Re: Response to Request for Information dated September 9, 2014
Class III Underground Injection Control (UIC) Well Permit Application
Curis Resources (Arizona) Inc.

Dear Ms. Rumrill:

Florence Copper, Inc. (Florence Copper) is pleased to submit the following in response to Mr. David Albright's September 9, 2014 letter to Mr. David Copeland, and to the Request for Information (RFI) included as an attachment to Mr. Albright's letter. Florence Copper's responses to each of the comments identified in the RFI are provided below. Each comment is listed in italics and is followed by our response.

Rather than submit a complete revised Application, we are submitting replacement pages and sections for items in the Application that have been revised in response to the RFI dated September 9, 2014 (Appendices 1 through 10). We have also provided a table listing all pages/sections being replaced and/or inserted. The revised pages/sections being provided contain changes made throughout the Application in response to the RFI dated September 9, 2014, and incorporates all changes made in response to earlier RFIs. A complete, revised electronic copy of the Application has also been provided on CD.

We believe the following is responsive to the September 9, 2014 RFI and we are available to answer any questions you might have.

Thank you for your assistance.

Sincerely,
Florence Copper Inc.

Daniel Johnson
Vice President – General Manager

cc: Richard Mendolia, Arizona Department of Environmental Quality
David Albright, U.S. Environmental Protection Agency

Appendix	UIC Application Section	Comment Reference
Appendix 1	Table C-1	Comment 1
Appendix 2	Exhibit C-1	Comment 2
Appendix 3	Attachment H Text	Comment 4
Appendix 4	Table H-1	Comment 5
Appendix 5	Figure M1-1 (Attachment M, Exhibit M-1; also Attachment P, Exhibit P-2)	Comment 7
Appendix 6	Table 5.2 (Attachment R, Exhibit R-1)	Comment 8
Appendix 7	Attachment R Text	Comment 8
Appendix 8	Exhibit R-2	Comment 8
Appendix 9	Exhibit Q-4 (PTF AOR Wells only)	Comment 9
Appendix 10	Attachment S Text	Comment 10

Comment 1

In Attachment C of the UIC Permit application, the two core holes drilled in 2011 were added to Table C-1. The status of these core holes should note they are abandoned. Also, the driller's logs provided for these core holes did not include a record for cementing of the intermediate casing. Further, the CMP11-06 core hole was reported as plugged with cement from the surface to 352 feet inside the casing; however, the casing was set to a depth of 429 feet, which is below the Lower Basin Fill Unit (LBFU). Please provide a more detailed description and schematics of the construction and plugging records, so that we may determine the necessity of any potential corrective action.

Response to Comment 1

Table C-1 has been revised to show that core holes CMP11-06 and CMP11-05 have been plugged and abandoned. A revised version of Table C-1 is provided in Appendix 1 of this response. Please remove and discard Table C-1 from your copy of the UIC Application submitted in August 2014, and replace it with the Table C-1 provided in Appendix 1.

FCI has conducted an additional search for cementing records associated with core holes CMP11-05 and CMP 11-06. The search resulted in the identification of additional perforation records for core hole CMP11-05. The perforation records are included with the cementing records in a revised version of Exhibit C-1 provided in Appendix 2. Please remove and discard the entire Exhibit C-1 from your copy of the UIC Application submitted in August 2014, and replace it with the Exhibit C-1 provided in Appendix 2 of this response.

Schematic diagrams showing the plugging and abandonment details of core holes CMP11-05 and CMP11-06 are included with the revised plugging and abandonment forms provided in Appendix 9 of this response. The revised plugging and abandonment forms for the PTF AOR Wells (including CMP11-06 and CMP11-05) are provided in Appendix 9 to replace the versions in our August 2014 submittal. Please remove and discard the PTF AOR Wells Section of Exhibit Q-4 of your copy of the UIC Application submitted in August 2014, and replace it with the revised PTF AOR Well forms provided in Appendix 9. Note: the BHP Wells section of Exhibit Q-4 remains unchanged.

Comment 2

Four other core holes, MCC367, MCC368, MCC535, and MCC561, have no record of a cemented annulus. Please provide a more detailed description and schematics of the cementing and plugging history of these core holes if that information is available. As discussed with Dan, these core holes may require some corrective action (i.e., placing cement at the base of the USDW) if there is not a clear record of a cement seal behind the casing.

Response to Comment 2

FCI has conducted an additional search for cementing records for core holes MCC367, MCC368, MCC535, and MCC561. The search resulted in the identification of one additional page of cementing records for core hole MCC367. No additional cementing records were identified for core holes MCC368, MCC535, or MCC561. The additional record has been inserted into Exhibit C-1 adjacent to the records previously provided for core hole MCC367.

The additional cementing record identified for core hole MCC367 indicates that the core hole was cemented form the total depth to the bottom of casing, and that cement was then circulated around the casing with a total volume of 700 gallons of type V cement used.

Cementing records previously provided for core hole MCC368 similarly indicate that the core hole was cemented from the total depth to the bottom of casing, and then cement was circulated around the casing with a total volume of 800 gallons of Type V cement used.

Cementing records previously provided for core hole MCC535 indicate that the core hole was cemented from the total depth to the top of casing with a total volume of 650 gallons of Type V cement used. The record indicates that casing was left in the hole between 220 and 360 feet depth. No further information is provided in the record regarding cement circulation around the casing.

Cementing records previously provided for core hole MCC516 indicate that the core hole was cemented from the total depth to the top of casing with a total volume of 800 gallons of Type V cement used. The record indicates that casing was left in the hole between 50 and 450 feet depth. No further information is provided in the record regarding cement circulation around the casing.

All of the cementing records described above are provided in a revised version of Exhibit C-1 provided in Appendix 2 of this response. The revised Exhibit C-1 includes one additional page for MCC367, and re-categorizes core holes CMP11-05 and CMP11-06 as abandoned on the Table of Contents provided at the beginning of Exhibit C-1.

Please remove and discard the entire Exhibit C-1 from your copy of the UIC Application submitted in August 2014, and replace it with the Exhibit C-1 provided in Appendix 2 of this response.

Comment 3

Please provide a more complete description and a schematic of the construction and plugging record for the DM-B well, if that information is available.

Response to Comment 3

FCI has conducted an additional search for cementing records for well DM-B. FCI has also been in contact with a former BHP employee that witnessed the plugging and abandonment of well DM-B and that former employee has provided an anecdotal account of the abandonment. However no additional cementing records have been located for well DM-B.

The DM-B well location is known and FCI plans to excavate the site to confirm the abandonment once the necessary clearance to excavate is obtained in accordance with Section 106 of the National Historic Preservation Act.

Comment 4

In Attachment H, Section H.3, Rate and Volume of Fluid to be Injected, please clarify discussion of the proposed total injection rate of 240 gallons per minute (gpm) and recovery rate of 300 gpm, and how those rates relate to the proposed average injection rate of 0.15 gpm/ft of injection interval and maximum injection rate of 0.20 gpm/ft and the initial minimum extraction to injection volume ratio of 110 percent. Also, please confirm the discussion aligns with the description of these rates and volumes in Attachment K and the Operations Plan in Exhibit K-2 and Table H-1 as discussed below.

Response to Comment 4

The text of Section H.3 of Attachment H has been revised to clarify that the maximum injection rate is limited to 240 gpm, and that the maximum extraction rate is limited to 300 gpm. Text has also been added to clarify that the proposed injection interval length may vary based on final well construction and packer configuration, which will in turn affect the injection rate per foot of injection interval. The final injection interval length and packer configuration will not be determined until the proposed wells have been drilled and constructed. However, regardless of well configuration or the length of the packer interval in each well, the total injection limit of 240 gpm will apply as will the extraction limit of 300 gpm.

Revised Attachment H text is provided in Appendix 3 to replace the version in our August 2014 submittal. Please remove and discard the text portion of Attachment H of your copy of the UIC Application submitted in August 2014, and replace it with the revised pages provided in Appendix 3.

Comment 5

Table H-1, Injection Rates and Volumes: The typical length injection interval of 580 feet and typical injection rate of 0.15 gpm/ft yield a total rate of 348 gpm in four injection wells in the PTF, however Table H-1 notes a planned total injection rate of 240 gpm. Please clarify and note that the initial minimum extraction:injection volume ratio is 110 percent, subject to change with prior EPA approval.

Response to Comment 5

Table H-1 of Attachment H has been modified to reflect “typical” injection interval of 400 feet, and an average injection rate of 0.15 gpm/ft to achieve an injection rate of 60 gpm per injection well. This configuration results in an aggregate injection rate of 240 gpm for the well field, which is the maximum proposed injection rate. A note has been added to Table H-1 to clarify that in all cases, the aggregate well field injection rate is limited to 240 gpm.

As noted in response to Comment 4 above, individual injection wells may have longer or shorter injection intervals depending on final well construction and packer configuration. Although injection intervals may be longer than 400 feet, the maximum injection rate is limited to 240 gpm for the entire well field. Consequently, longer injection intervals may result in lower injection rates per foot of injection interval, and shorter injection intervals may result in injection rates that are higher than the proposed average per foot of injection interval. However, in all cases, the aggregate well field injection rate is limited to 240 gpm regardless of injection interval length and well configuration.

A revised version of Table H-1 is provided in Appendix 4 to replace the version in our August 2014 submittal. Please remove and discard Table H-1 from Attachment H of your copy of the UIC Application submitted in August 2014, and replace it with the revised Table H-1 provided in Appendix 4.

Comment 6

Please clarify the type of casing to be installed in the operational, multi-level sampling, operational monitoring, and supplemental monitoring wells. Your response to RFI comment 10 states that those wells "will not have steel casing installed to bedrock, unless the well extends to the top of bedrock or deeper." However, proposed well designs depicted in figures M-3, M-4, 9A-3, and 9A-4 (in Attachments 0 and P) indicate these wells will be drilled and screened into the bedrock and have fiberglass reinforced casing.

Response to Comment 6

The observation, multi-level sampling, operational monitoring, and supplemental monitoring wells will not have steel casing installed to bedrock. The well construction details shown in Figures M-3, M-4, 9A-3, and 9A-4 correctly depict that these wells will be constructed with fiberglass reinforced casing.

Steel collars extending from ground surface to 40 feet below the top of bedrock will only be installed on injection and recovery wells.
Given that the misstatement identified in this comment occurred in the response document and not in the text of the Application, and that the Figures referenced in the comment correctly depict the proposed well construction, no replacement pages or replacement figures are provided for this response.

Comment 7

Attachment P, Exhibit P-2, Figure M1-1, Operational Monitoring MW-01 Proposed Well Design: The casing design requires clarification because steel casing is specified through the upper portion and PVC casing is specified in the lower segment of the deeper well through the LBFU but a steel to PVC adapter is shown connecting to the PVC screen in the Oxide unit. Please clarify or correct that depiction. Please also add a LBFU label and Oxide label to the upper and lower screened intervals, respectively in this figure.

Response to Comment 7

The proposed construction of Operational Monitoring Well MW-01 includes mild steel casing and PVC well screen. Both casings shown on Figure M1-1, Exhibit P-2 of Attachment P, will be steel from the surface to the interface with the PVC well screen. Figure M1-1 has been revised to reflect construction that includes steel casing from the surface to the top of the well screen, where an adapter will be installed to join the PVC screen to the steel well casing.

A revised version of Figure M1-1 is provided in Appendix 5 to replace the version in our August 2014 submittal. Figure M1-1 also occurs in Attachment M, Exhibit M-1 of our August 2014 submittal. Please remove and discard Figure M1-1 from Attachment P, Exhibit P-2 and Attachment M, Exhibit M-1 of your copy of the UIC Application submitted in August 2014, and replace it with the revised Figure M1-1 provided in Appendix 5 (two copies of Figure M1-1 are provided).

Comment 8

Attachment R, Exhibit R-1, Closure and Post-Closure Cost Estimates: As discussed with Dan Johnson, the total cost estimates presented in Table 5-2 do not include the BHP test wells and facilities presented in Table 5-2a. Please update Attachment R accordingly, and also include documentation of any other existing financial assurance.

Response to Comment 8

A revised version of Table 5.2 (Attachment R, Exhibit R-1) is provided in Appendix 6. The revised Table 5.2 incorporates Table 5.2a which describes the costs associated with closure of the BHP well field and an additional 10-percent administrative cost. The revised Table 5.2 is sealed by an Arizona Professional Engineer, and is dated September 4, 2014.

A revised version of Table 5.2 of Exhibit R-1 is provided in Appendix 6 to replace the version in our August 2014 submittal. Please remove and discard Table 5.2 from Attachment R, Exhibit R-1 of your copy of the UIC Application submitted in August 2014, and replace it with the revised Table 5.2 provided in Appendix 6.

FCI has provided a financial assurance instrument for closure of the PTF facilities in the amount of $3,487,743, provided in Exhibit R-2 of our August 2014 submittal. This instrument reflects the amount of financial assurance required by the Arizona Department of Environmental Quality to cover closure costs of the PTF infrastructure and facilities under APP No. 106360.

In addition to this financial assurance instrument, FCI has secured an additional instrument in the form of a Surety Bond issued by the Lexon Insurance Company in the amount of $1,066,000 for the closure of discharging facilities constructed by BHP under Aquifer Protection Permit (APP) No. 101704. The discharging facilities listed under APP No. 101704 inlcude process solution ponds and runoff ponds which were never constructed, one evaporation pond, and the Class III wells constructed for the BHP pilot test. As noted in Table 5.2, the cost to close the BHP test wells is $194,018, and administrative and contingency costs totaling an additional 25 percent. At a minimum, the instrument is sufficient to cover closure costs of the BHP test wells, with additional funds remaining to close other discharging facilities.

The text of Attachment R, Section R.4 has been revised to include a description of the financial assurance instrument associated with APP No. 101704. A copy of the instrument has also been added to Exhibit R-2.

The following replacement pages/sections are provided to replace, or be added to, the versions in our August 2014 submittal:

- A revised version of the Attachment R text is provided in Appendix 7; please remove and discard the Attachment R text portion of your copy of the UIC Application submitted in August 2014, and replace it with the revised Attachment R text provided in Appendix 7.
- A copy of the additional Surety Bond issued by the Lexon Insurance Company in the amount of $1,066,000 is provided in Appendix 8; please add this document to Attachment R, Exhibit R-2 of your copy of the UIC Application submitted in August 2014

Comment 9

Plugging and Abandonment Plans for Proposed PTF Wells and AOR Monitoring wells: The information presented on the EPA P&A Plan forms should not include cement volumes and estimated costs to construct the wells. The forms should only cite calculated cement volumes required to plug the wells and estimated abandonment costs.

<u>Response to Comment 9</u>

The plugging and abandonment forms for the PTF AOR Wells (Exhibit Q-4) have been revised to remove well construction information. The revised forms now include only the calculated cement volumes required to plug the wells and estimated abandonment costs.

The revised plugging and abandonment forms for the PTF AOR Wells are provided in Appendix 9 to replace the versions in our August 2014 submittal. Please remove and discard the PTF AOR Wells Section of Exhibit Q-4 of your copy of the UIC Application submitted in August 2014, and replace it with the revised PTF AOR Well forms provided in Appendix 9. Note: the BHP Wells section of Exhibit Q-4 remains unchanged.

Comment 10

Attachment S, Section S.4, Proposed Aquifer Exemption: Please delete "proposed" in the section header and the text and add "original" before "Area of Review" in the first sentence for clarity. Please delete reference to the figures in Attachment D in that sentence since the lower limit of the exempted zone is not depicted in those figures. Please include reference to the boundary limits as "The vertical limit of the aquifer exemption are depicted in Figure S-2 and the lateral and vertical limit are described in Exhibit S-1."

Response to Comment 10

The text of Attachment S has been revised to reflect the limits of the existing aquifer exemption established at the FCP site in conjunction with UIC Permit No. AZ396000001.

A revised version of the Attachment S text is provided in Appendix 10 to replace the version in our August 2014 submittal. Please remove and discard the Attachment S text portion of your copy of the UIC Application submitted in August 2014, and replace it with the revised Attachment S text provided in Appendix 10.

APPENDIX 1

Revised Table C-1

Table C-1 . Wells and Core Holes within 500 Feet of the PTF Well Field

General Information							Construction Details											Well Abandonment Details						
Location Name	ADWR Number	Type	Status	Easting	Northing	Surface Elevation (Feet)	Total Depth (Feet)	Diameter of Surface Borehole (Inches)	Diameter of Surface Casing (Inches)	Depth of Surface Casing (Feet)	Diameter of Intermediate Borehole (Inches)	Diameter of Intermediate Borehole Casing (Inches)	Depth of Intermediate Borehole (Feet)	Depth of Intermediate Borehole Casing (Feet)	Diameter of Inner Pipe (Inches)	Cement Seal (Feet)	Diameter of Core Hole	Abandonment Material	Bottom Depth (Feet)	Upper Depth (Feet)	Approximate Volume (Gallons)	Drilller's Log Available	Geologic Log Available	Comments

Subject HOLE SUMMARY 133-S

Coordinates: 746,398.00N 647,690.95E ~~I-2W~~ J-2W
Collar Elevation: 1477.01' est.
Depth to Bedrock: 538'
Oxide-Sulfide Interface: 1494'
Total Depth: 2217'
Rotary Starting Date: 10-14-71 Completion: 10-15-71 Footage: 560'
Core Starting Date: 5-10-72 Completion: 6-13-72 Footage: 1657'
Inclination: 6° S45°W @ 2200'.
Assay Data:

Cross Section:

560.5' - 645' = 84.5' @ .39 Oxide
645' - 700' = 55' @ .78 Oxide
700' - 770' = 70' @ .38 Oxide
770' - 815' = 45' @ .08 Oxide
815' - 865' = 50' @ .58 Oxide
865' - 895' = 30' @ .31 Oxide
895' -1380' = 485' @ .46 Oxide
1380'-1495' = 115' @ .24 Oxide
1495'-2218' = 723' @ .10 Sulfide

200 Scale:

560' - 765' = 205' @ .50 Oxide
815' -1380' = 565' @ .47 Oxide
1380'-1495' = 115' @ .24 Oxide
Total - 885' @ .45 Oxide

Waste:Ore Ratio: 0.79:1
Internal Waste:Ore Ratio: 0.09:1

Rock Types:

0' - 538' ---------- Conglomerate
538' - 601' ---------- Quartz Monzonite Porphyry
601' - 607' ---------- Aplite
607' - 669' ---------- Quartz Monzonite Porphyry
669' - 687' ---------- Diabase
687' - 777' ---------- Quartz Monzonite Porphyry
777' - 813' ---------- Dacite Porphyry
813' - 933' ---------- Quartz Monzonite Porphyry
933' - 938' ---------- Granodiorite Porphyry #1
938' - 1077' ---------- Quartz Monzonite Porphyry
1077' - 1111' ---------- Granodiorite Porphyry #1
1111' - 1124' ---------- Quartz Monzonite Porphyry
1124' - 1131' ---------- Granodiorite Porphyry #1
1131' - 1240' ---------- Quartz Monzonite Porphyry
1240' - 1247' ---------- Diabase
1247' - 1261' ---------- Quartz Monzonite Porphyry
1261' - 1313' ---------- Diabase

1860' -1920' = 60' @ .33 Sulfide
→ 1920' -1970' = 50' @ .44 Sulfide
1970' -2030' = 60' @ .31 Sulfide
→ 2030' -2080' = 50' @ .52 Sulfide

Total Oxide: 150' @ .45
Total Sulfide: 600' @ .44
Total Ore + Protore: 1,075'@ .40

Waste to Ore Ratio: 1.77:1
Internal Waste to Ore: 1.01:1

Mo and Ag in Ore and Protore:

Ore: 600' @ .0101 %Mo and .12 oz/tons Ag
Protore: 185' @ .0200 %Mo and .16 oz/tons Ag

Rock Types: The predominate rock type in 149-S was quartz monzonite porphyry with intrusions into it in the following intervals:

640' - 650' ---------- Andesite
702.5' - 792.5' ------- Granodiorite Porphyry #1
1327.5' - 1470' -------- Granodiorite Porphyry #3
1630' - 1637.5' ------- Diorite
1647.5' - 1652.5' ------ Diorite
1970' - 2010' --------- Granodiorite Porphyry #2
2065' - ~~2100~~' --------- Diorite
2075

MAGMA COPPER - FLORENCE
Drill Hole Summary
MCC544, (site F5)
September 10, 1995

Type: Rotary 0' to 30', Hx Diamond 30' to 1320.5'
Started: April 22, 1995; Completed: May 21, 1995
Total depth: 1320.5'
Collar coordinates: 745,956.03N; 647,696.25E
Top of casing elevation: 1473.10 ft
Ground elevation: 1473.70 ft
Azimuth: N/A
Inclination: -90°; downhole surveys at ±100 ft. increments from 400' to 1200' depth, with an off-interval measurement at 1315'.
Drilling contractor: Christensen Boyles Co.
Logged by: J. Downey
Purpose: Ore reserve confirmation and classification on the west side of the deposit during the 1995 pre-feasibility program. Hx holes core Gila Conglomerate for hydrologic data, packer tests, and down-hole geophysical logging. MCC544 is located approximately 5 feet west and 9 feet north of Conoco hole 459s.

Geologic Summary

The Quaternary alluvium from the surface to 318' is largely unconsolidated and consists of fine to very fine grained sands, interbedded with silts and clays, with a few small beds of coarser sands and occasional boulder beds. The fine sand and silt tend to alternate as thick beds (up to 25' thick) of one sediment, with minor beds (generally less than 1 foot thick) of the other. Both types are generally weakly to moderately calcareous, though local exceptions exist and often coincide with the coarser sands. The Tertiary Gila Conglomerate interval from 318' to 369' consists of moderately to poorly consolidated conglomerate/sed. breccia. Sorting is poor, with clast size ranging from a few millimeters to half a meter, supported by a semi calcareous matrix of silt and sand. Clasts are sub-angular to sub-rounded, and are usually basalt, andesite, granodiorite, or granodiorite porphyry. Quartz monzonite clasts are rare, and most occur below 359', where, coincidentally, there is a notable drop in carbonate content. The contact with bedrock at 369' is obscure, but seems to be depositional.

Precambrian Quartz Monzonite in the hole is fairly typical for the area, usually consisting of ~35% microcline, ~25% quartz, ~25% plagioclase, ~15% biotite, which is often partially or totally altered to chlorite. Alteration of the Precambrian Quartz Monzonite is generally potassic, defined here as moderate to abundant secondary biotite/chlorite, with varying amounts of Kspar-quartz-biotite veinlets. The interstitial secondary biotite in this hole is pervasive, though only locally strong, and the kqb veinlets are often absent entirely. Clay-sericite alteration is also present throughout the hole, though it is variable in intensity, and is enhanced in the oxide zone by supergene alteration. This alteration forms clay and sericite in the plagioclase feldspar sites, often stained by copper oxides. Biotite also seems to be affected, being altered to chlorite and locally to vermiculite. Some of the clay alteration is certainly primary, as it exists in and below the transition zone from oxide to sulfide. Mineralization consists of fracture chrysocolla ± tenorite and plagioclase hosted chrysocolla in fairly equal proportions, though the intensities of each are variable and do not seem to have any predictable relation.

There is an aphanitic mafic dike from 498.5' to 517.5', which is logged as Precambrian Diabase. The material is moderately altered to clay ± talc, and is strongly brecciated. The brecciation consists of angular fragments of ~1-4 cm size with a chrysocolla ± tenorite matrix. There are a few small needle-like phenocrysts in the rock that have been altered to iron oxides. Most of the dike is moderately to weakly magnetic, and the rock feels very dense in spite of the alteration.

MAGMA COPPER - FLORENCE
Interpretation of Downhole Geophysics
MCC-544

Memo to: File
From: Liz Greene
Date: November 1995

Subject: Geophysical Log Response Notes for MCC-544: correlation of geologic core logs with borehole geophysical logs.

GENERAL
Logs run: Caliper, Resistivity, SP(spontaneous potential), Gamma, Neutron, Sonic, VDL(variable density log).
Core size: 2.4 in. diameter (HX).
Casing size: 4 in.
Total depth: 1320.5 ft.
Drilled interval: 0-30 ft. rotary, 30-1320.5 ft. core.
Cased interval: 0-380 ft.
Logged depth: caliper 8-1300 ft., gamma and neutron 135-1320 ft., SP and resistivity 380-1320 ft., sonic and VDL 378-1312 ft.

Abbreviations:
Quaternary Alluvium - Qa
Tertiary Gila Conglomerate - Tgc
Precambrian Quartz Monzonite - Yqm
Precambrian Diabase - Ydb
Tertiary Granodiorite Porphyry - Tgdp

SUMMARY
Bedrock boundary:
Gradual increase on gamma log at Tgc/Yqm boundary. Significant increase at bedrock boundary on neutron log.

Fracture intensity:
Resistivity, gamma, neutron and sonic logs correlate to fracture intensity. In general as fracture intensity increases, resistivity decreases, gamma increases, neutron decreases and sonic velocity decreases (traveltime increases). There is a good example on the resistivity log in this well. A fault zone located at 1075-1120 ft. has two lows with a high of competent rock in between. This same zone is seen on the neutron, sonic and VDL logs with the expected responses.

Rock type response:
Quaternary Alluvium - low gamma, neutron.
Tertiary Gila Conglomerate - low gamma; neutron higher than Qal and lower than Yqm.
Precambrian Diabase - low resistivity, neutron.
Tertiary Granodiorite Porphyry - low gamma.
Tertiary Andesite - low gamma and neutron.
Biotite alteration - low resistivity and neutron, high gamma.

Oxide/sulfide boundary:
Resistivity - low in transition zone, very slight increase at top of sulfide zone 1300 ft., but below background.
Neutron - spike (high) at top of sulfides/bottom of transition zone - 1300 ft.

Memo

To:	Mel Lawson	**Date:**	October 5, 2011
Company:	Curis Resources Ltd.	**From:**	Daniel Russin
Copy to:	Bob Cluff	**Project #:**	204400.05
Subject:	Drill Hole Summary – CMP11-05, PQ Diameter Core		

Type: 0-427' 6.25" Rotary, cased to 427'
427-1200' PQ, 5' split barrel
Started: June 29, 2011 (diamond)
Completed: July 7, 2011
Total Depth: 1200 feet
Collar Coordinates: N: 746,095.87; E: 847,729.96 (UTM NAD 83 ft)
Ground Elevation: 1475 ft amsl (approx.)
Drilling Contractor: National (Rotary), Cabo Drilling Corp. (PQ Core)

1 Executive Summary

CMP11-05 was drilled to obtain large samples of core for metallurgical testing. Core was logged at the drill site and placed into plastic tubes for storage and transport to the analytical lab. Rotary drilling at this site was completed by National several weeks before the core drilling began. At the conclusion of PQ drilling, the rods got stuck in the hole and were not removed.

2 Downhole Survey

Downhole surveys were measured by Cabo and digitally recorded at approximately 100-foot increments below the top of bedrock. A subtraction of 11 degrees was made to the recorded azimuth to account for magnetic declination; note the declination calculators and charts range from a deviation of 10.3 to 11 degrees for this area. The measurements were recorded at the rig by Curis and SRK personnel.

Depth (ft)	Dip	Azimuth	Corrected Azimuth
456	-88.7	212.1	201.1
503.5	-88.8	176.8	165.8
600	-88.7	177.9	166.9
700	-88.9	189.3	178.3
800	No survey	No survey	No survey
900	-88.8	192.9	181.9
1000	-88.2	191.1	190.1
1100	-88.3	216.3	205.3
1200	-88.4	216	205

3 Geologic Summary

A summary of footages for rock type contacts is listed below. Contact angles are provided with respect to the core axis (TCA) and an indication if the contact is an intrusive or fault contact where known. It was not possible to assess fault or contact angle in core that was heavily broken or where core loss occurred.

