EXECUTIVE SUMMARY

This Technical Memorandum presents the results of a comprehensive groundwater investigation conducted for Operable Unit 2 (OU2) at the Lake Calumet Cluster Site (the Site or LCCS). The Site is in a heavily industrialized area in Southeast Chicago, Illinois and is immediately bounded by the Land and Lakes #3 landfill to the west; Paxton II landfill to the northwest; Paxton I landfill to the north; the Norfolk Southern Railroad and Indian Ridge Marsh immediately to the east; and 122nd Street to the south.

The groundwater investigation was performed to characterize the nature and extent of constituents in groundwater entering and emanating from the Site. There were two primary objectives for the groundwater studies at the LCCS. The first was to obtain the data necessary to complete a comprehensive evaluation of the hydrogeologic setting and groundwater flow behavior within the fill deposits that constitute the water-bearing zone at the Site. The second objective was to assess the overall groundwater conditions at the Site by comparing the results of groundwater sampling and analysis to applicable water quality benchmarks to determine the potential likelihood of unacceptable human health or ecological risks associated with groundwater emanating from LCCS to Indian Ridge Marsh (IRM).

To accomplish these objectives, the groundwater investigation was conducted in three separate phases. The first phase consisted of the collection of soil boring data to determine the geologic stratigraphy at the Site and establishment of a network of piezometers to evaluate horizontal and vertical hydraulic gradients, and groundwater flow directions. During the second phase, both hydraulic profiling and vertical aquifer sampling were performed to identify and sample the zones of highest permeability at locations around the perimeter of the Site. The data collected from these first two phases were then used to determine the locations for groundwater monitoring wells. To account for potential seasonal variability in groundwater flow directions and gradients, water levels in the newly installed piezometers at the Site were gauged monthly for twelve months. Four rounds of quarterly groundwater samples were collected from the monitoring wells installed at the Site during the investigation.

The groundwater assessment also included a review of published information regarding the extent and nature of the historical infilling of the wetlands in the Lake Calumet Region. IRM is part of a series of open spaces in the Lake Calumet area that includes Big Marsh, Heron Pond, and Dead Stick Pond. IRM consists of two separate pools (North Pool and South Pool) that are hydraulically connected to the Calumet River. Historically, prior to development of the Calumet Area, these wetland areas were much more extensive and were directly connected to Lake Calumet. However, during the initial industrial development of the wetland areas in the late 19th century, large amounts of fill were used to raise low-lying areas, including slag from nearby steel mills, dredge spoils from the channelization of the Calumet River, demolition debris, and municipal and industrial wastes, resulting in accompanying historical impacts to water resources on a regional-wide basis. The historical fill activities altered hydrologic flow patterns in the Calumet Area and reduced the previous extensive wetland areas to smaller pools, such as IRM, that are interspersed with the primarily industrial and commercial development in the area. Surface water flow in IRM is affected by surrounding properties, including surface water runoff from the former Acme Coke Site (located immediately north of IRM) through an existing culvert. Runoff from the Paxton I Landfill formerly drained directly to IRM via three culverts.

A key question addressed by the groundwater investigation was whether a native sand unit, locally referred to as the Dolton Sand, was present at the Site. Historical information suggesting that the Dolton Sand may have been mined at the Site was confirmed by geologic observations during the soil boring sampling program which indicated that native shallow unconsolidated materials at the Site had been removed and replaced with fill or waste material. The fill materials encountered during this investigation consisted of solid and household wastes, varying from industrial/demolition debris (*e.g.*, slag, metal pieces, bricks) to household wastes such as newspaper and general refuse.

The shallowest native geologic unit at the Site is a low-permeability silty clay located immediately beneath the anthropogenic fill deposits. The silty clay unit was encountered at every soil boring location and extends to the maximum depth of all soil borings completed.

The primary water-bearing unit at LCCS is the municipal/industrial waste fill. Water within the fill materials at LCCS does not meet the definition of "groundwater" under 35 IAC 620 because it is not located within a geologic material. The low permeability, uniform composition, and significant thickness of this unit provide a barrier that prevents the vertical migration of water within the fill unit into deeper permeable units.

Based on the results of groundwater sampling and analysis conducted during the groundwater investigation, the quality of the groundwater entering the Site, including that from the adjacent Paxton I and II Landfill properties, is similar to the quality of groundwater emanating from the Site. For many constituents, the concentrations in groundwater entering the Site and surrounding the Site are higher than the concentrations in groundwater emanating from the Site. Overall, upgradient and downgradient groundwater conditions are generally similar, with some constituents detected at lower levels emanating from the Site than entering the Site.

The results of human health and ecological screening evaluations presented in this technical memorandum indicate that constituents in groundwater along the border of LCCS and IRM, as well as in IRM surface water and sediments, likely do not pose an unacceptable risk to human health or the environment. Additionally, those evaluations, together with the findings that the highest concentrations of virtually all constituents in IRM surface water and sediments do not occur near the boundary with LCCS, indicate that the Site does not appear to be a principal source of constituents to IRM, and further investigation of IRM for the purpose of evaluating potential risks to human health and ecological receptors is not necessary.

Finally, the Site investigations have adequately characterized the nature of the groundwater entering, in, and emanating from the Site in satisfaction of the requirements of the Statement of Work and RI/FS Work Plan. Additional on-site investigations are not necessary to evaluate groundwater conditions for the purposes of the OU2 RI.

1 INTRODUCTION

1.1 Overview

Arcadis U.S., Inc. (Arcadis) has prepared this Technical Memorandum for Operable Unit 2 (OU2) at the Lake Calumet Cluster Site (the Site) on behalf of the Lake Calumet Cluster Site Group (LCCS Group). Remedial activities at the Site have been divided into two operable units with OU2 focusing exclusively on groundwater entering the Site, at the Site, and emanating from the Site.

The OU2 remedial investigation (RI) is being conducted pursuant to the 2013 Administrative Settlement Agreement and Order on Consent (Settlement Agreement) and the accompanying Statement of Work (SOW). The scope of RI activities to fulfill the requirements of the Settlement Agreement and SOW was presented in the Revised Remedial Investigation and Feasibility Study (RI/FS) Work Plan, which was submitted to the U.S. Environmental Protection Agency (USEPA) on August 21, 2015 and approved on September 30, 2015.

The objectives of this Technical Memorandum are the following:

- Describe the results of the investigations conducted to characterize the nature and extent of constituents in groundwater entering the Site, at the Site, and emanating from the Site;
- Determine from available information and data if there are likely to be unacceptable human health or ecological risks associated with exposure to groundwater discharges emanating from the Site to Indian Ridge Marsh (IRM); and
- Assess whether additional investigations are needed to complete the evaluations of potential human health or ecological risk.

To accomplish these objectives, this Technical Memorandum examines not only the information developed in the RI Site characterization studies, but also data available from prior related studies. Soil, surface water, and groundwater sampling at the Site and adjacent areas has been conducted by USEPA, the City of Chicago Department of the Environment (CDOE), the Illinois Environmental Protection Agency (IEPA), and the U.S. Army Corps of Engineers (USACE). As described in this Technical Memorandum, data from these events were obtained in accordance with standard data quality assurance and quality control procedures accepted by or consistent with those employed by USEPA.

1.2 Site Characterization Objectives

As described in the 2015 RI/FS Work Plan, one purpose of the OU2 RI was to gather information to fill data gaps regarding the Site groundwater and related conditions. The Site characterization objectives of the RI are listed below:

- Establish a well network to evaluate horizontal and vertical hydraulic gradients, hydraulic conductivities, and groundwater flow directions;

- Evaluate the hydrogeological conditions needed to classify Site groundwater according to IEPA regulations;
- Evaluate the horizontal and vertical distribution of constituents in groundwater entering into and emanating from the Site;
- Evaluate the flux of constituents emanating from the Site through groundwater and potentially discharging to IRM; and
- Evaluate constituent contributions to groundwater entering the Site from off-Site sources, including the Paxton I and Paxton II landfills.

In addition, in response to Site conditions encountered, the scope of Site characterization studies was expanded to include an assessment of seeps along the Site perimeter and sampling of light non-aqueous phase liquid (LNAPL) observed at one monitoring well.

1.3 Report Organization

This Technical Memorandum has been organized into the following sections:

Section 1.0 – Introduction. The introduction addresses the purpose of the Technical Memorandum and details how the report is organized.

Section 2.0 – Site Background. The Site background section describes the location, land use, and physical setting of the Site, and Site and regional geology and hydrogeology. This section also provides a summary of historical operations and removal actions, as well as a discussion of previous groundwater investigations.

Section 3.0 – Site Investigations. The Site investigations section describes the RI field activities, including piezometer installation and gauging, hydraulic profiling tool (HPT) investigation, vertical aquifer profiling (VAP), monitoring well installation, and groundwater monitoring.

Section 4.0 – Physical Characterization. The physical characterization section discusses geology and hydrostratigraphy at the Site.

Section 5.0 – Groundwater Assessment. The groundwater assessment presents the results of the quarterly groundwater monitoring and evaluates how constituents are entering into and emanating from the Site.

Section 6.0 – Preliminary Evaluation of Recent LCCS and Historical IRM Data. This section compares Site groundwater data to relevant screening criteria and compares current data with historical IRM data patterns to focus any potential additional investigations.

Section 7.0 – Summary and Conclusions. This section summarizes the Site characterization findings and presents conclusions based on these findings.

Section 8.0 – References. This section lists documents that are cited or discussed in this report.

2 SITE BACKGROUND

This section summarizes existing Site conditions, Site and regional geology and hydrogeology, previously completed removal actions, and prior Site groundwater investigations.

2.1 Location and Surrounding Land Use

The Site is located in a heavily industrialized area in southeastern Chicago, Illinois, southeast of Lake Calumet and approximately two miles northeast of Hegewisch, Illinois (**Figure 1**). The Site consists of an aggregation of four separate parcels (*i.e.*, Alburn Incinerator, U.S. Drum, the Unnamed Parcel, and the Paxton Lagoons). The property is bounded to the west by Land and Lakes #3 Landfill, to the northwest by Paxton II Landfill, to the north by Paxton I Landfill, to the east by the Norfolk Southern Railroad right-of-way and IRM, and to the south by 122nd Street (**Figure 2)**. The current Site layout is shown on **Figure 3.**

2.2 Regional Geology

The Site is located within the Chicago/Calumet Lacustrine Plain, a glacially formed, low crescent-shaped flat surface that slopes gently towards Lake Michigan, located approximately three miles east of the Site. The Lacustrine Plain is primarily a wave-scoured ground moraine with fine lake silts and clays covering the surface in former back-barrier settings. Prominent depositional features on the Plain are sand and gravelly sand spits, mainland beaches, and beach-ridge/dune complexes. This lowland region drains into Lake Michigan.

At the Site, the fill materials are underlain by the Carmi Member of the Equality Formation. This soil is a lake silt and clay that is well bedded, soft, thinly laminated, and locally varved. Lonestones (isolated stones) and lenses of gravel, sand, diamicton, organic debris, and wood are present locally in the silt and clay [Illinois State Geological Survey (ISGS) 2017]. The Carmi Member can be overlain by unmapped Richland Loess, thin eolian sand, swamp deposits, peat, and/or alluvium. Swamp deposits are mucky peat and organic residues mixed with fine-grained mineral sediment in abandoned glacial meltwater channels, ice-block depressions, and other shallow depressions and poorly drained areas. Similarly, peat deposits are fibrous peat and decomposed organic residues with similar origins. The Equality Formation is generally less than 20 feet thick and ranges from 0 to 40 feet thick [Illinois State Water Survey Division (ISWSD) 1990].

The Carmi Member of the Equality Formation is underlain by a silty clay glacial till, of the Wadsworth Till Member of the Wedron Formation. The Wadsworth Till Member ranges from 15 to 40 feet thick. The Wadsworth is underlain by Lemont drift, a gravel and silt that is very hard and dense. The Lemont drift ranges from 10 to 60 feet thick. Beneath the Lemont drift is the Silurian dolomite bedrock.

The bedrock geology consists of Precambrian-age crystalline rock overlain by gently dipping Paleozoic sedimentary bedrock units. The uppermost bedrock consists of eastward gently dipping Silurian dolomite. The bedrock surface topography is an undulating plain as a result of glacial and some lake erosion in which scattered steep valleys and low bedrock hills occur. The bedrock is overlain by approximately 50 to 100 feet of unconsolidated Quaternary-age deposits, which are composed primarily of dark gray, silty clay till overlain by medium- to fine-grained sands. The till deposits are assigned to the

Wadsworth Formation of the Wedron Group, and the sands are assigned to the Carmi Member of the Equality Formation [U.S. Geological Survey (USGS) n.d.].

2.3 Site Geology

Shallow Site geology was expected to consist of fine-grained silty clays of the Wedron Formation and sands locally referred to as the Dolton Sand and interpreted on a state-wide basis as a component of the Carmi Member of the Equality Formation. Historical information suggests that the Dolton Sand unit may have been removed at the Site as part of historical development of the Calumet Region. Underlying these units are the Silurian bedrock deposits present at 50 to 100 feet below ground surface (bgs) regionally, followed by Ordovician and Cambrian units. None of these bedrock units are significant sources of potable water in the vicinity of the Site.

During Site investigations (as discussed further below), geologic observations indicated that native shallow unconsolidated materials at the Site had been removed and replaced with fill or waste material. The shallowest native geologic unit at the Site was a low-permeability silty clay, which was encountered immediately beneath anthropogenic fill deposits and extended to the maximum depth of all soil borings completed.

2.4 Indian Ridge Marsh Hydrology

The discussion presented in this section on the hydrology of IRM is based primarily on information presented in an assessment of the hydrology of the marsh completed by the Illinois State Water Survey (ISWS) (Roadcap *et al*. 1999) and the City of Chicago's Hydrologic Master Plan for the Calumet Area (V3 2006). IRM is part of a series of open spaces in the Lake Calumet area that includes Big Marsh, Heron Pond, and Dead Stick Pond (**Figure 4)** IRM consists of several separate pools (North Pool, South Pool, and the Eastern Pools) that are hydraulically connected to the Calumet River.

Historically, prior to development of the Calumet Area, these wetland areas were much more extensive and were directly connected to Lake Calumet. However, during the initial development of the wetland areas in the late 19th century, large amounts of fill were used to raise the low-lying areas for development. There have been a number of studies conducted to characterize the nature of the fill deposits in the Calumet Area. The main types of fill reportedly used in the Calumet Area included slag from nearby steel mills, dredge spoils from the channelization of the Calumet River, demolition debris, and municipal and industrial wastes (Roadcap *et al*. 1999; USGS 1997). As a result of the historical fill activities, hydrologic flow patterns in the Calumet Area were altered and the previous extensive wetland areas were reduced to smaller pools, such as IRM, that are interspersed with the primarily industrial and commercial development in the area.

Based on the results of a topographic survey completed by the ISWS in 1999, the total wetland area in IRM was estimated to be approximately 92 acres. At the time of the ISWS survey, the surface areas of the North Pool, South Pool, and combined Eastern Pools were 49, 26, and 17 acres, respectively. There is an inlet to the North Pool from the former Acme Coke Plant located directly to the north of IRM (V3 2006). At one time, there were three culverts located beneath the railroad tracks immediately south of 116th Street that conveyed surface water runoff from Paxton I Landfill to IRM (Roadcap *et al.* 1999). In the

2006 Calumet Area Hydrologic Master Plan, V3 indicated that those culverts had been abandoned. The specific date of abandonment was not reported.

IRM is located in an urbanized watershed and thus surrounding properties could be influencing the surface water flow of the marsh. Surface water flow in the marsh is from north to south. There is a main channel that runs along the western edge of the marsh adjacent to the Norfolk and Southern railroad tracks. The channel is approximately 50 feet wide and extends along the entire length of the marsh. The estimated area within the Calumet Area watershed boundary that drains to the North Pool of IRM is approximately 185 acres (V3 2006).

Discharge from the North Pool of IRM to the South Pool is controlled by an outfall structure consisting of an inlet box and attached 24-inch corrugated metal pipe culvert that runs under 122nd Street connecting the North and South Pools. Under normal and low-stage conditions, water flows from the South Pool of IRM into the Calumet River.

As part of the IRM restoration project completed by the USACE in 2015 (see section 2.8), debris was removed from the inlet box of the outfall structure in the North Pool and a water control structure was installed south of 122nd Street.

2.5 Historical Site Operations and Removal Actions

The Site has a long history of waste disposal activities dating back more than a century. Fill operations in the Calumet Region of Northwestern Indiana and Northeastern Illinois appear to have occurred before 1880 (USGS 1997). Several documents report that, in the Lake Calumet region, beginning in the early 1900s, nearby industries disposed of slag and other wastes that raised the ground surface to an elevation just above the water table. In describing the Site in its "National Priorities List (NPL) Site Narrative," USEPA states the following (USEPA 2010):

> The Site was originally a wetland. Various excavation, filling, and dumping activities occurred from the 1940's to the 1980's. The Site is now covered by as much as 30 feet of fill consisting of various materials, including steel mill slag and industrial, chemical, and municipal waste.

Historical operations and removal actions at each of the four parcels included in the Site are summarized below. The four parcels are shown on **Figure 2.** The boundary with Paxton I landfill on the north is virtually indistinguishable, with no clearly defined fence line, differential land use, or topographic inclination.

Alburn Incinerator: The Alburn Incinerator facility (9± acres) was located at 2200 119th Street and was operated as an industrial waste incinerator and storage facility (Agency for Toxic Substances and Disease Registry [ATSDR] 2009). Evidence of waste disposal operations dates from the period beginning in approximately 1958 and continues to approximately mid-1983.

In the 1950s through approximately 1962, an entity known as the "Southside Landfill" operated in an area that included what later became the area of operations of the Alburn Incinerator, and from approximately 1962 to 1972, the Cal Harbor Landfill conducted waste disposal operations in this portion of the Site. In the 1970s, Earth II began operating on the Alburn Incinerator area of the Site (PRC Engineering 1986). A February 1974 IEPA inspection report of the Earth II facility describes its operations as primarily a landfilling operation, but notes that some liquid wastes were being received (*e.g.*, waste solvents, waste

oils, wastewater) from various industries, and further notes that burnable material was being dumped into one of three 8,000-gallon open pits (IEPA 1974).

In January 1975, IEPA issued a permit to Earth II to operate an incinerator (IEPA 1975). In February 1977, Cal Harbor took over the operations of Earth II on the Alburn Incinerator area of the Site (IEPA 1977). In September 1978, Cal Harbor entered into a lease with Alburn, Inc. to take over the operations of the incinerator. In March 1979, Alburn, Inc. contracted with Chemical Incineration, Inc. to operate the incinerator, and Chemical Incineration, Inc. operated the Alburn facility until September 1979 (PRC Engineering 1986). By December 1979, Alburn, Inc. had terminated the Chemical Incineration contract and again taken over operation of the incinerator on the Alburn Incinerator area of the Site (Hagarty 1979; IEPA 1982). From 1980 to 1982, it appears that Alburn, Inc. continued to operate the incinerator (Pierard 1983). Available documentation shows that, as of a June 1983 USEPA Site inspection, another company, known as "American Incineration," was operating the incinerator at the Alburn Incinerator area of the Site.

In 1983, USEPA removed 36 bulk storage tanks, 6,000 drums, 239 five-gallon buckets, and 174,000 gallons of waste from a lagoon at the Alburn Incinerator Site. Surface soil was removed to a depth of 6 inches, and at least part of the Site was covered with a 2-foot clay cap (ATSDR 2009).

U.S. Drum: The U.S. Drum facility (5.6± acres) was located at 2400 119th Street. The beginning of waste disposal operations specific to the U.S. Drum portion of the Site is difficult to identify. The U.S. Drum portion of the Site had been used as a disposal area for municipal and industrial wastes since the 1940s (PRC Engineering 1986). Thereafter, it was used as a waste transfer and solvent recovery facility, and later as a temporary storage and transfer facility for waste drums (ATSDR 2009). By the early 1970s, some type of drum staging operation was occurring on the U.S. Drum area of the Site (Hagarty 1984).

