RCRA Corrective Action
Environmental Indicator (EI) RCRIS code (CA725)
Current Human Exposures Under Control

Facility Name: **MacDermid Incorporated**
Facility Address: **526 Huntingdon Avenue, Waterbury, Connecticut**
Facility EPA ID #: **CTD001164599**

1. Has **all** available relevant/significant information on known and reasonably suspected releases to soil, groundwater, surface water/sediments, and air, subject to RCRA Corrective Action (e.g., from Solid Waste Management Units (SWMU), Regulated Units (RU), and Areas of Concern (AOC)), been **considered** in this EI determination?

   __X*__ If yes - check here and continue with #2 below.
   _____ If no - re-evaluate existing data, or
   _____ if data are not available skip to #6 and enter "IN" (more information needed) status code.

*Note: **According to a February 11, 2002 correspondence from the United States Environmental Protection Agency (EPA), groundwater monitoring was reportedly performed in 8/87, 1/88, 10/88, 10/92, 2/93 *and twice in 1/94; however, this data was not available for review and was not used in development of* this EID.**

BACKGROUND

Definition of Environmental Indicators (for the RCRA Corrective Action)

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

Definition of "Current Human Exposures Under Control" EI

A positive "Current Human Exposures Under Control" EI determination ("YE" status code) indicates that there are no "unacceptable" human exposures to "contamination" (i.e., contaminants in concentrations in excess of appropriate risk-based levels) that can be reasonably expected under current land- and groundwater-use conditions (for all "contamination" subject to RCRA corrective action at or from the identified facility (i.e., Site-wide)).

Relationship of EI to Final Remedies

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Current Human Exposures Under Control" EI are for reasonably expected human exposures under current land- and groundwater-use conditions ONLY, and do not consider potential future land- or groundwater-use conditions or ecological receptors. The RCRA Corrective Action program's overall mission to protect human health and the environment requires that Final remedies address these issues (i.e., potential future human exposure scenarios, future land and groundwater uses, and ecological receptors).

Duration / Applicability of EI Determinations

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

2. Are groundwater, soil, surface water, sediments, or air **media** known or reasonably suspected to be **"contaminated"**[1] above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

	Yes	No	?	Rationale/Key Contaminants
Groundwater	X			As, Cd, Cu, Pb, Hg, Ni, Ag, Zn, PCE, TCE, 1,2-DCE, 1,1-DCE were detected at concentrations that exceeded the maximum contaminant levels, the surface water protection criteria, and/or the commercial/industrial volatilization criteria.
Air (indoors)[2]		X		
Surface Soil (e.g., <2 ft)		X		
Surface Water		X		No Surface water bodies onsite.
Sediment		X		No Surface water bodies onsite.
Subsurf. Soil (e.g., >2 ft)	X			Though subsurface soil at portions of the Site is reasonably expected to be contaminated, exposure to subsurface soil is controlled through the Project Activity Analysis (PAA) an institutional control, to ensure analytical data for subsurface soils are reviewed or generated/evaluated prior to exposure.
Air (outdoors)	X			Exposure to outdoor air (trench air) is considered applicable to Excavation Laborers. As the subsurface soil at portions of the Site is reasonably expected contaminated, it is similarly reasonably expected that excavation laborers may be exposed to contaminated air during performance of excavations. The exposure to air by excavation laborers is limited through the implementation of an institutional control, the Project Activity Analysis to ensure analytical data for subsurface soils and/or groundwater are reviewed or generated/evaluated prior to exposure

____ If no (for all media) - skip to #6, and enter "YE," status code after providing or citing appropriate "levels," and referencing sufficient supporting documentation demonstrating that these "levels" are not exceeded.

__X__ If yes (for any media) - continue after identifying key contaminants in each "contaminated" medium, citing appropriate "levels" (or provide an explanation for the determination that the medium could pose an unacceptable risk), and referencing supporting documentation.

____ If unknown (for any media) - skip to #6 and enter "IN" status code.

Rationale and References:

The Site is located at 526 Huntingdon Avenue in Waterbury, Connecticut (Figure 1 in Attachment 1) and includes two parcels of land (i.e. the NORTH parcel and the SOUTH parcel). The first parcel is located on the southern side of Huntingdon Avenue and encompasses approximately 11 acres. For the purposes of clarity in this document, the 11-acre parcel will be referred to as the SOUTH parcel. The SOUTH parcel is improved with three interconnected buildings with a total footprint of approximately 182,500 square feet. These buildings are referred to as the Gear Street Building, East Aurora Street Building, and the Huntingdon Avenue Building. There is little topographic relief on the SOUTH portion of the Site, which lies at approximately 300 feet above mean sea level (MSL). The Site is located approximately 1,000 feet northwest of the Naugatuck River, which lies at approximately 260 feet above MSL. The Site and immediately surrounding area are zoned for industrial use.

The second parcel is located on the northern side of Huntingdon Avenue, and encompasses approximately 30 acres. For the purpose of clarity in this document, the 30-acre parcel will be referred to as the NORTH parcel. The NORTH parcel is primarily covered with grass and other native vegetation. Two paved areas

are located on the southern and southeastern portions of the NORTH parcel. The first paved area is located immediately along the north side of Huntingdon Avenue and was used for parking by employees of the MacDermid facility located on the southern side of Huntingdon Avenue. The second paved area, located approximately 400-feet north of Huntingdon Avenue, serves as an asphalt cap to a sludge disposal area. Historical information pertaining to the sludge disposal area is presented later in the text of this section.

The MacDermid facility was primarily engaged in blending and/or compounding chemical materials used in the metal finishing, plating on plastics and printed circuit industries. In particular, MacDermid manufactured inks and electroless nickel plating solutions for these industries. The Standard Industrial Classification (SIC) Code for the facility is 2899. Ancillary activities conducted by MacDermid at the facility included reprocessing copper etchant solution received in bulk from their customers or off-site MacDermid facilities.

In order to determine a general history of the Site, Sanborn Fire Insurance Maps and aerial photographs pertaining to the Site were reviewed. The Sanborn Fire Insurance Maps obtained from the Connecticut State Library archives indicated that the Waterbury Steel Ball Company occupied the Gear Street Building and the Carroll Wire Company occupied the Huntingdon Avenue Building in 1921. Mapping prior to 1921 was not available. Also, the Sanborn Map indicated that MacDermid occupied the Huntingdon Avenue Facility in 1930. Aerial photographs of the Site obtained from the DEP depict a drum storage area of approximately 30 drums behind a shed outside the Huntingdon Avenue Building in the 1965 photograph that did not appear in the 1970 photograph. Aerial photographs also indicate a lagoon was added between 1970 and 1975 west of the Huntingdon Avenue Building near Huntingdon Avenue. This lagoon and a second adjacent lagoon were used for disposal of organic and inorganic process waste generated at the facility by MacDermid. The lagoons were removed between approximately 1980 and 1986 and the East Aurora Street Building was constructed such that the Huntingdon Avenue Building was connected to the Gear Street Building. The Site remained generally unchanged from 1986 to 2002.