Depth (ft)	Rock Type	Contact
0-427	Rotary – no recovery	
427-440	Yqm	Yqm → Mixed, Indeterminate contact
440-446	Mixed Yqm and Tgdp	Mixed → Tgdp, Indeterminate contact
446-457.5	Tgdp	Tgdp → Yqm, Indeterminate contact
457.5-670	Yqm	Yqm → Mixed, Fault contact?
670-675	Mixed Yqm and Tgdp	Mixed → Yqm, Fault contact?
675-759	Yqm	Yqm → Diabase, Fault contact, 60°
759-774.3	Ydb	Ydb → Yqm, Planar contact (fault?), 35°
774.3-858.5	Yqm	Yqm → Tgdp, Rubblized contact, appears ~50°
858.5-881.5	Tgdp	Tgdp → Yqm, Intrusive contact, 45°
881.5-1007.3	Yqm	Yqm → Mixed, Irregular contact
1007.3-1012	Mixed Yqm and Tgdp	Mixed → Tgdp, Irregular contact
1012-1017	Tgdp	Tgdp → Mixed, Irregular contact
1017-1026	Mixed	Mixed → Yqm, Irregular contact
1026-1057	Yqm	Yqm → Ta, Rubblized contact
1057-1065.2	Ta	Ta → Yqm, Irregular contact, ~25°
1065.2-1074.1	Yqm	Yqm → Mixed, Rubblized contact
1074.1-1078	Mixed Yqm, Tgdp, and Ta	Mixed → Yqm, Rubblized contact
1078-1200	Yqm	

3.1 Rock Types

Chip samples were not collected during mud rotary drilling of the basin-fill formations and bedrock to 427 feet. The depth to the top of bedrock is unknown, since rotary drilling and casing penetrated the contact.

Precambrian Quartz Monzonite (Yqm) constitutes 87.3% of the drill hole. This rock type consists of equigranular to coarsely porphyritic monzonite with an original texture of 25-35% quartz, 30-35% potassium feldspar, 20-25% plagioclase, and 5-8% biotite. The rock is broadly porphyritic in nature with large K-feldspar in a matrix of smaller quartz, plagioclase, and biotite. Most of the original texture has been overprinted by clay alteration and oxidation minerals (iron and manganese oxides), and has been disrupted by abundant fault breccia and gouge. Large, euhedral crystals of potassium feldspar exist at 0.5-3 cm across. Quartz crystals are 0.5-2 cm, plagioclase crystals are 2-10 mm, and biotite crystals are 1-10 mm in size.

Tertiary Granodiorite Porphyry (Tgdp) constitutes 3.1% of the drill hole. The rock contains 1-5 mm feldspar phenocrysts, mostly plagioclase, in an olive gray aphanitic matrix. Biotite phenocrysts compose ~10% of the rock. The geology logging did not attempt to segregate the granodiorite intercepts into Types 1, 2, and 3 as defined by Conoco.

Mixed Precambrian Quartz Monzonite (Yqm) and Tertiary Granodiorite Porphyry (Tgdp) constitutes 5.9% of the hole. SRK attempted to split out as many individual rock types as possible but in many cases the intervals were too small and were logged as a mixed zone. Often, the mineralogical composition was a true mix, meaning there were 2-5 mm plagioclase phenocrysts, indicative of the Tertiary Granodiorite Porphyry, intermixed with 1-2.5 cm salmon-colored K-feldspar crystals, found in Precambrian Quartz Monzonite. The overall mineral assemblages are consistent with those zones of non-mixing described above.

Tertiary Andesite (Ta) constitutes 1.3% of the hole. This rock type is a dark olive grey with an aphanitic texture. It contains some areas of intense copper oxide clay. Chrysocolla and tenorite are also present in some zones.

Precambrian Diabase (Ydb), constitutes 1.3% of the hole. This rock type is dark gray to black with strong alteration and mineralization.

3.2 Structure

Numerous fault structures, breccia zones, and fault planes were noted as described below. The breccia varies from crumbly, broken rock with no discernible breccia fragments or fault contact angles to well-milled breccia fragments in fine-grained gritty iron-stained matrix. Fault gouge consisting of clay and fine rock particles with or without slickensides was noted in many intervals typically less than one foot in thickness.

Depth (ft)	Fault Zones
464-475	Shattered rock, not milled breccia
477.5-479	Fault zone, 60°
485-498.5	Fault zone, gouge in various orientations
530-532	Fault zone, 65°
559.5-660	Fault zone, gouge in various orientations; **Rattlesnake Fault**
787-805	Fault zone, no orientation visible; **Thrasher Fault**
840-843	Fault zone, no orientation visible
855-880	Fault zone, gouge in various orientations
885.5-912	Fault zone, gouge in various orientations
938-950	Fault zone, 25° at top contact
973-995	Fault zone, ~35°
1010-1095	Fault zone, gouge in various orientations; **Sidewinder Fault**

3.3 Alteration

The rock is dominated by potassic alteration of low to moderate intensity. Quartz veins and associated secondary K-feldspar are common; secondary biotite is locally present. Pervasive argillic alteration (mostly supergene) obscures much of the hypogene detail. Sericitic and propylitic alteration are locally observed. Sericitic alteration was likely more abundant than was evident, however it was strongly overprinted by supergene iron oxides and clay and was thus difficult to observe.

3.4 Metzone

Metallurgical zones (Metzone) codes were recorded for each sample interval. The codes for the Oxide Zone designate the interval in terms of whether the interval is dominated by copper oxides/silicates (code 1), mixed copper and iron oxides (code 2) , or shows high concentration of iron oxides with little or no copper oxides (code 3). The Transition Zone (code 4) is designated by the presence of one or more overlapping Oxide and Sulfide minerals including hematite/goethite, pyrite, chrysocolla, cuprite, native copper, chalcocite, and/or chalcopyrite.

Depth (ft)	Metallurgical Zone
427-1174	Intermingled zones of mixed copper and iron oxides and high-iron zones
1174-1200	4 (Transition zone; coexisting oxide and sulfide minerals)

3.5 Mineralization

There are pervasive copper oxides on fractures and in clay sites throughout the oxide zone. Copper oxides are consistently present from 427-1200 feet, with the exception of 860-880 feet. The most common copper oxide is a copper-bearing clay that replaces plagioclase; other copper oxides present are chrysocolla and tenorite/wad. No copper oxides were present in the sulfide zone. Iron oxides (hematite, goethite, and jarosite) occur at mostly low abundances (1-5%) throughout the hole, both in the oxide and sulfide zones; however, abundances are lowest in the sulfide zone. Minor chalcocite (<<1%) is present in the lowest portions of the hole.

4 Geotechnical Summary

Average total core recovery (TCR) was over 95% for the hole. Average rock quality (RQD) was generally well below 50%.

MetZone	Oxide	Transition

Depth	427-1174	1174-1200
Total Feet	747	26
Average TCR (%)	90.2	97.3
Average RQD (%)	38.4	21.9

4.1 Fracture Intensity

Core was collected in a split-tube barrel in order to ensure the highest integrity of intact conditions. Mechanical fractures caused by handling or placing the materials in the core box were discounted during the fracture intensity review.

The fracture intensity is low to moderate for the majority of the hole, with abundances of 0-15 fractures per foot. Areas near fault zones are substantially more fractured.

4.2 Core Recovery

Statistics on the core recovery in CMP11-05 are presented below. Recovery averaged 95.2% with the lowest recovery in Yqm (83.6%) and the highest recovery in andesite (100%). RQDs range from 50% to 77.3%; these numbers are almost certainly skewed high. No handling of the core was permitted, so determining RQD is less precise.

Rock Type	Drill Run Interval (ft)	TCR %	RQD %
Yqm	675	90.8	35.8
Tgdp	25	97.2	51
Mixed Yqm & Tgdp	47	97.7	34.4
Ta	10	100	0
Ydb	15	66.7	41
CMP11-01 Totals	375	92.2	52.1

5 Sampling and Analysis

No assay samples were taken from CMP11-05, since the material was to be used in metallurgical tests. As of September 2011, metallurgical testing on this material is ongoing. No HQ companion hole was drilled at this site, since the drillers were unable to remove the PQ rods from the hole.

DESCRIPTION: GEO., MINERAL., ALT, STRUCT.

0-427' Casing through basin-fill sediments. Top of bedrock is unknown; first run of core is in QMP. Mud rotary drilling.
Collar coordinates are NAD 83, not state plane (NAD 27) as in older holes.
NAD 27 coords: 746039.99 N, 647950.60 E

427-440' QMP
429.2-430' leached cap - hematite w/ considerable clay
433.5-434' yellow stains; jarosite?
435.8 + 436.5' Thin parallel faults, 40° TCA.
Considerable quartz; phenocrysts? silicification?

440-446' Mixed QMP + Tgdp

446-457.5' Tgdp
449.2-450.2' hard, silicified
451-452' hard, silicified
452-456.5' No recovery
456.5-457.5' same

457.5-670' QMP
458-458.5' breccia w/ some clay
458.6-460' Cu clays after plagioclase
464' 1/4" gouge zone @ 20° TCA; separates competent from broken rock. CuOx in clays above this seam; none below. Fault breccia below 464'; 95% QMP, 5% Tgdp. Abundant FeOx.
468-470' very broken; FeOx occurs as streaks of different colors. Shattered breccia is not milled. Trace Cu clay, no CuOx!
470-473.5' slightly more competent rock, poorly mineralized as above.
472-473' shattered.
473.5-475' same as above, slight increase in Cu clay, w/ associated jarosite. Very broken
475-477.5' competent rock w/ salmon-colored kspar (strong color). Rock appears fairly fresh, w/ no obvious alteration or mineralization.
477.5-479' fault w/ layered gouge + breccia. 60° TCA.
479-480' shattered QMP w/ blood-red ksp + abundant Cu clay in feldspars, + on fractures.
480-485' shattered QMP.
481.5-481.7, 489.5-490' milled breccia
Streaky FeOx + CuOx
485-490' milled fault breccia, w/ clasts of QMP embedded in shattered milled QMP.
Gouge zones @ various orientations (30°, 55°, 70°; appears to be random)

FRACTURING

GEOLOGY

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

457.5–670' QMP

490–498.7' continued fault breccia. Gouge seams in multiple orientations. Very abundant clay w/ local jerosite.
495–498.5' same fault bx. ~1/16" chrys. vein @ 497.5'; 35° TCA.
497.5' 1/16" chrys. vein, 35° TCA.
498.7'–501' shattered QMP w/o rotation (no milling)
501–503.5' competent QMP; pale blue-green in plag + hem on fxs
503.5–506.5' same
506' 3" of shattered breccia; completely disaggregated. No jerosite + very little goethite.
504' 3/8" qtz-bio vein, 55° TCA.
506.5–509' solid QMP, same as 501–503.5'
509–510.5' shattered, ~3" zone of gouge/bx @ 509–509.3', 75° TCA. Gouge contains traces of Cu clay.
510.5–513.5' solid QMP as above; low-grade w/ minor Cu clay after plag.
513.5–515.8' shattered fault breccia.
514.5' 2" vein of ksp+bio+qtz, 75° TCA.
515–515.7' intensely altered fault breccia, all Tgdp w/ strong ksp→qtz alt.
515.7–518' same QMP
517.5' minor tenorite on fractures.
519.5–522' moderate qtz-ksp-bio alteration w/ tenorite + minor chrys. Well-broken
522–527' hard barren QMP as common above. Very little clay; bio → chl + ep (completely; it is very green)
523–523.5' ~6" silicified zone w/ w/ ghostly biotite patches.
527–527.2' shattered gouge bx; 65° TCA.
527.2–529.3' QMP as above; slightly more fractured w/ abundant FeOx on fxs.
530–532' milled breccia w/ clay gouge. 65° TCA.
532.2–532.5' chunk of fine-grained light pink rock; aplite?
533–533.1' clay w/ some breccia, some Cu clay after plag.
537–537.8' abundant hematite.
537–542' abundant chlorite after biotite
539.5–540' sheared zone w/ abundant yellow FeOx
as above
549.8–552' common cu clay after plag
abundant chl after biotite
THIS FAULT CORRESPONDS W. RATTLESNAKE FAULT 559.5 to at least 660'
559.5–561' fault breccia w/ cobbles + clay

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

457.5-670' QMP continued from above

RATTLESNAKE FAULT ~559.5 – 660'

562-562.5' all ~2cm gravel.
562.5-562.7' fault breccia (total 559.5-562.7')
562.7-568' much larger fragments, + stronger alteration

568-573' fault breccia w/ frags up to ~4-6".

571.1-573' Tgdp; all sheared fault breccia. Common Cu clay.

573-573.3' strong chrys in one fx; ~1-3cm crackled rock w/ chrys cement.
573-578' all fault bx w/ milled frags.

578-580.5' fault bx, 50° TCA? No visible Cu.

580.5-583' very abundant ksp; rock is nearly all pink. No visible Cu; fxs ~35° TCA.
580.5-580.7' bx w/ abundant FeOx; ~70° TCA.
583-588' very high FeOx; minor Cu visible of fxs.
585.7-586', 583-583.2', 584.8-585.2' fault bx, ~40° TCA.
rock is fairly hard between them

588-590' Cu increases downward; rock is very well broken.

590-591.5' no recovery
591.5-592.5' fault bx w/ gouge 591.5-591.7'.
592.5-597.5' high Cu clay + CuOx; minor tenorite. Biotite flooding @ bottom of the interval.
594.3-596.3' fault breccia; w/ gouge (minor) + possible pieces of Tgdp. No ∠ measurable.

597.5-602.5' breccia w/ gouge; as above. Cu clay is conspicuous throughout the interval.
597.5-598' biotite flooding as seen above. ~40x40mm ksp phenos embedded in bio.
Fault ~60° TCA.

602.5-607.5' more competent QMP, scattered Fe/CuOx.
irregular fractures very common, w/ ↗, minor clay + chrys.

607.5-610' very broken but not milled bx.
609.6-610' high Cu, some chrys. on fxs w/ slickensides.
609-611' 2mm-wide vein of CuOx; 20° TCA. Full of light green clay, w/ tenorite on the sides.
Rock is brecciated below this vein; thin fault?
613-615' back into fault breccia

615-620' entirely fault breccia, w/ large fragments surrounded by FeOx-rich matrix.

620-625' very fractured w/ intermittent breccia, little gouge.
CuOx on fractures oriented ~50-70° TCA.

625-630' very fractured as above, could not clean core from 628.5-629.5'
627.2-627.5', 628.5-629.5' fault breccia w/ gouge in lower zone, ∠25° TCA.
some Cu clay in fault gouge.

COMMENTS:

AVG. CORE REC'Y/HOLE

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

457.5-670' QMP continued from above

630-635' fault bx; very crumbly; can't wash 632.8-633.2'. Minor chrysocolla on fls, very little gouge

635-640' similar to above; fault bx; seems to be ~30° TCA.

638.9-640' high-grade Cu; rich Cu clay (seafoam green)

639' 2x2cm bio patch → chlorite; ~2x2cm of Tgdp (?)

640-646' similar fault bx; discontinuous zones of breccia separated by shattered QMP.

640-640.2' solid Cu clay

644.2-644.5' gouge

645-650' shattered QMP.

646.3-646.5', 646.9-647.1', 648.9-649', 649.2-649.4' thin intervals of milled bx, ~50° TCA.

649-649.4' olive-green patches of clay.

650-655' fault bx, little gouge. Low Cu.

655-660' same shattered rock; low Cu + intermittent thin breccia zones

658.5-660' biotite flooding

660.5-661.4' Cu clay after plag.

661.7-663.5' 1cm vein of CuOx/Cu clay, ~10° TCA.

Rock has strong clay-chlorite overprint

668.3-668.4' ~1.5" qtz vein ~70° TCA.

670-675' Mixed QMP + Tgdp

Mostly Tgdp; well broken w/ abundant goethite

Little Cu.

675-759' QMP

675.9-680' Cu clay after plag

675-675.9 Tgdp; contact w/ QMP @ 675.9' is ~70°.

676.1-676.3' brecciated

680-685' minor Cu clay in plag sites, as above

~3% bio → chl.

Fairly uniform rock, streaks of goethite + minor Cu clay after plag.

685-700' increase in hematite

GEOLOGY

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

675-759' QMP continued from above

700-705' very hard competent rock.
702.1-705' Cu in plag sites + on fractures.

708' minor tenorite + hematite plates Cu

712.4 + 714.2'

715-720' blown out of tube halfway w/o plug. Well-fractured but intact QMP. Blood-red hematite common in plag; minor Cu clay present throughout the interval.

715.5-716' streaks of tenorite up to ~1cm wide. Irregular.

720-725' competent core w/ decent RQD. Abundant qtz veins w/ hem pseudomorphs after py+/cpy.

725-730' patches of quartz flooding; several 1/4-1/2" qtz vns (w/ hem after sulfides) with ~1" qtz-bio envelopes. ~45° TCA.

733.5' crackled qtz w/ tiny (<<1mm) hem on fxs

730-735' similar to above; slightly less intense qtz-ksp-bio alt. Common hem + Cu clay in plag sites

734.5-734.7' shattered zone

735-740' same as previous interval.

736.5' 1" qtz-tenorite vein, ~40° TCA. Abundant thin (<2mm) fxs w/ chrys. Common cu clay after plag.

741' 1" qtz-ten vn w/ ~1.5" (on each side) qtz-ksp-bio envelope. Abundant jarosite + greenish clay

744.6-745.1' abundant qtz veins <1cm, w/ chrys + hem after plag. Jarosite is common in plag sites. A few small thin sericite envelopes (?) visible in ksp grains.

750.1-750.6' streaks + irregular clots of tenorite. Good grade

751.5' 1" vein of qtz+chrys+tenorite w/ hem + goe. ~30° TCA.

751.5-754' common ~1cm veins of chrys + Cu clays.

756-756.4' solid qtz w/ some chrys + ten on fxs. Silicified zone, not vein quartz.

756.4-757' milled fault bx. 35° TCA; abundant jarosite + Cu clay.

758-759' strong Cu clay w/ minor chrys. in fxs.

759-774.3' Diabase ← contact sheared; ~60° TCA.

Medium gray slightly porphyritic diabase. Abundant quartz veins w/ thin sericite envelopes, largest vein is ~7mm. Most are 50-70° TCA. Not much Cu mineralization.

764-769' recovered 0.4' of brecciated diabase + gray-brown gouge.

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

759-774.3' Diabase — continued from above; abundant qtz vns w/ sericite envelopes.

759-759.6' mostly clay w/ some diabase fragments

772.7-773' 2cm vein of solid chrys; likely a former solid cpy vn.

774.3-858.5' QMP — contact is ~35° TCA; planar intrusive (?) fault?

Similar to QMP seen above; strong FeOx + clay + bio → chlorite.

782.6' several patches of tenorite.

787.2-788.2' fault breccia w/ abundant FeOx + little gouge.

similar to above.

790.5-791' exceptionally strong clay alteration (ksp + plag → completely white clay)

794.5-800' no recovery.

THRASHER FAULT ZONE ~787-805' SHEARED, CLAY ALT, NO REC.

800-805' similar to above; sheared QMP w/ strong clay alt. Minor Cu clay after plag.

805-810' similar to above. Yellow-green (jarosite + Cu clay?) in plag sites. Common qtz vns up to ~10mm.

810.8-811.8' sheared + deformed orthoclase

810-815' decent Cu mineralization of fractures + clays.

817.6-818' numerous clay-filled fractures

823.4-825' mostly light green Cu clay in feldspars, fine hematite.

823.7-825' silicified.

826-826.3' breccia w/ clay

825.3-826.6' good Cu clay; one is light green.

830-835' QMP w/ common qtz-biotite veins; possibly some sericite in the vein envelopes.

Weak-mod Cu clay in plag sites.

835-840' very uniform rate; Cu clay partially repl. plag; streaks of hem + goe. Common Qtz vns up to ~1cm.

837.5' 1" qtz vein w/ weak ksp envelope.

FRACTURING / GEOLOGY

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

774.3-858.5' QMP cont. from above

840-843' milled bx & gouge. Weak Cu clay throughout, no measurable orientation.
844-845' slightly finer-grained QMP; largest ksp < 1cm. Similar alt/min to above.
843.8-844.5' abundant biotite veins & irregular patches.
844.3' 1/2" bio-chl vein.
848.6' ~3/8" qtz-ksp(?) vn w/ 1.5" bio-hem envelope. EDM vein? 848-850' wk Cu clay after diag.
852' 2" qtz-bio swath; pervasive alteration, not a vein.
854' 3" of gouge/bx; 60° TCA. Shattered bx below.
855-856' fault bx w/ gouge; 40° TCA. Strong Cu clay & minor chrys.
856.6' 3" sheared breccia, strong Cu clay.

contact is broken; appears to be ~50° TCA.

858.5-881.5' Tgdp

Medium-light gray, locally altered (qtz, ser, ksp)
860-865' fault breccia, all Tgdp. Milled fragments up to ~10cm. Some fragments have visible veining (qtz w/ ser(?) envelopes)
865-867' same breccia
867-873.5' very well broken but not milled. Possible abundant fine qtz veins, but hematite overprint makes it difficult to tell.
873.5-875' much more competent rock. Abundant qtz vns w/ ksp envelopes. Common jarosite on fxs. No Cu.
875-880' similar to above; shattered Tgdp. Heavy clay + FeOx overprint, makes veins difficult to identify.
876' 1/4" biotite vein, 25° TCA.
876, 878, 879' shears @ 30° TCA. QMP frag @ 880.5' (4" or so)

intrusive planar contact; 45° TCA.

881.5-1007.3 QMP

hard QMP w/ strong qtz-ksp alt. Sheeted chrys & tenorite vlts, < 5mm, mostly ~35° TCA.
885-885.5' Tgdp w/ 2 1" EDM vns, both parallel @ ~40° TCA.
884.5-885' much CuOx; irregular mass? Broken up removing from the shoe.
885.5-910' QMP Fault breccia. Abundant blotches of clays, tenorite, & Cu clay. Shears are ~35° TCA. Top contact is ~80° TCA.
890-895' extremely sticky core; stuck badly to splits & was mostly pulled apart.
890.3-890.8' very strong CuOx; tenorite & chrysocolla are nearly solid in small areas.
895-900' strong clay - FeOx overprint; detail is obscured.
900-905' slightly more competent.
903' ~2" of solid gouge; 65° TCA.
905' mod. Cu clay in pieces. sides.
905-907.1
907.1-910' strong clay; core sticking to splits.

COMMENTS:

AVG. CORE REC'Y/HOLE

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

881.5-1007.3' QMP

~910-912' no recovery

915-915.3' redrilled pebbles

916.9-917.5' fault zone, ~45° TCA

Minor Cu clay after plagioclase

917 & 918.5' chunks of bio-rich ro ; looks almost like clasts but is probably alteration. Strong Cu clay associated with them.

Abundant qtz veins w/ associated qtz-ksp-bio envelopes (thin)

925-930' similar to above, not very interesting. Fewer qtz vns & bio than previous interval. Lots of ksp; flooding (?) 927-927.8'.

930-932.5' same; most qtz veins are ~70° TCA.

932.5-933' strong qtz (+bio+ksp) alt; w/ Cu clay & minor chrys; epidote common in bio sites.

933.5-934' shattered zone; seams of breccia (milled) are < 1/2".

935-940' same weakly mineralized QMP.

936.5-937' gouge/bx; no measurable angle.

938-939.5' gouge/bx; 25° TCA. Minor Cu clay + common jarosite.

940-945' fault bx; shattered & locally milled. Some low-grade QMP. numerous qtz-ksp vns w/ bio; various orientations.

945-950' same

950.3' begin competent QMP. Same rock, just not faulted. Abundant <1mm fxs w/ hem.

953-955' sheeted fxs; ~30° TCA. Abundant hem @ bottom of the run; very red color.

955-956.5' same

956.5-959' strong sericite alt (?); looks almost etched. Intense hem; sheeted fxs ~40° TCA. Looks leached.

959-960' back into weakly altered, low grade QMP.

960-964.1' shattered & milled breccia

963' 4" clot of biotite; altered diabase fragment?

964.1' 25° TCA top of gouge zone. Abundant goethite + jarosite in bx.

965-968' same QMP

968-968.8' v. strong qtz-ksp alt (or aplitic dike?); no orientation visible. Fractured & original texture of QMP is gone.

969' 1" gouge w/ Cu; 65° TCA.

969-970' increase in Cu; more competent rock.

970-972' same?; sheeted fx w/ hem coating; 10° TCA.

972.5' ~1" of yellow-stained clay; ~50° TCA.

973-975' shattered; possibly milled but difficult to see. Abundant hematite

975-980' recovered 4'; all fault breccia w/ fairly large fragments. Little milling, or just v. large pieces? Abundant Clay, Cu clay, & FeOx

1050					6	1						1	3	4		0	1	3						5	-	3			1045–1050	100		

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

881.5–1007.3' QMP

980–982.5' fault bx; large fragments & gouge w/ trace Cu clay. 30° TCA bottom contact
982.5–985' QMP as above; Qtz+ksp+bio, w/ minor Cu clay after plag.
985–990' same QMP — alt. mainly present as veins & assoc. envelopes.
987.5' ~2" x 0.5" clot of secondary biotite.
988.5–988.8' stronger clay alt; w/ mod. Cu clay
990–995' shattered fault breccia w/ milled frags & gouge; streaky clay, FeOx, & chl. Minor Cu clay. Shears are ~35° TCA. Difficult to see any alteration, so used codes from the interval immediately above.
995–1000' same QMP
995.1' end of fault zone, bottom contact @ 45° TCA.
1000–1000.5' common Cu on fractures
1000.5–1000.6' bx zone ~2cm wide
1002.5' 1-2cm band of blue-green Cu clay; looks like a thin bx zone. ~40° TCA.

1007.3–1012' Mixed QMP + Tgdp

Rock is faulted & well broken; strong FeOx-clay overprint. Fault ~50° TCA.

1012–1017' Tgdp

SIDEWINDER FAULT ZONE 1010 — 1095

Plag is partially replaced by Cu clay
Core is sheared & very soft.

1017–1026' Mixed QMP + Tgdp

Common Cu clay after plag.
1019.6–1020.5' swirls of irregular Cu clay
1019.9' minor component of clasts of Ta
1020.5–1026' common tenorite & chrysocolla, esp. 1022–1022.5'

1026–1057' QMP

1026–1030' common chrys & tenorite.
1030–1035' fault breccia, all frags are QMP. Patches of Cu clay, w/ minor chrys & ten locally. Slightly more competent at bottom of interval, not milled bx.
1031.5' strong tenorite in sheared zone; streaks are over 2" wide
1035–1038.5' same harder QMP as above, QMP w/ strong clay
1038.5–1057' fault zone w/ much gouge; streaky FeOx

1040–1045' all frags <2", shears ~25° TCA.

