SUBJECT: Georgetown Flume - FYI

Quarterly monitoring results (1st quarter 1990) for the Georgetown Flume indicate that PCB levels in the flume head have increased to ≈ 54 ppm. During winter quarter 1989 sampling results for the flume head were 9.6 ppm, although spring quarter 1989 was 28 ppm. It appears that there is some seasonal fluctuation & that early in the year PCB levels increase. Flume cleanup & closure should be pursued pending NOAA suit outcome.