According to historical environmental investigation reports, between 1978 and 1979, approximately 1,000-cubic yards of metal hydroxide sludge was removed from the aforementioned waste lagoons and disposed of in an excavated area on the southeastern portion of the MacDermid NORTH parcel located on the northern side of Huntingdon Avenue. In addition to metal hydroxide sludge, potentially-contaminated soil from the MacDermid property south of Huntingdon Avenue was reportedly also disposed of in the same excavated area. The specific origin of the potentially-contaminated soil is unknown. Prior to emplacement on the MacDermid NORTH parcel, the waste materials were mixed with Site sand and gravel to increase load-bearing characteristics. In 1986, the material was covered with approximately nine inches of processed aggregate and three inches of asphalt.

In 2002, manufacturing activities at the facility ceased. At the time of this submittal, MacDermid conducts only office activities in the Huntingdon Avenue Building and shipping/receiving of raw product (from other MacDermid facilities) in the East Aurora Street Building. With the exception of shipping and receiving, all product and waste materials have been removed from the facility.

A report entitled *Conceptual Site Model (CSM) and Screening Levels, MacDermid Incorporated* was prepared in May 2002 by LEA. EPA comments to the CSM have been addressed in the cover letter included with this environmental indicator determination. The CSM provides a description of exposure media and exposure pathways, a description of potential receptors, a rationale and approach to screening analytical data generated for exposure media, and screening levels for exposure media. For the facility, the

model also identifies the applicable receptors, exposure media and pathways that require screening as shown on Drawing 1 through Drawing 3 in Attachment 2 and depicted graphically on Figure 2 in Attachment 1. These receptors and exposure pathways and media include:

On-Site Receptors

- Excavating laborers: surficial and subsurface soils by ingestion and dermal contact, inhalation of trench air;
- Groundskeepers: surface soil by ingestion and dermal contact;
- Indoor workers: indoor air inhalation;
- Environmental samplers: ingestion and dermal contact with surficial and subsurface soils and groundwater;
- Trespassers: dermal contact with surficial soils and known contaminated soils (metal hydroxide sludge) on the MacDermid NORTH parcel on the northern side of Huntingdon Avenue.

Off-Site Receptors

- Utility Repair Workers: ingestion and dermal contact with surficial and subsurface soils and inhalation of trench air. However, any contamination present in shallow off-site soils would not be the result of MacDermid activities because shallow soil contamination typically occurs when a release of contaminants has occurred. There is no documentation of an off-site release to soil associated with MacDermid activities.
- Off-Site Residents: indoor air inhalation.
- Off-Site Recreators: ingestion and dermal contact with surface water and sediment in the Naugatuck River and Steele Brook that is contaminated by groundwater discharging from the Site.

This documentation of environmental indicator determination is based on a review of all available relevant/significant data as it applies to these receptors for the identified exposure media and pathways. Notably, according to a February 11, 2002 correspondence from the United States Environmental Protection Agency (EPA), groundwater monitoring was performed 8/87, 1/88, 10/88, 10/92, 2/93 and twice in 1/94; data from these events were not available for review and were not used in development of this EID.

Groundwater

A Site plan for the MacDermid facility that also depicts groundwater sampling locations and a complete listing of constituents detected in groundwater is provided as Drawing 1. Drawing 2 depicts Site features, groundwater sampling locations and an interpretation of groundwater flow direction. Site geology has been evaluated during the course of investigation activities completed at the Site by Loureiro Engineering Associates, Inc. (LEA) and others. The unconsolidated deposits beneath the Site generally consist of grey

brown and brown, fine to coarse sand with traces of gravel. A fill layer consisting of medium to coarse sand and building debris was identified in some boring locations to depths of approximately five feet below grade. Groundwater flow direction beneath the Site in the unconsolidated deposits is generally from north to south in the direction of the Naugatuck River. Based on an evaluation of depth to groundwater and topographic relief change between the Site and the Naugatuck River, it is likely that groundwater beneath the Site discharges to the Naugatuck River. With the addition of two groundwater monitoring wells to the southeastern Site boundary in August 2002, the groundwater monitoring well network at the Site is determined to be adequate in number and spatial distribution to assess the quality of groundwater at the Site.

To address potential impacts to surface water, the groundwater data was compared to the Surface Water Protection Criteria (SWPC) listed in the Connecticut Remediation Standard Regulations (RSR). During the 2002 sampling round, groundwater from a total of four monitoring wells contained constituents or compounds that exceed the SWPC. These constituents/compounds include: arsenic, cadmium, copper, lead, mercury, nickel, silver, zinc, 1,1-dichloroethylene, and tetrachloroethylene. The concentrations were similar or less than previously detected in wells during 1995 and 2001 sampling events. Exceedances of the SWPC noted in groundwater samples collected during the 1995 and 2001 sampling events include: arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, zinc, cyanide, and tetrachloroethylene. A summary of exceedances to the SWPC are presented on Drawing 1 in Attachment 2 and Table 1 in Attachment 3.

To address potential exposures to Environmental Samplers from contact with groundwater while collecting samples at the Site, the groundwater data collected from the MacDermid facility were compared to the Federal Maximum Contaminant Levels (MCL). Exceedances of the MCL identified for the most recent sampling round include: nickel, 1,1-dichloroethylene, 1,2-dichloroethane, tetrachloroethylene, and trichloroethylene. The concentrations were similar or less than previously detected in wells during the 2001 sampling events. Exceedances of the MCL noted in groundwater samples collected during the 2001 sampling event include: cadmium, chromium, nickel and tetrachloroethylene. Table 2, provided in Attachment 3 to this EID, includes a summary of exceedances of the MCL for groundwater collected at the Site. The data is also summarized on Drawing 1.

The potential for exposure to off-site residents by indoor air impacted by volatile organic compounds in groundwater was indeterminate at the time of the submittal of the *Conceptual Site Model and Screening Levels, MacDermid Incorporated* in May 2002, due to the lack of data to verify groundwater flow direction, depth to groundwater, and potential for volatilization of contaminants from Site groundwater. From a review of groundwater analytical data collected in July and September 2002, combined with the fact that groundwater flow beneath the Site is southerly toward the Naugatuck River, it is concluded that contaminated groundwater at the Site does not have the potential to impact abutting residential properties to the southwest. Groundwater contours developed during the September 2002 sampling event are depicted on the site plan included as Drawing 2.

Air (Indoor)

Indoor air samples have not been collected at the Site. However, the potential for indoor air exposure from the volatilization of compounds in groundwater beneath the Site was evaluated by comparing groundwater data to the Connecticut RSR Residential Volatilization Criteria (RVC) for off-site residents and the Industrial/Commercial Volatilization Criteria (IVC) for on-site workers. The sample data set is adequate to

assess the quality of indoor air likely to be encountered by Indoor Workers or off-site Residents. This is discussed further in response to Question 3.

The compounds 1,1-dichloroethylene and 1,2-dichloroethane were detected at concentrations that exceed the RVC and the IVC in two downgradient monitoring wells at the Site. Because the groundwater beneath the building is at a depth of greater than 15 feet, volatilization of constituents is not considered a complete pathway to indoor workers.

A summary of exceedances of the RVC are included in Attachment 3 on Table 3 and depicted on Drawing 1, and a summary of exceedances of the IVC are included in Attachment 3 on Table 4 and on Drawing 1.