COMMENTS:

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

1078-1200' QMP

1122.5' ~2"x2" fragment of fine-grained diorite (?)
Cu clay locally on fractures
1127.4-1127.8' bright white zeolite (?) in irregular fractures, ~50° TCA
1126-1129' CuOx on fxs & in plag
1129-1134' a couple ~1/2" qtz veins
little to no Cu clay in plag sites
1134-1139' numerous qtz-ksp vns @ ~60° TCA.
1136.5-1138' strong hematite stain
1141.3-1141.7' gouge zone; ~45° TCA.
1142.5-1143' common greenish Cu clay on fxs
1144-1149' streaky FeOx + bio alt
1147.9' ~1" vein of solid hematite
1149-1150.7' strong hem stain
1152.5-1153.5' greenish yellow clay; Cu + jarosite?
1154-1160' no recovery
1160-1164' low-grade, reasonably competent QMP. Top 6" is redrilled fragments.
1162.5' shattered 3" zone of strong ksp alt; pink-tan color w/ relict igneous texture. V. little Cu.
1163.5-1164' several tiny fxs w/ spots of chrys.
1164-1169' hard QMP w/ deep red feldspars
1164-1166' 3/8" clay vein, 10° TCA. Mod. Cu, some chrys in w/ clay. various orientations
1166-1167' strong silicification; v. hard rock w/ deep red ksp + common chrys veins, tr. tenorite.
1169-1170' shattered zone; mod. bio alt strong FeOx overprint
1170-1172.5' same as 1160-1164' above. Large ksp phenos are partially converted to biotite.
1172.5-1174' shattered; slight increase in Cu.
1174-1179' hard QMP; uniform trace Cu in plag.
1174.8' 4" frag of diorite (?), fine bio + plag; salt + pepper appearance.
1175.2-1179' very uniform. Trace pyr/cc @1177.7'
1179-1183' same weakly mineralized QMP. Locally shattered w/ abundant clay.
1181.5' several hairline vlts w/ chrysocolla; various orientations.
1191-1193' 1/8" vein of white clay w/ hem specks + streaks; wanders across core
1183-1188' hard QMP; dead rock. V. little oxides & no visible sulfides.
1186' 2" thick ksp vein (aplite dike??), ~20° TCA, trace chrys in nearby veins, w/ qtz + glassy limonite.
Tr. Cu clay.

DESCRIPTION: GEO., MINERAL., ALT, STRUCT.

0-427' Casing through basin-fill sediments. Top of bedrock is unknown, first run of core is in QMP. Mud rotary drilling.
Collar coordinates are NAD 83, not state plane (NAD 27) as in older holes.
NAD 27 coords: 746039.99 N, 647950.60 E

427-440' QMP
429.2-430' leached cap - hematite w/ considerable clay
433.5-434' yellow stains; jarosite?
435.8 + 436.5' Thin parallel faults, 40° TCA.
Considerable quartz; phenocrysts? silicification?

440-446' Mixed QMP + Tgdp

446-457.5' Tgdp
449.2-450.2' hard, silicified
451-452' hard, silicified
452-456.5' No recovery
456.5-457.5' some

457.5-670' QMP
458-458.5' breccia w/ some clay
458.6-460' Cu clays after plagioclase
464' 1/4" gouge zone @ 20° TCA; separates competent from broken rock. CuOx in clays above this seam; none below. Fault breccia below 464'; 95% QMP, 5% Tgdp. Abundant FeOx.
468-470' very broken; FeOx occurs as streaks of different colors. Shattered breccia is not milled. Trace Cu clay, no CuOx!
470-473.5' slightly more competent rock, poorly mineralized as above.
472-473' shattered.
473.5-475' same as above, slight increase in Cu clay, w/ associated jarosite. Very broken
475-477.5' competent rock w/ salmon-colored kspar (strong color). Rock appears fairly fresh, w/ no obvious alteration or mineralization.
477.5-479' fault w/ layered gouge + breccia. 60° TCA
479-480' shattered QMP w/ blood-red ksp + abundant Cu clay in feldspars, + on fractures.
480-485' shattered QMP.
481.5-481.7, 489.5-490' milled breccia
Streaky FeOx + CuOx
485-490' milled fault breccia, w/ clasts of QMP embedded in shattered milled QMP.
Gouge zones @ various orientations (30°, 55°, 70°; appears to be random)

FRACTURING

GEOLOGY

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

457.5-670' QMP

490-498.7' continued fault breccia. Gouge seams in multiple orientations. Very abundant clay w/ local jarosite.

495-498.5' same fault bx. ~1/16" chrys. vein @ 497.5'; 35° TCA.

497.5' 1/16" chrys. vein, 35° TCA.

498.7'-501' shattered QMP w/o rotation (no milling)

501-503.5' competent QMP; pale blue-green in plag + hem on fxs

503.5-506.5' same

506' 3" of shattered breccia, completely disaggregated. No jarosite + very little goethite.

504' 3/8" qtz-bio vein, 55° TCA.

506.5-509' solid QMP, same as 501-503.5'

509-510.5' shattered, ~3" zone of gouge/bx @ 509-509.3', 75° TCA. Gouge contains traces of Cu clay.

510.5-513.5' solid QMP as above; low-grade w/ minor Cu clay after plag.

513.5-515.8' shattered fault breccia.

514.5' 2" vein of ksp+bio+qtz, 75° TCA.

515-515.7' intensely altered fault breccia, all Tgdp w/ strong ksp→qtz alt.

515.7-518' same QMP

517.5' minor tenorite on fractures.

519.5-522' moderate qtz-ksp-bio alteration w/ tenorite + minor chrys. Well-broken.

522-527' hard barren QMP as common above. Very little clay; bio → chl+ep (completely; it is very green)

523-523.5' ~6" silicified zone w/ w/ ghostly biotite patches.

527-527.2' shattered gouge bx; 65° TCA.

527.2-529.3' QMP as above; slightly more fractured w/ abundant FeOx on fxs.

530-532' milled breccia w/ clay gouge. 65° TCA.

532.2-532.5' chunk of fine-grained light pink rock; aplite?

533-533.1' clay w/ some breccia, some Cu clay after plag.

537-537.8' abundant hematite.

537-542' abundant chlorite after biotite

539.5-540' sheared zone w/ abundant yellow FeOx

as above

549.8-552' common Cu clay after plag

abundant chl after biotite

THIS FAULT CORRESPONDS W. RATTLESNAKE FAULT 559.5 to at least 660'

559.5-561' fault breccia w/ cobbles + clay

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

457.5-670' QMP continued from above

630-635' fault bx; very crumbly; can't wash 632.8-633.2'. Minor chrysocolla on fds, very little gouge.

635-640' similar to above; fault bx; seems to be ~30° TCA.

638.9-640' high-grade Cu; rich Cu clay (sectoon green)

639' 2x2cm bio patch → chlorite; ~2x2cm of Tgdp (?)

640-645' similar fault bx; discontinuous zones of breccia separated by shattered QMP.

640-640.2' solid Cu clay

644.2-644.5' gouge

645-650' shattered QMP.

646.3-646.5', 646.9-647.1', 648.8-649', 649.2-649.4' thin intervals of milled bx. ~50° TCA.

649-649.4' olive-green patches of clay.

650-655' fault bx, little gouge. Low Cu.

655-660' some shattered rock; low Cu + intermittent thin breccia zones.

658.5-660' biotite flooding

660.5-661.4' Cu clay after plag.

661.7-663.5' 1cm vein of CuOx / Cu clay, ~10° TCA.

Rock has strong clay-chlorite overprint

668.3-668.4' ~1.5" qtz vein, ~70° TCA.

670-675' Mixed QMP + Tgdp

Mostly Tgdp; well broken w/ abundant goethite. Little Cu.

675-759' QMP

675.9-680' Cu clay after plag

675-675.9 Tgdp; contact w/ QMP @ 675.9' is ~70°.

676.1-676.3' brecciated

680-685' minor Cu clay in plag sites, as above

~3% bio → chl.

Fairly uniform rock, streaks of goethite + minor Cu clay after plag.

685-700' increase in hematite

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

675-759' QMP continued from above

700-705' very hard competent rock.
702.1-705' Cu in plag sites & on fractures.

708' minor tenorite + hematite plates Cu

712.4 + 714.2'

715-720' blown out of tube halfway w/o plug. Well-fractured but intact QMP. Blood-red hematite common in plag; minor Cu clay present throughout the interval.

715.5-716' streaks of tenorite up to ~1cm wide. Irregular.

720-725' competent core w/ decent RQD. Abundant qtz veins w/ hem pseudomorphs after py+/cpy.

725-730' patches of quartz flooding; several 1/4-1/2" qtz vns (w/ hem after sulfides) with ~1" qtz-bio envelopes. ~45° TCA.

733.5' crackled qtz w/ tiny (<1mm) hem on fxs
730-735' similar to above; slightly less intense qtz-ksp-bio alt. Common hem + Cu clay in plag sites
734.5-734.7' shattered zone.

735-740' same as previous interval
736.5' 1" qtz-tenorite vein, ~40° TCA. Abundant thin (<2mm) fxs w/ chrys. Common cu clay after plag.
741; 1" qtz-ten vn w/ ~1.5" (on each side) qtz-ksp-bio envelope. Abundant jarosite + greenish clay

744.6-745.1' abundant qtz veins <1cm, w/ chrys + hem after plag. Jarosite is common in plag sites. A few small thin sericite envelopes (?) visible in ksp grains.

750.1-750.6' streaks + irregular clots of tenorite. Good grade
751.5' 1" vein of qtz+chrys+tenorite w/ hem + goe. ~30° TCA.
751.5-754' common ~1cm veins of chrys + Cu clays.

756-756.4' solid qtz w/ some chrys + ten on fxs. Silicified zone, not vein quartz.
756.4-757' milled fault bx. 35° TCA; abundant jarosite + Cu clay.
758-759' strong Cu clay w/ minor chrys. in fxs.

759-774.3' Diabase ← contact sheared; ~60° TCA.

Medium gray slightly porphyritic diabase. Abundant quartz veins w/ thin sericite envelopes, largest vein is ~7mm. Most are 50-70° TCA. Not much Cu mineralization.

764-769' recovered 0.4' of brecciated diabase + gray-brown gouge.

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

774.3-858.5' QMP cont. from above

840-843' milled bx + gouge. Weak Cu clay throughout, no measurable orientation.
844-845' slightly finer-grained QMP; largest ksp < 1cm. Similar alt/min to above.
843.8-844.5' abundant biotite veins + irregular patches.
844.3' 1/2" bio-chl vein.
848.6' ~3/8" qtz-ksp(?) vn w/ 1.5" bio-hem envelope. EDM vein? 848-850' wk Cu clay after plag.
852' 2" qtz-bio swath; pervasive alteration, not a vein.
854' 3" of gouge/bx; 60° TCA. Shattered bx below.
855-856' fault bx w/ gouge; 40° TCA. Strong Cu clay + minor chrys.
856.6' 3" sheared breccia, strong Cu clay.

858.5-881.5' Tgdp ← contact is broken; appears to be ~50° TCA.

Medium-light gray, locally altered (atz, ser, ksp)
860-865' fault breccia, all Tgdp. Milled fragments up to ~10cm. Some fragments have visible veining (qtz w/ ser(?) envelopes)
865-867' same breccia
867-873.5' very well broken but not milled. Possible abundant fine qtz veins, but hematite overprint makes it difficult to tell.
873.5-875' much more competent rock. Abundant qtz vns w/ ksp envelopes. Common jarosite on fxs. No Cu.
875-880' similar to above; shattered Tgdp. Heavy clay + FeOx overprint, makes veins difficult to identify.
876' 1/4" biotite vein, 25° TCA.
876, 878, 879' shears @ 30° TCA. QMP frag @ 880.5' (4" or so)

881.5-1007.3 QMP ← intrusive planar contact; 45° TCA.

hard QMP w/ strong qtz-ksp alt. Sheeted chrys + tenorite vlts, < 5mm, mostly ~35° TCA.
885-885.5' Tgdp w/ 2 1" EDM vns, both parallel @ ~40° TCA.
884.5-885' much CuOx; irregular mass? Broken up removing from the shoe.
885.5-910' QMP fault breccia. Abundant blotches of clays, tenorite, + Cu clay. Shears are ~35° TCA. Top contact is ~80° TCA.
890-895' extremely sticky core; stuck badly to splits + was mostly pulled apart.
890.3-890.8' very strong CuOx; tenorite + chrysocolla are nearly solid in small areas.
895-900' strong clay-FeOx overprint; detail is obscured.
900-905' slightly more competent.
903' ~2" of solid gouge; 65° TCA.
905' mod. Cu clay in plag. sites.
905-907.1
907.1-910' strong clay; core sticking to splits.

COMMENTS:

AVG. CORE REC'Y/HOLE

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

881.5-1007.3' QMP

~910-912' no recovery

915-915.3' redrilled pebbles

916.9-917.5' fault zone, ~45° TCA.
Minor Cu clay after plagioclase

917 & 918.5' chunks of bio-rich ro ; looks almost like clasts but is probably alteration. Strong Cu clay associated with them.
Abundant qtz veins w/ associated qtz-ksp-bio envelopes (thin)

925-930' similar to above, not very interesting. Fewer qtz vns & bio than previous interval
Lots of ksp; flooding (?) 927-927.8'.

930-932.8' same; most qtz veins are ~70° TCA.
932.5-933' strong qtz (+bio+ksp) alt; w/ Cu clay & minor chrys; epidote common in bio sites.
933.5-934' shattered zone; seams of breccia (milled) are < ½".

935-940' some weakly mineralized QMP.
936.5-937' gouge/bx; no measurable angle.
938-939.5' gouge/bx; 25° TCA. Minor Cu clay & common jarosite.

940-945' fault bx; shattered & locally milled. Some low-grade QMP.
numerous qtz-ksp vns w/ bio; various orientations.

945-950' same

950.3' begin competent QMP. Same rock, just not faulted. Abundant <1mm fis w/ hem.
953-955' sheeted fis; ~30° TCA. Abundant hem @ bottom of the run; very red color.

955-956.5' same
956.5-959' strong sericite alt (?); looks almost etched. Intense hem; sheeted fis ~40° TCA.
Looks leached.
959-960' back into weakly altered, low grade QMP.
960-964.1' shattered & milled breccia
963' 4" slot of biotite; altered diabase fragment?
964.1' 25° TCA top of gouge zone. Abundant goethite & jarosite in bx.
965-968' same QMP
968-969.8' v. strong qtz-ksp alt (or aplitic dike?); no orientation visible. Fractured & original texture of QMP is gone.
969' 1" gouge w/ Cu; 65° TCA.
969-970' increase in Cu; more competent rock.
970-973' same?; sheeted fe w/ hem coating; 10° TCA.
972.5' ~1" of yellow-stained clay; ~50° TCA.
973-975' shattered; possibly milled but difficult to see. Abundant hematite.
975-980' recovered 4'; all fault breccia w/ fairly large fragments. Little milling, or just v. large pieces? Abundant Clay, Cu clay, & FeOx

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

881.5-1007.3' QMP

980-982.5' fault bx; large fragments & gouge w/ trace Cu clay. 30° TCA bottom contact
982.5-985' QMP as above; Qtz+ksp+bio, w/ minor Cu clay after plag
985-990' same QMP ↳ alt. mainly present as veins & assoc. envelopes.
987.5' ~2" x 0.5" clot of secondary biotite.
988.5-988.8' stronger clay alt; w/ mod. Cu clay
990-995' shattered fault breccia w/ milled frags + gouge; streaky clay, FeOx, + chl. Minor Cu clay. Shears are ~35° TCA. Difficult to see any alteration, so used codes from the interval immediately above.
995-1000' same QMP
995.1' end of fault zone, bottom contact @ 45° TCA.
1000-1000.5' common Cu on fractures
1000.5-1000.6' bx zone ~2cm wide
1002.5' 1-2cm band of blue-green Cu clay; looks like a thin bx zone. ~40° TCA.

1007.3-1012' Mixed QMP + Tgdp

Rock is faulted + well broken; strong FeOx-clay overprint. Fault ~50° TCA.

1012-1017' Tgdp

SIDEWINDER FAULT ZONE 1010 — 1095

Plag is partially replaced by Cu clay
Core is sheared + very soft.

1017-1026' Mixed QMP + Tgdp

Common Cu clay after plag.
1019.6-1020.5' swirls of irregular Cu clay
1019.9' minor component of clasts of Ta
1020.5-1026' common tenorite + chrysocolla, esp. 1022-1022.5'

1026-1057' QMP

1026-1030' common chrys + tenorite.
1030-1035' fault breccia, all frags are QMP. Patches of Cu clay w/ minor chrys + ten locally. Slightly more competent at bottom of interval, not milled bx.
1031.5' strong tenorite in sheared zone; streaks are over 2" wide
1035-1038.5' same harder QMP as above, QMP w/ strong clay
1038.5-1057' fault zone w/ much gouge; streaky FeOx

1040-1045' all frags <2", shears ~25° TCA.

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

SIDEWINDER FAULT ZONE 1010 – 1095'

1026-1057' QMP
cont. from above; milled fault bx.

1057-1065.2' Ta ← contact rubblized
1057-1061.5 cont. fault bx.
Quite porphyritic; white plag up to ~5mm. Rock is rich red-brown, 5YR 3/4
still very broken w/ abundant gray-green clay

1065.2-1074.1' QMP ← contact irregular, but ~25° TCA.
Back into same fault bx
1066.5' 4" clast w/ strong chrys + Cu clay
Shears @ ~ 40° TCA; much gouge & frags are <1".

1074.1-1078' Mixed QMP + Tgdp ← contact brecciated
Fault bx w/ abundant Ta fragments. Mostly Tgdp, w/ mod Cu mineralization; chrys & ten locally abundant.

1078-1200' QMP ← contact brecciated
1080-1085' shattered QMP, not milled bx. Heavy clay overprint w/ v. little Cu.
1085-1085.6' same
1085.6-1086' light blue clay gouge; 25° TCA. Mod. Cu clay.
1086-1089.5' shattered, well oxidized QMP w/ strong clay overprint.
1089.5-1090' milled bx & gouge. Shears ~65° TCA.
1090-1095' recovered 0.6' of milled bx as above. All in shoe, tube was empty.
1095-1100' reasonably competent QMP, sheared fxs ~15° TCA. Weak Cu clay after plag.
Clay seams up to ~1/4" locally. Weakly altered; only small vlts of qtz + ksp + bio.
1101.7' CuOx on fractures
1106.5-1108' moderate development of bio in QMP.
1110.7-1111.5' brecciated zone w/ v. abundant FeOx.
1113.5-1119' competent QMP. Strong clay after plag; very little ksp as well. Rock is quite light in color.
Considerable biotite.

COMMENTS:

AVG. CORE REC'Y/HOLE

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

1078-1200' QMP

1122.5' ~2"x2" fragment of fine-grained diorite (?)
Cu clay locally on fractures
1127.4-1127.8' bright white zeolite (?) in irregular fractures, ~50° TCA.
1126-1129' CuOx on fxs & in plag
1129-1134' a couple ~½" qtz veins
little to no Cu clay in plag sites
1134-1139' numerous qtz-ksp vns @ ~60° TCA.
1136.5-1138' strong hematite stain
1141.3-1141.7' gouge zone; ~45° TCA.
1142.5-1143' common greenish Cu clay on fxs
1144-1149' streaky FeOx + bio alt.
1147.9' ~1" vein of solid hematite
1149-1150.7' strong hem stain
1152.5-1153.5' greenish yellow clay; Cu + jarosite?
1154-1160' no recovery
1160-1164' low-grade, reasonably competent QMP. Top 6" is rectilled fragments.
1162.5' shattered 3" zone of strong ksp alt; pink-tan color w/ relict igneous texture. V. little Cu.
1163.5-1164' several tiny fxs w/ spots of chrys.
1164-1169' hard QMP w/ deep red feldspars
1164-1166' 3/8" clay vein, 10° TCA. Mod. Cu, some chrys in w/ clay. ⇒ various orientations
1166-1167' strong silicification; v. hard rock w/ deep red ksp + common chrys veins, tr. teronite.
1169-1170' shattered zone; mod. bio alt strong FeOx overprint
1170-1172.5' same as 1160-1164' above. Large ksp phenos are partially converted to biotite.
1172.5-1174' shattered; slight increase in Cu.
1174-1179' hard QMP; uniform trace Cu in plag.
1174.8' 4" frag of diorite (?), fine bio + plag; salt + pepper appearance.
1175.2-1179' very uniform. Trace pyr/cc @1172.7'
1179-1183' same weakly mineralized QMP. Locally shattered w/ abundant clay.
1181.5' several hairline vlts w/ chrysocolla; various orientations.
1181-1183' ⅛" vein of white clay w/ hem specks + streaks; wanders across core
1183-1188' hard QMP; dead rock. V. little oxides & no visible sulfides.
1186' 2" thick ksp vein (aplite dike??), ~20° TCA, trace chrys in nearby veins, w/ qtz + glassy limonite.
Tr. Cu clay.

BASINFILL
CASING TO 426.5

427-440 Ygm

429.2-430 LEACHED CAP - HEMATITE w/ CONSIDERABLE CLAY
433.5-434 YELLOW STAINS - Limon

435.8 & 436.5 2 THIN PARALLEL FAULTS 40°
CONTAINS RARE QTZ PHENO CRYSTS
440-446 Ygm - Tgdp - MIXED

446-457.5 Tgdp

449.2-450.2 HARD SILICIFIED SECTION
QTZ PHENOCRYSTS
SILICA ATTACK - HARD

AS ABOVE
457.5 - Ygm
458-458.5 CLAY w/ some BRECCIA 458.6-460 FELDSPAR → Cu

464' 1/4" gouge zone separates competent from broken rock. CuOx in clays above, none below.
fault breccia below 464; 95% QMP, 5% Tgdp abundant FeOx
466-470' v. broken, streaks of different FeOx. Sheared but not milled by Tiger Cu clay, no CuOx1
470-473.5' more competent QMP; purely mineralized, only trace Cu clay in plag. sheared 472-473'.
473.5-475' same as above. slightly increased cu in clays w/ jarosite. v. well broken
475-480' QMP
475-477.5' competent w/ salmon bsp; little Cu or obvious alt.
477.5-479' fault; layered quartz + milled bx; 60° TCA.
479-480' sheared QMP; well-red bsp + abundant Cu clay in plag sheared fr surfaces.

DESCRIPTION: GEO., MINERAL., ALT, STRUCT.

SEE BELOW

571.1 QMP

562-562.5 broken QMP rock ~2cm pieces continued from 559.5 fault?

562.5-562.7 Fault breccia (559.5-562.7) 70°
THE REST OF CORE AT 562.5 W/ FEW FRACTURES

571.1-573 Tgdp contact 70°
R: IPA2 - clay - Cu, clay → Cu blue

573-578 QMP
Nice Cu at top of hole, bright teal on fractures
Lots of fault breccia w/ gouge and milled fragments, esp 275-277

578-580.5 QMP fault breccia ∠~50° (?), no visible Cu ox, not even any light grn clays

580.5-583 QMP, lots of kspar - almost all pink, 580.5-580.7 high Fe ox w/ breccia, ∠70° fractures at 35° deeper in core, still no visible Cu, pretty solid rock low gouge

583-588 QMP very oxidized - mostly Fe ox, some Cu ox visible on fractures
Rock is fairly competent, 585.7-586 zone of breccia w/ little gouge Faults at 30-40°
583-583.2 breccia w/ ~ no gouge, 584.8-585.2 breccia no gouge

588-590 - little Cu in first foot, more in bottom foot, rock pretty broken up
Cu ox are lt grn and teal, all QMP

590-592.5 lost 1.5 ft, 591.5-592.5 QMP breccia w/ gouge in first 2 inches, ∠(?)

592.5-597.5 QMP, 594.3-596.3 fault breccia w/ low gouge and chunk of Tgdp (?)
595.5-597.5 high Cu ox - clay, chrys, some tenorite, fault ∠(?), biotite foliation at bottom

597.5-602.5 QMP - lots of breccia w/ gouge (esp 597.5-598.5, 599.3-600.8, 601-602)
597.5-598 Bio foliation, Cu clay visible throughout interval
Fault angle ~60°
597.5-598 huge (40x40mm) Kspar surrounded by Bio

602.5-607.5 QMP, mostly solid last foot crumbly, evenly scattered Fe/Cu ox
Cu ox present but dispersed, irregular fractures x-crossing, entire core has some clay, some chrysocolla

607.5-610 QMP very broken up but does not look brecciated, fracture angle is irregular. first Cu in bottom 0.1 ft, lots of clay + some chry on fract w/ slickensides, 609-610 2mm wide Cu ox vein at 20°

610-615 QMP - pretty solid rock, 610-611 bottom of 2mm wide vein from previous interval, breccia on one side of vein so it's prob a fault ∠~10° here. Very full of lt grn clay w/ tenorite on sides, 613-615 more fault breccia, low gouge

615-620 QMP very fractured, but held up to scrubbing, whole thing looks like breccia, large chunks rimmed w/ Fe ox

620-625 QMP, very fractured and broken up, intermittent breccia, low gouge
Nice Cu ox on fractures 50-70°
620-620.2 solid green, some lt grn Cu clay, also dk grn (malachite?)

625-630 QMP very fractured as before, could not watch 628.5-629.5 b/c so brittle
627.2-627.5, 628.5-629.5 fault breccia, some gouge in lower zone
Fault ∠ 25° Some Cu ox clay on surface

AVG. CORE REC'Y/HOLE

DESCRIPTION: GEO., MINERAL., ALT, STRUCT.

700 - 7gM
CORE IS VERY HARD
702.1 - 705 K-SPAR - CU, CU IN FRACTURES

AS ABOVE 708 TENERITE/ACTINOLITE - PLATED COPPER

AS ABOVE
712.4 & 714.2 TENERITE/ACTINOLITE

715-720' half blown out v/o plug. Well broken but intact QMP. Common dood-red hem. in plag, common weak Cu clay in plag throughout interval.
715.5-716' streaks of tenorite in masses up to 1cm wide.
720-725' hard QMP, reasonable RQD'
abundant qtz vns w/ hem after cpy; qtz-ksp envs up to ~1"
725-730' quartz flooding; several ~1/4-1/2" vns (qtz hem after cpy) w/ ~1" qtz-bio envelopes. ~45° TCA.
733.5' cracked qtz w/ hem in tiny fracs column
similar to above; slightly less intense qtz-ksp-bio alt. Common hem in fellopes
734.5-734.7' shattered zone. Cu clay + FeOx in ↗
735-740' similar, hard QMP w/
736.5 1" qtz-ten vn, 40° TCA. Abundant thin (<2mm) fracs w/ chrys. common cu clay in plag sides
741' 1" vn of qtz + tenorite; ~1.5" on each side ksp-qtz-bio env. Abundant jarosite + green clay. Otherwise same as previous.
744.6 & 745.1' abundant qtz vns <1cm, w chrys after cpy.
Jarosite common in plag sites. A few small sericite (?) envelopes visible in ksp grains, throughout the interval.
750.1-750.6' streaks + irregular clots of tenorite; quite rich
751.5' 1" vn of qtz + chrys + ten; hem + goe as well. 30° TCA
751.5-754' common <1cm vns of chrys + Cu clays
756-756.4' solid qtz; w/ some chrys + ten. Silicified, not well
756.4-757' milled fault breccia, 35° TCA. Abundant jarosite + Cu clay in tex.
758-759' strong Cu clay w/ chrys in 4mm vns

759- Diabase
medium gray, porphyritic. Abundant qtz vns w/ v. thin sericite envelopes; largest vn ~2mm, most are 50-70° TCA. Very little mineralization
764-789 - recovered 0.4' of diabase fault breccia.

DESCRIPTION: GEO., MINERAL., ALT, STRUCT.

910 - Yqm

K-SPAR - CU TENORITE BIO SPHENOID OXO CLASO

913.3-913.5 RE DRILL 913.5-916.5 CLAYEY QMP KSPAR & CLAY - CU

916.9-917.5 LOW ANGL FAULT W/ CLAY & CU

Some K-SPAR-CLAY & CU BIOTITE

918-919.5 "chunks" of bio-rich, looks like clasts but is all. Strong Cu clay w/ bio abundant qtz vns w/ qtz-ksp-bio alt.