By 1975, the Earth II company was operating a waste transfer and solvent recovery facility, and a fire occurred on July 4, 1975. Operations on the U.S. Drum area were abandoned shortly thereafter, leaving behind 1,000 to 1,750 drums on the Site (IEPA 1976). The storage and transfer facility was closed in 1979, at which time an estimated 34,100 gallons of waste were removed. In 1984, USEPA conducted an emergency removal at the U.S. Drum Site, which included the removal of 435 cubic yards of soil, 62,000 gallons of standing water, and 3,000 drums. The areas of waste removal were then capped with clay and topsoil (ATSDR 2009).

Unnamed Parcel: There is little information available regarding the history of the Unnamed Parcel (38± acres). It is suspected that this area was filled at various times with dredged materials from the Calumet River, slag wastes from nearby steel mills, demolition debris, and municipal wastes (ATSDR 2009).

Paxton Lagoons: The Paxton Lagoons parcel (13 acres) was used as an industrial disposal Site beginning in the 1950s (ATSDR 2009). By mid-1985, it appears that landfill activities at the Paxton Avenue Lagoons had been suspended (John Mathes & Associates, Inc. 1985). Beginning in 1989, IEPA conducted a removal action at the Paxton Lagoons in which the lagoons were drained and approximately 16,000 tons of impacted soil were excavated and processed through an on-Site mobile incinerator. USEPA conducted an emergency removal at the Paxton Lagoons area in 1990, removing 60 drums of waste materials and 2,200 cubic yards of acidic soil. IEPA subsequently placed an engineered clay cap atop the closed lagoons and fenced the Paxton Lagoon area in October 1993.

2.6 Operable Unit One

As indicated in Section 1.0, remedial activities at the Site have been divided into two operable units. Operable Unit 1 (OU1) is intended to provide source control related to impacted soils and buried waste materials present at the Site. OU1 also addresses potential human health and ecological exposure pathways related to direct contact and potential migration of constituents via surface water runoff and soil erosion. IEPA was the lead agency for the planning, design, and implementation of the remedy for OU1.

IEPA prepared a Focused Feasibility Study (FFS; Ecology & Environment, Inc. (E&E) 2006) to evaluate capping alternatives for OU1. Following completion of the FFS, IEPA issued a Proposed Plan and Record of Decision (ROD) for OU1 in September 2006 (IEPA 2006), which was approved by USEPA. The alternative selected by IEPA in the ROD consisted of placement of a low-permeability clay cap over the Site that meets the IEPA requirements for closure of a hazardous waste land disposal facility. IEPA initiated construction of the capping remedy in 2007, but stopped construction before completing the grading layer that was intended to establish slopes and serve as the subgrade for the final cover system.

2.7 Prior Groundwater Investigations

This section summarizes the available groundwater sampling results from the historical monitoring well network (shown on **Figure 5**). These wells were not available for the OU2 RI; in the meeting among the LCCS Group, USEPA, and IEPA representatives on July 7, 2012, IEPA indicated that existing monitoring wells at the Site were destroyed during the IEPA OU1 grading layer construction, and those monitoring wells no longer exist. There do not appear to be any logs that define how these wells were abandoned.

Groundwater investigations at the Site began in 1998, when E&E, on behalf of IEPA, collected three Geoprobe® water samples (GW1 through GW3). In April 1999, E&E, on behalf of IEPA, installed several monitoring wells (LC01 through LC07 and LC09 through LC13) to supplement an older monitoring network (P01 through P05) that previously had been installed at the Alburn Incinerator parcel, and monitoring well G21S, which had been installed at the U.S. Drum parcel. Monitoring wells LC02 and LC11 were screened completely within native soils. Monitoring wells LC01, LC03, LC06, LC10, LC13, and P02 were screened completely within fill material. The remaining wells (LC04, LC05, LC07, LC09, LC12, P01, P03, and P04) were screened across the fill/native soil interface. No boring logs are available for monitoring wells P05 and G21S. Three nested well pairs were created as part of the 1999 groundwater investigation using newly installed and previously existing monitoring wells. These well pairs are: P05/LC07, LC09/LC10, and LC11/LC12.

IEPA sampled 18 monitoring wells (P01 through P05, LC01 through LC07, LC09 through LC13, and G21S) in 1999 (E&E 1999). The groundwater samples were analyzed for a suite of constituents, including volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs), total and dissolved metals, and nitrogen compounds (*i.e.*, ammonia, total cyanide, total Kjeldahl nitrogen, and nitrate-nitrite). The approximate locations of the Geoprobe® borings and monitoring wells sampled by E&E in 1999, which include monitoring well locations at the Site and at Paxton I and Paxton II landfills, are shown on **Figure 5**.

In 2002, IEPA performed a groundwater monitoring event that included many of the same wells sampled in 1999, in addition to several wells located on the Paxton I and Paxton II landfills. The groundwater samples were analyzed for VOCs; SVOCs; pesticides; PCBs; and a suite of inorganic parameters,

including total metals, nitrogen compounds, sulfate, phosphate, chloride, total dissolved solids, total suspended solids (TSS), and cyanide.

IEPA's contractor, E&E, conducted an additional groundwater monitoring event in March 2007. Groundwater levels were measured at 14 existing Site monitoring wells (LC05, LC06, G104, LC12, LC11, LC03, E, G20D, G20S, LC02, R21S, R21D, G21D, and G21S), and samples were collected at 12 of these wells (LC05, LC06, G104, LC12, LC11, LC03, E, G20S, LC02, R21S, R21D, and G21S). Collected samples were analyzed for VOCs, SVOCs, and selected metals.

2.8 USACE Indian Ridge Marsh Restoration Project

2.8.1 Site Setting and Description

IRM is an undeveloped, disturbed marshland that lies immediately to the east of the Site. It is bounded by heavy industrial sites across Torrence Avenue on the east, 116th Street on the north, Norfolk Southern Railroad tracks on the west, and the Sidestream Elevated Pool Aeration (SEPA) station on the south. The marsh, considered a Palustrine wetland in an urban watershed, occupies more than 185 acres on the southeast side of Chicago between Lake Calumet and the Calumet River. It was originally located adjacent to the shoreline of Lake Calumet and was a mixed wetland and sand prairie (Smalley *et al*. 2001). In the late 19th century, the marshes in the Lake Calumet region were filled to create dry ground. The fill included slag, river dredging spoils, cinders, fly ash, and other types of solid waste. Some records indicate that IRM may have been mined for sand (Smalley *et al*. 2001). Filling activities at IRM intensified after 1930 with materials including dredging spoils and construction debris.

Aerial photographs of IRM were reviewed from 1938, 1952, 1959, 1964, 1973, 1988, 1998, 2009, and 2012. These photos document filling operations at IRM going back to 1938, as described above. The marsh appears in its current configuration beginning in the 1988 photograph.

The USACE completed a restoration project in IRM in 2015 that involved vegetative habitat improvement, aquatic habitat improvements, hydraulic controls, and improved public access. Specifically, invasive plant species were removed using herbicides and prescribed burning, and new plants were established to improve a variety of habitats and provide stabilization and decrease sediment runoff for the upland areas. Leaf compost inoculated with mycorrhiza was also incorporated into select upland areas. The leaf compost increases the organic carbon in the soils to facilitate binding of metals, pesticides, and polycyclic aromatic hydrocarbons (PAHs). Hydraulic control measures undertaken included cleaning the culvert under 122nd Street and installing a water control structure south of 122nd Street within the ditch that connects with the Calumet River. Finally, the USACE removed 500 tons of debris including approximately 1,000 tires, improved the trail system, and constructed a boardwalk to link the IRM trail system to the SEPA station along the Calumet River. Results of sampling conducted by the USACE in IRM indicated that removal of sediments was not necessary to meet the goals of the ecological restoration project.

2.8.2 Indian Ridge Marsh Data

As part of the USACE restoration project, Tetra Tech assessed the potential ecotoxicity of environmental media (soil, surface water, sediment) in IRM on behalf of the USACE. Results are documented in the

Ecotoxicological Evaluation prepared by Tetra Tech in 2008 and in the 2009 Addendum to the report (Tetra Tech 2008, 2009). Surface water, sediment, and plant tissue data were collected in 1999, 2001, 2002, and 2009 (**Figure 6**).

Ecotoxicological benchmarks and background values were established for the Calumet area by the Calumet Ecotoxicology Roundtable Technical Team in 2007. Two different values were established for sediment and surface water -- Calumet Open Space Reserve (COSR) Threshold and Benchmark values. Relevant background concentrations were also established for the area. In the USACE evaluations, these concentrations were used to screen the data collected from IRM to evaluate whether constituent concentrations have the potential to adversely affect flora and fauna in the marsh (Tetra Tech 2008, 2009). Arcadis reviewed the surface water and sediment sampling data collected during the restoration projects for usability and found them to meet data quality objectives for characterization. This review included a Level IV validation of the 2009 sediment and surface water sampling data (**Appendix A)**. This data validation indicated that the USACE data met the data quality objectives for the project and were usable. These data are included in the comparisons discussed in Section 6.

3 SITE INVESTIGATIONS

The LCCS Group conducted RI activities at the Site between September 2015 and March 2017 to identify and evaluate the nature and extent of groundwater impacts. The principal objectives of the RI work were the following:

- Establish a well network to evaluate horizontal and vertical hydraulic gradients, hydraulic conductivities, and groundwater flow direction;
- Evaluate the hydrogeological conditions needed to classify Site groundwater according to IEPA regulations;
- Evaluate the horizontal and vertical distribution of constituents in groundwater at the Site;
- Evaluate the flux of constituents leaving the Site through groundwater and potentially discharging to IRM;
- Evaluate the constituent contributions to Site groundwater from off-Site sources, including the Paxton I and Paxton II Landfills;
- Inspect for the possible presence of seeps along the Site boundary, especially on the eastern side near the Norfolk Southern Railroad trails, and sample such seeps if found; and
- Characterize LNAPL encountered in monitoring well MW-12.

These objectives have all been met in the completed Site characterization studies. All RI activities were performed in accordance with the following USEPA-approved work plans and other documents:

- Revised RI/FS Work Plan transmitted via letter dated August 21, 2015;
- Health and Safety Plan (HASP) transmitted on July 17, 2015;
- Field Sampling Plan (FSP) transmitted via letter dated July 17, 2015 with errata sheet dated September 30, 2015;

- Quality Assurance Project Plan (QAPP) transmitted via letter dated July 17, 2015 with revised Worksheet #18 transmitted via email on September 10, 2015; and
- QAPP Addendum transmitted on January 26, 2017 to address LNAPL sampling.

USEPA approved the RI/FS Work Plan, FSP, and QAPP on September 30, 2015 and approved the QAPP Addendum on February 8, 2017. The sections below describe each stage of the field investigation.

3.1 Phase 1 Piezometer Installation

Variations observed in the potentiometric surfaces presented in historical reports prompted installation of a network of piezometers across the Site to determine groundwater flow direction. A total of 19 piezometers were installed during this phase of the Site investigation, and locations are shown on **Figure 3**. The piezometers were placed as follows:

- Five shallow downgradient piezometers along the eastern edge of the Site;
- Four shallow upgradient piezometers along the western property boundary;
- Five shallow piezometers in the central portion of the Site; and
- Five deep piezometers clustered with selected shallow piezometers.

The RI/FS Work Plan indicated that six deep piezometers would be installed; however, due to the depth of the clay at PZ-1S, a deep nested piezometer was not necessary.

Piezometer installation began on October 6, 2015 and continued through October 8, 2015. The piezometers were installed using direct-push technology drilling methods. The shallow piezometers were installed to intersect the water table and were screened in the fill unit. The maximum depth of the shallow piezometers was 25 feet bgs. The deep piezometers were paired with the shallow piezometers and were installed in the first sand unit encountered below the fill unit, with a maximum depth of 44 feet bgs. At each location, a continuous soil core was collected from ground surface to the maximum depth of the piezometer being installed. The soil cores were logged to characterize the lithology and determine the depth of the water table.

The piezometers were named PZ-XS or PZ-XD, where X is the number of the piezometer and S or D indicates shallow or deep, respectively. The logs and piezometer construction details are included in **Appendix B**.

The piezometers were constructed of 1-inch-diameter, Schedule 40 polyvinyl chloride (PVC), 10-slot well screen completed with a pre-packed sand filter. The screen was connected to a Schedule 40 PVC riser, which extends to approximately 3 feet above ground surface. Piezometer installation was completed by adding filter sand on top of the pre-pack to increase the sand level to a minimum of 1 foot above the top of the well screen. A hydrated bentonite seal was placed to fill the annulus around the riser to ground surface. The piezometers were capped with expandable well plugs and secured above-grade with a lockable steel surface completion.

Following installation, the piezometers were developed to ensure communication with the surrounding formation. The piezometers were pumped until the water was free of visible sediment, and the pH,

temperature, turbidity, and conductivity were stable within 10% for three consecutive readings. The piezometers then were surveyed to the State Plan Coordinates to establish horizontal locations and North American Vertical Datum (NAVD) 88 to establish elevations.

The piezometers were initially gauged two times following installation to allow evaluation of the potentiometric surface and groundwater flow direction. Gauging was completed on October 12 and 19, 2015. Additional monthly water level measurements were then collected between January 2016 and December 2016 to characterize flow directions and variability. Groundwater level data are included in **Table 1.** Groundwater contour maps were prepared and are included as **Figures 7** through **10** for each quarter of 2016 using the data from March, June, August, and December, respectively.

Groundwater flow is reasonably consistent throughout the year. In the eastern portion of the Site, flow is generally to the east toward IRM and gradients are relatively steeper. In the western portion of the Site, flow is more to the south and southeast and gradients are relatively flatter.

The direction of groundwater flow presented on **Figures 7, 9, and 10** where groundwater elevation contours were inferred was confirmed by vector flow analysis using water level data collected from monitoring wells MW-2, MW-3, and MW-4. An overlay of the vector analysis for these three wells is shown in blue on each of these groundwater elevation maps. The results of the vector analysis confirm that the direction of groundwater flow along the northern perimeter of the Site is in the southeasterly direction. **Figure 8** includes groundwater elevation measurements for both the piezometers and monitoring wells and the resulting contours are consistent with those on **Figures 7, 9 and 10.**

3.2 Phase 2 HPT/VAP Transects

Phase 2 of the investigation included a combination of HPT and VAP borings. The borings were placed based on the results of the piezometer gauging events, and locations are shown on **Figure 3**.

3.2.1 HPT Soundings

Twenty-four HPT borings were completed to determine relative permeability throughout the depth of materials investigated. The HPT is attached to the end of a Geoprobe® drill string that enables a continuously metered injection of a small volume of fluorescent dye and water mixture (50 to 300 milliliters per minute) during advancement of the probe. Simultaneously, the fluid back pressure from the injection into the formation is measured and logged at frequent intervals along with the injection flow data. After correcting for equipment head losses, the flow and pressure are plotted as a relative permeability (or hydraulic conductivity) curve by recognizing that hydraulic conductivity (K) is the constant of proportionality of flow divided by pressure. The resulting data (flow and pressure) from each location are comparable within the vertical profile at each location, as well as between soundings across transects. The logs for the HPT soundings are included in **Appendix C**.

Pneumatic hydraulic conductivity testing was attempted at HPT locations as a way of calibrating or correlating reported relative conductivity values from the HPT soundings to results from conventional slug test methods and quantifying conductivity in areas of high permeability. However, pneumatic slug tests in areas of high permeability generally yielded inconsistent results, and slug tests at direct-push locations were discontinued in favor of later slug testing at conventional monitoring wells.

Geoprobe® soil borings were completed at six of the HPT sounding locations. The detail obtained through classification of the cores retrieved from those soil borings was used to characterize the HPT responses to particular soil lithologies.

3.2.2 Vertical Aquifer Profiling

Prior to beginning VAP, the HPT data were evaluated, and more highly permeable zones were identified at each VAP sampling location. These permeable zones were targeted for collection of VAP samples because they represent the potential areas of highest groundwater flux at the Site. Approximately five samples were collected at each location, and the results are reported in **Table 2**. Each sample is named VAP-HPTX(Y-Z)-date, where HPTX indicates with which HPT location the VAP sample corresponds; (Y-Z) indicates the depth of the sample in feet bgs; and the date the sample was collected is shown as month, day, and year.

Groundwater samples were collected through the drilling rods, which were attached to a Geoprobe® screen-point sampling device. The screen-point sampler was driven to the bottom of the target interval, after which the drill string was pulled up approximately one foot to expose the screen to the target sample interval. A peristaltic pump was then used to purge the sample interval until the water was free of fine-grained material. Once purged, the flow rate was reduced for sample collection.

The VAP groundwater samples were analyzed for VOCs, total and dissolved metals, and ammonia. The laboratory reports and data validation report are included in **Appendix D.**

3.3 Phase 3 Monitoring Well Installation

The data collected during the first two phases of Site characterization were used to determine the locations for the installation of monitoring wells. The proposed locations for monitoring wells were discussed with USEPA and IEPA during a conference call on February 11, 2016. On February 22, 2016, USEPA and IEPA approved a plan to install 13 monitoring wells across the Site.

The wells were installed using hollow-stem auger drilling methods in accordance with the guidelines presented in Section 920.170 of the Illinois Administrative Code (IAC) (Monitoring Wells). The soil boring logs and monitoring well construction details are included in **Appendix E**. Following installation, the permanent monitoring wells were developed to ensure adequate hydraulic communication with the surrounding formation. Development included a combination of surging and pumping development methods and was considered complete when water was free of visible sediment and the pH, temperature, turbidity, and conductivity were stable within 10% for three consecutive readings. The monitoring wells were then surveyed to establish location and elevation.

3.3.1 Monitoring Well Sampling

To evaluate groundwater concentration trends in relation to seasonal changes, the Phase 3 monitoring wells were sampled quarterly for one year (*i.e.*, four sampling events). Sampling events were completed in April, July, and October 2016 and February 2017.

Prior to collecting groundwater samples, the groundwater elevation was measured at each well. Groundwater samples were collected using low-flow sampling methods, and samples were packed on ice

and shipped to the project laboratory in accordance with appropriate chain-of-custody procedures. The parameters analyzed in the groundwater samples were the following:

- Field parameters: dissolved oxygen (DO), pH, conductivity, turbidity, temperature, and oxidation-reduction potential (ORP);
- Target Compound List (TCL) VOCs, SVOCs, PCBs, and pesticides;
- Total and dissolved Target Analyte List (TAL) metals;
- Nitrogen compounds: ammonia-N, nitrate-N, and nitrite-N;
- Geochemical characterization parameters: sulfate, sulfide, TSS, and total organic carbon (TOC); and
- Dissolved gases: methane, carbon dioxide, oxygen, and nitrogen.

Table 3 shows the results of groundwater sampling. The laboratory reports and data validation memos are included in **Appendix F**.

3.4 Other Site Investigations

3.4.1 Seep Investigation

In January 2017, a seep investigation was conducted along the eastern and southeastern perimeters of the Site in response to a request from USEPA. The purpose of the investigation was to determine if there were any areas of water seepage evident along the slopes formed by the cover materials that had previously been placed on the Site by IEPA.

A preliminary Site reconnaissance visit was performed to determine the extent of clearing required for visual inspection of the side slopes. The Site reconnaissance confirmed that the side slopes along the eastern perimeter were overgrown with phragmites, a non-native invasive plant. Arcadis and its subcontractor Environmental Restoration LLC of South Holland, Illinois cleared the Site on December 21 and December 28, 2016 as needed to facilitate the seep inspection.