Surface Soil

Four soil samples were collected from locations in grassy areas on the northwest and the southwest corners of the Site. These samples were collected at a depth of 0 to 0.5 feet below ground surface on July 30, 2002. The soil data obtained from this surface soil sampling conducted at the Site was compared to the Connecticut RSR Residential Direct Exposure Criteria (RDEC). Soil sampling conducted as part of the Voluntary Corrective Action Program (VCAP) was completed in areas where an exposure pathway exists (i.e. exposed soil, grass, and landscaped areas). The sample data set is adequate to assess the quality of surface soil in those areas likely to be encountered by Excavating Laborers, Groundskeepers, Environmental Samplers and Trespassers. No exceedances of the RDEC were noted. The locations of historic and recent soil sampling locations are depicted on Drawing 3 in Attachment 2. This drawing also provides a summary of analytical data collected for soil sampling conducted at the Site.

Surface Water

Exposure to surface water can potentially occur near the MacDermid facility in the Naugatuck River and/or Steele Brook, located approximately 1,000 feet southeast and southwest of the Site, respectively. No surface water is located on Site. An evaluation of surface water was completed by evaluating groundwater data collected at the Site against the SWPC of the Connecticut RSR. The only relevant potential exposures to the Naugatuck River and the Steele Brook from the Site are a result of groundwater discharge to these water bodies as it is unlikely these water bodies would be used for recreational purposes. The condition of groundwater at the Site is discussed above. No surface water samples have been collected from the Naugatuck River or Steele Brook as part of investigations at the Site.

Sediment

Exposure to sediment can potentially occur near the MacDermid facility in the Naugatuck River and/or Steele Brook. As with surface water exposures, sediment quality can potentially be impacted by groundwater discharge to surface water. In order to assess potential impact to sediment, groundwater samples were compared to the Surface Water Protection Criteria. Sediment quality may also have been impacted by a release of copper etchant in 1994 to MacDermid stormwater catchbasins that discharge to Steele Brook. The 1994 release assessment completed by HRP Associates included collection of eighteen sediment samples including two upstream of the discharge. The sediment samples were analyzed for copper, nickel, lead, and zinc. The results of the assessment indicate that concentrations of metals were generally highest at the point of discharge into Steele Brook with declining concentrations further downstream. Two exceptions are the concentrations of nickel and zinc, which were greater in sediment samples collected upstream in the Naugatuck River versus at the point of the release. No information has

been identified that suggests remediation and/or post-remediation sampling was conducted. No sediment samples were collected from the Naugatuck River or Steele Brook as part of the most recent investigations at the Site.

Subsurface Soil and Trench Air (Outdoor Air)

Subsurface soil and trench air are reasonably expected to be contaminated. Exposure to these media is controlled through an institutional control at the Huntingdon Avenue Facility. This institutional control is described in greater detain in response to Question 3.

Footnotes:

1 "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

2 Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

3. Are there **complete pathways** between "contamination" and human receptors such that exposures can be reasonably expected under the current (land- and groundwater-use) conditions?

Summary Exposure Pathway Evaluation Table

Potential **Human Receptors** (Under Current Conditions)

Contaminated Media	Residents	Workers	Construction	Trespassers	Recreation
Groundwater		YES			
Air (indoors)	NO	NO			
Surface Water					YES
Sediment					YES
Soil (subsurface e.g., >2 ft)		YES	YES		
Air (outdoors)		YES	YES		

Instructions for Summary Exposure Pathway Evaluation Table:

1. Strike-out specific Media including Human Receptors' spaces for Media which are not "contaminated") as identified in #2 above.
2. enter "yes" or "no" for potential "completeness" under each "Contaminated" Media -- Human Receptor combination (Pathway).

Note: In order to focus the evaluation to the most probable combinations some potential "Contaminated" Media - Human Receptor combinations (Pathways) do not have check spaces ("___"). While these combinations may not be probable in most situations they may be possible in some settings and should be added as necessary.

____ If no (pathways are not complete for any contaminated media-receptor combination) - skip to #6, and enter "YE" status code, after explaining and/or referencing condition(s) in-place, whether natural or man-made, preventing a complete exposure pathway from each contaminated medium (e.g., use optional Pathway Evaluation Work Sheet to analyze major pathways).

__X__ If yes (pathways are complete for any "Contaminated" Media - Human Receptor combination) - continue after providing supporting explanation.

____ If unknown (for any "Contaminated" Media - Human Receptor combination) - skip to #6 and enter "IN" status code

Rationale and Reference(s):

Groundwater

Groundwater beneath the Site may not be suitable for direct human consumption due to waste discharges, spills or leaks of chemicals or other land use impacts and has been assigned a classification of "GB" by the DEP. The GB groundwater classification includes the Site and surrounding areas within 1.0 mile to the south, east and west. The southern portion of the MacDermid NORTH parcel is also classified GB. Based on information provided in the May 23, 2001 "*RCRA Corrective Action Stabilization Report*", and depth to groundwater data collected during July 2002, groundwater beneath the Site ranges between 26.08 and 34.36 feet below grade.

The results of local well receptor survey has shown that there are no known active potable water supply wells in the immediate Site area that could be impacted by potential groundwater contamination emanating from the Site. Results of the survey are included as Attachment 4.

Environmental Samplers were identified in the *Conceptual Site Model and Screening Levels* as having an exposure pathway for groundwater. As described under Question No. 2 above, there are identified exceedances of the screening criteria for this exposure receptor, media and pathway. The significance of these exceedances will be discussed in Question 4 below.

Air (Indoor)

Volatilization of contaminants in groundwater is unlikely because depth to groundwater measurements indicate groundwater is approximately 26 feet below grade to 34 feet below grade as shown on Table 6 in Attachment 3. The potential human pathway in this instance would involve volatilization of contaminants from impacted groundwater into the vadose zone, migration through the soil column into indoor air space and inhalation by the receptor.

The compounds 1,1-dichloroethylene and 1,2-dichloroethane were detected at concentrations that exceed the RVC and the IVC in two downgradient monitoring wells at the Site (MW-111, MW-115). Based on the locations of these wells and the absence of exceedances of the RVC and the IVC for these compounds in upgradient monitoring wells, it is concluded that there is no potential for indoor air exposure from volatilization of these compounds in groundwater. Depth to groundwater is greater than 15 feet below grade at the facility, further reducing the potential for exposure to potentially volatilized contaminants. Also, the direction of groundwater flow precludes contaminated groundwater at the Site from potentially impacting abutting residential properties.

Trench Air (Outdoor Air) and Subsurface Soil

Excavating Laborers were identified as having an exposure pathway for groundwater and subsurface soil. However, the implementation of an institutional control will control these receptors' exposures to contaminants in groundwater, subsurface soil, and trench air (outdoor air encountered during performance of excavation of subsurface soil). The implementation of the Project Activity Analysis (PAA) process controls worker exposure to contaminants in subsurface soil, and trench air (outdoor air encountered in a trench during performance of an excavation). A PAA is completed prior to any activity that results in the excavation of soil (the potential source of exposure to constituents in groundwater, subsurface soil and air, due to soil movement). The PAA includes an assessment of available analytical data for soil and groundwater in the area where the proposed activity will occur. If no data are available, or if existing data are incomplete, samples are collected. The data for the areas are compared to the screening levels as discussed in this EID. If there are exceedances of applicable screening levels, all subsurface work in the area is conducted by personnel who have received appropriate health and safety training.