925-930' some minor Cu in QMP. Not very interesting. Fewer qtz vns & bio than above, but lots of ksp. Fluoring 927-927.8(?)

930-932.5' same, most qtz vns ~70° TCA

932.5-933' strong qtz-(bio+ksp) alt, w/ Cu clay & minor chrys, epid in bio sites

933.8-934' shattered zone, small breccia seams < 1/2".

935-940' some weakly mineralized QMP.

936.5-937' gouge/bx zone, no ∠ measurable.

938-939.5' gouge/bx, 25° TCA. Minor Cu clay & common jarosite.

940-945' fault bx, shattered & locally milled. Some low-grade QMP. numerous qtz-ksp vns w/ bio, fgs & veins various orientations.

945-950' exactly the same as above

950-953' hard QMP, looks the same but not milled. Weak Cu, only in plag sites. doubtful tiny sliver lm on fgs.

953-955' sheared fractures 30° TCA. Very red (hem) at bottom of the run

955-956.5 same

956.5-959' strongly ser(?) altered, looks etched. Intense hem development, sheared fgs 90° TCA looks almost leached.

957' 1" solid hem, 40° TCA.

959-960' Weakly altered/mineralized QMP w/ bio fine.

960-964.1' same?, shattered & locally milled

963' 4" chlot of bio-like alteration

964.1' 25° TCA top of gouge/bx zone. Abundant goe & jar in bx.

965-968' some low-grade QMP. Epidote common in bio sites.

968-969.9' v. strong qtz-kfs alteration (? dike of aplite?), no orientation visible. Fractured original QMP texture gone.

969' 1" gouge w/ Cu, 65° TCA

969-970' increase in Cu, hard rock

970-973' same?, sheared fgs w/ hem, ~10° TCA

972.5' ~1" of yellow-stained clay. ~90° TCA

973-975' shattered; pasty milled; hard to tell. Abundant hematite

975-980' lost 1' core somewhere... all fault bx w/ large frags. Little milling or just v. large frags(?)

Abundant clay & Cu clay, w/ FeOx

Memo

To:	Mel Lawson	**Date:**	October 6, 2011
Company:	Curis Resources Ltd.	**From:**	Daniel Russin
Copy to:	Bob Cluff	**Project #:**	204400.05
Subject:	Drill Hole Summary – CMP11-06, PQ Diameter Core		

Type: 0-429' 6.25" Rotary, cased to 429'
429-1145' PQ, 5' split barrel
Started: July 15, 2011 (diamond)
Completed: July 23, 2011
Total Depth: 1145 feet
Collar Coordinates: N: 746,166.58; E: 847,659.27 (UTM NAD 83 ft)
Ground Elevation: 1474.8 ft amsl (approx.)
Drilling Contractor: National (Rotary), Cabo Drilling Corp. (PQ Core)

1 Executive Summary

CMP11-06 was drilled to obtain large samples of core for metallurgical testing. Core was logged at the drill site and placed into plastic tubes for storage and transport to the analytical lab. Rotary drilling at this site was completed by National several weeks before the core drilling began.

2 Downhole Survey

Downhole surveys were measured by Cabo and digitally recorded at approximately 100-foot increments below the top of bedrock. A subtraction of 11 degrees was made to the recorded azimuth to account for magnetic declination; note the declination calculators and charts range from a deviation of 10.3 to 11 degrees for this area. The measurements were recorded at the rig by Curis and SRK personnel.

Depth (ft)	Dip	Azimuth	Corrected Azimuth
450	-89	121	110
500	-88.9	104.2	93.2
600	-89.3	3.3	352.3
700	-89.4	97.9	86.9
800	-89.4	97	86
900	-89.5	60.8	49.8
1000	-89.8	143	132
1100	-89.7	165.5	154.5

3 Geologic Summary

A summary of footages for rock type contacts is listed below. Contact angles are provided with respect to the core axis (TCA) and an indication if the contact is an intrusive or fault contact where known. It was not possible to assess fault or contact angle in core that was heavily broken or where core loss occurred.

Depth (ft)	Rock Type	Contact
0-429	Rotary – no recovery	
429-687	Yqm	Yqm → Tgdp, Fault contact, in breccia
687-758	Tgdp	Tgdp → Yqm, Contact rubblized
758-815	Yqm	Yqm → Tgdp, Contact in lost core
815-818.5	Tgdp	Tgdp → Yqm, Intrusive contact, 40°
818.5-1048.7	Yqm	Yqm → Ta, Fault contact, 30°.
1048.7-1060.4	Ta	Ta → Yqm, Intrusive (?) contact, 85°
1060.4-1079.1	Yqm	Yqm → Tgdp, Fault contact, 60°
1079.1-1081.5	Tgdp	Tgdp → Yqm, Rubblized contact
1081.5-1145	Yqm	

3.1 Rock Types

Chip samples were not collected during mud rotary drilling of the basin-fill formations and bedrock to 429 feet. The depth to the top of bedrock is unknown, since rotary drilling and casing penetrated the contact.

Precambrian Quartz Monzonite (Yqm) constitutes 87.6% of the drill hole. This rock type consists of equigranular to coarsely porphyritic monzonite with an original texture of 25-35% quartz, 30-35% potassium feldspar, 20-25% plagioclase, and 5-8% biotite. The rock is broadly porphyritic in nature with large K-feldspar in a matrix of smaller quartz, plagioclase, and biotite. Most of the original texture has been overprinted by clay alteration and oxidation minerals (iron and manganese oxides), and has been disrupted by abundant fault breccia and gouge. Large, euhedral crystals of potassium feldspar exist at 0.5-3 cm across. Quartz crystals are 0.5-2 cm, plagioclase crystals are 2-10 mm, and biotite crystals are 1-10 mm in size.

Tertiary Granodiorite Porphyry (Tgdp) constitutes 11% of the drill hole. The rock contains 1-5 mm feldspar phenocrysts, mostly plagioclase, in an olive gray aphanitic matrix. Biotite phenocrysts compose ~10% of the rock. The geology logging did not attempt to segregate the granodiorite intercepts into Types 1, 2, and 3 as defined by Conoco.

Tertiary Andesite (Ta) constitutes 1.4% of the hole. This rock type is a dark olive grey with an aphanitic texture. It contains some areas of intense copper oxide clay. Chrysocolla and tenorite are also present in some zones.

3.2 Structure

Numerous fault structures, breccia zones, and fault planes were noted as described below. The breccia varies from crumbly, broken rock with no discernible breccia fragments or fault contact angles to well-milled breccia fragments in fine-grained gritty iron-stained matrix. Fault gouge consisting of clay and fine rock particles with or without slickensides was noted in many intervals typically less than one foot in thickness.

Depth (ft)	Fault Zones
429-450	Heavily fractured zone with small faults at various orientations
465-470	Fault zone, 70°
500.5-525	Fault zone, gouge in various orientations
530-585	Heavily shattered material with several fault zones, gouge in various orientations
600-700	Fault zone, gouge in various orientations
800-818.5	Fault zone, bottom contact @ 40°
875-945	Heavily shattered material with several fault zones, gouge in various orientations
1042.5-1088	Fault zone, gouge in various orientations
1110-1128	Fault zone, gouge in various orientations

3.3 Alteration

The rock is dominated by potassic alteration of low to moderate intensity. Quartz veins and associated secondary K-feldspar are common; secondary biotite is locally present. Pervasive argillic

alteration (mostly supergene) obscures much of the hypogene detail. Sericitic and propylitic alteration are locally observed. Sericitic alteration was likely more abundant than was evident, however it was strongly overprinted by supergene iron oxides and clay and was thus difficult to observe.

3.4 Metzone

Metallurgical zones (Metzone) codes were recorded for each sample interval. The codes for the Oxide Zone designate the interval in terms of whether the interval is dominated by copper oxides/silicates (code 1), mixed copper and iron oxides (code 2) , or shows high concentration of iron oxides with little or no copper oxides (code 3). No transition or sulfide material was seen.

Depth (ft)	Metallurgical Zone
429-1145	Intermingled zones of mixed copper and iron oxides and high-iron zones

3.5 Mineralization

There are pervasive copper oxides on fractures and in clay sites throughout the oxide zone. Copper oxides are consistently present from 429-1200 feet, with the exception of the very slightly mineralized Tgdp from 687-758 feet. The most common copper oxide is a copper-bearing clay that replaces plagioclase; other copper oxides present are chrysocolla and tenorite/wad. No copper oxides were present in the sulfide zone. Iron oxides (hematite, goethite, and jarosite) occur at mostly low abundances (1-5%) throughout the hole.

4 Geotechnical Summary

Average total core recovery (TCR) was over 90% for the hole. Average rock quality (RQD) was below 50%.

MetZone	Oxide
Depth	429-1145
Total Feet	716
Average TCR (%)	93.1
Average RQD (%)	44.8

4.1 Fracture Intensity

Core was collected in a split-tube barrel in order to ensure the highest integrity of intact conditions. Mechanical fractures caused by handling or placing the materials in the core box were discounted during the fracture intensity review.

The fracture intensity is low to moderate for the majority of the hole, with abundances of 0-15 fractures per foot. Areas near fault zones are substantially more fractured.

4.2 Core Recovery

Statistics on the core recovery in CMP11-06 are presented below. Recovery averaged 95.2% with the lowest recovery in Ta (23.3) and the highest recovery in Yqm (93.5%). RQDs range from 19.3% to 47.3%; these numbers are almost certainly skewed high. No handling of the core was permitted, so determining RQD is less precise.

Rock Type	Drill Run Interval (ft)	TCR %	RQD %
Yqm	627.5	93.5	47.3
Tgdp	78.5	90.8	19.3
Ta	10	86	23.3
CMP11-06 Totals	716	93.1	44.8

5 Sampling and Analysis

No assay samples were taken from CMP11-06, since the material was to be used in metallurgical tests. As of September 2011, metallurgical testing on this material is ongoing. The companion HQ hole (CMH11-06) was sampled on-site and assayed by Skyline Assayer and Laboratories in Tucson.

COMMENTS: 429-687' QMP cont. from above
490-494' well fractured but not crumbly
490.4-490.9' patches of biotite flooding
494' chrys. on fxs
494.494.4' surfaces covered w/ light green clay
451.1, 451.6' thin zones of breccia; ~25° TCA. v. little gouge
kspar ~ 30x30 mm.
506.5-506.5' abundant hem/goe on fxs
502.3-502.7' fault bx; little gouge, ~40° TCA.
504-504.2'
504.9-505.5' all Cu clay after plag; very soft.
505.5-510' very fractured w/ lots of breccia; little gouge.
509.5' fx/fault, 70° TCA. Zones of chl replacing bio.
Low Cu; most fractures filled w/ FeOx.
510-515' similar to above; abundant breccia w/ little gouge. Angle varies.
Fine-grained matrix w/ abundant milled fragments, large kspar is conspicuous.
514.5-515' all black & white; probably a small fragment/dike of Tqdp
515-520' same; abundant fault bx w/ little to no gouge. Slips @ ~50° TCA.
Large (~20x20mm) milled fragments embedded in goethite.
520-525' similar to above; fault bx w/ slips ~70° TCA.
520-520.6' hematite-clay zone
523.7-524.2' goe in fractures.
525-530' QMP w/ v. little fracturing + little clay. Fractures ~70° TCA.
526-527' patches of biotite; partially altered to chl.
527-529' intense goethite development;
528.5' 5-10 mm qtz vein, 60° TCA.
529.2' fracture w/ Cu clay & bio @ 80° TCA.
530-535' >50% fault bx; ~35° TCA. Very strong Cu mineralization.
531.6-532' bands of goe
532-533.5' strong CuOx; veins of bright blue @ 50° TCA 532.3-532.5'
533.8-534.2' band of hem @ 50° TCA.
535-536.5' fault breccia w/ little gouge, ~40° TCA
Abundant FeOx w/ low Cu.
Fault breccia; strongly sheared & core is a sticky mess.
common CuOx in fxs & plag sites.
↳ chrys. & tenorite.
545-550' similar to above.
chrys. & tenorite in fxs, some Cu clay after plag.
well-fractured & sheared, not much Cu.
552.7-553.7' fault breccia w/ milled frags & minor clay gouge.
553.7-557' well fractured; lighter colored & finer grained. Not porphyritic.
No Cu & only minor hematite. Aplite? Sericitic alteration more likely.
557-558' no recovery
well fractured; 1-3 cm fragments.

AVG. CORE REC'Y/HOLE

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

429-687' QMP cont. from above.

560-562.5' fault bx w/ 2-3 cm clasts; abundant hematite in matrix.

562.5-565' Cu clay after plag

565.5-567.4' pale fine-grained unit; aplite? Clasts of QMP.

567.4-568.1' QMP as above

568.1-569' aplite (?) as above

569-573.3' QMP.

573.3-575' mixed QMP + Tgdp. Tgdp has strong Cu clay after plag. QMP has strong hematite alteration.

575.4-576.2 + 577.2-579' aplite? Decent CuOx + Cu clay in QMP.

583.6' narrow fault zone, 60° TCA. Cu clay after plag; some tenorite.

589.5-590' Tgdp; plag → cu clay

590.4-594.4' breccia/sheared zone w/ hematite matrix. some tenorite + Cu after plag

593.5-594.5 Tgdp w/ Cu clay after plag

595.4-597.7' Good Cu clay; abundant biotite

600-604.4' sheared w/ abundant hem

604.4-605' Tgdp

605-609' sheared/brecciated QMP w/ milled frags up to ~4 cm

609-610' Tgdp

610-610.6' fault bx w/ gouge; 30° TCA. Fractures @ ~50° TCA.

611.6' + 612.8' qtz + kspar veins

615-616.2' competent QMP w/ ~2mm qtz veins

616.2-618' fault breccia w/ ~50% gouge, 40° TCA.

620-621.6' fault bx w/ sandy matrix; no gouge, ~40° TCA.

621.7' + 621.9' bands of biotite, 90° TCA.

625-630' very fractured, fxs ~55° TCA

627.2-627.6' fault breccia, no gouge, ~70° TCA.

628.7-628.9 ↗, ~88° TCA.

429-687' QMP

cont. from above

630-635' mostly fault breccia w/ little gouge, ~50° TCA. Core is difficult to clean.
634-634.4' high clay content

635-640' fault breccia, no gouge, very friable. Angle not visible.
nothing else noteworthy

640-644' fault breccia, sandy zones 642-644, w/ some clay. ~75° TCA.
640.3' slickensided Cu/FeOx

644-648' fault breccia as above, v. little clay. No measurable angle
646.8-647.2' some clay

648-651' fault breccia w/ milled fragments + abundant gouge. No measurable angle
high Cu in clay-rich zones.

651-656' fault breccia, ~60° TCA. Subrounded large milled fragments, w/ goe/hem matrix; no gouge, matrix is sandy.

656-660' fault breccia, ~60° TCA. Milled fragments as above, sandy matrix.
658.7-660' some gouge.

660-664' fault breccia, no measurable angle.
660-661.6' almost solid FeOx w/ some milled fragments of QMP.
661.6-661.9 + 662.4-662.9' almost solid white + pale green clay, ~20° TCA.

664-664.4' fault breccia
664.4-665.2' fault, ~40° TCA.
some Cu clay after plag.

669-670.8' brecciated zone w/ considerable hematite.
670.8-671.8' Cu in fractures & clays.
671.9-679' no visible Cu
673.3' fault zone, ~45° TCA.

674-679.5 fault bx.
676.7-677' ~3" qtz vn w/ strong chrys, hem, + tenorite.

679.5-684.5' solid core w/ little clay or hematite, green CuOx on fxs
Coarse orthoclase + biotite

684.8-685.2' Tgdp, w/ abundant hematite, fracturing, and qtz veins
685.2-685.7' QMP
685.7-686.2 Tgdp; 686.2-687' QMP.

687-758' Tgdp

contact irregular, in fault breccia.

690-695' Tgdp w/ crossing qtz veins
hematite + CuOx on fractures
Abundant quartz veins.

Similar to above

697-697.8' clay-hematite zone

FRACTURING

GEOLOGY

COMMENTS:

AVG. CORE REC'Y/HOLE

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

687-758' Tgdp

700-703.5' nearly barren Tgdp. Dark gray w/ trace CuOx (chrys.) on fxs. Abundant secondary biotite (recrystallized bio phenos). hem in <1mm fxs, w/ minor white clay.
703.5-708' same as above, w/ several ½-inch qtz-ksp veins.
708-710' same as above. Numerous small qtz veins w/ various orientations.
708-714' nearly vertical ½"-1" qtz vein
712-712.5' swarm of thin qtz veins w/ sericitic envelopes up to ~1" wide.
714-715' fault zone w/ abundant gouge. ~50° TCA.
715-720' same rock. Common qtz veins w/ thin sericite envelopes; secondary bio common as well.
718-719.5' swath of strong sor+chl+epid alt, ~25° TCA.
719' Tgdp changes to lighter gray w/ much larger (up to ~1cm) plag phenos
717' 1.5" qtz+chrys+tenorite vein, no visible envelope, ~30° TCA.
719' 1"
720-725' same lighter-colored Tgdp. Increased FeOx, still only trace CuOx. Abundant qtz veins ~75° TCA. Streaks of FeOx. Sericite envelopes are common on qtz veins. Biotite is locally recrystallized. Patches of sericite flooding @ 721.5, 724-725'
725-730' same Tgdp; nearly universal moderate sericite alteration. Some fresh biotite, and a few qtz veins w/ sericite envelopes, w/ some ksp(?). goethite > hematite. ↳ 2mm phenos (?)
730-735' same Tgdp; barren.
732.3' 3mm EDM vein, 50° TCA.
↳ width includes envelope
735-740' same as above
very common qtz(±ser±ksp) veins w/ ser envelopes (±ksp?)
738.5-740' patches of strong sericite alt. Trace Cu clay.
740.2' ¼" Cu clay vein, ~70° TCA.
741-741.8' Cu clay in plagioclase.
742.2' ½" qtz-ksp vein, ~70° TCA.
742.7-743' shattered zone w/ abundant hematite
746-749' shattered, not milled breccia.
same rock & alteration as previous interval. No visible Cu.
749-751' increased hem. staining in gm & feldspar sites. Similar to above.
751-755' same; hem staining + no visible Cu.

758-815 QMP ← contact rubblized/lost.

758-758.5' good Cu, pieces up to ~2-3cm. Less Cu further down.
Hard core w/ Cu clay after plag. Some tenorite. Hem/goe stain on fxs + around feldspars
Considerable qtz; as above w/ Cu clay after plag.

ALTERATION: ORTHQ, BIO, QTZ, SER, CLAY, CHL, EPID, CARB, GYPS, ANHY, MAG

OXIDE: LIM, HEM, GOE, CU GRAPHIC, CUOX 1, CUOX 2

SULFIDE: MET ZONE, PY, CPY, CC, BN, MO

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

818.5-1048.7' QMP

842.8-843.3' ~0.5' of fault gouge + breccia, w/ clay

843.3-845' good Cu clay + tenorite

840.5-841' cu clay + tenorite

846-850' strongly sheared minerals w/ abundant goethite. Cu clay after plag.

850-855' sheared + brecciated w/ hem + goe; Considerable biotite + good Cu.

Abundant clay; core is difficult to clean.

Same as above, CuOx on thin fractures

Same as above

Same as above, weak rock.

875-876' less Cu clay, clearly visible qtz + kspar.

876-880' strongly sheared w/ little clay

880-885' core pumped out w/o splits - a big mess. hematite abundant on fractures fairly fresh amp; some Cu clay after plag.

885-890' core is coming out of splits when pumping the tube... very broken up again. abundant kspar (flooding) + very little Cu.

891.3-891.7' fault zone w/ greenish Cu clay. 60° TCA. Cu clay after plag.

895-897.5' good CuOx, w/ tenorite. Large kspar phenocrysts.

903.1-903.5' fault bx, no measurable angle; mostly sand w/ some clay.

904.5-905' fault bx w/ ~50:50 clay/sand, no measurable angle. Low CuOx; crumbly and difficult to clean.

905-910' very fractured + crumbly w/ zones of sandy breccia. Very little Clay or CuOx. Fault zones ~50° TCA, very difficult to clean the core.

COMMENTS: Survey @ 900' Az 60.8° Incl.-89.5° Cor 49.8°

COMMENTS:

AVG. CORE REC'Y/HOLE

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

818.5–1048.7' QMP

910–915' crumbly & fractured, esp. 910-912'. 91'-915' more competent rock.
910-912' barren, 912-915' typical low-grade Cu clay
910' 1cm atz vein, 70° TCA. Most fractures ~50° TCA.
915-920' v. abundant FeOx, good CuOx as well.
917.5-918' gravel, breccia? ~40° TCA.
some chrysocolla.
920-925' some high FeOx, very little Cu.
920-921.9' fault bx; ~75° TCA. All rock is very broken, the interval may be entirely fault bx.
925-927.2' broken up, ~45° TCA.
927.2-928.2' more solid
928.2-930' broken, flakes easily.
Some chrys on fxs, low Cu overall. Plag sites are greenish.
930-930.7' hard w/ good CuOx, some chrys. & dendritic hematite.
930.7-935' fault bx, ~50° TCA.
935-940' swaths of biotite flooding, poor Cu mineralization.
937-937.6' fault bx, w/ gouge ~35° TCA.
937.6-940' reasonably competent, washes easily. No chrys or tenorite.
940.9-941.4' fault bx, low gouge, ~60° TCA.
veins of bio, ~zones of bio flooding. Low Cu.
945-950' competent rock w/ decent Cu mineralization in clay sites. Small amounts of chrys visible in fractures.
948.1-948.3' fault bx, mostly sand w/ a little clay. ~55° TCA.
950-955' fractures ~40° TCA, pretty friable, chrys on fractures.
952.5-952.7' brecciated
954-955' intermittent breccia ~40° TCA.
955-960' same as above. Raining hard..
960-965' variable fracture angles, fairly competent rock.
Some chrys on fractures.
965-970' very competent rock, much ksp alteration
965-965.3' kspar flooding
967-967.2' clot of biotite (2ndary?) w/ increased CuOx around/in it, in clays + tiny fxs.
Some atz veins w/ FeOx pseudomorphs of sulfides. Bio is partially eroded, rutile needles clearly visible in holes.
970-971.7' same as above
970-970.6' thin shattered recemented zones, ~45° TCA.
971.7-975' no recovery
975-980' QMP similar to above.
975-975.3' clay gouge, 975.3-975.7' gravel, ~90° TCA.
975.7-980' veins of chrys, best Cu in hole so far. ~75° TCA.
979.8-980' almost solid blue Cu clay, w/ tenorite veins

FRACTURING

GEOLOGY

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

818.5-1048.7' QMP

980-985' well broken, good Cu mineralization @980-981', w/ lots of Cu clay, chrys, & flecks of tenorite.
Contact between well-mineralized & barren QMP is 60° TCA, same as other fractures.
Cu clay & chrys rare 981-985'.
985-990' top 1' of core (985-986') is sand from the hole.
987' ~1/8" vein of chrys, varders erratically across core
988-990' regularly fractured, ~35-40° TCA. 1 fx every 1/2". Streaks of bio alt w/ qtz veins, 30° TCA.
990-995' locally strong kspar alt. Bio → chl is nearly complete.
991-991.3' solid kspar.
993-994' shattered zone, no milling of fractures. Strong hem replacement in a few spots.
994-995' a couple of ~1/8" chrys veins, ~30° TCA.
995-1000' same, pretty competent rock w/ minor Cu clay after plag.
997.5' 2 1/2" bio-bearing qtz veins, parallel, 50° TCA.
998-999' well-broken.
1001-1002' well-broken
1003.5-1005' slightly elevated Cu, stronger green in clay & a few specks of chrys.
1006.5-1007' silicified
1006.5-1009' biotite appears recrystallized, then replaced by chlorite.
1007-1008.5' strong ksp alteration.
1009' ~1/2" seam of clay/bx, 65° TCA. Some Cu in clay.
1010-1014' same; low-grade competent QMP w/ qtz-bio veins w/ qtz-ksp envelopes. bio → chl.
1014-1014.5' intense hem development, rock is silicified
1015.5-1016.1' fault zone; gouge breccia ~60-65° TCA.
1018-1018.5' no recovery, very broken below.
1017-1018' sericite flooding, tan after kspar.
1020-1025 some QMP. Plag → Cu clay & trace chrys.
1024.2' 1/2" gouge/bx zone. 35° TCA.
1025-1030' same as above. Sheeted qtz veins ~45° TCA, visible as gray streaks through kspar.
1029-1030' increase in Cu clay + a couple of ~1mm chrys veinlets.
1030-1031' numerous <3mm chrys veinlets, various orientations
1033.5-1035' bio completely altered to epidote.
1035-1036.2' v. strong kspar flooding. Salmon-pink rock w/ qtz & chrys.
1036.2-1037.2' silicified & mineralized, w/ FeOx psuedomorphs of sulfides in qtz vns w/ chrys.
1038' 2" fault bx w/ gouge, ~30° TCA. bio → chl + ep, complete replacement.
1040-1045' highly oxidized QMP, very fractured
Patches of chrys, low CuOx overall.
1042.5-1044' breccia, ~25° TCA.
1045-1048.7' QMP.
1046.5-1047.2' chrys veins, FeOx abundant throughout the interval.
1048.7-1060.4' Ta ← sheared planar contact w/ 1cm gouge, 30° TCA.

																															1120				

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

1048.7-1060.4' Ta

1050-1055' Ta, competent rock w/ chrys in fxs
1050-1053' fault breccia w/ ~50% gouge, ~70° TCA.
1053-1053.2' QMP, well-mineralized, w/ Cu clay & chrys.
1055-1056.4' solid, competent, w/ flecks of tenorite
1056.4-1059' fault bx, ~60° TCA, ~20" of clay. Very little blue Cu clay, trace tenorite.
1058-1059' solid black clay; sheared Ta?
1059-1060' no recovery

1060.4-1079.1' QMP ← contact planar, intrusive(?) ~85° TCA.

1060-1065' weakly mineralized QMP
All brecciated; only trace visible Cu
1065-1070' alternating intervals of fault bx & heavily fractured but intact rock. chl→bio.
1065-1065.2' gouge, v. little clay elsewhere. ↳ ~80° TCA.
1069.5-1070' minor tenorite & chrys, FeOx pseudomorphs of sulfides visible.
1070-1075' mostly fault breccia, very crumbly w/ no gouge. ~60° TCA.
all bio→chl. Little visible Cu, as Cu clay.
1075-1079.1' well-mineralized w/ Cu clay, chrys., & tenorite.
1076, 1077.8' small brecciated areas, ~60° TCA.
1079.3-1078.6' highest Cu grade

1079.1-1081.5' Tqdp ← contact sheared, 1cm gouge. 60° TCA.
Phenocrysts → white clay, little Cu. Abundant thin vlts of hem.

