPANY

BUDGETARY ESTIMATE FOR ECOLOGY & ENVIRONMENT

Waste Name: Lead Contaminated Slag

Generating Facility: West Chicago, Illinois

Treatment Cost: $90.00 - $100.00 per ton

Treatment Method: Hazardous Stabilization

Treatment Facility: PDC #1 Landfill - Peoria, Illinois

Transportation:
$550.00 - $600.00 per load (dump trailer / roll-off box)
$650.00 - $700.00 per load (weekends and holidays)
One (1) hour in-plant, no charge
$ 65.00 demurrage per subsequent hour

The maximum net load is 34,000 pounds for the roll-off box and 46,000 pounds for the dump trailer. Charges incurred due to overloading of PDC supplied containers/vehicles are the responsibility of the generator.

Other Charges:
$250.00 per month container rental
22s capacity of container
$550.00 - $600.00 initial container delivery

Our final competitive quotation could be affected by the following conditions:

1. Acceptance by PDC's Wastestream Approval Committee.
2. Changes in regulatory assessments.
3. Changes in disposal methods and/or waste treatability.
4. PDC reserves the right to modify pricing upon receipt of a completed waste material data sheet and bench-scale treatability study, if appropriate.
5. Timing of the project.

EQ Site Services
Transportation Quote

November 21, 1996

Mr Don Robin
Ecology and Environment
33 North Dearborn
Suite 900
Chicago, IL 60602

Dear Mr. Robin:

EQ Site Services is pleased to provide you with a quotation for transportation of approximately **3000 yards of lead contaminated soil** from **Chicago, IL** to **Michigan Disposal, Inc in Belleville, MI**, in support of EQ Customer Quote **# 4000143**.

Type of Transportation (Truck/Rail).....Truck

Specific Type (Van, Dump, Gondola, Intermodal, etc.).....Dump trailer

Rate.....$38.00/ton

Load minimum.....22 tons

Liner charge.....included

Demurrage.....$60.00/hr
(two hours loading and full unloading are included in the rate.)

Taxes - Transporter tax assessed by federal, state, city, or county due to the nature, classification, or use of material being transported will be the shipper's responsibility

NOTES:

The above rates are quoted for use within thirty (30) days of the above date. Should the project start date extend beyond this period, please confirm the applicable rate prior to project start

If applicable, LOAD MINIMUMS WILL BE BILLED. (If the shipment does not meet stated load minimum, the load will be billed 22 tons X $38.00, for a total of $836.00, regardless of load weight).

Trucks ordered but not used will be billed at $1000.00. Daily layovers will be billed at $600.00.

Rejected and returned shipments will be billed at the original rate plus 50%.

Rejected shipments diverted to an alternate facility will be billed at $3.30 per mile with a minimum of $330.00 for less than 100 miles.

The above rates are based on equipment availability.

A SIGNED CONFIRMATION OF THE ACCEPTANCE OF THIS QUOTE MUST BE ON FILE TO ORDER SHIPMENTS.

If you have any exceptions or questions with any of the terms stated above, please provide a written response prior to service.

Sincerely,

Wilson Anthony
Midwest Regional Manager

ACKNOWLEDGMENT

Please sign the acknowledgment below confirming the rates and conditions listed and return it via FAX to (313) 326-5670.

Position/Title _____ Date _____

Proposal prepared by
AETS-Controlled Waste Division
for

Waste Management, Inc.

on

November 20, 1996

Waste:	Lead contaminated soil (3000 yards)
Location of Waste:	31st and Pulaski - Chicago, IL

WMX Site:	Controlled Waste Division/Orchard Ridge Landfill
Location:	Menomonee Falls, WI
Method:	Stabilization/Subtitle D Landfill

Analytical & Permitting: . . . . . No fee
Disposal: . . . . . $95.00 per ton
Transportation: . . . . . $15.00 per ton(22 ton minimal fee per shipment)
Liners: . . . . . Included
Taxes: . . . . . Included
Demurrage: . . . . . $85.00 per hour after one free hour of loading time

This pricing is subject to verification via the AETS approval and contracting process initiated upon submission of a representative sample of the waste stream and required paperwork.

All prices are subject to change with notification thirty (30) days in advance.

This proposal is submitted based upon the negotiation of a mutually agreeable contract.

Re: Waste Management Proposal/USEPA

Dear Mr. Robins:

The following proposal is submitted for direct disposal of approximately 3,000 cubic yards of lead contaminated soil located at 31st & Pulaski. The landfill specified for this project is Laraway RDF located in Elwood, Illinois.

SERVICE	DESCRIPTION	RATE
Disposal	Lead Contaminated Soil	$23.50/CY
Transportation	Dump Trailers	$218.00/LD
Analytical	R+EOX+LN Panel	$1310.00

Pricing for project completion is only part of the total cost. There is always the possibility of costly Non-Sudden Environmental Liability problems. To protect you and your client against any future liability costs, we offer the following:

- *Indemnification*
- Environmental Impairment Liability Insurance
- Backed by the largest asset base in the environmental industry.

This proposal is good for sixty (60) days. These prices are subject to final confirmation via the WMI approval and contracting process initiated by submission of sample/analysis and proper paperwork. Thank you very much for the opportunity to quote on this project. If you have any questions or comments, please do not hesitate to contact me at **708/409-3521.** **If I am not in the office at the time of your call, please call my customer service representative at 708/409-3507.**

Sincerely,

Mike Egizie,
Special Waste Consultant