Two Arcadis field staff returned to the Site on January 19, 2017 to conduct the seep investigation. The inspection consisted of walking along the side slope of the cover materials that extends between the monitoring wells (MW-4 through MW-8, as shown on **Figure 3**) and the piezometers (locations PZ-1 through PZ-5). This slope connects a general area of higher elevation in the central part of the Site where IEPA placed soil cover materials to an area of lower elevation, approximately matching the surrounding grade off Site, near the monitoring wells. One Arcadis observer walked near the middle of the slope, and one walked near the bottom of the slope. A total of three seeps were observed during this inspection. At each seep, general observations regarding location and surroundings were recorded, and water samples were collected.

The samples from the seeps were delivered to TestAmerica Laboratories, Inc. in University Park, Illinois. They were analyzed for TCL VOCs, ammonia, and TAL metals. The results are presented in **Table 4**, and the laboratory report is included as **Appendix G**. There were no exceedances of IAC Part 302 Water Quality Standards or Illinois Derived Water Quality Criteria for any of the parameters analyzed in the seep samples.

Following the seep inspection, Arcadis reviewed the Landfill Cover – Phase 2 design drawings prepared by E&E on behalf of IEPA (E&E, 2009). Arcadis compared those drawings to the Site figure (**Figure 3**) and determined that the seeps appear to be located where the gas collection pipes and surrounding backfill, described on Drawing 8 and Drawing 15 of E&E's Landfill Cover drawings, are exposed. However, the lack of documentation regarding construction of the grading layer and Site infrastructure, combined with the incomplete nature of the cap construction, constitute significant uncertainty regarding the presence and configuration of potential drainageways or flow paths in surface and near-surface materials deposited as part of OU1 activities. The findings of the seep investigation are described in more detail in the March 3, 2017 Technical Memorandum titled December 2016/January 2017 Seep Investigation (Arcadis 2017).

3.4.2 LNAPL Sampling

During the second quarterly groundwater monitoring event in July 2016, LNAPL was observed in MW-12. The in-well LNAPL thickness observed was approximately 0.5 foot. Following this observation, the LCCS Group elected to sample the LNAPL to characterize its chemical composition. The presence of LNAPL had not been noted in prior groundwater sampling reports for the Site, and no LNAPL was observed in any of the other 12 monitoring wells in 4 sampling rounds.

A revised QAPP Addendum submitted to USEPA on January 26, 2017, included procedures for sampling and analyzing the LNAPL. USEPA approved the QAPP on February 8, 2017, and the LNAPL in MW-12 was subsequently sampled on March 2, 2017. The LNAPL was collected using a bailer to avoid any mixing of water and LNAPL. The sample was delivered to the project laboratory and analyzed for PCBs, SVOCs, and VOCs. Those results are included in **Table 5** and were submitted to USEPA on May 5, 2017. The laboratory report is included in **Appendix H**.

4 PHYSICAL CHARACTERIZATION

4.1 Site Geology

The geology at the Site was characterized using the lithologic logs collected during the various phases of the investigation. The geology consists primarily of fill overlaying a low-permeability native clay.

The uppermost unit encountered at the Site was a silty clay fill material placed by IEPA as part of grading layer construction related to OU1. The thickness of this grading layer material varies and was encountered down to a maximum depth of approximately 10 feet. Underlying the grading layer is a unit of fill consisting of solid and municipal wastes varying from industrial/demolition debris (*e.g.*, slag, metal pieces, bricks) to household wastes such as newspaper and rags. The fill layer had a maximum thickness of 22 feet based on the piezometer boring logs. At some soil boring locations, sand was observed within the fill layer; however, at each location where this material was observed, it was identified as fill and not native sand based on the presence of anthropogenic materials such as wood or glass within the sand layers.

Beneath the fill layer, a silty clay was encountered at each location. This clay was encountered at all deep borings that penetrated the entire thickness of the fill material and represents the only native material encountered in the stratigraphic profile. The composition of the clay indicated a very uniform and

very low-permeability material. The base of the clay layer was not encountered during drilling, but the clay was still present as deep as 44 feet bgs.

Native sand deposits were not encountered at any boring location on the Site. Detailed boring logs are included in **Appendices B and E.**

4.2 Site Hydrostratigraphy

The hydrostratigraphy at the Site is defined by the three primary units described in Section 4.1:

- The silty clay fill (grading layer);
- The combined thickness of the municipal/industrial waste fill, and
- The underlying clay.

The key hydrogeologic characteristics of each unit are summarized below:

- The silty clay unit (grading layer) is generally unsaturated and has low permeability.
- The primary water-bearing unit is the municipal/industrial waste fill unit. The highly variable composition of this unit results in a range of permeabilities, as shown in the HPT logs and slug test results, included as **Appendices C** and **I,** respectively. This variable permeability is consistent with the heterogeneity introduced during the placement of the fill material and the different composition of the fill.
- The clay unit underlying the fill material represents the vertical limit of groundwater flow originating at the Site. The low permeability, uniform composition, and significant thickness of this unit do not provide a pathway for groundwater to migrate vertically in to the deeper permeable units.

Water level measurements were collected from the piezometers on a monthly basis for a period of one year (**Table 1).** As previously noted in Section 3.1, groundwater contour maps were prepared and are included as **Figures 7** through **10** for each quarter of 2016 using the data from March, June, September, and December, respectively. The groundwater contour maps presented as **Figures 7** through **10** show that groundwater flow in the municipal/industrial waste fill unit is reasonably consistent throughout the year. In the eastern portion of the Site, flow is generally to the east toward IRM and gradients are relatively steeper. In the western portion of the Site, flow is more to the south and southeast and gradients are relatively flatter. A vector analysis was completed for wells MW-2, MW-3, and MW-4 that confirmed flow in the northeastern portion of the site is in the southeasterly direction.

As discussed in Section 3.4.1, the only seeps along the eastern side slopes of the Site appeared to be related to the partially constructed IEPA cap. Those discharges were all sampled and analyzed for VOCs, metals, and ammonia, and the results were all below IAC Part 302 Water Quality Standards and Illinois Derived Water Quality Criteria.

5 GROUNDWATER ASSESSMENT

This section presents the results of groundwater sampling conducted to determine the distribution of constituents in groundwater entering and emanating from the Site. This assessment is based on the

results of four rounds of quarterly groundwater sampling completed during the current investigation at newly installed monitoring wells MW-1 through MW-13 (**Figure 3**), as well as the results of sampling during previous groundwater investigations conducted at LCCS in 1999, 2002, and 2007. Overall, the results indicate that generally the concentrations of constituents detected in groundwater emanating from the Site along the eastern and southern perimeter are lower or similar to the concentrations of constituents detected in groundwater entering the Site along the western and northern perimeters. Also, many of the constituents were detected at concentrations below screening levels, as described in more detail in Section 6.

5.1 Nature and Extent of Constituents in Groundwater

The review of the groundwater sampling results in this section is presented by constituent groups, as well as by individual constituents chosen to best represent the distribution of important compounds at and adjacent to the Site.

Groups of constituents detected in groundwater include inorganics, PCBs, SVOCs, and VOCs.

For each constituent group, as well as the representative individual constituents, the presence and distribution are described by the following areas:

- Western perimeter of the Site adjacent to the Land & Lakes Landfill;
- Northern perimeter of the Site adjacent to the Paxton I and II Landfills;
- Eastern perimeter of the Site adjacent to the IRM;
- Southern perimeter of the Site adjacent to East 122nd Street; and
- Surrounding the Site (i.e. Paxton I and II Landfills).

As discussed in Section 4.2, groundwater flow in the eastern portion of the Site is generally to the east and in the western portion of the Site trends south to southeast. As such, the western and northern perimeters are generally hydraulically upgradient of most Site areas, and the eastern and southern perimeters are generally hydraulically downgradient.

Tables 6 to 9 present the results of the fourth quarterly monitoring event and use color gradation to illustrate the relative distributions of constituents within a constituent group. The results from all four quarters of data were very similar and the fourth monitoring event was chosen as a representative data set. Concentrations in the lowest 50th percentile are shaded blue; the lowest concentrations are dark blue, while those concentrations approaching the midpoint of all concentration data are light blue. Alternatively, data in the highest 50th percentile are shaded red; the concentrations near the midpoint are light red while the highest concentrations are dark red. In addition, the relative distributions for selected constituents and constituent groups are represented on areal maps (**Figures 11 to 18**). On these figures, the wells with generally high concentrations of constituents are red while wells with relatively low concentrations of those same constituents are blue. These figures also include previous data that show the Site groundwater concentrations in the context of the groundwater conditions surrounding the Site.

For certain constituents, the relative distribution is represented by the profiles in **Appendix J** for the western, northern, and eastern perimeters of the Site. Profiles were not prepared for the southern perimeter of the Site, where constituent concentrations in groundwater were generally low.

Inorganics

The inorganics are discussed below in three different groups: inorganics as a group, manganese, and ammonia. These groupings were chosen to best represent the distribution of inorganic constituents in groundwater entering and emanating from the Site.

Inorganics were detected in groundwater along the perimeter of the Site and surrounding the Site. During previous investigations in 1999, 2002, and 2007, inorganics were detected in the groundwater within and adjacent to the Paxton I Landfill, along the eastern perimeter of the Site and within the Site. **Figure 11** depicts the relative concentrations of inorganics at and surrounding the Site.

Most inorganics were detected along the western and northern perimeters of the Site as well as the eastern and southern perimeters of the Site. Furthermore, the same inorganics have also been detected within and adjacent to the Paxton I and II Landfills during the current Site investigation and previous sampling events. The highest metals concentrations were generally observed at wells MW-06 and MW-07. Overall metals concentrations in groundwater were similar along the perimeter of the Site and surrounding the Site (from current and previous sampling events) in the majority of well samples.

Manganese

Manganese was detected in groundwater along the perimeter of the Site and surrounding the Site. In addition, during the 1999 and 2002 sampling events, manganese was detected in groundwater within and adjacent to the Paxton I Landfill along the eastern and southern perimeters of the Site and within the Unnamed Parcel, within the Alburn Incinerator portion of the Site, and within the US Drum portion of the Site. **Figure 12** depicts the relative concentration of manganese at and surrounding the Site.

The relative ranges of manganese concentrations (in ug/L) by areas are summarized below:

Western Perimeter	Northern Perimeter	Eastern Perimeter	Southern Perimeter	Surrounding Site
ND to 2,600	ND to 1,700	ND to 2,400	ND to 8,520	ND to 13,700

Along the eastern perimeter, higher manganese concentrations were observed at well MW-04, and along the southern perimeter, higher manganese concentrations were observed at well MW-10. Higher manganese concentrations were also observed at MW-12 (Paxton Lagoon area). In contrast to other inorganics, lower concentrations of manganese were observed at wells MW-06 and MW-07. The highest (by an order of magnitude) manganese concentration was observed at LC01 (13,700 ug/L in 1999) within the Paxton Landfill. Manganese concentrations in the remaining groundwater samples are similar along the perimeters of the Site as well as surrounding the Site within and adjacent to the Paxton I Landfill including the eastern perimeter of the landfill adjacent to the IRM.

Ammonia-Nitrogen

As shown in **Table 6**, ammonia-nitrogen was detected in groundwater both entering and emanating from the Site. In addition, during the 1999 and/or 2002 sampling events, ammonia-nitrogen was detected in groundwater within and adjacent to the Paxton I Landfill, within the northern portion of the Paxton II Landfill, along the eastern and southern perimeters and within the Unnamed Parcel, within the Alburn Incinerator portion of the Site, and within the US Drum portion of the Site. **Figure 12** depicts the relative concentrations of ammonia-nitrogen at and surrounding the Site.

The relative ranges of ammonia- nitrogen concentrations (in milligrams per liter [mg/L]) by areas are summarized below:

Western Perimeter	Northern Perimeter	Eastern Perimeter	Southern Perimeter	Surrounding Site
19 to 440	14 to 98	5.3 to 870	19 to 140	1 to 800

Along the western, northern, and southern perimeters of the Site, the ammonia-nitrogen concentrations were generally low. Along the eastern perimeter, higher ammonia-nitrogen concentrations were observed at wells MW-06 and MW-07, which are on the southern end of the eastern perimeter, adjacent to the Unnamed Parcel. The lowest ammonia-nitrogen concentrations were observed at wells MW-04 (eastern perimeter, northern end adjacent to the US Drum parcel) and MW-10 (west side of southern perimeter). Overall, the highest ammonia-nitrogen concentrations observed at LC01 and G24D (Paxton I Landfill) are similar to the concentrations observed at MW-06 and MW-07. The remaining ammonia-nitrogen concentrations in groundwater are similar along the perimeters of the Site as well as surrounding the Site.

PCBs

As shown on **Table 7,** PCB Aroclors 1242 and 1254 were only detected in the groundwater along the eastern perimeter at wells MW-06 and MW-07 adjacent to the Unnamed Parcel. During the previous sampling event in 2002, total PCBs were detected along the eastern perimeter of the Unnamed Parcel, within the US Drum portion of the Site, within the Unnamed Parcel, along the eastern perimeter of the Paxton I Landfill adjacent to the IRM and within the Paxton I Landfill, and along the southern perimeter of the Site. **Figure 14** depicts the relative concentration of total PCBs at and surrounding the Site.

Overall, PCBs are sporadically detected at and surrounding the Site. The highest concentration of total PCBs observed in the study area, including the area surrounding the Site (11,000 ug/L) were detected at well G24D within the Paxton I Landfill.

SVOCs

SVOCs detected in the groundwater at and surrounding the Site include phenols, PAHs, phthalates, as well as other miscellaneous SVOCs. As shown in **Table 8**, SVOCs were detected in groundwater along the perimeter of the Site and surrounding the Site. During previous investigations in 1999, 2002, and 2007, SVOCs were detected in the groundwater within and adjacent to the Paxton I landfill, along the eastern perimeter of the Site and within the Unnamed Parcel, within the Alburn Incinerator portion of the Site, and within the US Drum portion of the Site. **Figure 15** depicts the relative concentration of SVOCs at and surrounding the Site.

Relatively higher concentrations of SVOCS were detected in the groundwater from well MW-13 along the western perimeter, wells MW-02 and MW-03 along the northern perimeter, and MW-07 along the eastern perimeter of the Site. Lower SVOC concentrations were observed at wells MW-01 (northern perimeter), MW-05 (eastern perimeter), MW-08 to MW-10 (southern perimeter), and MW-11 (western perimeter). In addition, higher SVOC concentrations were also detected in the groundwater from wells G24S and LC01 within the Paxton I Landfill. The highest groundwater concentrations (one to three orders of magnitude higher than other concentrations) were generally observed at well MW-12 (Paxton Lagoon area) and well LC01 (Paxton I Landfill). In the remainder of the wells, where detected, SVOC concentrations in groundwater were similar along the perimeters of the Site and surrounding the Site. Overall, SVOCs

were generally detected less frequently in the groundwater at and surrounding the Site compared to other constituents.

VOCs

VOCs were detected in groundwater along the perimeter of the Site and surrounding the Site. During previous investigations in 1999, 2002, and 2007, VOCs were detected in the groundwater within and adjacent to the Paxton I Landfill, along the eastern perimeter of the Site and within the Unnamed Parcel, within the Alburn Incinerator portion of the Site, and within the US Drum portion. **Figure 16** depicts the relative concentration of VOCs at and surrounding the Site.

Along the western perimeter of the Site, higher VOC concentrations were observed at wells MW-11 and MW-13. Along the northern perimeter of the Site, higher VOC concentrations were observed at wells MW-01 and MW-02. Along the eastern perimeter, higher VOC concentrations were observed at MW-04. Lower VOC concentrations were observed at MW-03 (northern perimeter) and MW-08 to MW-10 (southern perimeter). The highest off-Site VOC concentrations were observed at wells LC01 and G13S within the Paxton Landfill, and the highest VOC concentrations were observed at MW-13 (northern perimeter) and MW-12 (Paxton Lagoon area). The remaining VOC concentrations in groundwater are similar along the perimeters of the Site as well as surrounding the Site within and adjacent to the Paxton I Landfill.

Benzene, Toluene, Ethylbenzene, and Xylene (BTEX)

As shown in **Table 9** and on **Figure 17**, the relative distribution of BTEX is similar to the VOC distribution along the western (higher concentrations) and southern (lower concentrations) perimeters of the Site as well as within the Paxton I Landfill. However, along the northern perimeter, BTEX concentrations were generally lower than other VOCs and along the eastern perimeter BTEX concentrations were lower than other VOCs except at well MW-07 where higher BTEX concentrations were observed compared to VOCs. The highest BTEX concentrations were observed at MW-13 (northern perimeter) and MW-12 (Paxton Lagoon area). The remaining BTEX concentrations in groundwater are similar along the perimeters of the Site as well as surrounding the Site within and adjacent to the Paxton I Landfill. The relative ranges of BTEX concentrations (in ug/L) by areas are summarized below:

Western Perimeter	Northern Perimeter	Eastern Perimeter	Southern Perimeter	Surrounding Site
ND to 25,000	ND to 290	ND to1,800	ND to 2.8	ND to 1,800

Vinyl Chloride

As shown in **Table 9** and on **Figure 18,** the relative distribution of vinyl chloride at and surrounding the Site is different from the overall VOC distribution. The relative ranges of vinyl chloride concentrations (in ug/L) by areas are summarized below:

Western Perimeter	Northern Perimeter	Eastern Perimeter	Southern Perimeter	Surrounding Site
ND to 420	ND to 0.48	ND to 13	ND to 0.5	ND to 84

Along the western perimeter of the Site, higher vinyl chloride concentrations were observed at well MW-13. Along the northern and southern perimeters of the Site, vinyl chloride concentrations were low or non-detect. Along the eastern perimeter, higher vinyl chloride concentrations were observed at well MW-07 adjacent to the Unnamed Parcel in the southern portion of the Site. The highest vinyl chloride concentrations were observed at MW-12 (Paxton Lagoon area) and LC01 (Paxton I Landfill). Overall, vinyl chloride is sporadically detected at and surrounding the Site.

5.2 Summary

As demonstrated in the detailed evaluation of the frequently detected groundwater constituents, the following summarizes the nature and extent of these constituents in groundwater:

Metals: Antimony, cobalt, copper, mercury, and selenium were detected infrequently at low concentrations. When detected, the concentrations of these metals are the same along the perimeters where groundwater is entering the Site as well as in off-site wells surrounding the Site.

Arsenic, cadmium, chromium, lead, manganese, nickel, vanadium, and zinc were detected more frequently at higher concentrations. The higher concentrations are similar in perimeter wells monitoring where groundwater is entering the Site, as well as within and along the perimeters of the Paxton I and/or II Landfills.

PCBs: PCBs were detected infrequently at low concentrations that are significantly lower along the perimeters of the Site as compared to the surrounding groundwater conditions within the Paxton I Landfill. During the first quarterly groundwater sampling event, prior to the appearance of LNAPL in MW-12, PCBs were not detected in the groundwater sample collected from MW-12.

SVOCs: Phenols, PAHs, and several miscellaneous SVOCs were detected infrequently at low concentrations that are generally lower along the eastern perimeter of the Site as compared to the western and northern perimeters as well as within the Paxton I Landfill.

VOCs: Chlorinated VOCs, ketones, a few miscellaneous VOCs were detected infrequently at low concentrations that are lower or similar along the eastern perimeter of the Site as compared to the western and northern perimeters of the Site.

BTEX and vinyl chloride were detected more frequently than the other VOCs. The concentrations are lower or, in the case of benzene, similar along the eastern perimeters of the Site as compared to the western and northern perimeters as well as within the Paxton I Landfill.

These patterns suggest the area-wide presence of constituents surrounding the Site (*i.e.*, Paxton I Landfill, Paxton II Landfill) result in upgradient concentrations (background) entering the Site that are approximately equivalent to concentrations in groundwater emanating from the Site. For many constituents, the concentrations in groundwater entering the Site and surrounding the Site are higher than the concentrations in groundwater emanating from the Site. In addition, these

patterns indicate constituents are present along the eastern perimeter adjacent to the IRM both along the Site, as well as along the Paxton I Landfill (notably relatively higher metal concentrations at HPT-25 and well LC02 in Paxton I Landfill). The potential for groundwater to impact the IRM is discussed in Section 6.