1081.5-1145' QMP ← contact rubblized

1083-1085.2' bands of qtz + ksp + bio alt; most bio→chl.
1085.2-1086' fault breccia, ~50° TCA.
1086-1088' completely shattered, detail obscured.
1088-1090' QMP as above, very fractured.
1088.7' ~25mm band of kspar, ~60° TCA, smaller bands of bio. Vein envelopes?
1090-1095' very broken w/ zones of fault breccia. bio→chl mostly complete. Weakly mineralized.
1092.8' biotite vein fxs @ ~60° TCA.
1094.5-1095' clay gouge.
1095-1100' shattered QMP. Strong sericitic alteration; kspar phenos are entirely ten.
1097' 3" gouge w/ abundant goethite, 55° TCA. contains ~2" fragment of ~solid biotite.
1098.5' 3" fault bx, no gouge.
1100-1105' same ser-altered QMP, shattered, abundant clay & FeOx & very little Cu.
most of the rock is tan altered feldspar.
1105.8-1107' partially silicified.
1105', 1106.5' patches up to a couple inches of sericite alteration.
Little biotite in QMP; only a couple%
1110-1115' fault breccia & gouge, slips ~25° TCA. Stronger Cu than previous intervals, chrys vns up to ~2mm.
1111', 1113-1114' clots of Cu-rich clay. Competent rock, core in 4 pcs.
1112.5-1115' streaks of chrys + tenorite.
1115-1118' same fault bx; less Cu, limited to clays. Trace chrys.
large fragments w/ little matrix; fragments are clearly milled.
1118-1120' same fault bx.

AVG. CORE REC'Y/HOLE

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

1081.5-1145' QMP

1120-1125' same fault bx; low Cu grade w/ minor clay in plag sites. most hypogene detail is obscured.

1125-1128' Same.

1128-1129.6' Ta; top 6" is gouge. Top & bottom contacts sheared, ~45° TCA.

1129.6' QMP is much grayer, less Fe ox/clay overprint. Fresh bio + plag; hematite is common but confined to fracture surfaces.

1133-1133.8' lacy network of thin vlts of secondary biotite.

1135-1140' same; small cloudy areas of secondary biotite. Fractures @ variable angles.

1140-1145' same.

T.D. @ 1145'. Drill rig nearing rated depth for PQ; nearing sulfide zone but not reached.

COMMENTS:

AVG. CORE REC'Y/HOLE

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

700-703.5' nearly barren Tqdp. Dark gray, fr. CuOx on fbs. Abun. secondary biotite (recrystallized phenos). Hem in <1mm fbs, w/ minor white clay.

703.5-708' same. Several ~1/4-1/2" qtz vns, -/ksp-bio alt. stks.

708-710' some ½" vertical qtz-ksp vn. Numerous other smaller vns; various orientations. continues to 714', up to ~1" wide.

712-712.5' swarm of qtz vns w/ sericite envelopes up to ~1" wide.

714' fault begins, gouge. 50° TCA. end 715.

715-720' same rock. Common qtz//ser vns + secondary bio.

718-719.5' swath of strong ser+chl+epid. alt. ~25° TCA.

717' 1.5" qtz-CuOx vn, no envelope (60°?) 30° TCA

+719' 1"

719'- different Tqdp; lighter gray w/ much larger plag phenos

720-725' same lighter Tqdp. More FeOx; still only trace Cu. Abundant qtz vns ~75° TCA. Stringers of FeOx. Chlorite ser envelopes on qtz vns (± hem). Biotite is only locally recrystallized. Local patches of ser. flooding (@721.5, 724-725')

725-730' same Tqdp; nearly universal mod. ser flooding. fresh bio, few qtz vns/ser env. w/ some ksp(?). Biotite is fresh. gue > hem. ↳ uniform 2mm size.

730-735' same Tqdp; barren.

732.3' 3mm EDM vn, 80° TCA.

735-740' same

very common qtz(±ksp±ser) vns w/ ksp/ser envelopes.

738.5-740' strong patches of sericitic alt. Trace Cu clay.

740.2' 1/4" Cu clay vn, 70° TCA. Cu clay in plag @ 741-741.5'

742.2' 1/2" qtz vn w/ ksp

742.7-743' shattered zone w/ abund. hem.

746-747' shattered, not milled bx.

Same rock + alteration as above. No visible Cu

749-751' increased hem + stringers + blebs. Same rock.

751-755 FRACTURED HEMATITE STAINING

NO VISIBLE CU

758. Ygm HEMATITE/GOETITE STAINING

758-758.5 GOOD CU PLASTER ~2-1% LESS CU DOWN THE CORE

HARD COLT KSPAR → CU TENORITE HEMATITE/GOETITE STAINING ON FRACTURES & AROUND FELDSPAR

AS ABOVE

TENORITE K-SPAR → CU LARGE OTHE CLASTS - CONSIDERABLE QTZ

COMMENTS:

DESCRIPTION: GEO., MINERAL, ALT, STRUCT.

910-915 Ygm, flaky and fractured from 910-912, more solid 912-915
910-912 is barren, 912-915 typical disperded Cu ox
QTZ m at 910 1 cm wide, 70° TCA, Fracture ∠50°
915-920 Ygm, highly oxidized, mostly Fe ox but nice Cu ox too
esp from 918.6-919, Gravel from 917.5-918, ∠40°, breccia?
Some CHPYS
920-925 Ygm highly oxidized w/ very little visible Cu
Fault breccia 920-921.9 ∠75, rest of rock really broken up, all breccia?
925-930 Ygm, 925-927.2 broken up ∠45° 927.2-928.2 ~solid,
928.2-930 looks solid but flakes easily, Cu ox, low visible abundance,
some CHPYS on fractured, bright gm in clay sites, last foot of 2nd side not was read
930-935 Ygm 930-930.7 very solid w/ good Cu ox, some CHPYS
930.7-935 broken up breccia, ∠50° and dendritic HEM
935-940 Ygm, veins of BIO flooding, poor mineralization
937-937.6 fault breccia w/ gouge at 35°, rest of interval is
resistant to flaking and easily to break, All Cu ox in clays, no CHPY or TEN
940-945 Ygm, veins and zones of BIO flooding, low Cu ox
940.9-941.4 fault breccia, low gouge, 60°
945-950 Ygm, most competent rock so far today, decent mineralization
in clay sites, CHPYS on fractured (only small and visible)
948.1-948.3 Fault breccia, mostly sand, little clay, 55°
950-955 Ygm, Fractured at 40°, pretty friable, CHPYS on fractured
Breccia 952.5-952.7, and intermittent from 954-955, ∠40°
955-960 Bad rain night now Ygm
looks same, broken
960-965 Ygm, variable fracture angles, fairly competent
some CHPYS on fractured

PROJECT COMPLETION REPORT FOR MINERAL EXPLORATION DRILLING

This report must be prepared by the owner in all detail for each hole drilled and filed with the Department within 30 days following completion of the well drilling project.

1. Owner Name: BHP Copper

   Address: 14605 E. Hunt Hwy, Florence AZ 85232
   Street City State Zip

2. Lessee or Operator Name: Same as above

   Address: _____
   Street City State Zip

3. Driller Name: Boyles Drilling

   Address: 12030 E. Riggs Rd., Chandler AZ 85249
   Street City State Zip

4. Location: 4S N/S 9E E/W 28 SW 1/4 NE 1/4 SW 1/4
   Township Range Section 10-Acre 40-Acre 160-Acre

WELL REGISTRATION NO. 55-539336 (REQUIRED)

DESCRIPTION OF WELL

5. Type of Casing (if installed): Steel casing

6. Abandonment method and material used if abandoned: 941' to 0' type 5 cement

Was well abandoned in the course of drilling pursuant to R12-15-816, F.? Yes ✓ No ____

7. Date of period drilled: From: 6/7/93 To: 6/13/93

LOG OF WELL

[✓] Unconsolidated Formation

Magma Copper Company
Well Closure Certification Form

This form is to be filled out upon abandonment of any well or coreholes. A copy shall be filed in the well log file.

I certify that the well/core hole number MCC-367 has been abandoned in compliance with the attached "Magma Copper Company Well and Corehole Abandonment Work Plan" dated January 10, 1996. A copy of the following documents are t be attached to this certification:

1. ADWR Notice of Intent to Abandon a Well (Unit wells only)
2. Well abandonment completion report per R12-15-816.K
3. U.S.EPA Plugging and abandonment plan form 7520-14
4. A diagram for each well or core hole depicting "as abandoned conditions"
5. A description of placement methods and volumes
6. Notation of any deviation from typical procedures

Name: James M. Lewis
Company: Layne-Christensen
Date: 5-21-96

#5. Cemented bottom of core hole to bottom of casing. Cut casing. Circulated cement around casing. Total Volume approx. 700 gallons. Type V cement.

PROJECT COMPLETION REPORT FOR MINERAL EXPLORATION DRILLING

This report must be prepared by the owner in all detail for each hole drilled and filed with the Department within 30 days following completion of the well drilling project.

1. Owner Name: BHP Copper

   Address: 14605 E. Hunt Hwy, Florence AZ 85232
   Street City State Zip

2. Lessee or Operator Name: Same as above

   Address: _____
   Street City State Zip

3. Driller Name: Boyles Drilling

   Address: 12030 E. Riggs Rd., Chandler AZ 85249
   Street City State Zip

4. Location: 4S N/S 9E E/W 28 SW 1/4 NE 1/4 SW 1/4
   Township Range Section 10-Acre 40-Acre 160-Acre

WELL REGISTRATION NO. 55-539336 (REQUIRED)

DESCRIPTION OF WELL

5. Type of Casing (if installed): Steel casing

6. Abandonment method and material used if abandoned: 1044' to 0' type V cement

Was well abandoned in the course of drilling pursuant to R12-15-816, F.? Yes ✓ No ____

7. Date of period drilled: From: 6/20/93 To: 6/24/93

LOG OF WELL

☑ Unconsolidated Formation
0-470'

☑ Consolidated Formation
Depth to water in feet below land surface: ____
(if encountered or detected)
470' - 1044'

I state that this report is filed in compliance with A.R.S. §45-600 and is complete and correct to the best of my knowledge and belief.

Magma Copper Company
Well Closure Certification Form

This form is to be filled out upon abandonment of any well or coreholes. A copy shall be filed in the well log file.

I certify that the well/core hole number 368 has been abandoned in compliance with the attached "Magma Copper Company Well and Corehole Abandonment Work Plan" dated January 10, 1996. A copy of the following documents are t be attached to this certification:

1. ADWR Notice of Intent to Abandon a Well (Unit wells only)
2. Well abandonment completion report per R12-15-816.K
3. U.S.EPA Plugging and abandonment plan form 7520-14
4. A diagram for each well or core hole depicting "as abandoned conditions"
5. A description of placement methods and volumes
6. Notation of any deviation from typical procedures

Name: James M. Meeuls

Company: Boyles Bros.

Date: 5-17-96

5. Filled core portion of hole with cement. Cut casing and circulated cement around casing. Total Volume approx. 800 gallons of Type V cement

REMARKS

0-40' Alluvium

40'-374' - Gila Conglomerate
Moderate → poorly sorted;
Sub angular frags. Qm, GP,
Andesite,

374'-391' - Quartz Monzonite -
Highly weathered, fractured,
Low → mod. chrysocolla mainly
in clays and along fractures -
High limonite, hematite.

391'-419' - Granodiorite porphyry
Brownish - grey silicified groundmass -
Low recovery near contact -
Plag. phenos 5-10 mm - ≈50%
of g.m. - fairly fresh -
(biotite fresh) - Strong limonite -

419'-567' - Quartz Monzonite -
Broken - sheared @ contact -
fairly fresh K-spars -
quartz "eyes"
Strong Fe staining -
chrysocolla
Minor Sericite - clays -

Broken - Sheared -

Magma Copper Company
Well Closure Certification Form

This form is to be filled out upon abandonment of any well or coreholes. A copy shall be filed in the well log file.

I certify that the well/core hole number MCC-525 has been abandoned in compliance with the attached "Magma Copper Company Well and Corehole Abandonment Work Plan" dated January 10, 1996. A copy of the following documents are t be attached to this certification:

1. ADWR Notice of Intent to Abandon a Well (Unit wells only)
2. Well abandonment completion report per R12-15-816.K
3. U.S.EPA Plugging and abandonment plan form 7520-14
4. A diagram for each well or core hole depicting "as abandoned conditions"
5. A description of placement methods and volumes
   Bottom to top with approx. 750 gallons of Type V Cement.
6. Notation of any deviation from typical procedures

Name: James M. Quimby

Company: Layne Christensen

Date: 5-30-96

Memo to: File **MAGMA COPPER - FLORENCE**
From: R. Williamson
Date: August 29, 1995

Subject: Drilling Summary MCC-535 (site F-6) NX-diameter core.

Date Started:	3/7/1995
Date Completed:	3/31/1995
Collar Coordinates:	745,696.36 N, 647,744.11 E
Surface Elevation:	1471.8 ft.
Azimuth:	0°
Inclination:	-90°

Downhole surveys completed at 100-foot increments from 379 to 1,279 feet in depth. Rotary: 0 to 360 feet Core: 360 to 1,279 feet. Drilling contractor: Boyles. Purpose: Ore reserve confirmation and classification on the west side of the deposit during the 1995 feasibility program. MCC-535 is located approximately 35 feet west of Conoco hole 461-MF.

Geologic Summary:

Core is badly broken, >15 fractures per foot to depth of 550 ft. Below 550 ft, becomes relatively competent, 2-3 fractures per foot except in areas of major faults (listed below)

Lithology:		
	0-392 ft.	Gila Conglomerate (Tgc)
	392-520.2 ft.	Tertiary Granodiorite Porphyry (Tgdp)
	520.2-646.7 ft.	Precambrian Quartz Monzonite (Yqm)
	646.8-651 ft.	Tertiary Andesite (Ta)
	651-654.5 ft.	Precambrian Quartz Monzonite (Yqm)
	654.5-656.8 ft.	Tertiary Andesite (Ta)
	656.8-771.6 ft.	Precambrian Quartz Monzonite (Yqm)
	771.6-791 ft.	Tertiary Andesite (Ta)
	791-795 ft.	Precambrian Quartz Monzonite (Yqm)
	795-807.5 ft.	Tertiary Andesite (Ta)
	807.5-845.5 ft.	Precambrian Quartz Monzonite (Yqm)
	845.5-856.5 ft.	Tertiary Andesite (Ta)
	856.5-865.5 ft.	Precambrian Quartz Monzonite (Yqm)
	865.5-895 ft.	Tertiary Granodiorite Porphyry (Tgdp)
	895-980 ft.	Precambrian Quartz Monzonite (Yqm)
	980-985 ft.	Tertiary Andesite (Ta)
	985-1110 ft.	Precambrian Quartz Monzonite (Yqm)

Company: Boyles Bros.

Date: 3/25/96

Memo to: File **MAGMA COPPER - FLORENCE**
From: C. Hoag C. Hoag
Date: November 1, 1995

Subject: Drilling Summary MCC-536, (site F-7) NX-diameter core.

Diamond drill hole started March 28, 1995 and completed on April 10, 1995. *End of hole*: 1,162 feet. *Collar coordinates*: 745,705.31N 647,979.80E . *Ground elevation*: 1,472.23 feet *Top of casing elevation*: 1,473.93. Azimuth: 0° Inclination -90°. Downhole surveys completed at approximately 100-foot increments from 200 to 1,130 feet in depth. *Rotary*: 0 to 380 feet *Core*: 380 to 1,162 feet. Drilling contractor: Boyles. *Purpose*: Ore reserve confirmation and classification on the west-central side of the deposit during the 1995 feasibility program. MCC-536 is located 100 feet west of Conoco hole 460-MF.

GEOLOGIC SUMMARY
Lithology Summary

0 -380.0	Rotary, no core
380.0-392.0	Precambrian quartz monzonite (Yqm)
392.0-399.0	Tertiary granodiorite porphyry (Tgdp)
399.0-525.0	Precambrian quartz monzonite
525.0-531.0	Tertiary granodiorite porphyry
531.0-544.0	Precambrian quartz monzonite
544.0-568.0	Tertiary granodiorite porphyry
568.0-596.0	Tertiary andesite (Ta)
596.0-640.0	Tertiary granodiorite porphyry
640.0-657.0	Tertiary andesite (Ta)
657.0-696.0	Precambrian quartz monzonite
696.0-699.0	Tertiary andesite (Ta)
699.0-1043.5	Precambrian quartz monzonite
1043.5-1055.8	Tertiary granodiorite porphyry
1055.8-1162.0	Precambrian quartz monzonite

Oxide:	380.0-1,078.0
Transition:	1,078.0-1,146.0
Sulfide:	1,146.0-1,162.0

Rock Types: The predominant rock type is the Precambrian quartz monzonite (Conoco's quartz monzonite porphyry). The rock consists of coarse-grained orthoclase and quartz and lesser amounts of plagioclase and biotite. Although there are some competent intervals, the bulk of the rock is moderately broken with many intense rubble zones. Aplitic dikes and stringers of fine-grained orthoclase and quartz cut the quartz monzonite and may be pre-Laramide in age.

Thin dikes of Tertiary granodiorite porphyry appear to intrude the quartz monzonite along pre-existing fault or brecciated zones. Several of the no recovery zones in the Yqm are adjacent to or very near to Tgdp dikes. The granodiorite porphyry has a grayish black to olive gray aphanitic matrix with 1-2mm subhedral plagioclase phenocrysts. These dikes may correlate to Conoco's Type III Tgdp. The iron oxide staining and copper oxide development on fractures is minimal.

Name: James M. Daniels

Company: Boyles Bros.

Date: 4-2-96

Memo to: File **MAGMA COPPER - FLORENCE**
From: J. LeAnderson, C. Hoag
Date: August 21, 1995

Subject: Drilling summary MCC-538, (site F-9), NX-diameter core.

Diamond drill hole started March 29, 1995 and completed on April 10, 1995. End of hole: 1,169 feet. Collar coordinates: 745,523.510 N 648063.217 E . Ground elevation: 1,472.1 feet Top of casing elevation: 1,472.77. Azimuth: 0° Inclination -90°. Downhole surveys were completed at 100-foot increments beginning at 450 feet. Rotary: 0 to 359.3 feet Core: 359.3 to 1,169 feet. Drilling contractor: Boyles. Purpose: Resource confirmation during 1995 feasibility program. MCC-538 deepened/twinned a nearby Conoco hole 465MF.

SUMMARY OF GEOLOGY

Drill Log Summary

0 - 359.3'	Tertiary Gila Conglomerate
359.3 - 406.8	Precambrian Quartz Monzonite
406.8 - 419.9'	Tertiary Aplite
419.9 - 587.0'	Precambrian Quartz Monzonite
474.2 - 483.0'	Fault gouge
587.0 - 594.9'	Tertiary Andesite
594.9 - 597.4'	Tertiary Aplite
597.4 - 618.5'	Tertiary Granodiorite Porphyry
618.5 - 780.1'	Precambrian Quartz Monzonite Porphyry
780.1 - 788.85'	Tertiary Andesite
788.85 - 813.0	Precambrian Quartz Monzonite Porphyry
813.0 - 814.7'	Tertiary Andesite
814.7 - 834.0'	Precambrian Quartz Monzonite
815.8 - 818.0'	Fault gouge and breccia
834.0 - 839.0'	Tertiary Granodiorite Porphyry
839.0 - 870.6'	Precambrian Quartz Monzonite Porphyry
870.6 - 998.3'	Tertiary Granodiorite Porphyry
998.3 - 1006.8'	Precambrian Quartz Monzonite Porphyry
1006.8 - 1007.6'	Fault gouge and breccia **(Sidewinder Fault)**
1007.6 - 1013.2'	Tertiary Granodiorite Porphyry
1013.2 - 1044.0'	Precambrian Quartz Monzonite Porphyry
1044.0 - 1051.7'	Tertiary Granodiorite Porphyry
1051.7 - 1169.0	Precambrian Quartz Monzonite

Structure - A 0.8' fault beginning at 1006.8' is interpreted to be the Sidewinder Fault, a major structure of probable Basin and Range age. The hanging wall is intensely 'rubbleized', has intense iron oxide alteration, has weak Kfeldspar alteration, and has intense supergene clay alteration. The footwall is competent, has weak iron-oxide alteration, no clay alteration, and has intense potassium feldspar alteration. It is thought that the hanging wall block represents a block from higher up in elevation that was more intensely oxidized. There doesn't appear to be a major change in copper mineralization across the fault. However, 'tenorite' is rare in the hanging wall.

Name: James M. Daniels

Company: Layne Christensen

Date: 6-10-96

Memo to: File C. Hoag **MAGMA COPPER - FLORENCE**
From: C. Hoag
Date: October 9, 1995

Subject: Drilling Summary MCC-545, (site F-4) NX-diameter core.

Diamond drill hole started April 26, 1995 and completed on May 8, 1995. End of hole: 1,370 feet. *Collar coordinates*: 746,157.623N 647,675.460E . *Ground elevation*: 1,474.0 feet *Top of casing elevation*: 1,474.70. Azimuth: 0° Inclination -90°. Downhole surveys completed at approximately 100-foot increments from 400 to 1,350 feet in depth. *Rotary*: 0 to 363 feet *Core*: 363 to 1,370 feet; drilled with single tube. *Drilling contractor*: Boyles. *Purpose*: Ore reserve confirmation and classification on the west side of the deposit during the 1995 feasibility program. MCC-545 is located approximately 100 feet east of Conoco hole 455-S.

GEOLOGIC SUMMARY

Lithologic Summary

0-363.0	Rotary, no sample
363.0-415.0	Tertiary Gila Conglomerate
415.0-561.4	Precambrian quartz monzonite
561.4-589.0	Tertiary granodiorite porphyry
589.0-628.2	Precambrian quartz monzonite
628.2-676.5	Tertiary granodiorite porphyry
676.5-928.2	Precambrian quartz monzonite
928.2-937.0	Tertiary granodiorite porphyry
937.0-963.2	Tertiary trachy andesite
963.2-966.3	Tertiary granodiorite porphyry
966.3-1074.0	Precambrian quartz monzonite
1074.0-1106.2	Tertiary granodiorite porphyry
1106.2-1361.2	Precambrian quartz monzonite
1361.2-1370	Tertiary granodiorite porphyry

Oxide: 415.0-1316.5 feet
Sulfide: 1316.5-1370.0 feet

Rock types: The predominant rock (~800 feet) is competent, moderately broken, and rubbleized Precambrian quartz monzonite (Yqm). The rock consists of subequal amounts of orthoclase and quartz, lesser white plagioclase, 2-10 percent biotite, and trace magnetite. Large 1-2 cm perthitic k-feldspar phenocrysts are present throughout the hole. Tertiary granodiorite porphyry (Tgdp) dikes account for 120 feet. The dikes consist of medium-dark gray to olive gray fine-grained intrusive rock with abundant, 1-3mm long white plagioclase phenocrysts plus biotite. The contacts between Tgdp and Yqm are both gradational, intrusive contacts as well as fault contacts in some instances. One lone 25-foot dike of weakly magnetic, Tertiary trachy andesite (Tta) at 937-963 feet cross cuts a dike of granodiorite porphyry. The upper contact with Tgdp appears gradational; the lower contact is broken and no contact angle was determined. The upper and lower Tta contacts did exhibit "chilled margins" and overprint the Tgdp host rock.. Phenocrysts within the Tgdp looked indistinct near the contact with the trachy andesite.

Memo to: File **MAGMA COPPER - FLORENCE**
From: R. Williamson
Date: September 28, 1995

Subject: Drilling Summary MCC-546 (site F-3) NX-diameter core.

Date Started:	4/23/1995
Date Completed:	5/31/1995
Collar Coordinates:	746,598.80 N, 647,829.28 E
Surface Elevation:	1477.00 ft.
Casing Elevation:	1477.05 ft.
Azimuth:	0°
Inclination:	-90°

Downhole surveys were not taken on this hole due to poor hole conditions. Rotary: 0 to 397 feet. Core: 397 to 1,152 feet. Drilling contractor: Boyles. Purpose: Ore reserve confirmation and classification on the northwest side of the deposit during the 1995 feasibility program. MCC-546 is located approximately 46 feet east of Conoco hole 447-S.

Geologic Summary:

Lithology:	0-534 ft.	Gila Conglomerate (Tgc)
	534-633 ft.	Precambrian Quartz Monzonite (Yqm)
	633-716 ft.	Tertiary Granodiorite Porphyry (Tgdp)
	716-720 ft.	Tertiary Andesite (Ta)
	720-733 ft.	Precambrian Quartz Monzonite (Yqm)
	733-788 ft.	Tertiary Granodiorite Porphyry (Tgdp)
	788-1032 ft.	Precambrian Quartz Monzonite (Yqm)
	1032-1036 ft.	Tertiary Andesite (Ta)
	1036-1133 ft.	Precambrian Quartz Monzonite (Yqm)
	1133-1144 ft.	Precambrian Diabase (Ydb)
	1144-1145 ft.	Precambrian Quartz Monzonite (Yqm)
	1145-1146 ft.	Precambrian Diabase (Ydb)
	1146-1152 ft.	Precambrian Quartz Monzonite (Yqm)

Oxide: 534-1152 ft.

Rock type descriptions: The137 feet of Tertiary Gila Conglomerate consists of moderately to weakly consolidated, generally competent core. The material is conglomeratic, matrix supported, with subangular to subrounded clasts dominated by quartz monzonite. The lower contact is rubbleized but appears to be conformable. The 460 feet of Precambrian quartz monzonite is the coarse-grained variety with 1-2 cm. K-spar phenocrysts intergrown with smaller phenocrysts of quartz, plagioclase, and biotite. The 4 feet Andesite dike is weakly porphyritic, with 2-3% secondary biotite in the groundmass. The andesite contains copper oxides and calcite. The 138 feet of Tertiary granodiorite porphyry is strongly porphyritic, with approximately 30% phenocrysts of predominantly plagioclase in a fine-grained quartz-K-spar matrix. The phenocrysts are pervasively altered to clay and sericite ± copper oxides. The Precambrian diabase occurs

Magma Copper Company
Well Closure Certification Form

This form is to be filled out upon abandonment of any well or coreholes. A copy shall be filed in the well log file.

I certify that the well/core hole number 546 has been abandoned in compliance with the attached "Magma Copper Company Well and Corehole Abandonment Work Plan" dated January 10, 1996. A copy of the following documents are t be attached to this certification:

1. ADWR Notice of Intent to Abandon a Well (Unit wells only)
2. Well abandonment completion report per R12-15-816.K
3. U.S.EPA Plugging and abandonment plan form 7520-14
4. A diagram for each well or core hole depicting "as abandoned conditions"
5. A description of placement methods and volumes
   Cemented from 620' to top w/ approx. 450 gallons of Type V.
6. Notation of any deviation from typical procedures
   Hit twisted off rods @ 620'. Cemented from 620' to top.

Name: James A. Daniels

Company: Boyles Bros Drilling

Date: 4-8-96

Memo to: File
From: P. Stubbe
Date: October 13, 1995

Subject:Drilling Summary MCC-546A (Site F-3) NX diameter core

Date Started: 6/4/95
Date Completed: 6/18/95
Collar Coordinates: 746,606.99N, 647,838.83E
Surface Elevation: 1477.00 ft.
Casing Elevation: 1477.59 ft.
Azimuth: 0°
Inclination: -90°

Downhole surveys were made on this hole in 100 foot increments starting at 1000 feet. Rotary: 0 to 990 feet. Core: 990 to 1437 feet. Drilling contractor: Boyles. Purpose: Ore reserve confirmation and classification on the northwest side of the deposit during the 1995 feasibility study. MCC-546A is located 13 feet east of MCC-546 which was lost at 1152 feet; shy of the target depth by 250 feet.

Geologic Summary:

Lithology:	0-534	Gila Conglomerate
	534-633	Precambrian Quartz Monzonite
	633-716	Tertiary Granodiorite Porphyry
	716-720	Tertiary Andesite
	720-733	Precambrian Quartz Monzonite
	733-788	Tertiary Granodiorite Porphyry
	788-1097	Precambrian Quartz Monzonite
	1097-1185	Fault Gouge and Breccia
	1185-1253	Precambrian Quartz Monzonite
	1253-1269	Fault Gouge
	1269-1437	Precambrian Quartz Monzonite

Oxide: 990-1286
Sulfide: 1286-1437

Note: Lithology from 0-990 feet is based on the log of hole MCC-546.

