SUBJECT
Discussion w/ Jerry Black, Oklahoma Water Resources Board. 405-271-2537

SUMMARY OF COMMUNICATION
Jerry is working in setting up a 208 study in the Sand Springs area and he wanted to know the status of our activities at the Wynn site and Sinclair Acid Pit site. He said he had been in the area last week and had observed both sites. He said the Wynn lagoons looked really bad. He had also gone down along the bank of the Arkansas River opposite the acid pits and had observed some mushy pools of a brownish-red substance that still had an oily sheen. The material looked like it had seeped out of the bank.

I told him we were filing suit against Wynn to get his site cleaned up and were awaiting final sample results on the acid pit site. If the samples show the material is a hazard and is seeping or moving from the pits, we will take action. He requested a copy of the sample results when they were available.

Jerry said the material on Forsteel in Muscogee was mailed on Monday. He requested that he be allowed to accompany EPA

CONCLUSIONS, ACTION TAKEN OR REQUIRED
inspectors on any subsequent visit to the site.

He also said that a company called Southwest Porcelain was discharging metal wastes into the 96" storm drain adjacent to the acid pit. This drain discharges directly to the Arkansas River. He said OWRB was working to get this discharge taken care of.