The purpose of the PAA process is to provide the basis for a consistent approach to ensure that potential worker exposures to various environmental media resulting from facility modifications are evaluated prior to the implementation of a modification. The PAA process is primarily focused on the evaluation of potential human exposure to environmental contaminants in soil and groundwater. Any facility modification that could result in a human exposure to soil or outdoor air (trench air) is subject to the PAA process. Typical facility modifications addressed by the PAA process include, but are not limited to:

- Onsite underground utility repair;
- Onsite landscaping (involving excavation to depths greater than 6-inches; routine maintenance would not be included);
- Onsite excavation outside of landscaped areas to any depth;
- Pavement replacement; and
- Removal of building structures including flooring.

For reference purposes, a guide process flow chart has been included at the end of this report as Attachment 5. This is the generic form that MacDermid employees must complete when applying for a PAA within the facility. The PAA process flow chart illustrates the decision steps of the process.

Surface Water

As discussed above, The Naugatuck River is located approximately 1,000 feet southeast of the Site and is the discharge point for groundwater flowing beneath the Site. The discharge point was determined by calculation of groundwater flow direction, evaluation of depth to groundwater, distance to the river and approximate 40 foot decrease in topographic relief from the Site to the Naugatuck River. Direct contact with Site groundwater is possible to Off-site Recreators as it discharges into the River.

Sediment

As with the surface water pathway, potential impacts to Off-site Recreators from contact with sediment within the Naugatuck River and the Steele Brook are dependent on the quality of the groundwater that flows beneath the Site and discharges into these water bodies.

[3] Indirect Pathway/Receptor (e.g., vegetables, fruits, crops, meat and dairy products, fish, shellfish, etc.)

4 Can the **exposures** from any of the complete pathways identified in #3 be reasonably expected to be **"significant"**[4] (i.e., potentially "unacceptable" because exposures can be reasonably expected to be: 1) greater in magnitude (intensity, frequency and/or duration) than assumed in the derivation of the acceptable "levels" (used to identify the "contamination"); or 2) the combination of exposure magnitude (perhaps even though low) and contaminant concentrations (which may be substantially above the acceptable "levels") could result in greater than acceptable risks)?

__X__ If no (exposures can not be reasonably expected to be significant (i.e., potentially "unacceptable") for any complete exposure pathway) - skip to #6 and enter "YE" status code after explaining and/or referencing documentation justifying why the exposures (from each of the complete pathways) to "contamination" (identified in #3) are not expected to be "significant."

_____ If yes (exposures could be reasonably expected to be "significant" (i.e., potentially "unacceptable") for any complete exposure pathway) - continue after providing a description (of each potentially "unacceptable" exposure pathway) and explaining and/or referencing documentation justifying why the exposures (from each of the remaining complete pathways) to "contamination" (identified in #3) are not expected to be "significant."

_____ If unknown (for any complete pathway) - skip to #6 and enter "IN" status code

Rationale and Reference(s):

As discussed in Question 3 above, indoor air is not considered to have a complete pathway because the depth of groundwater at the Site is greater than 15 feet below grade and volatilization of contaminants is not considered significant. Also, exposures to trench air (outdoor air) and subsurface soil will be regulated by implementing an institutional control that determines the extent and concentration of contamination in an area of proposed activity and prevents unqualified personnel from working in these areas.

As discussed below, potential exposures to environmental samplers and off-site recreators via groundwater, surface water, and sediment can not reasonably be expected to be significant.

Groundwater

As discussed in Question No. 2, exceedances of the MCL were identified in four groundwater samples collected during the most recent round of sampling (July and September 2002). Prior to 2002, exceedances of the MCL were detected in two groundwater samples collected in 2001, in two of the same monitoring wells where exceedances were identified in 2002. Exceedances of the MCL were identified for cadmium, chromium, nickel, 1,1-dichloroethylene, 1,2-dichloroethane, tetrachloroethylene, and trichloroethylene. The concentrations of these constituents only slightly exceed the MCL, with the exception of those (volatile organic compounds only) detected in the recently installed monitoring well MW-115 where the concentrations of VOCs are two to seven times greater than the MCL.

Although the exposure pathway from groundwater to Environmental Samplers is considered complete, exposure to contaminants in groundwater will be minimized through implementation of health and safety controls. Only personnel who have received appropriate health and safety training and who are familiar with available data and potential hazards associated with contact with groundwater at the Site will conduct groundwater sampling at the Site, therefore exposures con not be reasonable expected to be significant.

Groundwater Discharging to Surface Water and Sediment

To address potential impacts to surface water, the groundwater data was compared to the SWPC. In 2002, groundwater from four monitoring wells contained constituents or compounds that exceed the SWPC. These constituents/compounds include: arsenic, cadmium, copper, lead, mercury, nickel, silver, zinc, 1,1-dichloroethylene, and tetrachloroethylene. Specific concentrations of these constituents are provided in Table 1.

According to the RSR, a Site-specific dilution attenuation factor (DAF) may be calculated in order to determine the potential impact of the groundwater flowing beneath the Site to the surface water and sediment of the Naugatuck River and Steele Brook located approximately 1,000 feet southeast and southwest of the Site, respectively. Calculations of the DAF were accomplished in accordance with the methodology provided in Section 22a-133k-3 (b)(3)(A) of the RSR. A value for the 7Q10 of the Lower Housatonic River Basin in the vicinity of the Site was determined by conservatively using published low-flow data for the Lower Naugatuck River Basin. The data used was collected from published United States Geological Survey data for the Lower Naugatuck River Basin, and the Connecticut DEP Water Resource Bulletin Number 34 (1982) for estimating the 7-day, 10-year low flow at a Site on the Naugatuck River. The reported 7Q10 for the Naugatuck River in the vicinity of the Site is 721,875 cubic feet/day. Twenty-five percent of the 7Q10 for the Naugatuck River at the Site is 180,469 cubic feet/day.

The plume of groundwater exiting the Site exhibiting contamination in excess of the default numeric SWPC was estimated conservatively to extend from between downgradient monitoring wells MW-113 and MW-104. These locations represent conservative boundaries as each did not have concentrations of metals or VOCs exceeding the applicable criteria. These wells are separated by a distance of approximately 725 feet. According to *The Bedrock Geology of the Waterbury Quadrangle* published in 1967 by the State Geological and Natural History Survey of Connecticut, the approximate depth to bedrock near the Site is 60 feet below grade. This was conservatively established as the lower bound of the plume of groundwater exiting the Site. As the depth to groundwater below the Site is approximately 30 feet, an estimated saturated thickness of contamination in groundwater below the site is 30 feet. The maximum cross sectional area (A) of contamination in groundwater at the Site is 21,750 square feet. The groundwater discharge in this area was calculated conservatively using the dimensions and the average hydraulic conductivity (K) of 15 feet per day based upon the composition of the soil, which in this case is a very fine to fine sand. The average horizontal hydraulic gradient was calculated using the groundwater contours from the July sampling event and was calculated to be 0.019 feet/foot.

The groundwater discharge (K * hydraulic gradient * area) for the Site was calculated to be 6,198.75 cubic feet/day.

The DAF for the contaminants ((25% * 7Q10)/discharge area) was calculated to be 29.11. The concentrations of VOCs detected in groundwater discharging from the Site into the Naugatuck River are well below the applicable criteria when multiplied by the DAF. Based upon these results, surface water and sediment in the Naugatuck River do not represent a significant exposure.