Rock Types: The 447 feet of core from this hole is dominantely Precambrian Quartz Monzonite. The rock is coarse grained with K-spar phenocrysts up to 4 cm. across. Plagioclase and quartz are intergrown in the matrix and flecked with small clots of biotite that rarely exceed 1 cm. in width. Over 100 feet of core was logged as fault gouge and breccia in this hole. The gouge consists mainly of sheared and shattered fragments of quartz monzonite in a very oxidized silty-sandy matrix. Within an 88 foot gouge zone, a 3 foot sample of Precambrian diabase was recorded. The diabase is interpreted as a xenolith in the gouge zone. It is a strongly sheared, green, fine grained, mafic rock with a few small biotite clots.

Structure: Major faults and/or shears occur at the following depths: 1031-1033 ft., 1097-1108 ft., 1253-1269 ft. The fault at 1031-1033 ft. appeared to have a true dip of 10°-30°. The large structural zone between 1097-1108 ft. had an undetermined orientation but appeared to be very steep (true dip 70°-90°) at the bottom where slickensides were subparallel to the core axis. At 1253-1269 ft. the fault had a true dip measured at 50°.

MAGMA COPPER - FLORENCE
Drill Hole Summary
MCC-569 (site F-35)
February 16, 1996

Type: Rotary 0' to 800', Nx Diamond, 10' split barrel 800' to 999', 5' split barrel 999' to 1663'
Started: September 20, 1995; **Completed:** October 16, 1995
Total depth: 1665 ft. (according to driller's log), 1663' measured on core.
Collar coordinates: 746,203.81N 647,315.61E
Top of casing elevation: No casing in place when surveyed.
Ground elevation: 1473.1 ft
Azimuth: N/A
Inclination: -90°; downhole surveys at ±100 ft. increments from 810' to 1650' depth.
Drilling contractor: Christensen Boyles Corp.
Logged by: J. Downey
Purpose: Ore reserve confirmation and classification on the west side of the deposit during the 1995 pre-feasibility program. MCC-569 is located approximately 50 feet north of Conoco hole 456-S.

Geologic Summary

Precambrian Quartz Monzonite is the most common lithology in MCC-569, and excepting the last interval, from 1613' to 1663', it is typical of the granitic rock seen in most of the recent drill holes. The unusual phase of Precambrian Quartz Monzonite in the last interval is equigranular, with little or no primary pink microcline. This interval is separated from the overlying typical Yqm by a major fault from 1607.5 to 1611.5. Mineral grains typically range from ~3mm to 10 mm, and the largest crystals tend to be euhedral to sub-hedral β-quartz. Quartz and plagioclase each average around 20% of the rock, and biotite (including secondary) also averages ~20%. The remainder is a whitish semi-opaque feldspar that commonly is altered to a light brown Ksp, usually surrounding host fractures or healed fractures. This mineral is assumed to be either white orthoclase or some other alkali feldspar. Petrographic sample of a similar rock (MFL5 & MFL7) from MCC-548 were described by Sid Williams. This interval is hosts significantly more Ksp flooding and argillization than the typical quartz monzonite, but it is not clear if this is the result of environment or chemistry. Going on the texture and composition of this rock it could be a phase of the Tertiary intrusion, but as no age date has been done it tends to get lumped with the Precambrian rock.

This hole contains two intervals of Granodiorite porphyry, one 15' thick and the other 50' thick. Both appear to be Conoco's type II porphyry, as they are a dark grey color and contain little or no quartz. Both tend to be highly fractured with mild K-spar veining and a moderate clay overprint. Mineralization tends to be weak in both intervals.

Tertiary Trachy-Andesite occurs as two dikes, the first being a thin brown-green drab dike with mildly developed flow alignment of needle-like phenos, and fairly strong exotic copper mineralization. Trachy-Andesite also occurs as a med to light brown dike with large sub-hedral plagioclase and anhedral quartz phenos. This dike is very competent, shows traces of trachitic flow alignment, and has traces of tenorite on some fractures. Neither contains significant alteration aside from clay, etc. on the fractures and some argillization of plagioclase phenos.

The entire hole seems to have a mild to moderate potassic alteration, as either biotite or Ksp ± qz depending upon host lithology. Chlorite and clinochlore (pennine, according to pet. reports) occur locally as areas of mod. to str. clots and zones of replacement in the Yqm. These minerals are assumed to be the results of further alteration of secondary and primary biotite. Clay alteration is mod. to str. throughout the hole and there is considerable clay alteration in the sulfide rock which is assumed to be hypogene, consisting of white and drab green clays, both on the fractures and in the matrix. Clay is also very common in the oxide rock, and much of it is assumed to be either hypogene or the result of structural movement. Some of the oxide clays are certain to have been formed from supergene processes, but these clays are realistically impossible to differentiate in hand sample. A similar such assumption deals with sericite. Recent petrographic studies and numerous Conoco pet. reports

14. Is the proposed wellsite within 100 feet of a septic tank system, sewage disposal area, landfill, hazardous waste facility, storage area of hazardous material or petroleum storage areas and tanks?
    Yes _____ No X

16. Proposed method of abandonment of well after project is completed: (All) wells will be capped upon completion of testing.

17. Is this well to monitor existing contamination? NO Potential contamination NO. Please explain: _____

GENERAL INSTRUCTIONS

1. Fill out this form in DUPLICATE and send WITH $10.00 FEE to 15 South 15th Avenue, Phoenix, AZ 85007.
2. For specific instructions, limitations and conditions, see the reverse side of this form.
3. Must be signed by land owner or lessee.
4. Section §45-596(D), provides that the Director shall determine that all information required on form has been submitted. If not, the person filing will be notified and the drilling, deepening, or modification of the well may not proceed.

JAN 10 1994

I state that Notice is filed in compliance with Section § 45-596 and is complete and correct to the best of my knowledge and belief and that I understand the conditions set forth on the reverse side of this form.

If construction plans have been coordinated with Arizona Department of Water Resources, who is the agency contact? _____

19. WELL CONSTRUCTION PLAN

a) Drilling method (mud rotary, hollow-stem auger, etc.) mud rotary

b) Borehole diameters: 6 inches from 0 feet to 1200 feet.

_____ inches from _____ feet to _____ feet.

Proposed only. Not as built.

c) Casing materials (PVC, steel, hollow-stem auger, etc.)

material Sch. 80 PVC diameter 4 inches from 21 feet to 1200 feet

material Steel diameter 6 inches from 0 feet to 20 feet

d) Method of sealing at reductions _____

e) Annular seal materials (cement, grout, etc.); method of placement (tremied, circulated)

material Grout (Bentonite) method tremied from 20 feet to 800 feet

material Cement Grout seal method tremied from 0 feet to 20 feet

f) Filter packs (state material):

material No. 12 Silica Sand - Gravel Pack from 800 feet to 1200 feet

material No. 30 river sand from 795 feet to 800 feet

g) Perforations or screen specifications:

type 0.020" Slot PVC from 800 feet to 1180 feet

type 2" PVC - Blank from 1180 feet to 1200 feet

h) Method of well development (bail, air lift, surge) air lift

i) Will surface or conductor casing extend above grade: Yes X No _____

20. Include detailed construction diagram showing expected water depth in feet below land surface, and details of vault, if specified.

CONDITIONS

I. Construction and abandonment standards for all wells shall be in accordance with A.A.C. R12-15-811 and R12-15-816.

II. Drilling of the well shall be completed within one (1) year after the date of Notice.

III. A Well Driller Report, is required within 30 days of completion of drilling. A Completion Report, is required to be filed with the Department within 30 days after installation of pump equipment for monitor wells.

IV. Pump equipment may not be installed on a well drilled for piezometer purposes. If a monitor well is pumped, pumping is limited to the maximum amount required for monitor purposes, but in no case may exceed 35 gallons per minute and an annual volume of 10 acre feet total.

V. A.A.C. Rule R12-15-811.H.2, requires that: "A monitor well shall be identified as such on the vault cover or at the top of the steel casing. Identification information will include well registration number."

VI. Special construction standards required pursuant to A.A.C. Rule R12-15-821: _____

DM-B

Memo to: File **BHP Florence**
From: C. Hoag
Date: October 11, 1996

Subject: Hydrology test wells DMA, DMB, DMC, DMD, DME, DMF, and DMG.

Conoco retained the consulting firm Dames & Moore to conduct a pre-mine study of the hydrology and provide an estimate of the amount of water that would be produced in the pilot mine workings. Seven shallow holes were drilled - DMA through DMG around the perimeter of the underground workings. Dames & Moore created plots of water inflow versus depth based on the analysis of radioactive tracers in the wells. Their prediction was that the mine would produce 2,000 to 8,000 gallons per minute for the entire pilot mine. Contrary to predictions, the mine produced a maximum of slightly over 650 gallons per minute. Most of the water occurred as general weeping from the back and ribs of the drifts, a significant percentage occurred in a few high production fault zones. A discussion of the pilot mine and hydrologic tests is located in the Conoco Feasibility Study, Vol. IV, Chapter 3. Dames & Moore's preliminary report, based on their geophysical and hydrological work on DMA through DME, is located in the file system in the library.

Although we have not found the geology logs for DMA through DMG, we do have records of the collar coordinates and downhole geophysical logs including: caliper, spinner, fluid density, temperature, and radioactive tracer. These holes are in the economic area of interest for BHP and are voids that should be identified prior to production. Therefore, the following drill data will be used in the Florence Model A database.

Hole	Northing	Easting	Elevation	Depth
DMA	746381.80	649148.51	1478.70	700 ft.
DMB	746381.71	648246.90	1478.11	700 ft.
DMC	746384.92	650185.43	1471.49	610 ft.
DMD	746842.25	649740.28	1480.10	635 ft.
DME	745516.10	650741.49	1464.94	700 ft.
DMF[1]	745518.90	649496.43	1466.10	392 ft.
DMG[2]	746600	651571	1475	345 ft.

1 No log has been found for DMF, plotted on drill collar map as 50 feet east of 398MF. Hole probably drilled to get slope stability data for Dames & Moore.

2 DMG was drilled to get slope stability information about the overburden. Geology log exists for DMG, collar coordinates referenced to Conoco grid system, E-W line J.5, 6E. The hole is plotted on map at approximately 746600N, 651571E or 250 east of core hole 337S.

H.1 Introduction

This Attachment H has been prepared in support of an Application by Florence Copper, Inc. (Florence Copper) to the United States Environmental Protection Agency (USEPA) for issuance of an Underground Injection Control Class III (Area) Permit (UIC Permit) for the planned Production Test Facility (PTF), to be located at the Florence Copper Project (FCP) property in Pinal County, Arizona. As required for Attachment H under USEPA Form 7520-6, this Attachment includes information regarding proposed operating data for all injection and recovery wells at the PTF. This Attachment provides background information and data in the order that it is requested in the instructions for Attachment H. The requested information includes:

- Average and maximum daily rate and volume of fluids to be injected;
- Average and maximum injection pressures;
- Nature of the annulus fluid; and
- A qualitative analysis and ranges in concentrations of all constituents of injected fluids.

H.2 Background

Florence Copper is proposing to operate the PTF to demonstrate the feasibility of developing an in-situ copper recovery (ISCR) facility at the FCP property that will consist, in part, of a closely spaced array of Class III injection wells and recovery wells. The proposed PTF area is approximately 13.8 acres in size.

The UIC Permit is requested to authorize injection and recovery operations in the oxide zone, the upper portion of the bedrock underlying the PTF. The top of the oxide zone is at approximately 450 feet below ground surface at the PTF well field. It has an average thickness of approximately 750 feet beneath the PTF well field. To prevent vertical excursion of injected fluids, the uppermost 40 feet of the oxide zone will be excluded from injection. Consequently, the injection wells constructed at the PTF will have a typical injection interval of 700 feet. Florence Copper has chosen to divide the injection interval for the PTF wells into multiple intervals to focus injection into targeted areas of the oxide zone.

H.3 Rate and Volume of Fluids to be Injected

Aggregate injection and recovery rates in the PTF well field will be carefully balanced to ensure that hydraulic control will be maintained throughout the portions of the oxide zone in which injection and recovery is occurring from the time that injection begins until the PTF well field is closed in accordance with the requirements of the UIC Permit.

For each well, the rate and daily volume of fluids injected may vary based on the length of the injection interval and the capacity of the oxide zone to transmit fluids at each well site. Because the oxide zone varies in thickness and packers will be used to focus injection, the length of the injection interval in each well will vary accordingly. The rate of fluid injection in wells with longer injection intervals will need to be greater than the rate in wells with shorter injection intervals to maintain a consistent rate of flow through the oxide zone on a per-foot of thickness basis to achieve a target pregnant leach solution (PLS) grade. To maintain PLS grade, injection rates in all wells must be proportionate to the length of the injection interval. Florence Copper proposes an average injection rate of approximately 0.15 gallons per minute per foot (gpm/ft) of injection interval, and a maximum injection rate of approximately 0.20 gpm/ft of injection interval. Injection rates may be lower than the proposed average based on the length of the final injection interval used and the location of packer placement. Typical injection rates may be as low as 0.10 gpm/ft of injection interval depending on formation properties and resulting final packer configuration in each well.

The maximum aggregate injection rate proposed for PTF operations is 240 gpm, and the maximum extraction rate is limited by the capacity of the planned SX/EW plant to 300 gpm. At the maximum injection rate and maximum recovery rate, extraction will exceed injection by 25 percent. The minimum ratio between injection and recovery will be 110 percent. This means that extraction will always be greater than injection by at least 10 percent and as much as 25 percent.

Given the relatively small area of the PTF well field, it is anticipated that the thickness of the oxide zone and the resulting screened interval from well to well will be approximately uniform.

The PTF wells will be constructed with multiple injection intervals separated by sections of blank well casing that will allow packer assemblies to be used to focus injection into targeted intervals of the injection zone.

Table H-1 lists example injection rates and the resulting daily total fluid volumes derived using these rates. The planned aggregate injection rate for the PTF is limited to 240 gpm regardless of well configuration or well performance. If formation performance is uniform, each of the four injection wells will be limited to an injection rate of 60 gpm. Variation in formation performance may require some wells to be operated at rates lower or higher than 60 gpm. In all cases, the aggregate injection rate will be balanced between the four injection wells to ensure that no more than 240 gpm is injected. The values presented in Table H-1 reflect potential injection rates for a variety of well configurations which may be applied to compensate for formation performance. Depending on formation performance, planned injection rates may be less than 0.15 gpm/ft of injection interval.

H.4 Average and Maximum Injection Pressure

Each of the proposed injection and recovery wells will be completed to Class III injection well standards and individually adjusted for the depth, thickness, and hydraulic characteristics of the portion of the oxide zone penetrated by the well. Because injection pressures are calculated based on the distance from the top of the well casing to the top of the injection interval, variations in well construction depth may in turn result in variation of the average and maximum injection pressures at each well. The calculated average and maximum injection pressures, therefore, will be specific to each of the planned wells. Each well will be constructed to ensure that the injection interval is at least 40 feet below the top of the oxide zone, but spans the remainder of the oxide zone below. Based on available formation thickness data, injection pressures have been calculated for the proposed PTF injection wells and are presented in Table H-2.

Typical wells may include one or more injection intervals ranging in length between 190 and 700 feet. The injection pressures presented herein are calculated by multiplying the depth from the top of well casing to top of the injection interval by a pre-determined factor that is designed to moderate injection pressures and prevent hydraulic fracturing of the formation.

H.4.1 Average Injection Pressure

Average injection pressures are calculated as a function of the dynamic elevation of the column of lixiviant standing above the top of the injection interval during PTF well field operations. For the purposes of estimating the average injection pressure, it is assumed that the dynamic elevation of the injected fluid is equal to the elevation of the well head, and that no additional mechanical pressure is applied.

Typical groundwater will exert a pressure equivalent to 0.43 pounds per square inch per foot (psi/ft) of depth. Although composed primarily of water, lixiviant also includes sulfuric acid and dissolved minerals that will increase the density by an estimated 5 percent. Thus, the lixiviant solution is estimated to exert a pressure equal to approximately 0.45 psi/ft of depth. This is the value used to calculate the average injection pressures at the top of each injection interval.

Average injection pressures are calculated by multiplying the depth to the top of the injection interval from the top of well casing by 0.45 psi/ft. This method reflects a well head pressure that is equal to atmospheric pressure, while the well casing is flooded with lixiviant. The pressure generated at the top of the injection interval results solely from the weight of the column of lixiviant with no additional mechanical pressure applied. Examples of average injection pressure at the anticipated depth of the top of the PTF injection intervals are included in Table H-2.

H.4.2 Maximum Injection Pressure

Formation testing conducted in 1995 by BHP Copper Inc. (BHP Copper) determined a minimum fracture gradient of approximately 0.71 psi/ft for rock within the oxide zone. To ensure that injection pressures did not induce additional fracturing of the oxide zone, UIC Permit No. AZ396000001 issued to BHP Copper for the FCP in 1997 established a fracture gradient limit of 0.65 psi/ft. The fracture gradient packer testing data are included in Attachment I of this Application. Florence Copper proposes to use the 0.65 psi/ft fracture gradient to determine the maximum injection pressure for each injection interval.

Maximum injection pressures are determined by multiplying the fracture gradient limit (0.65 psi/ft) by the depth from the top of well casing to the top of the injection interval. This method of calculating maximum injection pressures reflects the pressure generated by the weight of the column of raffinate and an additional pressure applied by mechanical means to achieve the maximum allowable injection pressure at depth.

As described above, packer assemblies may be used to focus injection in targeted areas of the broader injection zone. Because operational injection pressures are calculated to the top of each injection interval, the length of the interval does not affect the calculated injection pressures. Consequently, if multiple injection intervals are used, the injection pressure will be calculated at the top of the each interval.

Example average and maximum injection pressures at selected depths representing the top of potential injection intervals and the corresponding maximum well head pressures are included in Table H-2.

H.5 Nature of the Annulus Fluid

Annulus fluid is the fluid that exists between the injection pipe and the interior of the well casing. Over the operational life of a Class III injection well at the FCP site, the nature of the annulus fluid in a given well will vary between native groundwater from the oxide zone, lixiviant solution, and PLS. The estimated composition of native groundwater and the forecast compositions of lixiviant solution are presented in Exhibit H-1. Exhibit H-1 is discussed further in Section H.6.

H.5.1 Injection

The proposed Class III injection wells may be operated in one of two modes: pressurized at the well head with an injection pipe and packer assembly, or under atmospheric well head pressures with only an injection pipe. The nature of the annulus fluid under each of these injection conditions is described below.

H.5.1.1 Pressurized Injection

Under pressurized operation, an injection pipe and packer assembly will be used to isolate and focus injection into a targeted injection interval. The packer assembly will include packer(s) placed at the top and bottom (if required) of the injection interval. For new wells, the well will contain only native groundwater and when the packer assembly is inflated, native groundwater will be trapped in the annulus above the uppermost packer.

After operations have commenced, the packer assembly may periodically be deflated so the assembly can be moved between injection intervals within the injection zone. Deflation and moving of the packer assembly will result in incidental mixing of the native groundwater from the oxide zone, initially trapped above the uppermost packer with the lixiviant solution until eventually the composition of the annulus fluid reflects lixiviant solution.

H.5.1.2 Injection at Atmospheric Well Head Pressures

Under atmospheric well head pressure, lixiviant solution will be introduced with an injection pipe that discharges below the static fluid level in the well. Groundwater will not be isolated above a packer assembly. Operation under atmospheric well head pressure will flood the annulus with lixiviant solution for the entire length of the well at the commencement of operations and will maintain that condition throughout the period of injection.

H.5.2 Recovery

All wells used for recovering PLS will be constructed to Class III well standards. Annulus fluid within new recovery wells will initially be oxide zone groundwater. As injection begins and fluids are recovered from the injection zone and pumped back to the surface, the annulus of the recovery wells will be flooded with PLS at atmospheric pressure.

H.6 Qualitative Analysis of Constituents in Injected Fluid

Monitoring of injected fluid is required by 40 Code of Federal Regulations (CFR) 146.33(b)(1) at a sufficient frequency to yield representative data describing fluid characteristics. Permittees are required by 40 CFR 146.34(a)(7)(iii) to provide a qualitative analysis and ranges of concentrations of all constituents in the injected fluids. A new analysis is required by 40 CFR 146.33(b)(1) whenever the injected fluid is modified to the extent that the existing data is incomplete or incorrect, and the new data must be submitted pursuant to 40 CFR 146.34(a)(7)(iii).

Florence Copper requests that the UIC Permit authorize the injection of fresh water, solutions of sodium carbonate or other neutralizing agents, and lixiviant used to dissolve copper. The lixiviant solution will be generated on site starting with the commencement of PTF operations. The initial lixiviant solution will be composed of water and sulfuric acid, and can be considered an "immature" solution. Once this solution has been circulated through the oxide zone and recovered as PLS, and the copper has been recovered from the solution by the solvent extraction/electrowinning (SX/EW) process, the solution will be re-acidified and re-injected.

At the outset of PTF operations, the solution may be re-acidified and re-injected without recovering the copper by SX/EW until the copper concentration is sufficiently high to begin SX/EW recovery. With each injection and recovery cycle, the solution will accumulate constituents dissolved from the oxide zone. A "mature" lixiviant solution is one that has been acidified and circulated through the oxide zone and SX/EW process a sufficient number of times to reach equilibrium concentrations of dissolved constituents. The lixiviant solution will be recycled for the duration of PTF operations.

The typical concentrations of dissolved constituents that will occur in the mature lixiviant solution during PTF operations can only be estimated at this time because actual constituent concentrations can only be measured during the injection and recovery of an acidified solution though the oxide zone at a scale and duration representative of PTF operations, and no injection and recovery has yet been conducted at that scale or duration.

H.6.1 Injectate (Lixiviant) Solution Composition

Florence Copper proposes that "lixiviant" be used to refer to the solution prepared for injection and "raffinate" be used to refer to PLS after it has been processed in the SX/EW plant. The composition and constituent concentrations of PLS and raffinate are similar except that the SX/EW process removes approximately 90 percent of the copper from the PLS and causes a downward shift in pH. Florence Copper bases its proposal on the recognition that the "barren" PLS (or raffinate) exiting the SX/EW plant may need to be treated before it is ready for re-injection. Thus, "lixiviant" is proposed to distinguish between the solution that is ready for re-injection and the barren PLS solution, or raffinate, that has exited the SX/EW plant but has not been prepared for re-injection.

Organic constituents in in-situ solutions result from the contact of PLS with organic process chemicals in the SX/EW plant. Florence Copper proposes to limit the total concentration of organic constituents in the lixiviant solution to 10 milligrams per liter (mg/L). The organic constituents include polynuclear aromatic hydrocarbons (PAHs) derived from the kerosene type fluid used in the SX process. The composition of the organic compounds in the lixiviant solution can be controlled by specifying the quality of process chemicals purchased. Their concentrations can be controlled by the equipment process controls and the protocols for the SX/EW plant and mixing facilities.

Inorganic constituents in the in-situ solutions are a product of both process chemicals as well as chemical reactions resulting from the interaction of lixiviant solution with the host rock of the oxide zone during PTF well field operations. They will be variable in both composition and concentration. Some constituents are relatively predictable because their sources are the inorganic chemicals (such as sulfuric acid and calcium carbonate that will be mixed to acidify or neutralize solutions) which are controlled and measurable; however, other constituents are a function of the interaction between the injection fluids, pH of injection fluids, existing groundwater, and the solubility of minerals present in the oxide zone. Their composition and concentration will be difficult to validate until the injection and recovery process has continued for enough time to develop a mature PLS, and sufficient operational data are available. Therefore, a qualitative analysis of constituents in lixiviant solution cannot be definitively provided at this time until a mature PLS solution is produced from PTF operations.

H.6.2 Previous Studies

Two studies have been conducted in an effort to forecast the character and range of constituent concentrations in in-situ solutions that will be produced during ISCR operations at the FCP site. One study was conducted in 1995 and reported in Section 3 of Volume IV of the Aquifer Protection Permit (APP) application that BHP Copper submitted to the Arizona Department of Environmental Quality (ADEQ) in January 1996 (1996 Application), concurrent with its application to USEPA for UIC Permit No. AZ396000001. A summary of the results of that study was included in Table 4.3-1 of Volume 1 of the 1996 Application (included as Exhibit H-2 of this Attachment), and made part of the UIC Permit and of APP No. 101704 that ADEQ subsequently issued to BHP Copper in 1997. Solution compositions were re-evaluated by Daniel B Stephens and Associates in April 2014 on behalf of Florence Copper, to update and expand on the information in Table 4.3-1. Both studies are briefly discussed below.

As explained in Section 3, Volume 4 of the 1996 Application, forecast compositions of in-situ solutions were developed from geochemical models that were based on column tests of core samples collected from the FCP site. The core samples were collected from a number of locations within the oxide zone of the bedrock underlying the FCP site; this is the same bedrock oxide zone proposed for PTF operations. Some of the forecast compositions shown in Table 4.3-1 (Exhibit H-2) were developed from those models; however, the compositions of PLS and lixiviant solution (referred to as raffinate in Table 4.3-1) were based on actual process data from BHP Copper's copper leach in-situ operation at San Manuel, Arizona. The solution data from San Manuel were preferred because those solutions had been in contact with more copper oxide ore for a longer period of time and were therefore more mature than the solutions used in the column tests, and were likely to show more representative mineral concentrations than the less mature solutions from the BHP column tests.

Florence Copper retained the services of Daniel B Stephens & Associates (DBS&A) to use PTF site specific data and current geochemical modeling software to evaluate and refine the composition forecasts reported previously by BHP Copper in Table 4.3-1. As discussed in Exhibit H-1 of this Attachment, DBS&A used data generated by long term leaching test conducted by METCON laboratories of Tucson Arizona, using core samples collected from the oxide zone at the PTF well field site, and groundwater collected from the oxide zone near the PTF well field site. The DBS&A modeling results are presented in Exhibit H-1, and the forecast compositions produced by the modeling results are summarized in Table 3.1 of Exhibit H-1.

The DBS&A model did not use the PLS and raffinate data reported by BHP in Table 4.3-1 (Exhibit H-2) because those data were based on PLS and raffinate produced at BHP Copper's San Manuel deposit, which might have been significantly different geochemically than the oxide zone beneath the FCP site. The hydraulic control test conducted by BHP Copper at the FCP site was too short to produce solutions that could approximate equilibrium conditions of the minerals dissolved in solutions at the FCP. Accordingly, the estimated constituent concentrations derived by DBS&A do not represent anticipated maximum concentrations, or a range of concentrations. Rather, the concentrations provided in Table 3.1 of Exhibit H-1 represent potential typical constituent concentrations that must be validated by field-scale testing.

Florence Copper proposes to construct and operate the PTF to produce process solutions that are representative of commercial scale copper production. The PTF will produce in-situ solutions sufficiently mature to evaluate and fine-tune process treatment technologies and identify opportunities for groundwater conservation. Florence Copper estimates that mature PLS can be produced within 12 months after commencing PTF operations, and that the resulting data can then be used in geochemical models to accurately forecast the range of inorganic constituents in lixiviant solutions and PLS that can be reasonably expected over the life of operations at the FCP. At the conclusion of PTF operations, Table 3.1 will be amended to reflect solution compositions generated during PTF operations.

H.6.3 Forecast Composition of Raffinate

The fourth column form the left of Table 3.1 of Exhibit H-1 shows the estimated forecast composition of raffinate. The composition is based on the assumption that the solution after processing in the SX/EW plant may have a composition similar to the PLS composition (fourth column from the left of Table 3.1), with the exception that it will have lower copper concentrations and lower pH. Raffinate will exit the SX/EW plant and be directed to the raffinate pond before it is piped to the PTF well field and acidified, as needed, prior to injection as lixiviant.