6 PRELIMINARY EVALUATION OF RECENT LCCS AND HISTORICAL IRM DATA

This section presents the results of preliminary screening evaluations designed to determine if groundwater emanating from LCCS into IRM has the potential to pose a risk to either human health or the environment. Sections 4 and 5 of the RI/FS Work Plan for OU2 describe the approach to the Baseline Human Health Risk Assessment (BHHRA) and Baseline Ecological Risk Assessment (BERA), respectively. This section is not designed to replace either of those two assessments nor is it designed to replace any particular section of those assessments (such as the selection of constituents of concern (COCs)). Rather, its goal is to use methods available within the human health and ecological risk assessment paradigm to provide preliminary screening evaluations that show the likely findings of a BHHRA and BERA evaluating the potential risk associated with groundwater venting into IRM from LCCS. Developing a preliminary sense of the outcomes of the BHHRA and BERA will inform and expedite the process of completing the RI phase of the work.

The RI/FS Work Plan included a list of potential human health and ecological screening criteria. The screening evaluation presented in this Technical Memorandum includes comparisons of environmental media concentrations to those benchmarks. However, because some of those benchmarks are derived using exposure scenarios that are not representative of current and reasonably foreseeable futures uses of IRM (*e.g.*, use of either the groundwater emanating into IRM or IRM surface water as a potable water supply), concentrations are also compared to alternative IRM-specific benchmarks that are based on exposure scenarios consistent with current and reasonably foreseeable future uses (*e.g.*, recreational use of IRM). Screening evaluations are presented by environmental medium (*i.e.*, groundwater emanating into IRM, IRM surface water, IRM sediments). For each environmental medium, the human health screening evaluation is presented first, followed by the ecological screening evaluation. The conclusions of the screening evaluations also consider the spatial distribution of constituents in IRM and whether that distribution suggests that groundwater emanating from the LCCS could be a principal source of constituents to IRM.

The evaluation of the spatial distribution of constituents in IRM concludes that the LCCS is not a principal source of constituents to IRM and that any future investigation of IRM impacts should focus instead on other potential sources.

The results of the human health and ecological screening evaluations also do not support extending the scope of the RI work performed to date into IRM. This conclusion is further supported by the fact that the highest concentrations of virtually all constituents in IRM surface water and sediments occur at locations more distant from the LCCS. LCCS does not appear to be a principal source of constituents to IRM. These findings support the conclusion that further investigation of IRM for the purpose of evaluating potential risks to human health and ecological receptors is not necessary.

6.1 Comparison of LCCS Groundwater Data to Benchmarks

This section first compares concentrations of constituents in groundwater to several human health benchmarks, then compares constituents in groundwater to ecological benchmarks.

6.1.1 Human Health Benchmark Comparisons

Given that one of the purposes of the RI/FS is to evaluate groundwater emanating from the LCCS, and recognizing that IRM is the principal receptor, the human health screening evaluation is based on constituent concentrations measured in the five monitoring wells located along the border of the LCCS and IRM: MW-04, MW-05, MW-06, MW-07, and MW-08. The locations of these monitoring wells are shown on **Figure 3.** One set of screening evaluations uses the maximum constituent concentration reported in any quarterly sample from any of these five monitoring wells. This results in a very conservative evaluation of the potential for emanating groundwater to pose a human risk for at least two reasons. First, the human health benchmarks assume a chronic (*i.e.*, long-term) exposure. The single highest concentration measured in one quarter from these four wells is not representative of chronic exposure. Given that dilution of any groundwater venting to IRM is occurring, the screening comparison using the maximum concentration also overestimates the potential for acute exposures.

Second, using the maximum constituent concentration from any single well, or even the mean concentration from any single well, assumes that someone using IRM for recreation would contact only emanating groundwater from that well, a scenario that does not reasonably represent expected uses of IRM. The common border between LCCS and IRM is approximately 2,000 feet long. No reason exists to believe that a person using IRM would preferentially and consistently for many years contact emanating groundwater from a small portion of this common border. If anyone were using IRM for recreation for multiple years, and assuming that use is limited to the common border area, contact would be expected to occur along the entire 2,000 feet length of the border. Additionally, movement of surface water within IRM would result in any emanating groundwater being initially mixed within the portion of IRM along the LCCS and ultimately with surface water in the larger portion of IRM. Based on these considerations, the arithmetic average constituent concentration in LCCS monitoring wells bordering IRM was also compared to the screening benchmarks to better evaluate the potential for emanating LCCS groundwater to pose a risk to human health.

Several screening benchmarks are used to evaluate the potential for emanating groundwater to pose a risk to human health. The initial set of comparisons is based on the benchmarks listed in the RI/FS Work Plan. These include Illinois' Numeric and Derived Water Quality Standards (35 IAC 302.208, 302.210, and 302.407). Two of the Standards (35 IAC 302.208 and 302.407) include exposure through consumption of surface water as a drinking water supply. Because surface water in IRM is not suitable for use as a drinking water supply, these standards are not representative of current and potential future uses of surface water in IRM and are not discussed further in this Technical Memorandum; however, per the RI/FS Work Plan, the comparisons are shown in **Appendix K**. (Note as well, Table 1 of Appendix K presents a screening of all groundwater monitoring well data to Illinois Groundwater Quality Standards (35 IAC 620) and Illinois Tiered Approach to Corrective Action Objectives (TACO) Tier 1 Remediation Objectives (35 IAC 742) for both Class I and Class II groundwater for informational purposes. However, although subsurface water at the site is referred to as "groundwater" in this memorandum for simplicity, water within fill material at LCCS does not meet the definition of "groundwater" under 35 IAC 620 because

it is not located within a geologic material. Therefore, groundwater remediation objectives or groundwater standards provided in TACO or in 35 IAC 620 are not applicable to water present in Site monitoring wells, which are screened within fill material. Furthermore, the potable use of groundwater in the vicinity of the Site (and the entirety of Chicago) is prohibited by municipal ordinance and is not a realistic human health exposure pathway. Results of the comparison of groundwater monitoring well concentrations to groundwater screening criteria are not discussed further in this Technical Memorandum.

The third set of standards (35 IAC 302.210) is based on a recreational contact scenario. That scenario assumes incidental ingestion of small amounts of surface water (0.01 liter per day) during recreational activities and consumption of 20 grams per day of recreationally caught fish. Given the isolated nature of IRM, the assumed exposure frequency of 365 days per year is likely high and very conservative. Further, given the generally shallow nature of surface water in IRM, and particularly given its relatively small size, it is highly unlikely that anyone consumes as much fish from IRM as assumed by the standards.

The assumption of 20 grams of fish consumed for 365 days a year represents 7.3 kilograms of edible fish per year harvested from IRM by a single person. If a fish meal is equal to approximately 200 grams (or approximately a half pound), it represents approximately a fish meal every 10 days, or about 36 meals a year, every year, for a lifetime. Such a rate of consumption is unlikely, as outlined below.

First, many other fishable water bodies exist in the area (*e.g.*, Lake Calumet, Calumet River, Lake Michigan). These represent larger waters with greater productivity and a greater likelihood of catching more and larger fish.

Second, the ability of relatively small waters, such as IRM, to produce edible-sized fish sustainably is limited and precludes high rates of consumption of resident fish. Two pieces of information are necessary to estimate sustainable production of edible-sized fish: size of the waterbody in question and productivity of a waterbody per unit of water surface area (*e.g.*, acre or hectare). Based on an aerial view, North IRM has about 17 hectares of open water. A large-scale study of production data for 100 fish populations from 38 lakes and reservoirs in geographically diverse locations, including lakes that ranged from oligotrophic (poor in nutrients) to hypereutrophic (rich in nutrients), was used to determine fish population dynamics (Downing and Plante 1993). These authors reported that only small fractions of the standing fish biomass can be removed sustainably. The data evaluated indicated that more than 85% of the lakes had sustainable yields of less than 15% of the total mass of fish in the lake, that the majority of sustainable fish population yields in lakes were less than 1 kilogram per hectare per year (kg/ha-year), and more than 90% were less than 4 kg/ha-year. They concluded that sustainable yield generally appears to be approximately 10% of the fish production of a lake.

Based on this information, the range of sustainable productivity of IRM is between 17 and 68 kg of whole edible-sized fish per year. It is important to note, however, that this is the mass of whole fish that can be harvested and is not equivalent to the amount of fish that is consumed. USEPA (1989) guidance indicates that the edible portion of most fish is approximately 30% of the whole fish mass. If this fraction is applied to the total mass of fish that can be sustainably harvested from IRM, the result is a range of 5 to 14 kg per year of edible portions of fish. As an annualized daily average, which is the metric used to represent fish consumption rates when deriving the standards, this equates to between 14 and 56 g/day of edible fish tissue that can be sustainably harvested from IRM.

Applying the sustainable productivity estimated for the majority of lakes indicates that IRM could not support even a single person eating fish at the rate assumed by Illinois Derived Standards (estimated productivity of 14 grams per day versus an assumed consumption rate by the standard of 20 grams per day). Even using the 90th percentile of sustainable productivity indicates that IRM could support no more than three people eating fish at the rate assumed by the standards. If IRM is used for recreational fishing, it is highly unlikely that it is used by only one to three people, and that those people fish so often and thoroughly across the entire 17 hectares of open water than they harvest all the edible-sized fish sustainably produced by IRM. In other words, the fish consumption assumption of 20 grams of fish per day used to derive the Illinois Derived Standards is not representative of potential exposures associated with IRM surface water. Consequently, the human health screening evaluation, using the Illinois Derived Standards, is presented in **Appendix K** to meet the requirements of the RI/FS Work Plan, but is not discussed further in the remainder of this Technical Memorandum.

The RI/FS Work Plan also states that other appropriate benchmarks for the protection of human health may be used in the screening evaluation. One such set of benchmarks is USEPA's national human health ambient water quality criteria (AWQC). USEPA has two sets of AWQC. One set assumes that exposure occurs through use of surface water as a drinking water supply and consumption of 22 grams of fish per day, every day, for a lifetime. The second set assumes that exposure occurs only through consumption of 22 grams of fish per day, every day, for a lifetime. As described above, given its characteristics, the IRM cannot support either of those exposure scenarios. Therefore, USEPA's national AWQC are not discussed further in this Technical Memorandum; however, the results are presented in **Appendix K**.

As alluded to above, when describing the exposure scenarios included in the Illinois Derived Standards, the most likely current and possible future use of IRM is recreational. While the Illinois Derived Standards include only incidental ingestion of a small amount of surface water during recreational activity (as well as fish consumption), recreational use can also include dermal contact with surface water while a person is visiting IRM. To conduct a human health screening evaluation that better represents the potential exposures that might be associated with IRM, **Appendix L** derives conservative screening benchmarks protective of recreational exposures. Consistent with the Illinois Derived Standards, incidental ingestion of surface water is included. Additionally, the recreational benchmarks include dermal exposure to constituents in surface water (via dermal absorption). The assumptions used to derive the IRM-specific recreational benchmarks are presented in **Appendix L.**

Toxicity information from USEPA sources was available to derive IRM-specific benchmarks for 77 of 91 constituents detected at least one time in the monitoring wells along the border of LCCS and IRM. Maximum concentrations of six of the 61 constituents (arsenic, manganese, Aroclor-1221, Aroclor-1232, ethyl benzene, and vinyl chloride) in groundwater exceeded their respective IRM-specific benchmarks (**Table 10**). Arithmetic average concentrations of four constituents (arsenic, Aroclor-1221, Aroclor-1232, vinyl chloride) in groundwater also exceeded their respective IRM-specific benchmarks.

Comparison of concentrations of constituents measured in groundwater-to-surface water benchmarks is highly conservative, as it fails to account for mixing with IRM surface water. Any actual exposures in IRM surface water would be lower than the concentrations in groundwater emanating from LCCS. A rough estimate of mixing can be derived by comparing the concentrations of constituents measured in

monitoring wells closest to IRM (MW-04, MW-05, MW-06, and MW-07[1]) to the concentration of constituents measured in surface water along the border of IRM adjacent to LCCS. In 2009, the most recent IRM data available, surface water samples were collected from two such locations (SW-05 and SW-06; **Figure 6**). Paired data (at least one detected concentration in both groundwater and surface water) are available for nine metals and total ammonia nitrogen (**Table 11**). Dilution factors range from a low of 1.2 for manganese to a high of 111 for total ammonia nitrogen. Of the other metals, barium and iron have dilution factors of approximately 6, and the remaining six metals have dilution factors of between 19 and 45 (**Table 11**). These comparisons suggest that a conservative estimate of dilution for constituents in emanating groundwater would be approximately 10-fold.

If the human health screening evaluation is repeated, assuming that constituent concentrations in groundwater will be diluted 10-fold once the groundwater reaches IRM surface water, then only two of 61 constituents (Aroclor-1232 and vinyl chloride) have been detected at a maximum concentration that exceeds their respective IRM-specific recreational benchmarks, and only vinyl chloride has been detected at an arithmetic mean concentration that exceeds its recreational benchmark. Furthermore, both Aroclor -1232 and vinyl chloride were only detected sporadically along the eastern perimeter of the Site. Aroclor-1232 was only detected in one of four groundwater sampling events at wells MW-04 and MW-06. As shown on the profiles in **Appendix J**, although vinyl chloride was detected in the groundwater from wells MW-04, MW-06, and MW-07, the VAP sampling results indicate vinyl chloride is not detected in groundwater along most of the eastern perimeter of the Site at HPT-06, HPT-07, HPT-08, HPT-09, HPT-12, and HPT-14. In addition, PCB and vinyl chloride concentrations along the eastern perimeter of the Site are lower than area-wide groundwater concentrations along the western and northern perimeters of the Site as well as surrounding the Site as shown in Section 5.

The above described series of comparisons comprises a preliminary human health screening evaluation of potential exposures for LCCS groundwater emanating into IRM surface water. The goals of the evaluation were to both determine the potential for emanating groundwater to pose a risk to potential recreators using IRM and identify the constituents that may be the largest contributors to such potential risk. The series of comparisons begins with screening benchmarks that are based on exposure scenarios not representative and not appropriate for the IRM (*e.g.*, benchmarks that assume IRM surface water is used as potable drinking water supply, or that assume substantial recreational fish consumption) to more representative scenarios (*e.g.*, benchmarks that assume recreational use). The result of this progressively more representative human health screening evaluation indicates that, even using conservative benchmarks, no more than six constituents would be identified as requiring further evaluation in a human health risk assessment of LCCS groundwater emanating into IRM.

More importantly, when more representative but still conservative benchmarks and potential IRM surface water concentrations are used, only vinyl chloride is identified as a constituent that may require further evaluation in a human health risk assessment of IRM. However, as noted above, vinyl chloride concentrations along the eastern perimeter of the Site are lower than area-wide groundwater concentrations along the western and northern perimeters of the Site as well as surrounding the Site.

[1] MW-08 was not included in the estimation of dilution because it was further away from the IRM surface water sampling locations adjacent to LCCS than MW-04, MW-05, MW-06, and MW-07.

6.1.2 Ecological Benchmark Comparisons

As with the human health comparisons, this screening is based on constituent concentrations measured in monitoring wells located along the border of the LCCS and IRM (MW-04, MW-05, MW-06, MW-07, and MW-08). One set of ecological screening evaluations uses the maximum constituent concentration reported in any quarterly groundwater sample from any of those four monitoring wells to evaluate the potential for localized potentially acute effects. The second set of ecological screening evaluations uses the arithmetic average constituent concentration in LCCS monitoring wells bordering IRM to better evaluate the potential for emanating LCCS groundwater to pose a chronic risk.

Several screening benchmarks were used to evaluate the potential for emanating groundwater to pose a risk to ecological receptors in IRM. The initial set of comparisons is based on the benchmarks listed in the RI/FS Work Plan. These include Illinois' Numeric and Derived Water Quality Standards (35 IAC 302.208, 302.210, and 302.407-302.410). The RI/FS Work Plan also refers to comparisons to other appropriate ecological benchmarks. The screening evaluation presented in this Technical Memorandum also includes as benchmarks USEPA's acute and chronic national AWQC for protection of aquatic life and the COSR surface water Background, Threshold, and Benchmark values (**Appendix K**). The COSR Benchmarks represent different levels of protectiveness associated with chronic exposure, with the COSR Thresholds being more conservative than the COSR Benchmarks. As with the human health screening, benchmarks are compared to maximum and arithmetic average concentrations, and to better represent potential constituent concentrations in IRM surface water, to maximum and arithmetic average concentrations assuming a 10-fold dilution factor for groundwater that may emanate into IRM surface water. The full set of comparisons to ecological benchmarks is presented in **Appendix K**. **Table 12** presents a summary that includes the number of constituents for which benchmarks are available, how many constituents exceeded a benchmark, and the identity of those constituents.

The maximum groundwater concentration of between three and five constituents exceeds each set of acute benchmarks derived by IEPA and USEPA (**Table 12**). The COSR benchmarks are assumed to be protective of chronic and not acute exposures and are discussed below in the comparison to chronic standards. There is some overlap in the identity of constituents exceeding each set of benchmarks. For example, lead and zinc concentrations exceed both Illinois Numerical Standards and USEPA's national AWQC. Other constituent concentrations exceed only one set of benchmarks, primarily because only one regulatory program has derived benchmarks for those constituents. For example, Illinois does not have surface water quality standards for pesticides, but USEPA does have national AWQC for this constituent. Additionally, the maximum concentration of ammonia-nitrogen exceeds the Illinois water quality standard for Open Waters of Lake Michigan (**Table 12**); however, it is important to note that neither the LCCS nor the IRM falls within the regulatory definition of "open waters of Lake Michigan."

The maximum groundwater concentrations of between six and eight constituents exceed each set of chronic benchmarks derived by IEPA and USEPA (**Table 12**). The maximum concentrations of 18 constituents exceed the COSR Threshold, and of eight constituents exceed the COSR Benchmark (**Table 12**). The former is assumed to represent a more conservative chronic benchmark than the latter.

Comparison of maximum groundwater concentrations to chronic surface water benchmarks is highly conservative and not representative of the surface water concentrations to which most aquatic receptors will be exposed for several reasons: concentrations in groundwater emanating from LCCS change over time, most aquatic receptors in surface water are mobile and integrate concentrations over time, and

movement of surface water in IRM will reduce the maximum concentrations through mixing. For these reasons, the arithmetic average concentration of constituents in groundwater is a more representative concentration to use when comparing to standards or benchmarks derived to be protective of chronic ecological effects.

The arithmetic mean groundwater concentration of between zero and one constituent exceeds each set of acute benchmarks derived by IEPA and USEPA (**Table 12**). Additionally, the arithmetic mean concentration of ammonia-nitrogen exceeds the Illinois water quality standard for Open Waters of Lake Michigan. The arithmetic mean groundwater concentrations of four constituents exceed each set of chronic benchmarks derived by IEPA and USEPA. The arithmetic mean concentrations of eight constituents exceed the COSR Threshold and the arithmetic mean concentrations of three constituents exceed the COSR Benchmark.