[4] If there is any question on whether the identified exposures are "significant" (i.e., potentially "unacceptable") consult a human health Risk Assessment specialist with appropriate education, training and experience.

5 Can the "significant" **exposures** (identified in #4) be shown to be within **acceptable** limits?

_____ If yes (all "significant" exposures have been shown to be within acceptable limits) - continue and enter "YE" after summarizing and referencing documentation justifying why all "significant" exposures to "contamination" are within acceptable limits (e.g., a Site-specific Human Health Risk Assessment).

_____ If no (there are current exposures that can be reasonably expected to be "unacceptable")- continue and enter "NO" status code after providing a description of each potentially "unacceptable" exposure.

_____ If unknown (for any potentially "unacceptable" exposure) - continue and enter "IN" status code

Rationale and Reference(s):

6. Check the appropriate RCRIS status codes for the Current Human Exposures Under Control EI event code (CA725), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (and attach appropriate supporting documentation as well as a map of the facility):

__X__ YE - Yes, "Current Human Exposures Under Control" has been verified. Based on a review of the information contained in this EI Determination, "Current Human Exposures" are expected to be "Under Control" at the MacDermid Incorporated facility, EPA ID #**CTD001164599**, located at 526 Huntingdon Avenue, Waterbury, Connecticut under current and reasonably expected conditions.
This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

____ NO - "Current Human Exposures" are NOT "Under Control."

____ IN - More information is needed to make a determination.

WELL RECEPTOR SURVEY

MacDERMID, INC.
526 HUNTINGDON AVENUE
WATERBURY, CONNECTICUT

1.0 INTRODUCTION

HRP Associates, Inc. (HRP) has conducted a survey of potential receptors in the anticipated down-gradient area or side-gradient area of the above referenced site. The focus of this investigation was on potential public and private water supply sources within 1,400 feet to the south (Steele Brook and Naugatuck River junction), 1,000 feet to the northeast (including several residential properties to the north) (Route 8), 700 feet to the east (Connecticut River), and 1,000 feet to the west (Steele Brook) of the subject site.

2.0 SITE SETTING

The subject parcel (MacDermid, Inc. property) is located at 526 Huntingdon Avenue, in Waterbury, Connecticut (see Figures 1 and 2 for site location). The site area consists of a mix of industrial/commercial and residential properties. The parcels of interest are depicted on Figure 2 as map references 1 through 7.

The approximate geographic coordinates of the site are 41° 34' 31" north latitude and 73° 03' 26" west longitude. The site is located at an elevation of approximately 300 feet above mean sea level according to published U.S.G.S. topographic mapping[1].

The ground water beneath the subject site and vicinity has been assigned a ground water quality classification of "GB" by the CT DEP, which denotes that ground water may not be suitable for human consumption without treatment due to waste discharges, spills or leaks of chemicals or land use impacts.[2]. Steele Brook, located approximately 0.17 mile southwest of the subject site, has been assigned a surface water classification of "B" indicating it is known or presumed to meet Water Quality Criteria which support designated uses, which may include recreational use; fish and wildlife habitat; agricultural and industrial supply and other legitimate uses including navigation. The Naugatuck River, located 0.2 mile east of the site, has been assigned a surface water classification of "C/B", indicating that, due to point or nonpoint sources of pollution, certain Water Quality Criteria or one or more designated uses assigned to Class B waters are not currently met. The water quality goal is achievement of Class B Criteria and attainment of Class B designated uses.

Based on previous subsurface investigations conducted at the subject site, which have included the installation of overburden ground water monitoring wells, ground water in the shallow overburden aquifer beneath the subject site flows to the south-southeast.

3.0 IDENTIFICATION OF POTENTIAL RECEPTORS

The following sources of data and investigation methodologies for the identification of possible industrial water supply wells/monitor wells have been employed by HRP during this receptor survey. Table 1 summarizes the findings of this survey and indicates the data sources which provided documentation for the resulting confirmation of water supply (private well or public water). These sources are keyed to Table 1 by the circled numbers (①,②, etc). Table 2 lists all the properties within the selected area by street address and Waterbury Assessor's Department map, block, and lot numbers. Property owners' names are listed, as well as the reported confirmation status (from the Waterbury Water Company) of the public water supply connection to the site.

Data Sources:

① Connecticut Department of Environmental Protection (CT DEP) Public Water Supply Atlas
② Published hydrologic data
③ Windshield/walking survey of the site vicinity (visual evidence of well, fire hydrants, water gate valves, etc.)
④ Water supply well completion reports located at the U.S.G.S. Water Resource Division
⑤ Water supply well completion reports located at the Waterbury Health Department
⑥ Queries of the Waterbury Water Company
⑦ City of Waterbury Tax Assessor's Field Card
⑧ Queries of the Waterbury Engineering Department
⑨ Connecticut Department of Environmental Protection (CT DEP) P-5 files

Descriptions of the type(s) of wells identified in the well completion reports for the above-tabled properties are as follows:

- 327 Huntingdon Ave. – Installation of two monitoring wells, dated 11/10/98;
- 346 Huntingdon Ave. – Installation of a ground water remediation well, dated 4/21/89;
- 526 Huntingdon Ave. – Location of six (6) monitoring wells, dated 1/11/95;
- 420 Huntingdon Ave. – Location of one (1) water supply well, dated 1/10/65;
- 172 E. Aurora St. – Installation of two (2) monitoring wells, dated 10/1/98;
- 237 E. Aurora St. – Installation of one (1) industrial water supply well, dated 11/1/67;
- 000 E. Aurora St. – Identification of two (2) industrial water supply test wells, dated 8/1/78 and 3/31/79.

The operational status of these industrial water supply wells is currently unknown.

According to the 1974 State of Connecticut Water Resources Bulletin No. 19, Hydrogeologic Data for Housatonic River Basin, there are five water supply wells located within the designated search radius (Figure 2).

- Wells #(12,12A), located at 526 Huntingdon Ave. (Formerly Waterbury Steel Ball Co.), were completed in 1925 and 1947, respectively. Well #12 is listed as currently unused. Well # 12A is listed as a well used to withdraw water for air conditioning.
- Wells #(341, 341AB), located at 237 E. Aurora St. (LEA Manufacturing), were completed in 1957, 1966, and 1967, respectively. Well #341 is listed as currently unused. Wells #341A and B are listed as wells used to withdraw water for industrial purposes.
- Well #(343), located at E. Aurora St. (Formerly Brock-Hall Dairy Co.), was completed as a well used to withdraw water in 1945 for air conditioning.

The operational status of these wells is currently unknown.

Representatives of the City of Waterbury Engineering Department reported that public water supply lines are installed and available to all occupants in the site vicinity.

Multiple occupants were identified during the January 30, 2001 windshield/walking survey on several parcels located on the south side of E. Aurora Street. Several of these businesses were not listed on the Waterbury Water Company's lists as having public water. These properties map/lot/block numbers (143/707/19, 143/707/20, 143/707/191, 143/707/192, 160/707/6, 160/707/61, 161/707/1) were identified and cross-checked against the Tax Assessors Maps and Field Cards. According to the Field Cards, all map/block/lot parcels are serviced by public water (Appendix C).

4.0 CONCLUSIONS

Five water supply wells were identified in the 1974 State of Connecticut Water Resource Bulletin No. 19, Hydrogeologic Data for Housatonic River Basin. The operational status of these wells is currently unknown. If confirmation of the status of the identified wells is necessary, then an inquiry directed towards the current occupants may be appropriate.