H.6.4 Forecast Composition of Pre-Stacked PLS

No solution stacking is proposed for PTF operations. Solution stacking refers to the practice of staging and re-injecting intermediate grade solutions to manage overall PLS grade during commercial copper recovery.

At PTF startup, recovered solution will be re-acidified and re-injected until copper concentrations reach a level sufficient to achieve SX/EW copper recovery. Once SX/EW operations begin, solutions will only be re-injected following SX/EW copper recovery. Consequently, no pre-stacked solution composition is included in Table 3.1 of Exhibit H-1.

H.6.5 Estimated Composition of 98 Percent H_2SO_4

The third column from the left of Table 3.1 of Exhibit H-1 shows the estimated composition of 98 percent sulfuric acid. Sulfuric acid is typically produced from the recovery of sulfur dioxide at a smelter facility. The composition shown is representative of the sulfuric acid generated at the ASARCO Hayden smelter, and is typical of acid that will be delivered to the PTF for acidifying raffinate during PTF operations.

H.6.6 Estimated Composition of Make-up Water

The extreme right hand column of Table 3.1 of Exhibit H-1 shows the estimated composition of groundwater that would be used as make-up water during PTF operations. Make-up water will be obtained from an existing well named PW2-1, located east of the PTF well field and outside of the AOR.

APPENDIX 4

Revised Table H-1

Table H-1. Injection Rates and Volumes

	Injection Interval Length (Feet)	Typical Injection Rate at 0.15 gpm/ft (gpm)	Typical Injection Rate at 0.20 gpm/ft (gpm)	Daily Injection Volume at 0.15 gpm/ft (gallons)	Daily Injection Volume at 0.20 gpm/ft (gallons)
Well with Shortest Injection Interval	190	29	38	41,760	54,720
Well with Typical Length Injection Interval	400	60*	80*	86,400*	115,200*
Well with Longest Injection Interval	700	105*	140*	151,200*	201,600*

gpm = gallons per minute
gpm/ft = gallons per minute per foot
**The values provided in this Table are for a single injection well using a variety of injection interval lengths and injection rates. The maximum aggregate injection rate for the four injection wells planned for PTF operations is limited to 240 gpm regardless of well configuration or formation performance. It is anticipated that well performance may be variable, and that some of the four injection wells may accept less than 25% of the aggregate injection rate, and that some wells may accept more than 25% of the aggregate injection rate. The upper range of potential injection rates for a single well is reflected in the range of values provided in this Table. The lower range of injection rates will not be defined until the planned injection wells are drilled and the formation exposed to those wells characterized. In all cases, the injection rates at each of the four injection wells will be balanced to ensure that the aggregate injection rate of 240 gpm is not exceeded.*

Table H-2. Example Calculated Average and Maximum Injection Pressures for Selected Injection Intervals

Depth to top of Injection Interval (Feet)	Average Injection Pressure at Top of Injection Interval (psi)	Average Well Head Pressure (psi)	Maximum Injection Pressure at Top of Injection Zone (psi)	Maximum Well Head Pressure (psi)
500	225	Atmospheric	325	100
690	311	Atmospheric	449	138
880	396	Atmospheric	572	176

psi = pounds per square inch

TABLE 5-2. (Revised 9/4/2014) FLORENCE COPPER, INC. PTF CLOSURE AND POST-CLOSURE COST ESTIMATES

OBJECTIVES	DESCRIPTION OF TASKS	UNIT COST	PER UNIT	NO. OF UNITS	ESTIMATED COST
SECTION 1. PTF WELL FIELD					
1. Groundwater Restoration					
Restore groundwater to meet proposed permit criteria by rinsing IRZ and neutralizing/evaporating rinse solution. (Assumed 260 gpm well rinsing, 9 month period.) Well field includes 24 wells (4 injection wells, 9 recovery wells, 7 observation wells and 4 multi-level sampling wells).	1.Rinse wells. [1]	$78,478	Lump Sum	1	$78,478
	2. Operation and maintenance labor (for 9 month period plus 1 month closure period)[2]	$641,328	Lump Sum	1	$641,328
	3. Quicklime Neutralization[3]	$0.07	lbs	1,614,330	$113,003
	4. Evaporation during rinsing[22]	$1.08	1,000 gallons	102,585	$110,792
	5. Rinsing Contingency (6 month duration includes rinsing, neutralization, evaporation, operation and maintenance)[18]	$617,279	Lump Sum	1	$617,279
	6. Sampling Contingency (includes cost to perform sampling and analysis for items 8-10 below if additional rinsing is required)	$91,465	Lump Sum	1	$91,465
	7. Sampling and monitoring during rinsing. Level 1 analysis performed during 9 month rinsing period. (Assumed system is equipped with a manifold and will require 1 sampling location per event)[5]	$683	Sampling Event	7	$4,781
	8. Sampling and monitoring during rinsing. Level 2 analysis performed during 9 month rinsing period. (Assumed system is equipped with a manifold and will require 1 sampling location per event)[6]	$1,663	Sampling Event	3	$4,989
	9. Level 2 sampling and analysis. (To occur before hydraulic control suspension, includes sampling of 24 wells and 2 mine shafts)[6]	$1,663	Well	26	$43,238
	10. Level 2 sampling and analysis. (To occur after hydraulic control suspension, includes sampling of 24 wells and 2 mine shafts)[6]	$1,663	Well	26	$43,238
	Subtotal				**$1,748,591**
2.Abandon PTF Test Wells					
Abandon 24 PTF wells in accordance with Well Abandonment Plan. Well field includes 24 wells (4 injection wells, 9 recovery wells, 7 observation wells and 4 multi-level sampling wells).[7]	1. File NOIs with ADWR.	$54	Well	24	$1,296
	2. Remove electrical conduit, wellhead assemblies and control boxes.	$375	Well	17	$6,375
	3. Remove pumps.	$375	Well	17	$6,375
	4. Remove monuments and cement pads. Cut off casing 5 feet below land surface and backfill hole. (2 crew hours per well)	$150	Crew Hours	48	$7,200
	5. Dispose of liners, wood, and misc. pipe in off-site landfill (5 cy/well).	$54	CY	120	$6,480
	6. Type V Cement ($240/CY, 0.017 cy/ft)	$4.51	LF	28,440	$128,264
	7. Tremie Type V cement from TD to 5 feet below land surface.	$1.07	LF	28,440	$30,431
	8. Crew and equipment (per diem, backhoe, 10T smeal rig)	$4,286	Well	24	$102,864
	9. Mobilization/Demobilization	$1,598	Lump Sum	1	$1,598
	10. File Abandonment Completion Reports with ADWR.	$33	Well	24	$792
	11. Allowance for unexpected conditions.	$214	Well	24	$5,136
	Subtotal				**$296,811**
PTF Test Wells Total					**$2,045,402**

TABLE 5-2. (Revised 9/4/2014) FLORENCE COPPER, INC. PTF CLOSURE AND POST-CLOSURE COST ESTIMATES

OBJECTIVES	DESCRIPTION OF TASKS	UNIT COST	PER UNIT	NO. OF UNITS	ESTIMATED COST
SECTION 2. WATER IMPOUNDMENT AND PIPELINE CORRIDOR					
1. Impoundment Removal					
Includes evaporation/disposal of 9,725,300 gallons of liquid/sediment, removal/disposal of impoundment's liners and LCRS. Also includes removal of pipeline corridor and the backfilling and regrading of disturbed areas. Includes contingency and administrative costs.	1. Closure Cost Estimate by Knight Piesold and Co. May 9, 2012 CPI inflation adjusted to 2014. (RTC1.1)[8]	$430,933	Lump Sum	1	$430,933
	Subtotal				**$430,933**
2. Analysis of Soil Below Liner					
Quantities assume impoundment and pipeline corridor is approximately 9 acres.	1. Prepare Sampling Plan.[17]	$25,000	Lump Sum	1	$25,000
	2. Contingency screening S&A if soil shows evidence of liner leak. (Assumed 5 sample locations per acre)[10]	$710	Sample	45	$31,950
	3. Expanded sampling for select analytes identified during screening.[9]	$473	Sample	90	$42,570
	4. Contingency sampling and analysis for unanticipated costs.	$14,000	Lump Sum	1	$14,000
	Subtotal				**$113,520**
Water Impoundment and Pipeline Corridor Total					**$544,453**
SECTION 3. PROCESSING FACILITIES					
1. Tanks					
Empty tanks of contents, rinse and decommission for re-use. Remove concrete containment/pads. Line item for tank rinse assumes rinse will be required in addition to the extended flow of rinse water from IRZ restoration.	1. Tank rinse and evaporation contingency.[13]	$130	Crew Hour	24	$3,120
	2. Relocate tanks off-site.	$130	Crew hour	16	$2,080
	3. Sample concrete.[14]	$210	Sample	10	$2,100
	4. Analyze concrete.[14]	$410	Sample	10	$4,100
	5. Demo and remove concrete liner.	$7.75	SF	3,140	$24,335
	6. Transport and disposal concrete at off-site landfill.[11]	$64	Ton	458	$29,312
	Subtotal				**$65,047**
2. Buildings					
	1. Demolition/Removal of SX/EW Building. (Assumed metal construction)[15]	$3.51	SF	11,000	$38,610
	2. Sample concrete.[14]	$210	Sample	10	$2,100
	3. Analyze concrete.[14]	$410	Sample	10	$4,100
	4. Demolition/Removal of Concrete Pads, Foundation[15]	$7.86	SF	5,500	$43,230
	5. Removal of Modular Office	$510	Each	2	$1,020
	6. Removal of Septic Holding Tank	$510	Each	1	$510
	Subtotal				**$89,570**
3. Soil Beneath Aboveground Storage Tanks and Buildings					
Characterize and appropriately dispose, as necessary.	1. Contingency screening S&A if soil shows evidence of container leak. (Assumed 5 sample locations per acre)[10]	$710	Sample	5	$3,550
	2. Expanded sampling for select analytes identified during screening.[9]	$473	Sample	10	$4,730
	3. Contingency sampling and analysis for unanticipated costs.	$14,000	Lump Sum	1	$14,000
	Subtotal				**$22,280**
Processing Facilities Total					**$176,897**

TABLE 5-2. (Revised 9/4/2014) FLORENCE COPPER, INC. PTF CLOSURE AND POST-CLOSURE COST ESTIMATES

OBJECTIVES	DESCRIPTION OF TASKS	UNIT COST	PER UNIT	NO. OF UNITS	ESTIMATED COST
SECTION 4. RUN-OFF POND					
1. Liner and Earthwork					
Remove and dispose of liner in properly licensed off-site solid waste landfill. Test and properly manage soil below liner. (Assumed to be non-hazardous)	1. Remove liner.[12]	$0.05	SF	2,400	$120
	2. Dispose of liner in off-site landfill.[11]	$64	Ton	1	$32
	3. Dispose of miscellaneous pipeline in off-site landfill.[11]	$64	Ton	1	$64
	4. Fill, compact, and recontour to near original contours (assumes berm material to be used as fill).[4]	$3	CY	245	$750
	5. Contingency screening S&A if soil shows evidence of liner leak. (Assumed 5 sample locations per acre)[10]	$710	Sample	5	$3,550
	6. Expanded sampling for select analytes identified during screening.[9]	$473	Sample	10	$4,730
	7. Contingency sampling and analysis for unanticipated costs.	$14,000	Lump Sum	1	$14,000
	Subtotal				**$23,246**
Run-off Pond Total					**$23,246**
SECTION 5. MISCELLANEOUS COSTS					
1. Daily Monitoring and Observations					
Perform facility inspections and monitoring required by permit.	Included in Operation and Maintenance Labor, Section 1.				$0
2. Quarterly Well Monitoring					
Perform quarterly monitoring of 14 wells during closure.	Monitoring includes 3 Level 1 events and 1 Level 2 event.[21]	$72,265	Lump sum	1	$72,265
Total Miscellaneous Costs					**$72,265**
Closure Cost Subtotal					**$2,862,263**
Contingency (15%)(does not include item 2.1)					**$364,699**
Administrative and Miscellaneous Expenses (10%)[16] (does not include item 2.1)					**$243,133**
Closure Cost Total					**$3,470,095**

TABLE 5-2. (Revised 9/4/2014) FLORENCE COPPER, INC. PTF CLOSURE AND POST-CLOSURE COST ESTIMATES

OBJECTIVES	DESCRIPTION OF TASKS	UNIT COST	PER UNIT	NO. OF UNITS	ESTIMATED COST
SECTION 6. POST-CLOSURE MONITORING					
1. Initial monitoring					
Initial monitoring period to last 5 years.[21]	1. Level 2 event (1 per year for 5 year period, cost is for 14 wells).	$21,204	Event	5	$106,020
	2. Level 1 events (3 per year for 5 year period, cost is for 14 wells).	$8,654	Event	15	$129,810
	Subtotal				**$235,830**
2. Maintenance					
	Maintenance of pumps and wells. Perform visual inspection of surface facilities. (cost is for 14 wells)	$4,284	Event	5	**$21,420**
3. Post Closure Summary Report					
	Preparation of Summary Report to include PTF findings and post-closure groundwater modeling.[20] (cost is for 14 wells)	$35,636	Lump Sum	1	**$35,636**
4. AQL Exceedance Contingency Per UIC Permit (Part II.H.2.b)					
	1. Notify director and collect verification sample.	$2,544	Event	1	$2,544
	2. Notify director of verification results.	$424	Event	1	$424
	3. If verification sample indicates exceedance, submit report to ADEQ and USEPA.	$8,480	Event	1	$8,480
	Subtotal				**$11,448**
Post-Closure Monitoring Total					**$304,334**
SECTION 7. POC & SUPPLIMENTAL MONITORING WELLS					
1.Abandon PTF POC & Supplimental Monitoring Wells[23]					
Abandon 7 POC wells and 7 supplimental monitoring wells in accordance with Well Abandonment Plan.[7] The 14 wells include: M14, M15, M22, M23, M52, M54-LBF, M54-O, M55-UBF, M56-LBF, M57-O, M58-O, M59-O, M60-O, M61-LBF.	1. File NOIs with ADWR.	$54	Well	14	$756
	2. Remove electrical conduit, wellhead assemblies and control boxes.	$375	Well	14	$5,250
	3. Remove pumps.	$375	Well	7	$2,625
	4. Remove monuments and cement pads. Cut off casing 5 feet below land surface and backfill hole. (2 crew hours per well)	$150	Crew Hours	28	$4,200
	5. Dispose of liners, wood, and misc. pipe in off-site landfill (5 cy/well).	$54	CY	70	$3,780
	6. Type V Cement ($240/CY, 0.017 cy/ft)	$4.51	LF	11,640	$52,496
	7. Tremie Type V cement from TD to 5 feet below land surface.	$1.07	LF	11,640	$12,455
	8. Crew and equipment (per diem, backhoe, 10T smeal rig)	$4,286	Well	14	$60,004
	9. Mobilization/Demobilization	$1,598	Lump Sum	1	$1,598
	10. File Abandonment Completion Reports with ADWR.	$33	Well	14	$462
	11. Allowance for unexpected conditions.	$214	Well	14	$2,996
	Subtotal				**$146,622**
POC & Supplimental Monitoring Wells Total					**$146,622**

OBJECTIVES	DESCRIPTION OF TASKS	UNIT COST	PER UNIT	NO. OF UNITS	ESTIMATED COST
SECTION 8. OPERATIONS MONITORING WELL (MW-01)					
1.Abandon Operations Monitoring Well[23]					
Abandon operations monitoring well MW-01 in accordance with Well Abandonment Plan.[7]	1. File NOIs with ADWR.	$54	Well	1	$54
	2. Remove monuments and cement pads. Cut off casing 5 feet below land surface and backfill hole. (2 crew hours per well)	$150	Crew Hours	2	$300
	3. Dispose of liners, wood, and misc. pipe in off-site landfill (5 cy/well).	$54	CY	5	$270
	4. Type V Cement ($240/CY, 0.017 cy/ft)	$4.51	LF	1,800	$8,118
	5. Tremie Type V cement from TD to 5 feet below land surface.	$1.07	LF	1,800	$1,926
	6. Crew and equipment (per diem, backhoe, 10T smeal rig)	$4,286	Well	1	$4,286
	7. Mobilization/Demobilization	$1,598	Lump Sum	1	$1,598
	8. File Abandonment Completion Reports with ADWR.	$33	Well	1	$33
	9. Allowance for unexpected conditions.	$214	Well	1	$214
	Subtotal				**$16,799**
Operations Monitoring Well Total					**$16,799**
SECTION 9. BHP TEST WELLS					
1.Abandon BHP Test Wells					
Abandon 20 BHP test wells in accordance with the Well Abandonment Plan. Well field includes 20 wells (4 injection wells, 9 recovery wells, 5 observation wells and 2 chemical observation wells).[7]	1. File NOIs with ADWR.	$54	Well	20	$1,080
	2. Remove monuments and cement pads. Cut off casing 5 feet below land surface and backfill hole. (2 crew hours per well)	$150	Crew Hours	40	$6,000
	3. Dispose of liners, wood, and misc. pipe in off-site landfill (5 cy/well).	$54	CY	100	$5,400
	4. Type V Cement ($240/CY, 0.017 cy/ft)	$4.51	LF	16,000	$72,160
	5. Tremie Type V cement from TD to 5 feet below land surface.	$1.07	LF	16,000	$17,120
	6. Crew and equipment (per diem, backhoe, 10T smeal rig)	$4,286	Well	20	$85,720
	7. Mobilization/Demobilization	$1,598	Lump Sum	1	$1,598
	8. File Abandonment Completion Reports with ADWR.	$33	Well	20	$660
	9. Allowance for unexpected conditions.	$214	Well	20	$4,280
BHP Test Wells Sub Total					**$194,018**
Post Closure Cost Subtotal					**$661,773**
Contingency (15%)					**$99,266**
Administrative and Miscellaneous Expenses (10%)[16]					**$66,177**
POST-CLOSURE TOTAL					**$827,217**
TOTAL CLOSURE AND POST-CLOSURE COST					**$4,297,312**

SUPPLEMENT TO TABLE 5-2. (Revised 9/4/2014) FLORENCE COPPER, INC. PTF CLOSURE AND POST-CLOSURE COST ESTIMATES
COST EXPLANATION FOR MONITORING

OBJECTIVES	DESCRIPTION OF TASKS	UNIT COST	PER UNIT	NO. OF UNITS	ESTIMATED COST
SECTION 6. POST-CLOSURE MONITORING					
1. Initial monitoring					
Initial monitoring period to last 5 years.	1. Level 2 event (annual, 1 per year for 5 year period).				
	Field Activities	$8,000	Event		
	Analysis and Reporting	$9,000	Event		
	Laboratory Fee	$32,000	Event		
	Subtotal (Includes 2012 to 2014 CPI adjustment of 1.02)	$49,980	Event	5	$249,900
	2. Level 1 events (quarterly, 3 per year for 5 year period).				
	Field Activities	$8,000	Event		
	Analysis and Reporting	$8,000	Event		
	Laboratory Fee	$2,000	Event		
	Contingency	$2,000	Event		
	Subtotal (Includes 2012 to 2014 CPI adjustment of 1.02)	$20,400	Event	15	$306,000
	Total for 33 POC Wells				**$555,900**
Footnote	**Unit Cost Description**				
1	Level 2 event consists of sampling 33 wells for depth to water and collecting sample. Sample events take approximately 7 days and can be performed by one field technician. Additional time is included for expanded data processing and evaluation. Laboratory cost for a level 2 sample is approximately $890 per sample for 33 regular samples and 3 duplicate samples, for total laboratory cost of $32,000. Fee includes approximately $1,500 in supplies and expenses.				
2	Level 1 event consists of sampling 33 wells for depth to water and collecting sample. Sample events take approximately 7 days and can be performed by one field technician. Level 1 analysis consists of Mg, F, SO4, and TDS. Laboratory cost for a level 1 sample is approximately $55 per sample for 33 regular samples and 3 duplicate samples, for total laboratory cost of $2,000. Fee includes approximately $1,500 in supplies and expenses.

TABLE 5.2 (Revised 9/4/2014) FLORENCE COPPER, INC. PTF CLOSURE AND POST-CLOSURE COST ESTIMATES

Footnote	Unit Cost Description
1	Well rinsing unit costs assume 4 injection wells and 9 recovery wells, 260gpm for 9 months (102,585,600 gallons). Pumps will use 13 - 15 hp motors @ 11.19kw, $0.08/kwh, = $0.75/1,000 gallons. Assumed on-site water source is provided. 2012 cost of $76,939 CPI inflation adjusted to 2014 is $78,478.
2	Operation and maintenance labor crew assumes 3 day laborers $43.10/hr, 8 hours per day and 1 night laborer $43.10/hr, 16 hours a day; $1,724/day; assumes 10 month period = $517,200. Unit cost source is 2004 RS Means, CPI inflation adjustment to 2014 is 1.24. 2014 cost is $641,328.
3	Quicklime Neutralization assumes 5,979 lbs/day or 1,614,300 lbs for 9 months of rinsing, $135/ton or $0.06/lb lime unit cost. Source is M3 report exhibit 9C. 2012 to 2014 CPI inflation adjustment cost is $138/ton or $0.07/lb.
4	Backfill unit cost - per contractor estimate, includes equipment and operator cost. CPI inflation adjusted to 2014. Assumes backfill material import is not required. Reseeding of disturbed area is included in reclamation plan.
5	Level 1 sampling & analysis unit costs include sampling, lab analysis, and reporting. Costs based on recent similar projects. Lab analysis costs are $59 per sample. CPI inflation adjustment to 2014.
6	Level 2 sampling & analysis unit costs include sampling, lab analysis, and reporting. Costs based on recent similar projects. Lab analysis costs are $910 per sample. CPI inflation adjustment to 2014.
7	Well abandonment unit costs derived from average cost of 4 contractor bids received in May 2010. CPI inflation adjustment to 2014.
8	Cost estimate for closure of the water impoundment and pipeline channel is provided by Knight Piesold and Co. "*Curis Resources (Arizona) Inc. Florence Copper Project PTF Process Solution Impoundment & Pipeline Channel Closure Cost Estimate*" May 9, 2012 and is included in RTC1.1. 2012 cost of $422,483 with CPI adjustment to 2014 is $430,933.
9	Expanded sampling for selected analytes identified during screening analysis. Assumes 2/3 amount of analytes and includes twice the amount of samples.
10	Sampling and Analysis (S&A): Initial S&A will be performed to characterize soil potentially affected by spills and leaks. Follow-up S&A may be required in order to determine the extent of contamination or effectiveness of remediation efforts. The 2014 estimated S&A cost of $710 per sample is based on the following: sampling cost of $133 (2001 estimate of $100 adjusted by 2014 CPI inflation factor of 1.33); analytical cost of $570 for 13 priority pollutants including Ag, As, Be, Cd, Cr, Cu, Hg, Ni, Pb, Se, Tl, Zn, pH, VOC's, SVOC's, SPLP, Acid-Base Accounting as reflected in laboratory quote; and rounding the total cost of $703 to $710. Unit costs based on laboratory quote.
11	Disposal of non-hazardous waste - includes loading, transport, and disposal; unit cost source is 2010 contractor bid for similar project. CPI adjusted for 2014.
12	Liner Removal - unit cost per contractor estimate 2010, CPI inflation adjusted to 2014.
13	It is assumed all pipelines and tanks will be flushed clean during the groundwater restoration phase.
14	Sample and analyze concrete - sample unit costs assume not to exceed $200 per sample, analytical cost assume $150 for sample preparation, $210 for analysis, and $40 for misc. costs. Sampling cost is $200, analysis cost is $400. CPI inflation adjusted to 2014 is $210 for sampling and $410 for analysis.
15	Unit cost source is Racer cost estimate software version 8.1.2. CPI inflation adjusted to 2014.
16	Administrative support and expenses includes utilities and communications cost, miscellaneous equipment and site maintenance, and site management during closure. The closure cost estimate by Knight Piesold, Section 2.1 includes administrative and contingency costs. Therefore, Section 2.1 is not included in the contingency and administrative cost calculations reflected in Section 5.
17	Sampling plan to describe collection, preparation, and analysis of parameters described in note 10.
18	Rinsing contingency assumes an additional 6 month duration of rinsing and operation and maintenance costs in the event that additional rinsing is required beyond the initial 9 month period. Includes rinsing, neutralization, evaporation, maintenance and operation costs.
19	not used
20	Preparation of Summary Report assumes 1 person at $175/hr for 1 month, $28,000. Post closure ground water modeling assumes 2 people at $175/hr for 3 months, $56,000. Total for summary report is $84,000 for 33 POC wells. Report cost for 14 wells is assumed to be 14/33 of that total.
21	Post Closure Monitoring Total includes estimated cost for monitoring the 7 PTF POC wells and 7 supplemental monitoring wells. The 14 wells include M14, M15, M22, M23, M52, M54-LBF, M54-O, M55-UBF, M56-LBF, M57-O, M58-O, M59-O, M60-O, M61-LBF. The total post closure monitoring cost estimate for the FCP is based on 33 POC wells with a total estimated cost of $555,900. A breakdown of the monitoring costs is included as page 6 of this document. Cost for the monitoring of 14 wells was determined by taking 14/33 of that total.
22	Evaporation cost assumes mechanical evaporation rate is 2,250 gallons/hr and $1.06 per 1,000 gallons. Based on Landshark evaporation unit and electric cost of $0.08/kwh. 2012 to 2014 CPI inflation adjusted cost is $1.08/1,000 gallons.
23	Financial assurance for the closure of all POC wells except M54-LBF and M54-O is provided under existing permit.
Note:	Estimated quantities for proposed facilities are based on design plans by Knight Piesold Consulting and M3 Engineering prepared May 2012. Source for existing well data is Arizona Department of Water Resources (ADWR).

List of Exhibits

Exhibit R-1 Closure and Post-Closure Cost Estimates

Exhibit R-2 Demonstration of Financial Capability

R.1 Introduction

This Attachment has been prepared in support of an application (Application) by Florence Copper, Inc. (Florence Copper) to the United States Environmental Protection Agency (USEPA) for issuance of an Underground Injection Control Class III (Area) Permit (UIC Permit) for the planned Production Test Facility (PTF), to be located at the Florence Copper Project (FCP) located in Pinal County, Arizona. This Attachment refers to financial assurance information for the USEPA to consider, in accordance with Section 144.52(d)(7) of the UIC Program, Code of Federal Regulations (CFR) 40 144 *et seq*. Specifically, this Attachment provides evidence to verify that Florence Copper has the financial resources necessary to close, plug, and abandon wells and core holes regulated by the UIC Permit and located on the FCP site.

R.2 Basis of the Financial Assurance

The information in this Attachment R is based on closure and post-closure cost estimates for the PTF that Florence Copper prepared in support of their application for Temporary Aquifer Protection Permit (APP) No. 106360, which was issued by Arizona Department of Environmental Quality (ADEQ). The cost estimates were detailed in Attachment 5 of the temporary APP application and are described below in Sections R.1.1.1 through R.1.1.3. Tables from the temporary APP application summarizing the closure and post-closure cost estimates for the PTF are included herewith as Exhibit R-1.