As described above in the human health screening evaluation, concentrations of constituents in groundwater emanating from LCCS into IRM surface water will be diluted. Based on a comparison of recent LCCS groundwater concentrations and 2009 IRM surface water data, a conservative estimate of such dilution is 10-fold. When considering potential dilution, the maximum concentration of only chromium exceeds acute benchmarks derived by Illinois (**Table 12**). The maximum concentration of ammonia-nitrogen also exceeds the Illinois water quality standard for Open Waters of Lake Michigan, even accounting for dilution. The diluted maximum groundwater concentrations of between one and six detected constituents (aluminum, iron, lead, nickel, bis(2-ethylhexyl)phthalate, and ethylbenzene) exceed each set of chronic benchmarks derived by IEPA and USEPA. The diluted maximum concentrations of six detected constituents (ammonia, iron, lead, benzo[a]anthracene, benzo[a]pyrene, and pyrene) exceed the COSR Threshold, and of one constituent (iron) exceeds the COSR Benchmark. When arithmetic average concentrations are adjusted for potential dilution, the diluted average concentrations of almost all detected constituents with acute benchmarks derived by IEPA and USEPA are lower than such benchmarks. The exception is the diluted average concentration of ammonia nitrogen, which exceeds its Illinois standard. None of the diluted average concentrations exceed chronic benchmarks derived by IEPA and USEPA. The arithmetic mean concentrations of three constituents (ammonia, benzo[a]anthracene, and benzo[a]pyrene) exceed the COSR Threshold, while the arithmetic means of all constituents are below the COSR Benchmark values. However, benzo[a]anthracene and benzo[a]pyrene were only detected in one and two of four events, respectively, at only well MW-07 along the eastern perimeter of the Site. Further, ammonia is an area wide constituent that was observed throughout the Site including along the eastern perimeter as well as surrounding the Site.

This series of comparisons comprises a preliminary ecological screening evaluation of potential exposures for LCCS groundwater emanating into IRM surface water. The goals of the evaluation were to determine both the potential for emanating groundwater to pose a risk to aquatic receptors using IRM and to identify the constituents that may be the largest contributors to such potential risk. The comparisons incorporate several sets of acute and chronic benchmarks as well as maximum and arithmetic mean concentrations both without and with dilution. The results of the ecological screening evaluation indicate that several constituents carry the potential to pose a risk to ecological receptors using IRM surface water, but also find that the number of constituents that may require additional investigation decreases as more representative comparisons are conducted. Comparison of the diluted maximum concentration to acute benchmarks indicated that only iron and ammonia exceeded one or more of their respective benchmarks. Comparison of the diluted average concentrations found that no detected constituents

exceeded chronic standards derived by Illinois or USEPA, and that no detected constituents exceeded their respective COSR Benchmarks.

6.2 Spatial Comparisons of IRM Data

This section presents a brief evaluation of the spatial distribution of the concentrations of constituents in IRM surface water and sediments. The evaluation focuses on a comparison of constituent concentrations in sampling locations near the LCCS to concentrations in sampling locations distant from the LCCS. The comparisons are based on the IRM data collected by Tetra Tech in 2009. Surface water data are available from 10 locations in IRM, with two locations being adjacent to LCCS (SW-05 and SW-06; **Figure 6**). Surface water data are available for several metals, ammonia, and hardness (**Table 13**). Sediment data are available for two locations: one adjacent to LCCS (SD-06) and one in the northern portion of IRM distant from LCCS (SD-02). Sediment data are available for several metals and organic compounds (**Table 14**).

Spatial comparison of IRM surface water data reveals that the maximum concentrations of all except one constituent occur at a sampling location distant from the LCCS (**Table 13**). The one exception is thallium; its maximum concentration occurs at one of the sampling locations adjacent to LCCS and another location distant from LCCS. Notably, the thallium concentration at the other location adjacent to LCCS is one of the lowest concentrations measured in IRM. In general, for most constituents, the highest concentrations occur either in the northern portion of IRM (SW-01, SW-02, and SW-04) or in the south IRM (SW-07). Minimum concentrations occur more frequently in the southeast corner of IRM at SW-08 and SW-09. The latter two sampling locations exhibit distinct ammonia concentrations and hardness, suggesting that perhaps surface water in the southeast corner of IRM is isolated from the surface water in the remainder of IRM. If those locations are excluded from the spatial evaluation of surface water, the overall pattern changes little; most of the maximum concentrations continue to occur in the northern portion of IRM and in the south IRM. For most constituents, the two sampling locations adjacent to LCCS tend to exhibit low to intermediate concentrations (**Table 13 and Table 14**), suggesting that LCCS is not a principal source of constituents to IRM.

The sediment evaluation reaches the same conclusion that LCCS is not a principal source of constituents to IRM, albeit with a substantially smaller data set (two samples). The maximum concentrations of 30 of 31 constituents detected in either of the sediment sampling locations occurred in the location in the northern portion of IRM, distant from LCCS (**Table 15**). The single exception is diethyl phthalate, which had an estimated concentration of 0.5 milligrams per kilogram (mg/kg) at one sampling location adjacent to the LCCS but was not detected at the other sampling location nor was it detected in any monitoring wells along the perimeter of LCCS and IRM. Moreover, the concentrations of most constituents are at least 2-fold greater in the distant sampling location than in the location adjacent to LCCS, further indicating that LCCS is not a principal source of constituents to IRM.

Taken together, the 2009 surface water and sediment data provide no evidence that LCCS or groundwater emanating from LCCS is a principal source of constituents to IRM. To the extent that the human health and ecological screening evaluations presented elsewhere in this Technical Memorandum suggest that additional investigation and evaluation of select constituents in IRM may be necessary, the spatial evaluation of existing data presented herein suggests that such investigation and evaluation

should focus on other portions of IRM and sources of constituents to those portions of the IRM. LCCS should not be a focus of such investigations.

6.3 Comparison of IRM Surface Water Data to Human Health and Ecological Benchmarks

Another line of evidence to help determine whether surface water in IRM carries the potential to pose a risk to human health and ecological receptors, and to identify constituents that carry the greatest potential to pose such a risk, is a comparison of existing IRM surface water concentrations to the screening benchmarks described above in the screening evaluation of LCCS groundwater concentrations. The results of such a comparison, using the most recent data available for the IRM surface water (*i.e.*, those collected by Tetra Tech in 2009) are presented below. Unless otherwise specified, the comparisons are of all sampling locations collected by Tetra Tech, not just the two locations (SW-05 and SW-06) closest to LCCS.

6.3.1 Human Health Benchmark Comparisons

Surface water data are available for 17 metals and total ammonia-nitrogen (**Appendix K**). IRM-specific surface water screening benchmarks protective of potential recreational exposure are available for 14 metals. Of these 14 metals, 11 were detected in IRM surface water. Maximum concentrations of all 11 detected metals for which screening benchmarks are available are below such benchmarks, indicating that metals in surface water in 2009 did not pose a risk to people using the IRM for recreational purposes. Even if it is assumed that groundwater entering and emanating from the LCCS may have contributed to metals concentrations in IRM surface water in 2009, that contribution did not cause the maximum metals concentrations to exceed the screening benchmarks. Further, any metals concentrations in groundwater emanating from the LCCS should be lower now given that measures implemented as the remedy for Operable Unit 1 will have reduced runoff from LCCS, and any contribution related to LCCS groundwater emanating into IRM should be stable. Thus, comparison of IRM surface water to human health screening benchmarks indicates that additional evaluation of potential human health risk associated with IRM surface water is not necessary.

6.3.2 Ecological Benchmark Comparisons

Maximum concentrations of 9 of 10 detected constituents (nine metals and ammonia) for which acute screening benchmarks are available are below such benchmarks (**Table 16**). Iron is the only constituent with a maximum concentration that exceeds its acute benchmark. Comparison of maximum IRM surface water concentrations to chronic benchmarks derived by IEPA and USEPA also finds that all concentrations of all detected constituents except for iron and lead are below benchmarks. The maximum concentration of iron exceeds both the COSR Threshold and Benchmark concentrations. The sampling location with the maximum concentration of iron (SW-01) is in the northern portion of IRM and distant from LCCS. The iron concentration in one of the two sampling locations along the border of LCCS and IRM (SW-05) also exceeds the acute benchmark, though the concentration was consistent with those measured in other parts of IRM, suggesting that the exceedance is not unique to LCCS.

A key outcome of the surface water comparison is that concentrations of ammonia throughout IRM, including the locations adjacent to the LCCS, are below both acute and chronic benchmarks. Results of the IRM surface water benchmark comparison, together with the finding (presented above) that IRM surface water data provide no indication that LCCS is a principal source of ammonia to IRM surface water (despite having concentrations of ammonia in groundwater above surface water screening benchmarks), suggest that additional investigation and evaluation of ammonia concentrations in IRM surface water is not necessary.

The results of the IRM surface water screening indicate that detected concentrations of ammonia and most metals in surface water in 2009 did not pose a risk to aquatic life. The possible exception is iron, which is present at maximum and average concentrations that exceeded acute and chronic benchmarks. However, as described above in the section on the spatial distribution of IRM surface water concentrations in 2009, the available data do not suggest that LCCS is a principal source of iron to IRM. The highest concentrations of iron occur in the northern portion of IRM, and the average concentration of iron in the two sampling locations adjacent to the IRM is lower than the average concentration throughout the remainder of the IRM (1,170 microgram per liter [µg/L] versus 1,330 µg/L). To the extent that LCCS contributed iron to IRM surface water in 2009, that contribution should be lower now given that measures implemented as the remedy for OU1 will have reduced runoff from LCCS, and any contribution related to LCCS groundwater emanating into IRM should be stable. Thus, comparison of IRM surface water to aquatic life screening benchmarks indicates little potential for adverse effects to aquatic life, and that any additional evaluation of potential ecological risk associated with IRM surface water should not focus on LCCS, but instead on other sources that may be contributing iron and other metals to IRM.

6.4 Comparison of IRM Sediment Data to Human Health and Ecological Receptors

Another line of evidence to help determine whether constituents in the IRM have the potential to pose a risk to human health and ecological receptors, and to identify constituents that have the greatest potential to pose such a risk, is comparison of existing IRM sediment concentrations to human health and ecological screening benchmarks. The results of such a comparison, using data collected by Tetra Tech in 2009 (the most recent sediment data available), are presented below.

6.4.1 Human Health Benchmark Comparisons

For the human health screening evaluation, the RI/FS Work Plan lists residential soil Regional Screening Levels (RSLs) as possible screening benchmarks. Residential soil RSLs assume daily contact with soil in a residential setting. A residential exposure scenario is not representative of the IRM, and is neither appropriate nor applicable. Because residential soil RSLs are listed as possible benchmarks in the RI/FS Work Plan, a comparison of 2009 sediment data to residential RSLs is presented in **Appendix J**, but the results of the comparison are not discussed further in this Technical Memorandum.

Consistent with screening evaluations presented above for LCCS groundwater and IRM surface water, recreational sediment benchmarks were derived and used for the human health screening evaluation to better represent the potential exposures that might be associated with the IRM. As with the derivation of the IRM-specific surface water benchmarks, both incidental ingestion of sediment and dermal exposure to

constituents in sediment (via dermal absorption) are included in the derivation of the benchmarks. The assumptions used to derive the IRM-specific recreational sediment benchmarks are presented in **Appendix L**.

Toxicity information from USEPA sources was available to derive IRM-specific benchmarks for 31 of 32 constituents detected at least one time in IRM sediments (**Table 17**). IRM sediments were sampled at two locations in 2009. One location was adjacent to LCCS (SD-06), and one location was distant from LCCS (SD-02), located in the northern portion of IRM (**Figure 6**). Given the existence of only two sediment sampling locations, and that only one carries the potential to represent conditions near the LCCS, concentrations at each location are screened separately. Maximum concentrations of two detected constituents (B[a]P and arsenic) exceeded their respective IRM-specific recreational benchmarks at the sampling location distant from IRM. No detected constituent concentrations exceeded their respective IRM-specific sediment screening benchmarks at the sampling location adjacent to the LCCS.

As with surface water, to the extent that LCCS contributed to constituent concentrations in IRM sediment in 2009, that contribution should have been reduced by measures implemented by IEPA as part of the remedy for OU1, and any contribution related to LCCS groundwater emanating into IRM should be stable. Thus, comparison of IRM sediment to IRM-specific human health screening benchmarks indicates that additional evaluation of potential human health risk associated with IRM sediment near LCCS is not necessary.

6.4.2 Ecological Benchmark Comparisons

The IRM sediment ecological screening evaluation uses the same data and approach as those presented above for human health. The ecological screening benchmarks included those developed by COSR as well as Threshold Effects Concentrations (TECs) and Probable Effects Concentrations (PECs) (MacDonald *et al*. 2000). At the IRM, sediment sampling location distant from LCCS (SD-02), 28 detected constituents have COSR-derived benchmarks. Concentrations of 22 detected constituents exceed the more conservative COSR Threshold, and 16 exceed the less conservative COSR Benchmark (**Table 18**). At the IRM sediment sampling location adjacent to LCCS (SD-06), 21 detected constituents have COSR-derived benchmarks; concentrations of 13 constituents exceed the COSR Threshold, but only two (lead and zinc) exceed the COSR Benchmark. Notably, concentrations of both lead and zinc are substantially higher in sediments at the sampling location distant from the LCCS, and surface water concentrations were also higher at locations distant from LCCS, suggesting that LCCS is not the principal source of these metals to IRM.

Nineteen detected constituents at SD-02 (the sampling location in the northern portion of IRM) have TECs, and all 19 exceed their respective TEC (**Table 19**). Fifteen of the constituents also exceed their respective PECs, leading to a PEC ratio of 3.8 (**Table 20**). Fewer constituents were detected at the sediment sampling location adjacent to LCCS. Of the detected constituents, 14 have TECs. Concentrations of 11 constituents exceed their respective TECs, but only two exceed their respective PECs (lead and zinc), leading to a PEC ratio of 0.5. The results of the TEC and PEC screening are consistent with the COSR screening, in that concentrations of several constituents exceed the most conservative benchmarks that tend to over-predict the potential for an adverse effect in benthic communities, but that concentrations of few constituents exceed the less conservative benchmarks that

tend to be better predictors of the potential for adverse effects. In fact, the finding that the PEC ratio is less than 1.0 suggests that the totality of constituents in sediments near LCCS is unlikely to pose an adverse effect to the benthic community and that further evaluation of sediments near LCCS to determine effects to the benthic community is not necessary. This finding is consistent with the sediment toxicity testing completed by Tetra Tech in 2009, which found no evidence of adverse effects to the benthic community at a sediment sampling location adjacent to LCCS (Tetra Tech 2009).

7 SUMMARY AND CONCLUSIONS

Based on soil boring information collected during this investigation, the lithology at the Site consists entirely of fill materials overlaying a low-permeability native clay. In addition to the soil cover placed by IEPA as part of the OU1 remedy implementation, the fill materials consist of solid and household wastes, varying from industrial/demolition debris (*e.g.*, slag, metal pieces, bricks) to household wastes such as newspaper and general refuse. Beneath the fill layer, a silty clay was encountered at every soil boring location advanced during this investigation. The clay was encountered at all deep borings that penetrated the entire thickness of the fill material and represents the only native material encountered in the stratigraphic profile. The composition of the clay indicated a very uniform and very low-permeability material. The base of this clay unit was not encountered during drilling, but was still present as deep as 44 feet bgs. Native sand deposits were not encountered at any boring location on the Site.

The primary water-bearing unit is the municipal/industrial waste fill. The clay unit underlying the fill materials represents a vertical limit of groundwater flow originating at the Site. The low permeability, uniform composition, and significant thickness of this unit provide a barrier preventing groundwater from migrating vertically into deeper permeable units.

The RI work conducted to date has adequately characterized the nature of the groundwater entering, in and emanating from the Site in satisfaction of the approved RI Work Plan. Additional on-site investigation is not necessary to evaluate groundwater conditions. Based on the results of groundwater sampling and analysis conducted during the groundwater investigation, the quality of the groundwater entering the Site, including that from the adjacent Paxton I and II Landfill properties, is similar to the quality of groundwater emanating from the Site.

For many constituents, the concentrations in groundwater entering the Site and surrounding the Site are higher than the concentrations in groundwater emanating from the Site.

The screening evaluation presented several lines of evidence to 1) evaluate whether groundwater emanating from LCCS poses a potential risk to human health or ecological receptors, and 2) identify constituents with the potential to pose the greatest risk. For human health, those lines of evidence include comparing constituent concentrations in LCCS groundwater, IRM surface water, and IRM sediments to conservative IRM-specific benchmarks. All of those comparisons indicate that any LCCS groundwater that may be emanating to IRM likely does not pose a risk to human health. Vinyl chloride in groundwater is the only constituent present at a concentration that exceeds its benchmark in the most representative screening comparison. The highest vinyl chloride concentrations along the eastern perimeter were observed at well MW-07, which is located in the southeast portion of the Unnamed Parcel. Vinyl chloride is only detected sporadically at and surrounding the Site.

The ecological screening incorporated several sets of acute and chronic benchmarks as well as maximum and arithmetic mean concentrations both without and with dilution. The number of constituents exceeding benchmarks decreases when dilution is included or the average concentration is used. Comparison of the diluted maximum concentration to acute benchmarks indicated that only chromium, iron, and ammonia concentrations exceed one or more of their respective benchmarks. Comparison of the diluted average concentrations found that only the chromium concentration exceeds chronic standards derived by IEPA or USEPA, and that no detected constituent concentrations exceed their respective COSR Benchmarks. The concentrations of both ammonia and chromium in IRM surface water in 2009 were lower than acute and chronic benchmarks, indicating that, even if groundwater from LCCS was emanating to IRM surface water, the LCCS groundwater was not causing concentrations in IRM surface water to exceed surface water benchmarks and pose a potential ecological risk.

Concentrations of iron in LCCS groundwater, as well as many of the surface water sampling locations in IRM, exceeded surface water screening benchmarks. However, available data suggest that, if iron poses an ecological risk, that risk is IRM-wide and that LCCS is not a principal source. In addition, the screening evaluation found that concentrations of constituents in sediments adjacent to LCCS likely do not pose a risk to the benthic community. That finding is consistent with the whole sediment toxicity tests conducted in 2009, which found no adverse effects associated with sediments adjacent to LCCS.

Thus, the results of human health and ecological screening evaluations indicate that constituents in groundwater along the border of LCCS and IRM, as well as in IRM surface water and sediments, are unlikely to pose an unacceptable risk to human health or the environment. Additionally, the highest concentrations of virtually all constituents in IRM surface water and sediments are distant from the Site. LCCS does not appear to be a principal source of constituents to IRM. Taken together, the results of the human health and ecological screening evaluations and the findings relating to constituents in groundwater entering the IRM, support the conclusion that further investigation of IRM for the purpose of evaluating potential risks to human health and ecological receptors is not necessary.

Notes
All detections are shown in bold.

VOCs	Volatile Organic Compounds
T/D	Total/Dissolved
mg/L	milligram per liter
ug/L	microgram per liter
B	Associated compound was found in the sample and the blank.
J	Compound was identified; result is an estimated value.
R	The data was rejected due to matrix interference.
U	Compound was not detected. The associated value is the compound quantitation limit.
UB	Compound considered non-detect at the listed value due to associated blank contamination.
UJ	Compound not detected above the reported sample quantitation limit. Reported limit is approximate.

Notes
All detections are shown in bold.

VOCs	Volatile Organic Compounds
T/D	Total/Dissolved
mg/L	milligram per liter
ug/L	microgram per liter
B	Associated compound was found in the sample and the blank.
J	Compound was identified; result is an estimated value.
R	The data was rejected due to matrix interference.
U	Compound was not detected. The associated value is the compound quantitation limit.
UB	Compound considered non-detect at the listed value due to associated blank contamination.
UJ	Compound not detected above the reported sample quantitation limit. Reported limit is approximate.

Notes
All detections are shown in bold.

VOCs	Volatile Organic Compounds
T/D	Total/Dissolved
mg/L	milligram per liter
ug/L	microgram per liter
B	Associated compound was found in the sample and the blank.
J	Compound was identified; result is an estimated value.
R	The data was rejected due to matrix interference.
U	Compound was not detected. The associated value is the compound quantitation limit.
UB	Compound considered non-detect at the listed value due to associated blank contamination.
UJ	Compound not detected above the reported sample quantitation limit. Reported limit is approximate.

Notes
All detections are shown in bold.