Ten ground water monitoring wells and one ground water remediation well have been identified within the designated search radius surrounding the subject site. Six of these monitoring wells are located on the subject property. Four industrial water supply wells (status unknown) have been identified within the designated search radius. A former occupant of a portion of the current subject site (Raferty Brown Steel Co.) utilized a supply well. The operational status of these industrial water supply wells and monitoring wells is currently unknown. If confirmation of the status of the identified wells is necessary, then an inquiry directed towards the current occupants may be appropriate.

Several occupants along the south side of E. Aurora Street are not identified on the Waterbury Water Company list, but are recorded as being on public water per the Waterbury Tax Assessor's Field Cards. If confirmation of the status of the occupants' public water status is necessary, then an inquiry directed towards the current occupants may be appropriate.

The Naugatuck River and associated wetlands, located approximately 1,000 feet east of the subject site in a hydrogeologic cross to down-gradient position, is considered a potential receptor of any ground water contamination potentially originating from the site. The Naugatuck River has been assigned a water quality classification of "C/B", indicating that it is presumed to be significantly degraded and unsuitable as a potential drinking water supply.

WELL DRILLER'S PERMIT

Fee $4.00

I, Thomas E. Lovell, of the firm of Premco Drilling Co. Inc.
(address) Box 302, Canton, Connecticut
hereby state that I (we) am (are) a well driller duly and currently registered with the State of Connecticut Water Resources Commission and do make application herewith for a Well Driller's Permit in accordance with the provisions of Public Act 187 of the 1963 Session of the Connecticut Legislature, for a well to be drilled on the property of:

Name of Property Owner: Mr. Nelson P. Hart (Raferty Brown Steel Company)

Address of Property Owner: Box 192, Waterbury, Connecticut

Address of Premises on which well is located: 420 Huntington Avenue, Waterbury

The approximate location of the well will be as shown on the reverse side of this permit.

The undersigned is aware that upon completion of this well the above data, together with a well log of information required under (c) and (d) of Public Act 187 of the 1963 Session must be sent to: Water Resources Commission, 223 State Office Building, Hartford, Connecticut on the form entitled "Well Completion Report" which has been supplied to registered drillers.

Thomas E. Lovell
Applicant

This permit is issued for a well located as shown to the above named well driller in accordance with the Provisions of Public Act 187 of the 1963 Session of the Connecticut Legislature this 4th. day of January, 1966

	Receiving Stream STEEL'S BROOK	Watershed NAUGATUCK RIVER			
Mailing Address EAST AURORA ST	Contact JEAN KRRWIN - PLANT SUPT.				
	Type of Problem - (Serious), Routine, Minor, None				
Date Est. 1903	No. of Employees	100	15	85	2 — 80 — 5
Date Last Exp. —	Report by J. AHERN	Date 6/10/62			

Products CASTING, ROLLING, NICKEL, SILVER, BRASS, PHOSPHOR BRONZE

Processes
A CASTING
B ROLLING
C PICKLING
D ANNEALING

Origin of Waste
C

Waste Contains
A SULFURIC ACID (E) ZINC
B NITRIC ACID (F) PHOSPHOR
C NICKEL
D COPPER

Water Used For	Sanitary Wastes	Industrial Wastes	Clean Water
Discharged To	STREAM (U)	STREAM (U)	STREAM

Water Usage	Gals per day	How Computed
Sanitary Sewage	1500	100 x 15
Industrial Wastes	10,200	T - (SS + BW + CD) = I.W.
Clean Discharge	108,000	90% TOTAL (CONTACT)
Boiler Water	300	150 HP - 10 HRS - 5% make up
In Product		
Unaccounted		
Total Used	120,000	250 GPM - 8 HRS (CONTACT)

1. INTRODUCTION, PURPOSE AND SCOPE

This guidebook addresses MacDermid Incorporated (MacDermid) property located at 526 Huntingdon Avenue in Waterbury, Connecticut (the Site). MacDermid has elected to make use of the institutional control process for managing and controlling the human health risks that may be present at the Site and that may result in exposures as a result of, or during, facility changes. This control process is called Project and Activity Analysis (PAA).

The purpose of the PAA process is to provide the basis for a consistent approach to addressing the stabilization requirements associated with facility changes at the Huntingdon Avenue Site. The PAA process is being implemented to control human exposure to environmental contaminants in soil and groundwater. Regardless of the particular facility change, any activity that results or could potentially result in human exposure to soil and/or groundwater is subject to the PAA process. Facility modifications that would prompt a PAA include:

- Onsite underground utility repair;
- Onsite landscaping (involving excavation to depths greater than 6-inches; routine maintenance would not be included);
- Onsite excavation outside of landscaped areas to any depth;
- Pavement replacement; and
- Removal of building structures including flooring.

A flow chart, to be utilized during PAA process to assess potential environmental exposures, has been included in Attachment A.

1.1 Goal of PAA

The PAA has been designed to establish a change to management systems in the interest of:

- Minimizing potential environmental and health and safety impacts;
- Ensuring continued compliance with all applicable local, state and federal environmental health and safety regulations; and
- Ensuring facility changes, are reviewed by MacDermid Environmental Health and Safety personnel to minimize impacts.

2. TERMINOLOGY

In developing the PAA guidebook, certain terminology is used to describe facility features, equipment, participating MacDermid personnel (or designated subcontractors), and processes. The section provides a description of the components of this guidebook.

2.1 PAA

Project and Activity Analysis - A review process by which facility changes and site modifications are reviewed by MacDermid Environmental Health and Safety personnel for the purpose of minimizing potential exposure and impacts to the environment and human health.

2.2 PAA Inquiry

Party or process that initiates a PAA. The person making such an inquiry should be the most knowledgeable and responsible for the facility modification.

2.3 PAA Approval

Issued by a MacDermid Environmental Health and Safety professional or other qualified person authorized by a MacDermid Environmental Health and Safety professional following the appropriate review of the facility modification. The approving party may include one person or a team of people having the appropriate specific technical expertise.

2.4 Facility Alteration

A change or modification to the facility structure or infrastructure. A change or modification may include but is not limited to: underground utilities, activities resulting in water discharges, excavations to depths greater than 6 inches in landscaped areas, repair to drains, excavation to any depth outside landscaped areas, removal and replacement of paving, removal of building structures or parts thereof, repair to sumps, and repairs to trenches.

2.5 PAA Threshold Criteria

PAA Threshold Criteria are those default numeric criteria utilized in the evaluation of analytical data to qualitatively assess the potential risks associated with exposure to soil and groundwater at the Site. Specifically, soil PAA Threshold Criteria are the default numeric Commercial/Industrial Direct Exposure Criteria established in Section 22a-133k-2 of the Regulations of Connecticut State Agencies. Groundwater Threshold Criteria are the default

numeric Groundwater Protection Criteria and Commercial/Industrial Volatilization Criteria established in Section 22a-133K-3 of the Regulations of Connecticut State Agencies.

As these default criteria can be modified through modification to the underlying Connecticut regulation, the person or persons reviewing a PAA shall ensure PAA Threshold Criteria are current.

3. PAA PROCESS

A process flow chart to be utilized in implementing the PAA process is provided as Attachment A.