VOCs Volatile Organic Compounds
T/D Total/Dissolved
mg/L milligram per liter
ug/L microgram per liter
B Associated compound was found in the sample and the blank.
J Compound was identified; result is an estimated value.
R The data was rejected due to matrix interference.
U Compound was not detected. The associated value is the compound quantitation limit.
UB Compound considered non-detect at the listed value due to associated blank contamination.
UJ Compound not detected above the reported sample quantitation limit. Reported limit is approximate.

Notes
All detections are shown in bold.

VOCs	Volatile Organic Compounds
T/D	Total/Dissolved
mg/L	milligram per liter
ug/L	microgram per liter
B	Associated compound was found in the sample and the blank.
J	Compound was identified; result is an estimated value.
R	The data was rejected due to matrix interference.
U	Compound was not detected. The associated value is the compound quantitation limit.
UB	Compound considered non-detect at the listed value due to associated blank contamination.
UJ	Compound not detected above the reported sample quantitation limit. Reported limit is approximate.

Notes
All detections are shown in bold.

VOCs Volatile Organic Compounds
T/D Total/Dissolved
mg/L milligram per liter
ug/L microgram per liter
B Associated compound was found in the sample and the blank.
J Compound was identified; result is an estimated value.
R The data was rejected due to matrix interference.
U Compound was not detected. The associated value is the compound quantitation limit.
UB Compound considered non-detect at the listed value due to associated blank contamination.
UJ Compound not detected above the reported sample quantitation limit. Reported limit is approximate.

Notes

T/D/N	Total/Dissolved/Not Applicable
mg/L	milligrams per liter
ug/L	micrograms per liter
PCBs	polychlorinated biphenyls
SVOCs	semi-volatile organic compounds
TOC	total organic carbon
VOCs	volatile organic compounds
J	compound was identified; result is an estimated value
R	data was rejected during data validation
U	compound was not detected; result is the compound quantitation limit
UB	compound considered non-detect at listed value due to blank contamination
UJ	compound not detected above quantitation limit; reported limit is approximate
D	concentration based on diluted sample

Vinyl chloride	75-01-4	N	mg/kg	**7.7**

Notes

mg/kg	milligram per kilogram
PCBs	polychlorinated biphenyls
SVOCs	semi-volatile organic compounds
VOCs	volatile organic compounds
J	compound was identified; result is an estimated value
U	compound was not detected; result is the compound quantitation limit
UJ	compound not detected above quantitation limit; reported limit is approximate
D	concentration is based on a diluted sample

Notes:
mg/L = milligram per liter
U = constitent not detected. Associated value is the reporting limit.
Detected results are presented without laboratory qualifiers (i.e. "J" flag for estimated values).
Color gradation is used to highlight values along the spectrum of highest detected concentration (dark red) to lowest detected concentration (dark blue).

Notes:
mg/L = milligram per liter
U = constitent not detected. Associated value is the reporting limit.
Detected results are presented without laboratory qualifiers (i.e. "J" flag for estimated values).
Color gradation is used to highlight values along the spectrum of highest detected concentration (dark red) to lowest detected concentration (dark blue).

U = constitent not detected. Associated value is the reporting limit.
Detected results are presented without laboratory qualifiers (i.e. "J" flag for estimated values).
Color gradation is used to highlight values along the spectrum of highest detected concentration (dark red) to lowest detected concentration (dark blue).

Table 10. Summary of Comparison of LCCS Groundwater Data to Human Health Surface Water Benchmarks
Lake Calumet Cluster Site, Chicago, IL

Analyte	Maximum	Average	Maximum Diluted	Average Diluted
Metals				
Arsenic	X	X	o	o
Manganese	X	o	o	o
Polychorinated Biphenyls				
Aroclor 1221	X	X	o	o
Aroclor 1232	X	X	X	o
Volatile Organic Compounds				
Ethylbenzene	X	o	o	o
Vinyl chloride	X	X	X	X

Notes:

X = exceeds criterion
o = does not exceed criterion

This summary table only lists consituents that had one or more exceedances of the screening benchmarks. Constituent meeting benchmarks are not shown.
Averages calculated using half reporting limit for non-detects.
Diluted concentrations calculated using dilution factor of 10.

Table 11. Estimation of Potential LCCS Groundwater to IRM Surface Water Dilution
Lake Calumet Cluster Site, Chicago, IL

Analyte	Mean Water Concentration SW-05/SW-06 (ug/L)		Mean MW-04, MW-05, MW-06, MW-07 (mg/L)		Dilution (MW4/5/6/7 and SW-05/06)

Notes:

Detected results are presented without laboratory qualifiers (i.e., "J" for estimated values).
Color gradation is used to highlight values along the spectrum of highest detected concentration (dark red) to lowest detected concentration (dark blue).

mg/kg = milligrams per kilogram
ND = not detected

Table 16. Summary of Comparison of IRM Surface Water Data to Ecological Surface Water Benchmarks
Lake Calumet Cluster Site, Chicago, IL

Criteria	Number of Criteria Available	Number of Detected Analytes for Which Criteria are Available	Detected Analytes that Exceed (Maximum)	
			Number	Names
Illinois Acute Standards for the Protection of Aquatic Organisms	14	10	1	Iron
Illinois Chronic Standards for the Protection of Aquatic Organisms	10	8	0	
Illinois Standards for Open Waters of Lake Michigan (Ammonia)	1	1	0	
Illinois Acute Standards for the Protection of Aquatic Organisms for the Chicago Area Waterway System	10	8	0	
Illinois Chronic Standards for the Protection of Aquatic Organisms for the Chicago Area Waterway System	10	8	0	
Illinois Derived Acute Standards for the Protection of Aquatic Organisms	0	0	0	
Ilinois Derived Chronic Standards for the Protection of Aquatic Organisms	0	0	0	
USEPA Acute Aquatic Life Criteria	8	5	0	
USEPA Chronic Aquatic Life Criteria	8	6	2	Iron, Lead
Calumet Open Space Reserve Surface Water Background	16	12	5	Barium, Iron, Lead, Manganese, Zinc
Calumet Open Space Reserve Surface Water Threshold	15	11	1	Iron
Calumet Open Space Reserve Surface Water Benchmark	15	11	1	Iron

Notes:

Maximum concentration based on results of surface samples collected in 2009 throughout IRM, not just locations adjacent to LCCS.

CHICAGO, ILLINOIS

Semivolatiles, Pesticides, PCBs, Metals, AVS/SEM
and Miscellaneous Analyses

SDG#C9D090311 and C9F100120

Analyses Performed By:
TestAmerica Laboratories
Pittsburgh, Pennsylvania

Report: #23445R
Review Level: Tier III
Project: CI001805.0001.00001

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) # C9D090311 and C9F100120 for samples collected in association with the Indian Ridge Marsh Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDG Number	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
						SVOC	AVS/ SEM	PEST/ PCB	MET	MISC
C9D090311	SD-01 04082009	C9D090311001	Sediment	4/8/2009			X			
	SD-02 04082009	C9D090311002	Sediment	4/8/2009		X	X	X		X
	SD-03 04082009	C9D090311003	Sediment	4/8/2009			X			
	SD-04 04082009	C9D090311004	Sediment	4/8/2009			X

C9F100120	SD-02 04082009	C9F100120001	Sediment	4/8/2009					*X*	
	SD-06 04082009	C9F100120002	Sediment	4/8/2009					*X*	

Note:

1. Miscellaneous analyses for surface waters include Ammonia-Nitrogen and Hardness.
2. Miscellaneous analyses for sediment samples include TOC.

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Method 8270C, 8082A and 8081A. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999 and professional judgement.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The compound was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

  JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is

that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

SEMI-VOLATILE VOLATILE ORGANIC COMPOUND (SVOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8270C	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were detected in the associated QA blanks; however, the associated sample results were greater than the BAL and/or were non-detect. No qualification of the sample results was required.

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (15%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (20%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
SD-02 04082009 SD-06 04082009	CCV %D	2,2'-Oxybis(1-chloropropane)	21.6%
		Atrazine	-25.9%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 15% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >20% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >20% (decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria requires the internal standard compounds associated with the SVOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

7. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample locations associated with the MS/MSD exhibiting recoveries outside of the control limits are presented in the following table.

Sample Locations	Compound	MS Recovery	MSD Recovery
SD-02 04082009 SD-06 04082009	Hexachloroethene	AC	<LL but >10%

AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

Please note: The MS/MSD was spiked with a subset list of the compounds that were analyzed and reported for client samples. Although not a SW-846 method requirement, the current industry standard is to include all target compounds in the MS/MSD spiking standard. This had no impact on the data usability; therefore, the data were not qualified.

8. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

Please note: The LCS was spiked with a subset list of the compounds that were analyzed and reported for client samples. Although not a SW-846 method requirement, the current industry standard is to include all target compounds in the LCS spiking standard. This had no impact on the data usability; therefore, the data were not qualified.

9. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices and 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not included with this SDG.

10. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

11. System Performance and Overall Assessment

The calculated %solids were acceptable with the exception of the sample location presented in the following table.

Sample Location	%Solids
SD-02	13.2%
SD-06	10.2%

The criteria used to evaluate percent solids are presented in the following table. The qualifications are applied to the all sample results associated with sample location.

Sample Concentration	Sample Result	Qualification
Percent solids < 30%	Non-detect	UJ
	Detect	J

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA VALIDATION CHECKLIST FOR SVOCs

PESTICIDES ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. System Performance

The instrument performance checks are performed to ensure adequate resolution and instrument sensitivity.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99 is allowed.

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. pesticide analysis requires that one of the two pesticide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

Sample locations associated with surrogates exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Surrogate	Recovery
SD-02 SD-06	Tetrachloro-m-xylene	D
	Decachlorobiphenyl	D

Diluted (D)

The criteria used to evaluate the surrogate recoveries are presented in the following table. In the case of a surrogate deviation, the sample results associated with the deviant fraction are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
One surrogate exhibiting recovery outside the control limits but > 10%	Non-detect	No Action
	Detect	
Surrogates diluted below the calibration curve due to the high concentration of a target compound.	Non-detect	J[1]
	Detect	

[1] A more concentrated analysis was not performed with surrogate compounds within the calibration range; therefore, no determination of extraction efficiency could be made.

6. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The laboratory noted “Due to the concentration of the target compounds detected and/or matrix, the samples were analyzed at a dilution.” Since the MS/MSD analysis was performed at a 25-fold dilution, the

matrix spike compounds were diluted out; therefore, the percent recoveries associated with the MS/MSD analysis were not evaluated.

7. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

Please note: The LCS was spiked with a subset list of the compounds that were analyzed and reported for client samples. Although not a SW-846 method requirement, the current industry standard is to include all target compounds in the LCS spiking standard. This had no impact on the data usability; therefore, the data were not qualified.

8. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices and 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not included with this SDG.

9. Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the percent difference (%D) of detected sample results must be less than 40%.

The column %D was within control limits for detected all detected compounds.

10. System Performance and Overall Assessment

The calculated %solids were acceptable with the exception of the sample location presented in the following table.

Sample Location	%Solids
SD-02	13.2%
SD-06	10.2%

The criteria used to evaluate percent solids are presented in the following table. The qualifications are applied to the all sample results associated with sample location.

Sample Concentration	Sample Result	Qualification
Percent solids < 30%	Non-detect	UJ
	Detect	J

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

%RSD – relative standard deviation, %R - percent recovery, RPD - relative percent difference, %D – difference.

POLYCHLORINATED BIPHENYLS (PCBs) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8082	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. System Performance

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

A maximum RSD of 20% for each peak is allowed. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors.

4.2 Continuing Calibration

All peaks associated with the opening continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%). The closing continuing calibration standard must exhibit a %D less than the control limit (50%)

All Aroclors associated with calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
SD-02 SD-06	CCV %D	Aroclor 1016	26.8%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial Calibration	%RSD > 20%or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
Continuing Calibration	%D >15% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >15% (decrease in sensitivity)	Non-detect	UJ
		Detect	J

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires the surrogate compounds must exhibited recoveries within the method established acceptance limits.

All surrogate recoveries were within control limits.

6. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the method established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the method established acceptance limits.

> Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD exhibited recoveries within the control limits.

7. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the method established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

8. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 35% for water matrices and 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not performed on a sample within this SDG.

9. Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (%RPD) of detected sample results must be less than 40%.

The dual column analysis exhibited an acceptable %RPD between columns.

10. System Performance and Overall Assessment

The calculated %solids were acceptable with the exception of the sample location presented in the following table.

Sample Location	%Solids
SD-02	13.2%
SD-06	10.2%

The criteria used to evaluate percent solids are presented in the following table. The qualifications are applied to the all sample results associated with sample location.

Sample Concentration	Sample Result	Qualification
Percent solids < 30%	Non-detect	UJ
	Detect	J

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6020, 7470, 7471, EPA AVS/SEM, 350.1, SM 2340C and Lloyd Kahn. Data were reviewed in accordance with USEPA National Functional Guidelines of October 2004 and professional judgement.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

  B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

  J The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The reported value is estimated due to the presence of interference.

  N Spiked sample recovery is not within control limits.

  * Duplicate analysis is not within control limits.

- Validation Qualifiers

  J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

  UB Analyte considered non-detect at the listed value due to associated blank contamination.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6020	Water	180 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7470	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
SW-846 7471	Soil	28 days from collection to analysis	Cool to <6 °C.

The analyses that exceeded the holding time are presented in the following table.

Sample Locations	Holding Time	Criteria
SD-02 SD-06	64 Days	28 Days

Sample results associated with sample locations analyzed by analytical method Mercury by SW-846 7471 were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the instrument detection limit (IDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
SW-01 SW-02 SW-03 SW-06	Selenium	Detected sample results <RL and <BAL	"UB" at the RL
SW-04 SW-05	Thallium		
SD-06	Beryllium		

RL Reporting limit

The equipment blank contained low concentrations of certain metals; however it was not compared to sediment samples associated with this SDG since the equipment blank was collected on a different day.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All continuing calibration verification standard recoveries were within the control limit.

3.2 CRDL Check Standard

The CRDL check standard serves to verify the linearity of calibration of the analysis at the CRDL. The CRDL standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the CRDL standard analysis are presented below in the CRDL standards evaluation table (if applicable).

All CRDL standard recoveries were within control limits.

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

4. Matrix Spike (MS)/ Matrix Spike Duplicate (MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

A MS/MSD analysis was not performed on a sample location within this SDG.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to five times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

A laboratory duplicate was not performed on a sample location within this SDG.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices and 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Field duplicate analysis was not performed on a sample location within this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

A serial dilution analysis was not performed on a sample location within this SDG.

8. System Performance and Overall Assessment

The laboratory qualified detects above detection limit but less than reporting limit with a "B" qualifier; these results were flagged with "J" during validation.

The calculated %solids were acceptable with the exception of the sample location presented in the following table.

Sample Location	%Solids
SD-02	13.2%
SD-06	10.2%

The criteria used to evaluate percent solids are presented in the following table. The qualifications are applied to the all sample results associated with sample location.

Sample Concentration	Sample Result	Qualification
Percent solids < 30%	Non-detect	UJ
	Detect	J

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

SIMULTANEOUSLY EXTRACTED METALS (SEM) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
EPA SEM 121/R-91-100	Solid	180 days to analysis	Cool to <6 °C.
		28 days to analysis	

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the instrument detection limit (IDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the IDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Matrix Spike (MS)/ Matrix Spike Duplicate (MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

A MS/MSD analysis was not performed on a sample location within this SDG.

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to five times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

A laboratory duplicate was not performed on a sample location within this SDG.

4. Field Duplicate Analysis

The field duplicate sample analysis is used to assess the precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices and 50% for soil and sediment matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the reporting limit (RL), a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil and sediment matrices.

Field duplicate analysis was not performed on a sample location within this SDG.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

6. System Performance and Overall Assessment

The laboratory qualified detects above detection limit but less than reporting limit with a “B” qualifier; these results were flagged with “J” during validation.

The calculated %solids were acceptable with the exception of the sample location presented in the following table.

Sample Location	%Solids
SD-01	9.1%
SD-02	13.2%
SD-04	21.9%
SD-05	15.2%
SD-06	10.2%

The criteria used to evaluate percent solids are presented in the following table. The qualifications are applied to the all sample results associated with sample location.

Sample Concentration	Sample Result	Qualification
Percent solids < 30%	Non-detect	UJ
	Detect	J

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Total Organic Carbon by EPA Lloyd Kahn	Sediment	28 days from collection to analysis	Cooled @ <6°C.
Hardness by SM2340C	Water	6 months from collection to analysis	Cooled @ <6°C; preserved to a pH of less than 2.
Ammonia-N by EPA 350.1	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
Acid Volatile Sulfide (AVS) by EPA AVS	Sediment	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were detected in the associated QA blanks; however, the associated sample results were greater than the BAL and/or were non-detect. Therefore, sample results greater than the BAL resulted in the removal of the laboratory qualifier (J). No other qualification of the sample results was required.

3. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all initial calibration verification standard recoveries were within control limits.

All calibration standard recoveries were within the control limit.

4. Matrix Spike (MS)/ Matrix Spike Duplicate (MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

A MS/MSD analysis was not performed on a sample location within this SDG.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

The laboratory duplicate sample results exhibited RPD within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

A field duplicate was not performed on a sample within this data set.

6. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

The laboratory qualified detects above detection limit but less than reporting limit with a "B" qualifier; these results were flagged with "J" during validation.

The calculated %solids were acceptable with the exception of the sample location presented in the following table.

Sample Location	%Solids
SD-01	9.1%
SD-02	13.2%
SD-04	21.9%
SD-05	15.2%
SD-06	10.2%

The criteria used to evaluate percent solids are presented in the following table. The qualifications are applied to the all sample results associated with sample location.

Sample Concentration	Sample Result	Qualification
Percent solids < 30%	Non-detect	UJ
	Detect	J

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA VALIDATION CHECKLIST FOR GENERAL CHEMISTRY

SURROGATE	PERCENT RECOVERY	RECOVERY LIMITS
Tetrachloro-m-xylene	NC,DIL	(45 - 130)
Decachlorobiphenyl	NC,DIL	(45 - 130)

NOTE(S):

NC The recovery and/or RPD were not calculated.

DIL The concentration is estimated or not reported due to dilution or the presence of interfering analytes.

Results and reporting limits have been adjusted for dry weight.

Indian Ridge Marsh

Data Review

CHICAGO, ILLINOIS

Semivolatiles, Pesticides, PCBs, Metals, AVS/SEM
and Miscellaneous Analyses

SDG#C9D110102

Analyses Performed By:
TestAmerica Laboratories
Pittsburgh, Pennsylvania

Report: #23466R
Review Level: Tier III
Project: CI001805.0001.00001

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) # C9D110102 for samples collected in association with the Indian Ridge Marsh Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDG Number	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
						SVOC	AVS/ SEM	PEST/ PCB	MET	MISC
C9D110102	SD-07 04092009	C9D110102001	Sediment	4/9/2009			X			
	SD-08 04092009	C9D110102002	Sediment	4/9/2009			X			
	SD-09 04092009	C9D110102003	Sediment	4/9/2009			X

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Method 8270C, 8082A and 8081A. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999 and professional judgement.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The compound was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

  JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is

that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

SEMI-VOLATILE VOLATILE ORGANIC COMPOUND (SVOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8270C	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (15%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (20%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
ER-1 04092009	CCV %D	Benzaldehyde	-33.5%
		Atrazine	-28.9%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01[1]	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01[1]	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 15% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >20% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >20% (decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. SVOC analysis requires that two of the three SVOC surrogate compounds within each fraction exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria requires the internal standard compounds associated with the SVOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

7. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

A MS/MSD analysis was not performed on a sample location within this SDG.

8. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

Please note: The LCS was spiked with a subset list of the compounds that were analyzed and reported for client samples. Although not a SW-846 method requirement, the current industry standard is to include all target compounds in the LCS spiking standard. This had no impact on the data usability; therefore, the data were not qualified.

9. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices and 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not included for this parameter.

10. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

11. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

PESTICIDES ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8081	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. System Performance

The instrument performance checks are performed to ensure adequate resolution and instrument sensitivity.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

A maximum RSD of 20% is allowed or a correlation coefficient greater than 0.99 is allowed.

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%).

All compounds associated with the calibrations were within the specified control limits.

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. pesticide analysis requires that one of the two pesticide surrogate compounds exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

6. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

A MS/MSD analysis was not performed on a sample location within this SDG.

7. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

Please note: The LCS was spiked with a subset list of the compounds that were analyzed and reported for client samples. Although not a SW-846 method requirement, the current industry standard is to include all target compounds in the LCS spiking standard. This had no impact on the data usability; therefore, the data were not qualified.
.

8. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices and 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not included for this parameter.

9. Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the percent difference (%D) of detected sample results must be less than 40%.

The column %D was within control limits for detected all detected compounds.

10. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA VALIDATION CHECKLIST FOR PESTICIDES

%RSD – relative standard deviation, %R - percent recovery, RPD - relative percent difference, %D – difference.

POLYCHLORINATED BIPHENYLS (PCBs) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8082	Water	7 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C
	Soil	14 days from collection to extraction and 40 days from extraction to analysis	Cool to <6 °C

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. System Performance

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

A maximum RSD of 20% for each peak is allowed. Multiple-point calibrations were performed for Aroclor 1016 and 1260 only. Single-point calibrations were performed for the remaining Aroclors.

4.2 Continuing Calibration

All peaks associated with the opening continuing calibration standard must exhibit a percent difference (%D) less than the control limit (15%). The closing continuing calibration standard must exhibit a %D less than the control limit (50%)

All compounds associated with the calibrations were within the specified control limits.

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. PCB analysis requires the surrogate compounds must exhibited recoveries within the method established acceptance limits.

All surrogate recoveries were within control limits.

6. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the method established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the method established acceptance limits.

> Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD exhibited recoveries within the control limits.

7. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the method established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

8. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 35% for water matrices and 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not included for this parameter.

9. Compound Identification

The retention times of all quantitated peaks must fall within the calculated retention time windows for both the primary and confirmation columns. When dual column analysis is performed the relative percent difference (%RPD) of detected sample results must be less than 40%.

The dual column analysis exhibited an acceptable %RPD between columns.

10. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6020, 7470, EPA AVS/SEM, 350.1 and SM 2340C. Data were reviewed in accordance with USEPA National Functional Guidelines of October 2004 and professional judgement.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

  B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

  J The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The reported value is estimated due to the presence of interference.

  N Spiked sample recovery is not within control limits.

  * Duplicate analysis is not within control limits.

- Validation Qualifiers

  J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

  UB Analyte considered non-detect at the listed value due to associated blank contamination.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6020	Water	180 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7470	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
SW-846 7471	Soil	28 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the instrument detection limit (IDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
SW-08	Selenium Antimony	Detected sample results <RL and <BAL	"UB" at the RL
SW-09	Selenium		
SW-09D	Selenium Thallium		
SW-10	Copper Thallium		
SW-07	Thallium		

RL Reporting limit

The equipment blank contained low concentrations of certain metals; however, it was not compared to sediment sample results since the sediments analyzed for total metals were collected on a different day.

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All continuing calibration verification standard recoveries were within the control limit.

3.2 CRDL Check Standard

The CRDL check standard serves to verify the linearity of calibration of the analysis at the CRDL. The CRDL standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the CRDL standard analysis are presented below in the CRDL standards evaluation table (if applicable).

All CRDL standard recoveries were within control limits.

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

4. Matrix Spike (MS)/ Matrix Spike Duplicate (MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis exhibited recoveries and RPD within the control limits.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to five times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

A laboratory duplicate was not performed on a sample location within this SDG.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices and 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
SD-09 04092009/ SD-09W 04092009	Arsenic	1.7	0.91 B	AC
	Barium	34.7	33.7	2.9%
	Boron	50.0	45.7	AC
	Chromium	3.8 B	5.1	AC
	Copper	1.6 B	1.6 B	AC
	Iron	558	569	2.0%
	Manganese	131	128	2.3%
	Nickel	1.1	1.3	16.7%
	Lead	6.4	6.2	3.2%
	Antimony	1.1 B	1.1 B	AC
	Thallium	0.14 B	0.092 B	AC
	Zinc	10.7	11.4	AC

AC Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The sample locations associated with the deviant %D are also presented in the following table.

Sample Locations	Analytes	Serial Dilution (%D)
SW-08	Zinc	10.4%

The criteria used to evaluate the serial dilution are presented in the following table. In the case of a serial dilution deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	UJ
	Detect	J

8. System Performance and Overall Assessment

The laboratory qualified detects above detection limit but less than reporting limit with a “B” qualifier; these results were flagged with “J” during validation.

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

SIMULTANEOUSLY EXTRACTED METALS (SEM) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
EPA SEM 121/R-91-100	Solid	180 days to analysis	Cool to <6 °C.
		28 days to analysis	

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the instrument detection limit (IDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the IDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Matrix Spike (MS)/ Matrix Spike Duplicate (MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
SD-08 04092009	Mercury	138%	136%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with this SDG.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to five times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

A laboratory duplicate was not performed on a sample location within this SDG.

4. Field Duplicate Analysis

The field duplicate sample analysis is used to assess the precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices and 50% for soil and sediment matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the reporting limit (RL), a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil and sediment matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
SD-09 04092009/ SD-09D 04092009	Cadmium	0.024	0.028	AC
	Copper	1.0 B	1.1 B	AC
	Nickel	0.34	0.36	AC
	Lead	1.4	1.7	19.4%
	Zinc	9.8	10.6	7.8%
	Mercury	0.00046 U	0.00046 U	AC

AC Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

6. System Performance and Overall Assessment

The laboratory qualified detects above detection limit but less than reporting limit with a “B” qualifier; these results were flagged with “J” during validation.

The calculated %solids were acceptable with the exception of the sample location presented in the following table.

Sample Location	%Solids
SD-07	9.9%
SD-08	11.0%
SD-09	13.6%
SD-09D	13.6%

The criteria used to evaluate percent solids are presented in the following table. The qualifications are applied to the all sample results associated with sample location.

Sample Concentration	Sample Result	Qualification
Percent solids < 30%	Non-detect	UJ
	Detect	J

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Hardness by SM2340C	Water	6 months from collection to analysis	Cooled @ <6°C; preserved to a pH of less than 2.
Ammonia-N by EPA 350.1	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
Acid Volatile Sulfide (AVS) by EPA AVS	Sediment	14 days from collection to analysis	Cool to <6 °C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all initial calibration verification standard recoveries were within control limits.

All calibration standard recoveries were within the control limit.

4. Matrix Spike (MS)/ Matrix Spike Duplicate (MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

The MS/MSD analysis exhibited recoveries within the control limits.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

The laboratory duplicate sample results exhibited RPD within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
SD-09 04092009/ SD-09D 04092009	AVS	50.6	53.4	5.4%
SD-09 04092009/ SD-09W 04092009	Hardness	128	126	1.6%
	Nitrogen as Ammonia	0.60 U	0.85 B	AC

AC Acceptable
NC Not compliant

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All compounds associated with the LCS/LCSD analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

The laboratory qualified detects above detection limit but less than reporting limit with a “B” qualifier; these results were flagged with “J” during validation.

The calculated %solids were acceptable with the exception of the sample location presented in the following table.

Sample Location	%Solids
SD-07	9.9%
SD-08	11.0%
SD-09	13.6%
SD-09D	13.6%

The criteria used to evaluate percent solids are presented in the following table. The qualifications are applied to the all sample results associated with sample location.

Sample Concentration	Sample Result	Qualification
Percent solids < 30%	Non-detect	UJ
	Detect	J

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Data Review

CHICAGO, ILLINOIS

Metals Analysis

SDG#C9E160102 and C9F170216

Analyses Performed By:
TestAmerica Laboratories
Pittsburgh, Pennsylvania

Report: #23467R
Review Level: Tier III
Project: CI001805.0001.00001

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) # C9E160102 and C9F170216 for samples collected in association with the Indian Ridge Marsh Site. The review was conducted as a Tier III evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDG Number	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
						SVOC	AVS/ SEM	PEST/ PCB	MET	MISC
C9E160102	IRM-V-1 05142009	C9E160102001	Vegetation	05/14/2009					X	
	IRM-V-2 05142009	C9E160102002	Vegetation	05/14/2009					X

6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6020 and 7471. Data were reviewed in accordance with USEPA National Functional Guidelines of October 2004 and professional judgement.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

  B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

  J The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The reported value is estimated due to the presence of interference.

  N Spiked sample recovery is not within control limits.

  * Duplicate analysis is not within control limits.

- Validation Qualifiers

  J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

  UB Analyte considered non-detect at the listed value due to associated blank contamination.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6020	Water	180 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to <6 °C.
SW-846 7470	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.
SW-846 7471	Soil	28 days from collection to analysis	Cool to <6 °C.

The analyses that exceeded the holding time are presented in the following table.

Sample Locations	Holding Time	Criteria
IRM-V-1D 05142009 IRM-V-2D 05142009 IRM-V-3D 05142009 IRM-V-4D 05142009	41 Days	28 Days

Sample results associated with sample locations analyzed by analytical method SW-846 7471 were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ

The laboratory noted the plant tissue samples were received at ambient temperature with no Ice. Based on professional judgment, there is no impact on the metals analyses and therefore, no qualification of the sample results was necessary, with the exception of mercury. Mercury tends to volatilize more readily; therefore, all results for mercury have been qualified as estimated (J).

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the instrument detection limit (IDL). The BAL is compared to the

associated sample results to determine the appropriate qualification of the sample results, if needed.

Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
IRM-V-1 05142009 IRM-V-2 05142009 IRM-V-3 05142009 IRM-V-4 05142009 IRM-V-1D 05142009 IRM-V-2D 05142009 IRM-V-3D 05142009 IRM-V-4D 05142009	Thallium	Detected sample results <RL and <BAL	"UB" at the RL

RL Reporting limit

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All continuing calibration verification standard recoveries were within the control limit.

3.2 CRDL Check Standard

The CRDL check standard serves to verify the linearity of calibration of the analysis at the CRDL. The CRDL standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the CRDL standard analysis are presented below in the CRDL standards evaluation table (if applicable).

All CRDL standard recoveries were within control limits.

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

4. Matrix Spike (MS)/ Matrix Spike Duplicate (MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis exhibited recoveries and RPD within the control limits.

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to five times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

A laboratory duplicate was not performed on a sample location within this SDG.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 30% for water matrices and 50% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Field duplicate analysis was not performed on a sample location within this SDG.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution performed on sample location IRM-V-4 05142009 and IRM-V-4D 05142009 exhibited %D within the control limit.

8. System Performance and Overall Assessment

The laboratory qualified detects above detection limit but less than reporting limit with a “B” qualifier; these results were flagged with “J” during validation.

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DEPTH	ELEVATION	Sample Interval	Recovery (feet)	PID Headspace (ppm)	USCS Code	Geologic Column	Stratigraphic Description
-4							
-3							
-2							
-1							
0	0						
1				0.7			ORGANICS: Grass and rootlets.
2		0-4	3.3				SILTY CLAY and SAND (FILL): very dense (>4 tons/sft); very fine to coarse grained sand; trace to little gravel; subangular; poorly sorted; trace roots in upper portion; 10YR 3/2, very dark grayish brown; dry; no odor. (1.8) After 1.8 ft bgs, moist to damp.
3				0.8			(3.5-5.6) CONCRETE/GRAVEL (FILL): Crushed gravel or concrete; White N/8; dry.
4							
5				0.8			
6		4-8	2.5				(5.6-8.0) SILTY CLAY as above; 2.5Y 4/1, dark gray.
7				8.8			
8							(8.0-8.7) SILTY CLAY as above; nonplastic to low plasticity; generally coarser grained; angular; 2.5Y 3/1, very dark gray.
9				399.0			(8.8-9.5) ORGANIC RICH SILT; stiff to very stiff (3.5 tons/sft); no dilatency; organic rich; little clay; GLEY1 2.5/N, black; dense rootlets throughout.
10		8-12	3.6				(9.5-10.9) SILTY CLAY; moderate plasticity; very stiff (3.25 tons/sft); decreased (trace) sand and gravel; subrounded to subangular; well sorted; 2.5Y 4/1, dark gray.
11				1,802	(FILL)		(10.9-12) SAND; fine to coarse grained sand; some gravel (granule to large pebble); angular to subangular; poorly sorted; loose to very loose (1.5 tons/sft); 10YR 3/1, very dark gray, trace mottling throughout; moist to damp. (11.6) Trace purple coloring on matrix and on gravel piece at 11.6 ft bgs; odor of paint.
12							
13				172.6			(12.0-15.2) CLAY: medium to high plasticity; hard (>4 tons/sft); trace sand; subangular; 10YR 2/1, black, with small and streaked mottles of GLEY1 2.5/N, black and 5Y 4/2, olive gray; trace fibrous, weathered concrete; moist to damp; no odor.
14		12-16	3.6				
15				305.1			(15.2-16.0) SAND with SILTY CLAY: sand as above, with silty clay matrix. Loose to medium dense (2 tons/sft); little to some green glass shards; trace red and blue stained matrix; odor of paint; GLEY1 2.5/N, black; moist; slight odor.
16							(16.0) Wet after 16 ft bgs.
17				21.6			SLAG, FILL, and MUNICIPAL WASTE (FILL): generally loosely consolidated; wet. (17.1-17.7) Fibrous organics
18		16-20	2.1				
19				7.1			(18.9-20.3) Slag, coarse grained and gravelly mixture.
20							
21				3.1			(20.3-21.7) Very fine grained material; smooth; no plasticity; White N/8; saturated; no odor.

-3							
-2							
-1							
0	0						
1				0.9			SILTY CLAY, SAND, and GRAVEL (FILL): nonplastic; dense/stiff to very stiff (3.5 tons/sft); crumbled moderately easily; very fine to very coarse grained sand; trace granule; little gravel (small to large pebble); subangular; 2.5Y 3/2, very dark grayish brown; dry; no odor.
2		0-4	2.9				
3				1.1			
4							SILT and CLAY (FILL): low plasticity; hard (>4.5 tons/sft); does not crumble easily; trace to little sand and granule; subangular to subrounded; poorly sorted; 10YR 4/1, dark gray; dry to moist; no odor.
5				0.9			
6		4-8	3.5				SILTY CLAY, SAND, and GRAVEL (FILL): nonplastic; dense/stiff to very stiff (3.5 tons/sft); crumbled moderately easily; very fine to very coarse grained sand; trace granule; little gravel (small to large pebble); subangular; 2.5Y 3/2, very dark grayish brown; saturated; no odor.
7				1.5			-Greenish-purple staining and odor from 7.4 to 7.5 ft bgs; fibrous woody pieces ~1 inch long, soft and flexible.
8							
9				65.9			SLAG, FILL, INDUSTRIAL and MUNICIPAL WASTE (FILL): Gley1 2.5/N, black throughout; saturated throughout; strong odor throughout. (8.0-10.6) Slag; very coarse grained (very coarse grained sand-size to granule; mostly granule to large pebble size); very loosely consolidated; trace silt; thick, viscous, black coating; moderate odor.
10		8-12	2.7		(FILL)		
11				88.0			(10.7-12.0) Silty, spongy fill; fine grained; little coarse sand-size particles; loosely consolidated; nonplastic.
12							(12.0-16.0) Slag; very coarse grained (very coarse grained sand-size to granule; mostly granule to large pebble size); very loosely consolidated; trace silt; thick, viscous, black coating; moderate odor. Oversaturated. Plastic bag-like material at bottom.
13				26.1			
14		12-16	1.8				
15				19.9			
16							(16.0-17.3) Poor recovery. Silty, spongy fill; 1 inch x 1 inch wood chunk; fine grained; little coarse sand-size particles; loosely consolidated; nonplastic.
17				6.5			(17.0-19.6) Liquified; no recovery.
18		16-20	1.2				
19				3.1			(19.6-20) Sand and silt; very fine grained; saturated.
20							
21							END OF BORING AT 20 FT BGS.

Data Usability Summary Report

CHICAGO, IL

Volatile, Metals and Misc. Analyses

SDG#s 500-103464, 500-130546, 500-103623 and 500-103708

Analyses Performed By:
TestAmerica Laboratories
Chicago, IL

Report: # 24860R
Review Level: Tier II
Project: CI001805.0003.00001

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDGs) 500-103464, 500-103546, 500-103623 AND 500-103708 for samples collected in association with the Lake Calumet Cluster Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDG	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis					
						VOC	SVOC	EXPL	DG	MET	MISC
500-103464	VAP-HPT-05(6-9)	103464-1	Water	11/02/15		X				X	X
	VAP-HPT-05(10-13)	103464-2	Water	11/02/15		X				X	X

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to (United States Environmental Protection Agency) USEPA Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.

  B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.

- Quantitation (Q) Qualifiers

  E The compound was quantitated above the calibration range.

  D Concentration is based on a diluted sample analysis.

- Validation Qualifiers

  J The compound was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.

  JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.

  UB Compound considered non-detect at the listed value due to associated blank contamination.

  N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to <6°C; preserved to a pH of less than 2.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to<6°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
SDG (500-103464) VAP-HPT-05(6-9) VAP-HPT-05(10-13) VAP-HPT-05(18-20) VAP-HPT-06(10-13) VAP-HPT-06(14-17) VAP-HPT-06(18-20) VAP-HPT-07(6-9)	Methylene chloride	Detected sample results >RL and <BAL	“UB” at detected sample concentration
SDG (500-103708) VAP-HPT13(13-16) VAP-HPT13(19-22) VAP-HPT13(24-27) VAP-HPT14(10-13) VAP-HPT14(14-17) VAP-HPT14(20-22) VAP-HPT15(10-13)	Acetone	Detected sample results >RL and <BAL	“UB” at detected sample concentration

Sample Locations	Analytes	Sample Result	Qualification
SDG (500-103708) VAP-HPT15(15-18)	Acetone	Detected sample results >RL and <BAL	"UB" at detected sample concentration

RL Reporting limit

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

An MS/MSD was not performed on a sample location within these sample data group.

4. Laboratory Control Sample

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery
Trip Blank	Cyclohexane	>UL
	1,1,2-Trichloro-1,2,2-trifluoroethane	>UL

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

Sample locations associated with surrogates exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Surrogate	Recovery
VAP-HPT11(24-27)	1,2-Dichloroethane-d4	AC
	4-Bromofluorobenzene	>UL
	Dibromofluoromethane	AC
	Toluene-d8	AC

UL Upper control limit
AC Acceptable

The criteria used to evaluate the surrogate recoveries are presented in the following table. In the case of a surrogate deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> UL	Non-detect	No Action
	Detect	J
< LL but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Surrogates diluted below the calibration curve due to the high concentration of a target compounds	Non-detect	UJ[1]
	Detect	J[1]

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

A field duplicate was not included in these data packages.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA VALIDATION CHECKLIST FOR VOCs

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010C/7470A and SM4500. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

  U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

  B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

  E The reported value is estimated due to the presence of interference.

  N Spiked sample recovery is not within control limits.

  * Duplicate analysis is not within control limits.

- Validation Qualifiers

  J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

  UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

  UB Analyte considered non-detect at the listed value due to associated blank contamination.

  R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010C	Water	180 days from collection to analysis	Cool to <6°C; preserved to a pH of less than 2.
SW-846 7470	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
VAP-HPT12(8-11)	Manganese	Detected sample results >RL and <BAL	“UB” at detected sample concentration

RL = reporting limit

3. Matrix Spike (MS)/ Matrix Spike Duplicate(MSD) Analysis

MS and MSD data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS performed on sample locations where the analyte’s concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier “N” will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
SDG (500-103464) VAP-HPT-05(14-17)	Aluminum	204%	222%
	Selenium	40%	34%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with this SDG.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices and 100% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not included in these data packages.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

6. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution was not performed on a sample location within this SDG.