3.1 Process Details

- All PAA shall be submitted and approved prior to initiation of a facility alteration. NO work shall be started without PAA approval. Examples of activities which require a PAA include but are not limited to:
    - Repair of underground utilities;
    - Activities resulting in water discharges;
    - Excavations to depths greater than 6 inches in landscaped areas;
    - Repair to onsite facility drains;
    - Excavation to any depth outside landscaped areas;
    - Removal and replacement of paving;
    - Removal of building structures or parts thereof;
    - Repair to sumps; and
    - Repairs to trenches.
- The scope of a PAA may be for single facility alteration or for an entire building or Site modification.
- The PAA should be submitted as early as possible in the proposed alteration process to ensure a complete review and evaluation of process change.
- Exemptions to the PAA process exist and include those alterations that do not present a potential impact to soil, groundwater or air and which also do not create a potential exposure to soil or groundwater at the Site.
- The MacDermid Environmental Health and Safety team should be consulted whenever clarification is required.

3.2 Responsibilities

3.2.1 PAA Inquiry

The person or party requesting an alteration will submit a PAA request to the designated PAA Approval group, most likely the Environmental Health and Safety team. The PAA request will be completed on a standardized request form, either in hardcopy or electronic form. The following provides a description of the types of information that is included on a PAA request form. A copy of a generic form is included in Attachment B.

- In order for a comprehensive assessment and subsequent approval to occur, the person requesting the alteration must supply adequate information which will generally include: type and description of alteration, material safety data sheets (MSDS) as appropriate, chemical usage, location of proposed alteration, and applicable supporting documentation (e.g. drawings, specifications, process sheets, etc.). The person seeking PAA approval must supply additional information, as requested by the approving party.

- Once an approval is granted, the person requesting approval must,

    - Note the PAA approval number on any financial information as necessary;

    - Meet all conditions assigned to the requesting party. This may also apply to any subcontractors or third parties working as part of the alteration.

    - Communicate any specific conditions of the PAA to individuals, subcontractors or parties involved with the alteration. This may include posting the PAA in the location of the proposed alteration.

- The person or party requesting the PAA is responsible for fulfilling any PAA conditions issued by the approving party prior to initiating the alteration.

- Once the alterations are completed, the person requesting the PAA is responsible for closing it and ensuring the approval team is notified.

3.2.2 PAA Approval

The person or party issuing an approval for a PAA will have the responsibility of reviewing, approving, identifying conditions, and maintaining a record of open and closed PAA. As part of the PAA review, all applicable environmental, health and safety laws, regulations, permits and standard operating procedures will be considered. In the event the PAA is incomplete and/or

additional information or supporting documentation is required, then the person reviewing the PAA will immediately notify the person submitting the PAA.

If the person reviewing the PAA does not have specific technical knowledge or the necessary resources to review all aspects of the PAA, then the person must forward the PAA to the appropriate knowledgeable person or parties for review.

The following administrative responsibilities are assigned to the person reviewing the PAA.

- The person reviewing the PAA must do so in a reasonable time period. A record will be maintained by the reviewer that documents the review and approval or provides an explanation for rejection of the PAA. Upon completion of the review process, the person who submitted the PAA will be notified and provided with the status of the PAA (i.e. approval, denial, approval with conditions).

- The approving party must include all conditions which are necessary to ensure records are updated including but not limited to inventory changes, permits, emergency response plans, and project assessment.

- Once the alterations have been completed, the approving party is responsible for ensuring the PAA is closed out and recorded appropriately through either written or electronic documentation. Closure of the PAA should be completed by the person requesting the alteration (See Section 3.2.1).

3.3 PAA Awareness Training

Any and all new, transferred or current MacDermid employees whose job responsibilities may include alterations to the Site are required under this PAA process to receive PAA awareness training. PAA awareness training may also be incorporated as a component of other related training for those employees at the Site, including but not limited to health and safety training and hazardous materials handling and shipping.

Training records must be maintained for those personnel who receive PAA awareness training and these records will be maintained with other employee training records.