7. General Assessment – Total vs. Dissolved

The calculated %D between the total and the dissolved sample results were within the control limit, with the exception of the analytes presented in the following table.

Sample Location	Analytes	%D
VAP-HPT-05(10-13)	Calcium	11.8%
	Magnesium	14.3%
	Potassium	12.5%
VAP-HPT-08(14-17)	Calcium	18.8%
	Magnesium	20.0%
	Potassium	21.1%
	Sodium	21.8%
VAP-HPT-11(10-13)	Sodium	16.3%
VAP-HPT-11(16-18)	Sodium	13.3%
VAP-HPT11(19-22)	Sodium	14.3%
VAP-HPT11(24-27)	Sodium	23.3%
VAP-HPT10(22-25)	Sodium	35%
VAP-HPT12(8-11)	Sodium	12.5%
VAP-HPT13(8-11)	Sodium	75%
VAP-HPT13(13-16)	Potassium	14.8%
VAP-HPT13(24-27)	Potassium	16.2%
	Sodium	16%
VAP-HPT14(10-13)	Potassium	13.5%
	Sodium	17.4%
VAP-HPT14(14-17)	Potassium	15.3%
	Sodium	30.8%
VAP-HPT14(20-22)	Sodium	16%
VAP-HPT15(15-18)	Potassium	12%
	Sodium	12.5%

The criteria used to evaluate total and dissolved %D are presented in the following table. In the case of a total and dissolved %D deviation, the sample results are qualified. The qualifications are applied to the associated total and dissolved sample results associated with the sample location referenced above.

Sample Concentration	Control Limit	Sample Result	Qualification
Dissolved sample concentration > total sample concentration and > 5x RL or MDL	>10%	Non-detect	UJ
		Detect	J

Sample Concentration	Control Limit	Sample Result	Qualification
Dissolved sample concentration > total sample concentration and > 5x RL or MDL	>50%	Non-detect	R
		Detect	R

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Ammonia-N by SM4500	Water	28 days from collection to analysis	Cool to <6 °C; preserved to a pH of less than 2.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were detected in the associated QA blanks; however, the associated sample results were greater than the BAL. Therefore, sample results greater than the BAL resulted in the removal of the laboratory qualifier (B). No other qualification of the sample results was required.

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

A MS/MSD was not included in these data packages.

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 50% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

A field duplicate was not included in these data packages.

5. Laboratory Control Sample

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries results within the control limits.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA VALIDATION CHECKLIST FOR GENERAL CHEMISTRY

General Chemistry: EPA OIA 1677, Total Organic Carbon EPA 9060	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier II Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
D. Method blanks		X	X		
E. Equipment blanks	X				X

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Comments
No additional comments.

Receipt
The samples were received on 12/1/2015 3:15 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 3.6º C and 4.3º C.

GC/MS VOA
Method(s) 8260B: The method blank for batch 315539 was non-detect for all target analytes. Samples associated with this method blank detected Acetone just above the reporting limit. Acetone is a known lab contaminant; therefore all low level detects for this compound should be considered lab contamination. The results have been flagged with a "CN" to denote the probable contamination: VAP-HPT18(12-14)-113015 (500-104630-5), VAP-HPT18(25-27)-113015 (500-104630-8), VAP-HPT22(14-16)-120115 (500-104630-12), VAP-HPT22(24-27)-120115 (500-104630-14) and VAP-HPT23(8-11)-120115 (500-104630-15)

Method(s) 8260B: The following samples were diluted due to the abundance of non-target analytes: VAP-HPT18(12-14)-113015 (500-104630-5) and VAP-HPT18(19-22)-113015 (500-104630-7). Elevated reporting limits (RLs) are provided.

Method(s) 8260B: The following samples were diluted to bring the concentration of target analytes within the calibration range: VAP-HPT18(16-18)-113015 (500-104630-6), VAP-HPT22(14-16)-120115 (500-104630-12) and VAP-HPT22(18-21)-120115 (500-104630-13). Elevated reporting limits (RLs) are provided.

Method(s) 8260B: The MSD (matrix spike duplicate) in batch 315539 was analyzed 5 minutes outside the method specified 12 hour tune time: VAP-HPT19(6-8)-113015 (500-104630-2)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method(s) 6010C: The continuing calibration verifications (CCV) associated with batch 500-314956 recovered above the upper control limit for Zinc. The samples associated with these continuing calibration verifications were non-detects for the affected analyte; therefore, the data have been reported. The following samples are impacted: VAP-HPT18(12-14)-113015 (500-104630-5), VAP-HPT18(16-18)-113015 (500-104630-6), VAP-HPT18(25-27)-113015 (500-104630-8), VAP-HPT21(8-10)-120115 (500-104630-9), VAP-HPT21(12-14)-120115 (500-104630-10) and VAP-HPT21(16-18)-120115 (500-104630-11).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Field Service / Mobile Lab
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
cn	Refer to Case Narrative for further detail
F2	MS/MSD RPD exceeds control limits

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits.
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL. The data are considered valid because the absolute difference is less than the RL.
F3	Duplicate RPD exceeds the control limit
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

General Chemistry

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

QC Association Summary

Client: ARCADIS U.S., Inc.
Project/Site: Lake Calumet Cluster Site

TestAmerica Job ID: 500-104630-1

GC/MS VOA

Certification Summary

Client: ARCADIS U.S., Inc.
Project/Site: Lake Calumet Cluster Site

TestAmerica Job ID: 500-104630-1

Laboratory: TestAmerica Chicago

Unless otherwise noted, all analytes for this laboratory were covered under each certification below.

Authority	Program	EPA Region	Certification ID	Expiration Date
Illinois	NELAP	5	100201	04-30-16

The following analytes are included in this report, but certification is not offered by the governing authority:

Analysis Method	Prep Method	Matrix	Analyte
8260B		Water	Cyclohexane
8260B		Water	Methyl acetate
8260B		Water	Methylcyclohexane

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	(3.6)(4.3)c
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Comments
No additional comments.

Receipt
The samples were received on 12/2/2015 3:05 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.1º C.

GC/MS VOA
Method(s) 8260B: The following sample was diluted to bring the concentration of target analytes within the calibration range: VAP-HPT1(14-16)-120215 (500-104695-3). Elevated reporting limits (RLs) are provided.

Method(s) 8260B: The following samples were collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, the pH was outside the required criteria when verified by the laboratory, and corrective action was not possible: VAP-HPT23(15-18)-120115 (500-104695-2), VAP-HPT1(14-16)-120215 (500-104695-3), VAP-HPT1(18-20)-120215 (500-104695-4), VAP-HPT24(15-18)-120215 (500-104695-6) and VAP-HPT24(20-23)-120215 (500-104695-7).

Method(s) 8260B: Surrogate recovery for the following sample was outside control limits: VAP-HPT1(14-16)-120215 (500-104695-3). Evidence of matrix interference is present; therefore, re-analysis was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method(s) 6010C: The low-level CCV at line 8 in 6010C batch 500-315145 was above the method acceptance limits of 70-130% recovery for Lead. The samples VAP-HPT23(15-18)-120115 (500-104695-2), VAP-HPT1(14-16)-120215 (500-104695-3), VAP-HPT1(18-20) -120215 (500-104695-4), VAP-HPT24(6-8)-120215 (500-104695-5), VAP-HPT24(15-18)-120215 (500-104695-6), VAP-HPT24(20-23) -120215 (500-104695-7), VAP-HPT3(8-10)-120215 (500-104695-8) and VAP-HPT3(13-16)-120215 (500-104695-9) were bracketed. The low-level standard concentration was insignificant compared with the reported sample results and the sample results were unaffected by the bias at that level. The mid-range bracketing the data were all within the 90-110% recovery limits

Method(s) 6010C: The continuing calibration verifications (CCV) associated with batch 500-315145 recovered above the upper control limit for Zinc. The samples associated with these continuing calibration verifications were non-detects for the affected analyte; therefore, the data have been reported. The following samples are impacted: VAP-HPT23(15-18)-120115 (500-104695-2), VAP-HPT1(14-16)-120215 (500-104695-3), VAP-HPT1(18-20)-120215 (500-104695-4), VAP-HPT24(6-8)-120215 (500-104695-5), VAP-HPT24(15-18)-120215 (500-104695-6), VAP-HPT24(20-23)-120215 (500-104695-7), VAP-HPT3(8-10)-120215 (500-104695-8) and VAP-HPT3(13-16)-120215 (500-104695-9).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Field Service / Mobile Lab
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Mercury	**0.00089**		0.00020	0.000061	mg/L		12/03/15 13:30	12/04/15 10:20	1

Method: 7470A - Mercury (CVAA) - Dissolved

Analyte	Result	Qualifier	RL	MDL	Unit	D	Prepared	Analyzed	Dil Fac
Mercury	<0.00020		0.00020	0.000061	mg/L		12/03/15 13:30	12/04/15 10:22	1

General Chemistry

Analyte	Result	Qualifier	RL	MDL	Unit	D	Prepared	Analyzed	Dil Fac
Ammonia	**65**	**B**	4.0	0.86	mg/L		12/11/15 17:50	12/11/15 21:30	2

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits.
F1	MS and/or MSD Recovery is outside acceptance limits.
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL. The data are considered valid because the absolute difference is less than the RL.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

General Chemistry

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Certification Summary

Client: ARCADIS U.S., Inc.
Project/Site: Lake Calumet Cluster Site

TestAmerica Job ID: 500-104695-1

Laboratory: TestAmerica Chicago

Unless otherwise noted, all analytes for this laboratory were covered under each certification below.

Authority	Program	EPA Region	Certification ID	Expiration Date
Illinois	NELAP	5	100201	04-30-16

The following analytes are included in this report, but certification is not offered by the governing authority:

Analysis Method	Prep Method	Matrix	Analyte
8260B		Water	Cyclohexane
8260B		Water	Methyl acetate
8260B		Water	Methylcyclohexane

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	3.1
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Comments
No additional comments.

Receipt
The samples were received on 12/4/2015 7:15 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.4º C.

GC/MS VOA
Method(s) 8260B: The following sample was diluted due to the abundance of non-target analytes: VAP-HPT4(17-19)-120315 (500-104781-8). Elevated reporting limits (RLs) are provided.

Method(s) 8260B: The following samples were collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, the pH was outside the required criteria when verified by the laboratory, and corrective action was not possible: VAP-HPT3(18-21)-120215 (500-104781-2), VAP-HPT26(10-13)-120315 (500-104781-4), VAP-HPT26(15-18)-120315 (500-104781-5) and VAP-HPT25(13-16)-120315 (500-104781-10).

Method(s) 8260B: The method blank for batches 315731 and 315850 were non-detect for all target analytes. Samples associated with the method blanks detected Acetone just above the reporting limit. Acetone is a known lab contaminant; therefore all low level detects for this compound should be considered lab contamination. The results have been flagged with a "CN" to denote the probable contamination.

VAP-HPT26(10-13)-120315 (500-104781-4) and VAP-HPT25(13-16)-120315 (500-104781-10)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Field Service / Mobile Lab
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
cn	Refer to Case Narrative for further detail
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

General Chemistry

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Certification Summary

Client: ARCADIS U.S., Inc.
Project/Site: Lake Calumet Cluster Site

TestAmerica Job ID: 500-104781-1

Laboratory: TestAmerica Chicago

Unless otherwise noted, all analytes for this laboratory were covered under each certification below.

Authority	Program	EPA Region	Certification ID	Expiration Date
Illinois	NELAP	5	100201	04-30-16

The following analytes are included in this report, but certification is not offered by the governing authority:

Analysis Method	Prep Method	Matrix	Analyte
8260B		Water	Cyclohexane
8260B		Water	Methyl acetate
8260B		Water	Methylcyclohexane

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	3.4
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Narrative

Job Narrative
500-103464-1

Comments
No additional comments.

Receipt
The samples were received on 11/3/2015 2:50 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.1º C.

Receipt Exceptions

Received 1 VOA vial for samples 5, 6, & 8 with larger than pea size bubbles. Two good vials remain for each sample.

Received Trip Blank not on COC, added to COC as sample 11 and logged.

GC/MS VOA
Method(s) 8260B: The following sample was diluted to bring the concentration of target analytes within the calibration range: VAP-HPT-05(6-9)-110215 (500-103464-1). Elevated reporting limits (RLs) are provided.

Method(s) 8260B: The method blank for preparation batch 312425 contained Methylene Chloride above the reporting limit (RL). Samples associated with this method blank contained the target compound.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Field Service / Mobile Lab
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Toluene-d8 (Surr)	102		75 - 120		11/13/15 01:02	1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL. The data are considered valid because the absolute difference is less than the RL.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

General Chemistry

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Certification Summary

Client: ARCADIS U.S., Inc.
Project/Site: Lake Calumet Cluster Site

TestAmerica Job ID: 500-103464-1

Laboratory: TestAmerica Chicago

Unless otherwise noted, all analytes for this laboratory were covered under each certification below.

Authority	Program	EPA Region	Certification ID	Expiration Date
Illinois	NELAP	5	100201	04-30-16

The following analytes are included in this report, but certification is not offered by the governing authority:

Analysis Method	Prep Method	Matrix	Analyte
8260B		Water	Cyclohexane
8260B		Water	Methyl acetate
8260B		Water	Methylcyclohexane

List Source: TestAmerica Chicago

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	3.1
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Refer to Job Narrative for details.
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	False	Refer to Job Narrative for details.
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Comments
No additional comments.

Receipt
The samples were received on 11/4/2015 3:40 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.9º C.

GC/MS VOA
Method(s) 8260B: The laboratory control sample (LCS) for batch 312503 recovered outside control limits for the following analytes: Cyclohexane and 1,1,2-Trichloro-1,2,2-Trifluoroethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method(s) 8260B: The following samples were collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, the pH was outside the required criteria when verified by the laboratory, and corrective action was not possible: VAP-HPT-08(9-12)-110315 (500-103546-1), VAP-HPT-08(14-17)-110315 (500-103546-2), VAP-HPT-09(9-12)-110415 (500-103546-3), VAP-HPT-09(14-17)-110415 (500-103546-4), VAP-HPT-11(10-13)-110415 (500-103546-5) and VAP-HPT-11(16-18)-110415 (500-103546-6).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method(s) 6010C: The continuing calibration verification (CCV) associated with batch 500-312005 recovered above the upper control limit for Antimony. The samples associated with this CCV had results below the reporting limit (RL) for the affected analytes; therefore, the data have been reported. The following samples are impacted: VAP-HPT-08(9-12)-110315 (500-103546-1), VAP-HPT-08(14-17)-110315 (500-103546-2), VAP-HPT-09(9-12)-110415 (500-103546-3), VAP-HPT-09(14-17)-110415 (500-103546-4), VAP-HPT-11(10-13)-110415 (500-103546-5) and VAP-HPT-11(16-18)-110415 (500-103546-6).

Method(s) 6010C: The continuing calibration verification (CCV) associated with batch 500-312005 recovered above the upper control limit for Copper. The samples associated with this CCV had results below the reporting limit (RL) for the affected analytes; therefore, the data have been reported. The following samples are impacted: VAP-HPT-08(14-17)-110315 (500-103546-2), VAP-HPT-09(9-12)-110415 (500-103546-3) and VAP-HPT-11(10-13)-110415 (500-103546-5).

Method(s) 6010C: The low-level CCV at line 8 in 6010C batch 500-312005 was above the method acceptance limits of 70-130% recovery for Selenium. The samples VAP-HPT-08(9-12)-110315 (500-103546-1), VAP-HPT-08(14-17)-110315 (500-103546-2), VAP-HPT-09(9-12) -110415 (500-103546-3), VAP-HPT-09(14-17)-110415 (500-103546-4), VAP-HPT-11(10-13)-110415 (500-103546-5) and VAP-HPT-11(16-18)-110415 (500-103546-6) were bracketed. The low-level standard concentration was insignificant compared with the reported sample results and the sample results were unaffected by the bias at that level. The mid-range bracketing the data were all within the 90-110% recovery limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Field Service / Mobile Lab
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
*	LCS or LCSD is outside acceptance limits.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits.
L	A negative instrument reading had an absolute value greater than the reporting limit

General Chemistry

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

QC Association Summary

Certification Summary

Client: ARCADIS U.S., Inc.
Project/Site: Lake Calumet Cluster Site

TestAmerica Job ID: 500-103546-1

Laboratory: TestAmerica Chicago

Unless otherwise noted, all analytes for this laboratory were covered under each certification below.

Authority	Program	EPA Region	Certification ID	Expiration Date
Illinois	NELAP	5	100201	04-30-16

The following analytes are included in this report, but certification is not offered by the governing authority:

Analysis Method	Prep Method	Matrix	Analyte
8260B		Water	Cyclohexane
8260B		Water	Methyl acetate
8260B		Water	Methylcyclohexane

Client: ARCADIS U.S., Inc.

Job Number: 500-103546-1

Login Number: 103546
List Number: 1
Creator: Sanchez, Ariel M

List Source: TestAmerica Chicago

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	3.9
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Received Trip Blank(s) not listed on COC.
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
500-103623-1

Comments
No additional comments.

Receipt
The samples were received on 11/5/2015 3:00 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.3º C.

Receipt Exceptions

Received Trip Blank not on COC, added to COC and logged in.

GC/MS VOA
Method(s) 8260B: The following samples were collected in properly preserved vials for analysis of volatile organic compounds (VOCs). However, the pH was outside the required criteria when verified by the laboratory, and corrective action was not possible: VAP-HPT11(19-22)-110415 (500-103623-1), VAP-HPT11(24-27)-110415 (500-103623-2), VAP-HPT10(10-13)-110515 (500-103623-3), VAP-HPT10(22-25)-110515 (500-103623-4), VAP-HPT12(8-11)-110515 (500-103623-5) and VAP-HPT13(8-11)-110515 (500-103623-6).

Method(s) 8260B: The following sample was diluted to bring the concentration of target analytes within the calibration range: VAP-HPT11(24-27)-110415 (500-103623-2). Elevated reporting limits (RLs) are provided.

Method(s) 8260B: Surrogate recoveries were outside of acceptance limits for the following sample: VAP-HPT11(24-27)-110415 (500-103623-2). The sample shows evidence of matrix interference. Re-analysis was performed at a dilution for target compounds, with all surrogates within QC limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method(s) 6010C: The low-level ICVL at line 8 in 6010C batch 500-312128 was above the method acceptance limits of 70-130% recovery for Lead. The sample VAP-HPT11(19-22)-110415 (500-103623-1), VAP-HPT11(24-27)-110415 (500-103623-2), VAP-HPT10(10-13) -110515 (500-103623-3), VAP-HPT10(22-25)-110515 (500-103623-4), VAP-HPT12(8-11)-110515 (500-103623-5) and VAP-HPT13(8-11) -110515 (500-103623-6) was bracketed. The low-level standard concentration was insignificant compared with the reported sample results and the sample results were unaffected by the bias at that level. The mid-range bracketing the data were all within the 90-110% recovery limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Field Service / Mobile Lab
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Client Sample Results

Client: ARCADIS U.S., Inc.
Project/Site: Lake Calumet Cluster Site

TestAmerica Job ID: 500-103623-1

Client Sample ID: Trip Blank

Lab Sample ID: 500-103623-7

Date Collected: 11/04/15 00:00

Matrix: Water

Date Received: 11/05/15 15:00

Surrogate	%Recovery	Qualifier	Limits	Prepared	Analyzed	Dil Fac
4-Bromofluorobenzene (Surr)	91		75 - 120		11/17/15 22:43	1
Dibromofluoromethane	92		75 - 120		11/17/15 22:43	1
1,2-Dichloroethane-d4 (Surr)	94		75 - 125		11/17/15 22:43	1
Toluene-d8 (Surr)	89		75 - 120		11/17/15 22:43	1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
X	Surrogate is outside control limits

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits.
B	Compound was found in the blank and sample.

General Chemistry

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