3.4 PAA Auditing

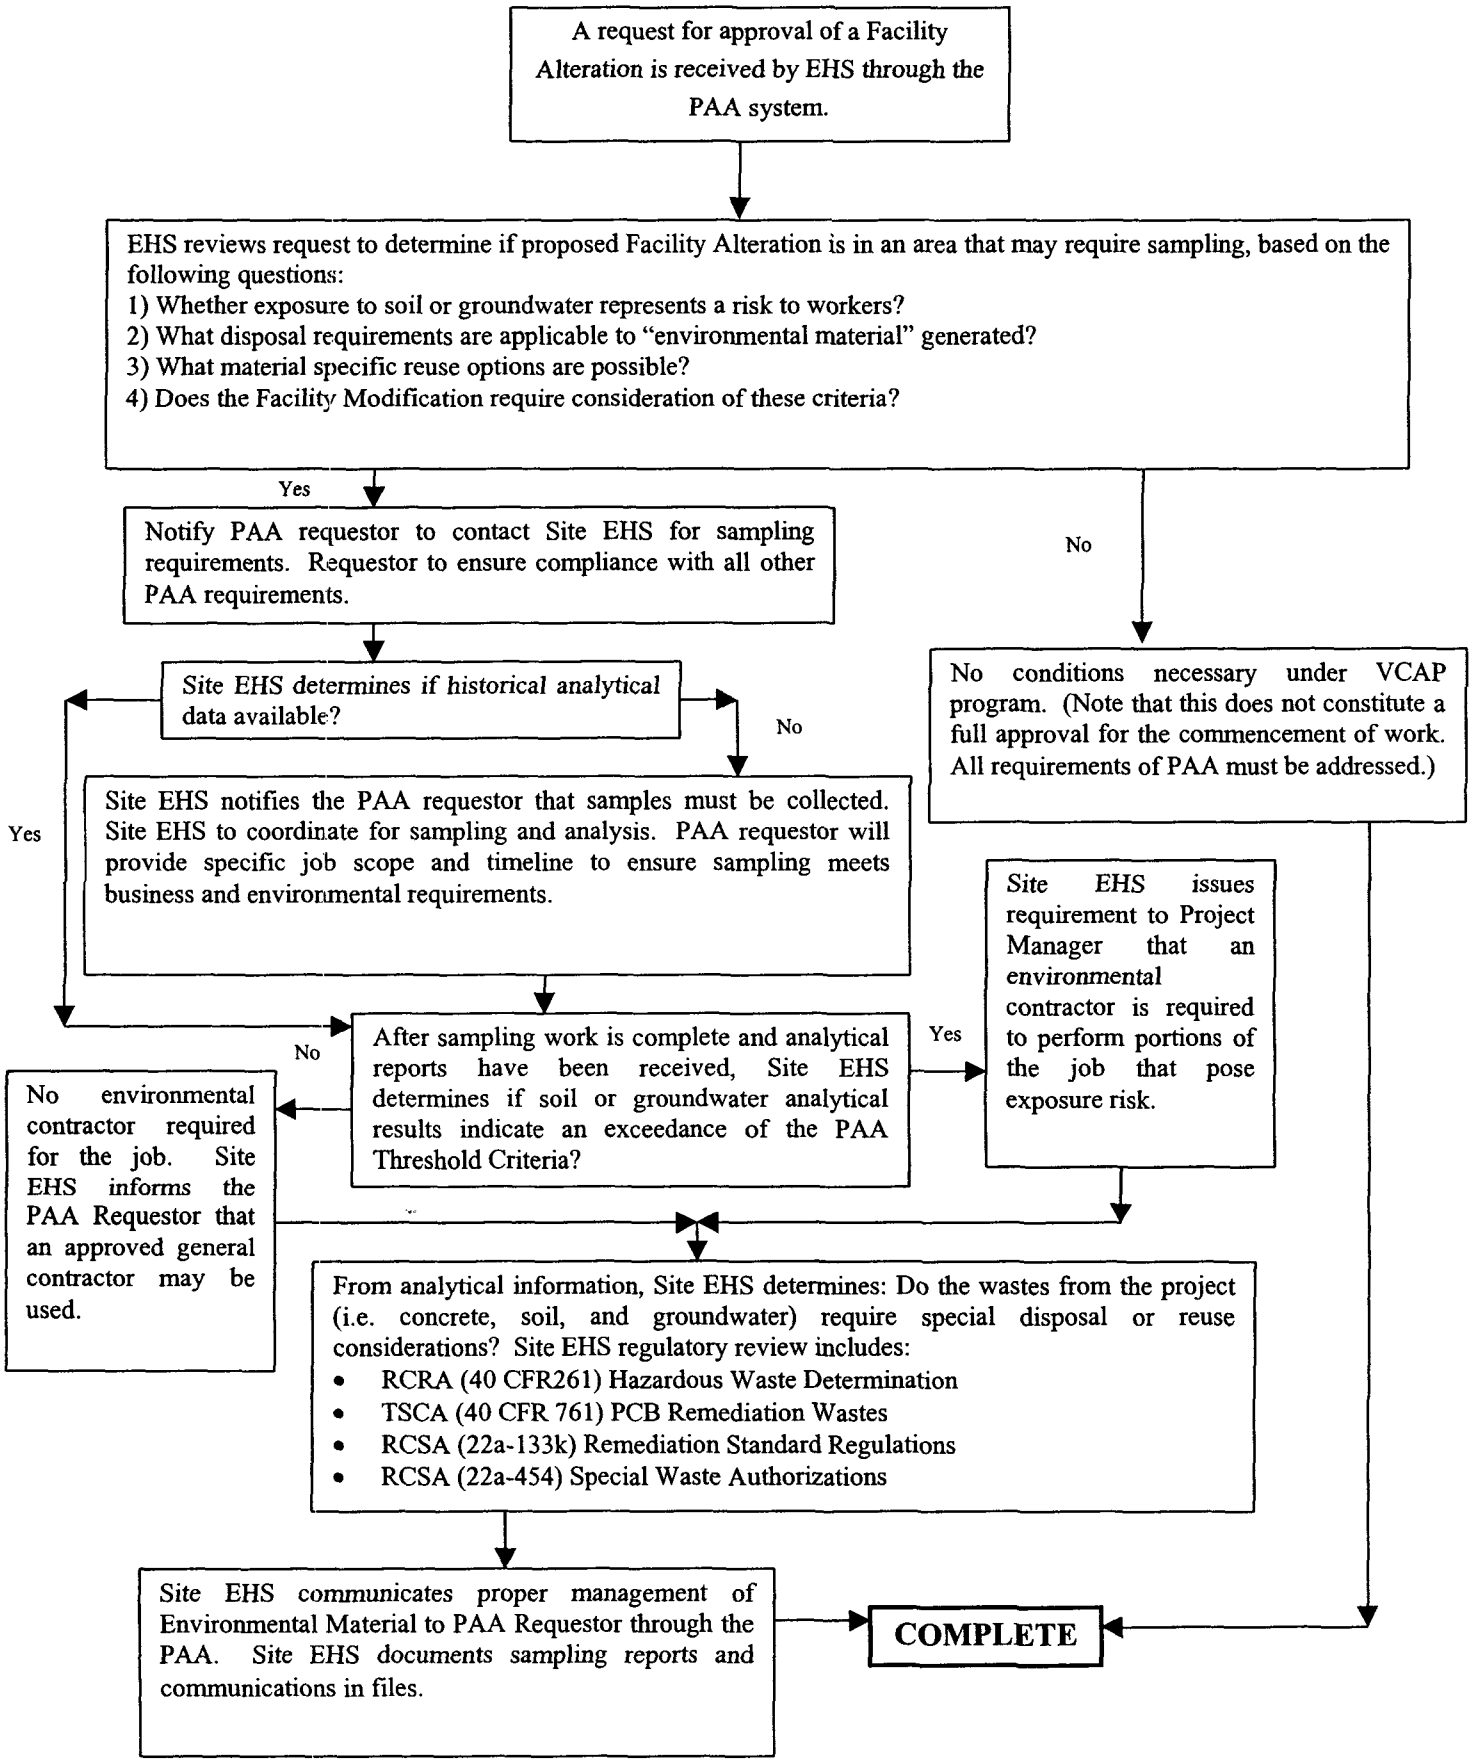
The PAA process should be audited annually, at a minimum, to verify compliance with this procedure. As with personnel training, the auditing process may be incorporated into other related Site or management system audits. Audits of the PAA process must be recorded and

maintained at the facility or appropriate MacDermid office. Specific items to be included in such an audit may include:

- PAA are submitted for all appropriate activities.
- PAA are processed in a timely manner.
- PAA are posted, as necessary.
- PAA conditions, if applicable, are met.

Attachment A

Flow Chart of General Steps Taken to Assess Environmental Exposure



A request for approval of a Facility Alteration is received by EHS through the PAA system.
EHS reviews request to determine if proposed Facility Alteration is in an area that may require sampling, based on the following questions:
1) Whether exposure to soil or groundwater represents a risk to workers?
2) What disposal requirements are applicable to "environmental material" generated?
3) What material specific reuse options are possible?
4) Does the Facility Modification require consideration of these criteria?
Yes
No
Notify PAA requestor to contact Site EHS for sampling requirements. Requestor to ensure compliance with all other PAA requirements.
No conditions necessary under VCAP program. (Note that this does not constitute a full approval for the commencement of work. All requirements of PAA must be addressed.)
Site EHS determines if historical analytical data available?
No
Yes
Site EHS notifies the PAA requestor that samples must be collected. Site EHS to coordinate for sampling and analysis. PAA requestor will provide specific job scope and timeline to ensure sampling meets business and environmental requirements.
Site EHS issues requirement to Project Manager that an environmental contractor is required to perform portions of the job that pose exposure risk.
Yes
No
After sampling work is complete and analytical reports have been received, Site EHS determines if soil or groundwater analytical results indicate an exceedance of the PAA Threshold Criteria?
No environmental contractor required for the job. Site EHS informs the PAA Requestor that an approved general contractor may be used.
From analytical information, Site EHS determines: Do the wastes from the project (i.e. concrete, soil, and groundwater) require special disposal or reuse considerations? Site EHS regulatory review includes:
• RCRA (40 CFR261) Hazardous Waste Determination
• TSCA (40 CFR 761) PCB Remediation Wastes
• RCSA (22a-133k) Remediation Standard Regulations
• RCSA (22a-454) Special Waste Authorizations
Site EHS communicates proper management of Environmental Material to PAA Requestor through the PAA. Site EHS documents sampling reports and communications in files.