R.3 PTF Closure and Post-Closure Cost Estimates

The Sections below describe the basis for the PTF closure and post-closure cost estimates presented in support of the Individual APP application form submitted to ADEQ in March 2012. The application submitted to ADEQ resulted in the granting of APP No. 106360 on September 28, 2012. A detailed breakdown of the costs supporting the closure and post-closure cost estimates is shown in Table 5-2 of the March 2012 APP application, which was updated on September 21, 2012 prior to the issuance of APP 106360. These closure costs have been updated again to 2014 dollars and to include the closure of the supplemental monitor wells and the operational monitoring well. The current cost estimates are reflected in the updated Table 5-2 (dated July 2014) provided in Exhibit R-1 of this Attachment. The cost estimates are based on information submitted by Knight Piésold Ltd.) and M3 Engineering and Technology Corporation, and other sources as indicated in Exhibit R-1. Table 5-2a of Exhibit R-1 includes closure costs for the Class III wells constructed by BHP within the Area of Review defined in UIC Permit No. AZ396000001.

R.3.1 Closure

R.3.1.1 PTF Well Field

R.3.1.1.1 Groundwater Restoration

Restoration of groundwater in the portion of the oxide zone in which injection and recovery has occurred (the injection and recovery zone [IRZ]) will be conducted to meet closure criteria specified in the temporary permit. The criteria, described in Attachment 16 of the March 2012 APP application, require groundwater to be restored such that constituents for which Aquifer Water Quality Standards (AWQS) have been established meet either the AWQS or pre-operational concentrations if those concentrations exceed AWQS. The restoration process involves rinsing the IRZ; the injection of sodium bicarbonate or equivalent non-hazardous neutralizing agents as needed to neutralize the groundwater; and the neutralization of the rinse solution with lime or other agents. The estimated volume of rinse water required to adequately restore the groundwater in the IRZ assumes 8 percent porosity in the oxide zone and six to eight pore volumes. For those conditions, it is estimated that rinsing of the IRZ can be completed within nine months at a total recovery rate of up to 260 gallons per minute (gpm). A report will be submitted to ADEQ and USEPA documenting restoration in compliance with the permit requirements of both agencies.

R.3.1.2 Abandon PTF and BHP Well Fields

The 24 wells (four injection wells, nine recovery wells, seven observation wells, and four multi-level sampling wells) located in the PTF well field, and the 20 wells located in the BHP well field, will be abandoned in accordance with the provisions of the temporary APP and UIC Permit. The wells will be abandoned in accordance with the requirements of the Arizona Department of Water Resources (ADWR) and the Well Abandonment Plan, provided as Attachment Q of this Application. The following provides a general description of the well abandonment procedures:

1. Each well will be closed by removing the downhole pumps and electrical equipment. The well will be filled from the bottom to the top with Type V Portland cement, and the collar pipe will be removed to 5 feet below ground surface (bgs). The surface will then be backfilled and leveled out.
2. Groundwater will be used to rinse the piping that connects the wells to the pipelines discussed below. The rinse water will be discharged into the water impoundment. The piping and all electronics, pumps, and other material will be removed off site for reuse, recycling, or landfill disposal.
3. Liners upon which pipes connecting the wells to the pipelines will be removed and samples of the underlying soil will be analyzed using the same procedures used to verify that the soil beneath the pipeline corridor complies with applicable soil remediation standards. The well field area will then be leveled and prepared for post-closure use.
4. A report will be submitted to the ADEQ and USEPA demonstrating that closure conditions required by the APP and the UIC Permit have been met.

R.3.1.3 Pipelines

The pipelines that were placed in the lined corridor connecting the PTF test well area to the beneficiation facility will be rinsed with groundwater and removed for off-site recycling or landfill disposal. The rinse water may be used to rinse equipment, tanks, and the liner of the runoff pond before being discharged to the water impoundment.

R.3.1.4 Soil and Liner Beneath Pipeline Corridor

The liner forming the pipeline corridor will be removed from the corridor and samples of the underlying soil will be collected and analyzed to verify that soil beneath the pipeline corridor complies with the soil remediation standards. The liner will be transported off site for recycling. However, if the liner cannot be recycled, it will be transported to a nearby appropriately licensed commercial landfill for disposal. The corridor will be backfilled with on-site soil, leveled and prepared for post-closure use. The closure cost estimate assumes no impacts to soil beneath the liner.

R.3.1.5 Tanks

The tanks located in and adjacent to the beneficiation area, including tanks and equipment in the solvent extraction/electrowinning (SX/EW) plant, and tanks located in the runoff pond will be rinsed and then moved to a storage area for future use or sold as surplus equipment. Rinse water will be captured in the runoff pond sump and then pumped to the water impoundment. The tank foundation and underlying soils will be sampled and analyzed to determine compliance with applicable regulations and then managed accordingly. The liners beneath the tanks will be rinsed and the rinse water will be drained to the sump of the runoff pond. Rinse water will be pumped from the runoff pond to the water impoundment.

R.3.1.6 Runoff Pond

R.3.1.6.1 Liquid Removal

Any remaining liquid and rinse water will be pumped from the sump in the runoff pond to the water impoundment.

R.3.1.6.2 Sediment

Little sediment is expected to be in the runoff pond at any time. If sediment is in the pond, sampling and analysis will be conducted to verify that the sediment is non-hazardous. Non-hazardous sediment will be placed in the water impoundment or transported to a nearby commercial landfill. The closure cost estimate assumes plant runoff pond sediments are non-hazardous.

R.3.1.6.3 Liner and Earthwork

Concrete tank foundations and the high-density polyethylene (HDPE) liner will be carefully removed to avoid soil contamination. Exposed concrete foundations will be sampled to verify that the concrete is not subject to hazardous waste regulations. The concrete and liner will be transported off site for recycling or disposal. The pond area will be backfilled with on-site berm materials. The backfilled area will be leveled to match surrounding grade and prepared for post-closure use. The closure cost estimate assumes no impacts to soil beneath the liner and disposal of concrete and liner material in a nearby properly licensed landfill.

R.3.1.7 Water Impoundment

R.3.1.7.1 Water Evaporation

Natural and enhanced (mechanical) evaporation will be used during PTF operations. The mechanical evaporators used during PTF operations will be used during the IRZ restoration process to minimize the amount of water remaining in the impoundment at the time IRZ restoration is complete and the commencement of the rinsing and dismantling of the surface facilities is begun. It is anticipated that the evaporation rate will diminish as the solids content in the sediment increases. Time and weather conditions permitting, enhanced evaporation will continue until the sediment can be removed from the impoundment as solids or semi-solids. Otherwise, the sediment will be pumped from the impoundment as slurry. The sediment will be sampled and analyzed to verify that the sediment is not subject to hazardous waste regulation. The removed sediment will be transported to a facility permitted to recycle or dispose of the sediment. The cost associated with evaporation after the in-situ copper recovery (ISCR) operation is discontinued and the cost of managing the removed sediment are included in Exhibit R-1.

R.3.1.7.2 Liner and Earthwork

After liquid and sediment have been removed from the impoundment, the chain link fence will be removed and stored on site for future use or will be transported off site for recycling. The upper liner will be then be carefully removed to avoid damage to the lower liner. The upper liner will be transported off site for recycling or disposal. The geonet and the sump material forming the impoundment's leak collection and removal system (LCRS) will be sampled and analyzed. The geonet and sump material will then be carefully removed to prevent damage to the lower liner and transported to a properly licensed landfill for disposal. The lower liner will be carefully removed to avoid contamination of the soil and transported off site for recycling or disposal. The excavated area will be backfilled with stockpiled soil and berm material and will then be contoured and prepared for post-closure use. The closure cost estimate assumes that (1) the sediment will be shipped to a nearby, properly licensed disposal facility for further solidification, as needed, and disposal; and (2) the liners and LCRS material will be shipped to a nearby properly licensed disposal facility for disposal.

R.3.1.8 Miscellaneous Costs

R.3.1.8.1 Daily Monitoring and Observations

The proposed permit conditions will require that injection and recovery wells, the water impoundment, the tank farm, and beneficiation facilities be monitored and inspected on a daily basis until closure has been completed. Although closure activities are estimated to be completed in less than one year, the estimated costs are based on a 12-month period and included in the operation and maintenance labor costs in Exhibit R-1.

R.3.1.8.2 Quarterly Well Monitoring

The proposed permit will require the compliance groundwater monitoring program be continued through the closure period of IRZ restoration and the closure of the surface facilities. Although it is estimated that the closure activities will be completed in less than one year, the estimated cost included in Exhibit R-1 assumes three quarters of Level 1 monitoring and one quarter of Level 2 monitoring.

R.3.1.8.3 Administrative and Miscellaneous Costs, General Project Support Costs

A general cost allowance is included for 12 months of contractor technical support and miscellaneous facility maintenance activities during the closure period. Maintenance activities may include minor facility maintenance such as road grading or minor repairs. Also included in this category are telephone and electrical utility charges (for office facilities), and miscellaneous office and site expenses (postage, office supplies, chemicals, etc.).

R.3.2 Post-Closure

The post-closure monitoring schedule will be synchronized, to the extent practicable, with the applicable closure/post-closure schedule established under Temporary APP No. 106360 for the PTF site and APP No. 101704 and UIC Permit No. AZ396000001 for the surrounding property. Florence Copper proposes a five-year post-closure period, as described below. Accordingly, Exhibit R-1 includes a cost estimate for a five-year period.

- Years 1 – 4: Two quarterly Level 1 sampling events and two quarterly Level 2 events will be conducted each year. Quarterly reports will be submitted to ADEQ and USEPA.
- Year 5: Three quarterly Level 1 sampling events and one quarterly Level 2 event will be conducted. Quarterly reports will be submitted to ADEQ and USEPA. In addition, during the first quarter, a report will be submitted to ADEQ and USEPA that summarizes trends and describes significant events observed during the previous four years. Based on the information provided in the report, Florence Copper will recommend continuation of post-closure monitoring or cessation of post-closure monitoring. If Florence Copper recommends continuation of monitoring, the recommendation may include proposed changes in the scope and frequency of analysis. Within 180 days following its receipt of the report, ADEQ and USEPA will advise Florence Copper of their decisions. The monitoring program will continue throughout the fifth year until such time that ADEQ and USEPA announce their decisions. If ADEQ's and USEPA's decisions involves continuation of the monitoring program for the next five-year period, or portion thereof, Florence Copper will adjust the cost estimates to reflect estimated costs for implementing ADEQ's decision, and will adjust the financial assurance required for the period covered by ADEQ's decision.

During point-of-compliance (POC) monitoring events, visual inspection of surface facilities will be conducted. Areas to be monitored include POC wells, signage, fences, revegetated areas, and storm water control measures. Conditions noted during inspections will be documented using inspection forms. Photographs and written reports will be used to document completion of indicated repairs. Repairs will be performed as indicated by the inspection monitoring program and will be documented in quarterly reports submitted to ADEQ.

R.4 Contents of the Financial Assurance

Florence Copper warrants that demonstrating financial assurance suitable for PTF closure and post-closure, as required for Temporary APP No. 106360, is also suitable for demonstrating financial assurance as required by the USEPA for this Application. The financial instrument submitted to ADEQ is a Surety Bond issued by the Lexon Insurance Company in the amount of $3,487,743. The financial instrument is sufficient to meet the financial assurance requirements of Temporary APP No. 106360 for the PTF and is provided as Exhibit R-2 of this Attachment.

In addition to the financial assurance instrument required by APP No. 106360, FCI has secured additional financial assurance in the form of a Surety Bond issued by the Lexon Insurance Company in the amount of $1,066,000 for the purpose of closing discharging facilities constructed under APP No. 101704. A copy of the surety bond is included in Exhibit R-2. Discharging facilities to be closed under APP No. 101704 include process solution ponds and runoff ponds which were never constructed, one evaporation pond, and the Class III wells constructed for the BHP pilot test. As noted in Exhibit R-1 the cost to close the BHP class III test wells in 2014 dollars is $194,018 and administrative and contingency costs totaling an additional 25 percent. The total amount required to close the BHP Class III test wells is well within the amount of the instrument established for the closure of discharging facilities under APP No. 101704.

Louisville, KY 40223

Aquifer Protection Permit Identification Number: APP 101704

Facility Name: Florence Copper Project Production Test Facility
Facility Address: 1575 W. Hunt Highway
Florence, AZ 85132

Total Penal Sum of Bond: $1,066,000.00

Surety's Bond Number: 1099677

KNOW ALL MEN BY THESE PRESENTS, THAT;

We, Florence Copper Inc., hereinafter called "**Principal**", as Principal, and Lexon Insurance Company, a Corporation, organized and existing under the laws of the State of Texas and authorized to transact business in the State of Arizona (hereinafter called "**Surety**"), as Surety are firmly bound to the Arizona Department of Environmental Quality, a State of Arizona Agency ("ADEQ") (hereinafter called "**Obligee**"), as Obligee, in the penal sum of One Million Sixty-Six Thousand and 00/100 Dollars ($1,066,000.00), good and lawful money of the United States of America, for the payment of which, well and truly to be made, we bind ourselves, our heirs, executors, administrators, successors, *and assigns*, jointly and severally, provided that, where the Sureties are corporations acting as co-sureties, we, the Sureties, bind ourselves in such sum "*jointly and severally*" only for the purpose of allowing a joint action or actions against any or all of us, and for all other purposes each Surety binds itself, jointly and severally with the Principal, for the payment of such sum only as is set forth opposite the name of such Surety, but if no limit of liability is indicated, the limit of liability shall be the full amount of the penal sum.

WHEREAS, said Principal is required under terms and conditions of the Arizona Environmental Quality Act, Arizona Revised Statutes §49-241 and §49-243(N) Article 3 Aquifer Protection Permits, to obtain an Aquifer Protection Permit and to establish financial competence to operate a discharging facility. The discharging facility known as Florence Copper Project Production Test Facility, which Aquifer Protection Permit number APP 101704 is hereby referred to and made a part hereof, as fully and to the same extent as if copied at length herein.

WHEREAS, said Principal is required to provide the ADEQ financial assurance in the amount at least equal to the current closure or post-closure care cost estimate, or corrective action cost estimate, whichever is applicable, as a condition of the permit or interim status;

NOW, THEREFORE, THE CONDITIONS OF THIS OBLIGATION ARE SUCH, that if the Principal shall faithfully, perform closure or post-closure care monitoring according to the plans or strategies submitted under Arizona Administrative Code R18-9-A201(B)(5), whenever required to do so of the discharging facility for which this surety bond guarantees closure or post-closure, or correction action costs, whichever is applicable in accordance with the closure plan or other requirements of the Aquifer Protection Permit as such plan and permit may be amended, pursuant to all applicable laws, statutes, rules and regulations, as such laws, statutes, rules and regulations may be amended from time to time.

And, if the Principal shall faithfully perform post-closure care of the discharging facility for which this bond guarantees post-closure-care, in accordance with the post-closure plan and other requirements of the permit, as such plans and permit may be amended pursuant to all applicable laws, statutes, rules and regulations, as such laws statutes, rules and regulations may be amended.

Or, if the Principal shall provide alternate financial assurance, as specified in Arizona Revised Statutes §49-761(J), or under Arizona Administrative Rules, Title 18, Chapter 9, Article 2 Part A (R18-9-

A203(C), amended by final rule at 11 A.A.R. 4544, effective November 12, 2005 as applicable, and obtain the ADEQ's Director's written approval of such assurance, within 90 days after the date of notice of cancellation is received by both the Principal and the ADEQ Director from the Surety, then this obligation shall be null and void, otherwise it is to remain in full force and effect.

The Surety shall become liable on this bond obligation only when the Principal has failed to fulfill the conditions described below;

Upon notification by the ADEQ Director that the Principal has been found in violation of the closure requirements for the discharging facility, which this bond guarantees performance of closure, the Surety shall either perform closure in accordance with the approved closure plan and other permit requirements or place funds for the total amount of the guaranty sum for the facility directly into a standby trust fund as directed the ADEQ Director.

Upon notification by the ADEQ Director that the Principal has been found in violation of the post-closure care requirements for the discharging facility, which this bond guarantees performance of post-closure care, the Surety shall either perform post-closure care in accordance with the approved post-closure care plan and other permit requirements or place funds for the total amount of the guaranty sum for the facility directly into a standby trust fund as directed the ADEQ Director.

Upon notification by the ADEQ Director that the Principal has failed to provide alternate financial assurance as specified in Arizona Administrative Code R18-9-A203(E) and obtain written approval of such assurance from the ADEQ Director during the 90-days following receipt by both the Principal and the Department of a Notice of Cancellation of the bond. The Surety shall place funds in the amount guaranteed for the facility into a standby trust as directed by the ADEQ Director.

Whenever Principal shall be and is declared by the ADEQ Director to be in default under its Aquifer Protection Permit closure or post-closure care conditions, the ADEQ Director having given written notice of default to the Principal and Principal having failed to commence to cure the default within thirty (30) days after service of such written notice, or if the default is not cured promptly in a continuous and diligent manner within a reasonable time after commencement, the Surety may promptly remedy the default or shall either perform closure or post-closure care in accordance with the approved closure or post-closure care plan and other permit requirements or place funds for the total amount of the guaranteed sum for the facility directly into a standby trust fund as directed by the ADEQ Director.

All written notices to be given under the Performance Bond Agreement shall be given by certified U.S. mail, return receipt requested, to the party entitled thereto at its address set forth below, or at such address as the party may provide to the other parties in writing from time to time.

Obligee:	Arizona Department of Environmental Quality Program Financial Services – Water Programs 1110 West Washington Street Phoenix, Arizona 85007
Principal:	Florence Copper Inc. 1575 W. Hunt Highway Florence, AZ 85132
Corporate Surety:	Lexon Insurance Company 10002 Shelbyville Road, Suite 100 Louisville, KY 40223

The Surety hereby waives notification of amendments to closure plans, permits, applicable laws, statutes, rules, and regulations and agrees that no such amendment shall in any way alleviate its obligation on this bond.

The liability of the Surety shall not be discharged by any payment or succession of payments hereunder, unless and until such payment or payments shall amount in the aggregate to the penal sum of the bond, which is at least equal to the current closure, post-closure care or corrective cost estimate, whichever is applicable, but in no event shall the obligation of the Surety hereunder exceed the amount of said penal sum.

The Surety may cancel the bond by sending notice of cancellation by certified mail to the Principal and to the ADEQ Director provided, however, that cancellation shall not occur during the ***90*** **days** beginning on the date of receipt of the notice of cancellation by both the Principal and the ADEQ Director, as evidenced by the return receipts.

The Principal may terminate this bond by sending written notice to the Surety provided, however, that no such notice shall become effective until the Surety receives written authorization for termination of the bond by the ADEQ Director.

This Surety bond is governed by and construed in accordance with the laws of the State of Arizona.

In Witness Whereof, the Principal and Surety have executed this Performance Bond and have affixed their seals on the date set forth above.

The persons whose signature appears below hereby certify that they are authorized to execute this surety bond on behalf of the Principal and Surety.

POWER OF ATTORNEY

LX- 078338

Lexon Insurance Company

KNOW ALL MEN BY THERE PRESENTS, that **LEXON INSURANCE COMPANY**, a Texas Corporation, with its principal office in Louisville, Kentucky, does hereby constitute and appoint:

Brook T. Smith, Raymond M. Hundley, Jason D. Cromwell, James H. Martin, Barbara Duncan,*****

Sandra L. Fusinetti, Mark A. Guidry, Jill Kemp, Jackie C. Koestel, Lynnette Long, Amy Meredith, Deborah Neichter, Sheryon Quinn, Dawson West, Bonnie J. Wortham

its true and lawful Attorney(s)-In-Fact to make, execute, seal and deliver for, and on its behalf as surety, any and all bonds, undertakings or other writings obligatory in nature of a bond.

This authority is made under and by the authority of a resolution which was passed by the Board of Directors of **LEXON INSURANCE COMPANY** on the 1st day of July, 2003 as follows:

Resolved, that the President of the Company is hereby authorized to appoint and empower any representative of the Company or other person or persons as Attorney-In-Fact to execute on behalf of the Company any bonds, undertakings, policies, contracts of indemnity or other writings obligatory in nature of a bond not to exceed $4,000,000.00 Four Million********** dollars, which the Company might execute through its duly elected officers, and affix the seal of the Company thereto. Any said execution of such documents by an Attorney-In-Fact shall be as binding upon the Company as if they had been duly executed and acknowledged by the regularly elected officers of the Company. Any Attorney-In-Fact, so appointed, may be removed for good cause and the authority so granted may be revoked as specified in the Power of Attorney.

Resolved, that the signature of the President and the seal of the Company may be affixed by facsimile on any power of attorney granted, and the signature of the Assistant Secretary, and the seal of the Company may be affixed by facsimile to any certificate of any such power and any such power or certificate bearing such facsimile signature and seal shall be valid and binding on the Company. Any such power so executed and sealed and certificate so executed and sealed shall, with respect to any bond of undertaking to which it is attached, continue to be valid and binding on the Company.

IN WITNESS THEREOF, **LEXON INSURANCE COMPANY** has caused this instrument to be signed by its President, and its Corporate Seal to be affixed this 21st day of September, 2009.

Paperwork Reduction Act Notice

The public reporting and record keeping burden for this collection of information is estimated to average 4.5 hours for operators of Class I hazardous wells, 1.5 hours for operators of Class I non-hazardous wells, 3 hours for operators of Class II wells, and 1.5 hours for operators of Class III wells.
Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to the collection of information; search data sources; complete and review the collection of information; and, transmit or otherwise disclose the information. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR Part 9 and 48 CFR Chapter 15.
Please send comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, including the use of automated collection techniques to Director, Office of Environmental Information, Collection Strategies Division, U.S. Environmental Protection Agency (2822), Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street, NW., Washington, DC 20503, Attention: Desk Officer for EPA. Please include the EPA ICR number and OMB control number in any correspondence.

Paperwork Reduction Act Notice

The public reporting and record keeping burden for this collection of information is estimated to average 4.5 hours for operators of Class I hazardous wells, 1.5 hours for operators of Class I non-hazardous wells, 3 hours for operators of Class II wells, and 1.5 hours for operators of Class III wells.
Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to the collection of information; search data sources; complete and review the collection of information; and, transmit or otherwise disclose the information. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR Part 9 and 48 CFR Chapter 15.
Please send comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, including the use of automated collection techniques to Director, Office of Environmental Information, Collection Strategies Division, U.S. Environmental Protection Agency (2822), Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street, NW., Washington, DC 20503, Attention: Desk Officer for EPA. Please include the EPA ICR number and OMB control number in any correspondence.

Paperwork Reduction Act Notice

The public reporting and record keeping burden for this collection of information is estimated to average 4.5 hours for operators of Class I hazardous wells, 1.5 hours for operators of Class I non-hazardous wells, 3 hours for operators of Class II wells, and 1.5 hours for operators of Class III wells.
Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to the collection of information; search data sources; complete and review the collection of information; and, transmit or otherwise disclose the information. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR Part 9 and 48 CFR Chapter 15.
Please send comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, including the use of automated collection techniques to Director, Office of Environmental Information, Collection Strategies Division, U.S. Environmental Protection Agency (2822), Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street, NW., Washington, DC 20503, Attention: Desk Officer for EPA. Please include the EPA ICR number and OMB control number in any correspondence.

Paperwork Reduction Act Notice

The public reporting and record keeping burden for this collection of information is estimated to average 4.5 hours for operators of Class I hazardous wells, 1.5 hours for operators of Class I non-hazardous wells, 3 hours for operators of Class II wells, and 1.5 hours for operators of Class III wells.
Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to the collection of information; search data sources; complete and review the collection of information; and, transmit or otherwise disclose the information. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR Part 9 and 48 CFR Chapter 15.
Please send comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, including the use of automated collection techniques to Director, Office of Environmental Information, Collection Strategies Division, U.S. Environmental Protection Agency (2822), Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street, NW., Washington, DC 20503, Attention: Desk Officer for EPA. Please include the EPA ICR number and OMB control number in any correspondence.

Paperwork Reduction Act Notice

The public reporting and record keeping burden for this collection of information is estimated to average 4.5 hours for operators of Class I hazardous wells, 1.5 hours for operators of Class I non-hazardous wells, 3 hours for operators of Class II wells, and 1.5 hours for operators of Class III wells.
Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to the collection of information; search data sources; complete and review the collection of information; and, transmit or otherwise disclose the information. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR Part 9 and 48 CFR Chapter 15.
Please send comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, including the use of automated collection techniques to Director, Office of Environmental Information, Collection Strategies Division, U.S. Environmental Protection Agency (2822), Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street, NW., Washington, DC 20503, Attention: Desk Officer for EPA. Please include the EPA ICR number and OMB control number in any correspondence.

Paperwork Reduction Act Notice

The public reporting and record keeping burden for this collection of information is estimated to average 4.5 hours for operators of Class I hazardous wells, 1.5 hours for operators of Class I non-hazardous wells, 3 hours for operators of Class II wells, and 1.5 hours for operators of Class III wells.
Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to the collection of information; search data sources; complete and review the collection of information; and, transmit or otherwise disclose the information. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR Part 9 and 48 CFR Chapter 15.
Please send comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, including the use of automated collection techniques to Director, Office of Environmental Information, Collection Strategies Division, U.S. Environmental Protection Agency (2822), Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street, NW., Washington, DC 20503, Attention: Desk Officer for EPA. Please include the EPA ICR number and OMB control number in any correspondence.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR Part 9 and 48 CFR Chapter 15.
Please send comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, including the use of automated collection techniques to Director, Office of Environmental Information, Collection Strategies Division, U.S. Environmental Protection Agency (2822), Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street, NW., Washington, DC 20503, Attention: Desk Officer for EPA. Please include the EPA ICR number and OMB control number in any correspondence.

Paperwork Reduction Act Notice

The public reporting and record keeping burden for this collection of information is estimated to average 4.5 hours for operators of Class I hazardous wells, 1.5 hours for operators of Class I non-hazardous wells, 3 hours for operators of Class II wells, and 1.5 hours for operators of Class III wells.
Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to the collection of information; search data sources; complete and review the collection of information; and, transmit or otherwise disclose the information. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR Part 9 and 48 CFR Chapter 15.
Please send comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, including the use of automated collection techniques to Director, Office of Environmental Information, Collection Strategies Division, U.S. Environmental Protection Agency (2822), Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street, NW., Washington, DC 20503, Attention: Desk Officer for EPA. Please include the EPA ICR number and OMB control number in any correspondence.

$12,500 - abandonment costs

Certification

I certify under the penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibliity of fine and imprisonment. (Ref. 40 CFR 144.32)

Dan Johnson, VP Environmental and Technical Services		

Paperwork Reduction Act Notice

The public reporting and record keeping burden for this collection of information is estimated to average 4.5 hours for operators of Class I hazardous wells, 1.5 hours for operators of Class I non-hazardous wells, 3 hours for operators of Class II wells, and 1.5 hours for operators of Class III wells.
Burden means the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. This includes the time needed to review instructions; adjust the existing ways to comply with any previously applicable instructions and requirements; train personnel to be able to respond to the collection of information; search data sources; complete and review the collection of information; and, transmit or otherwise disclose the information. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations are listed in 40 CFR Part 9 and 48 CFR Chapter 15.
Please send comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, including the use of automated collection techniques to Director, Office of Environmental Information, Collection Strategies Division, U.S. Environmental Protection Agency (2822), Ariel Rios Building, 1200 Pennsylvania Ave., NW., Washington, DC 20460; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street, NW., Washington, DC 20503, Attention: Desk Officer for EPA. Please include the EPA ICR number and OMB control number in any correspondence.

Exhibit S-1 Aquifer Exemption (May 1, 1997)

Exhibit S-2 NI 43-101 Technical Report Pre-Feasibility Study, Florence, Pinal County, Arizona

S.1 Introduction

This Attachment has been prepared in support of an application (Application) by Florence Copper, Inc. (Florence Copper) to the United States Environmental Protection Agency (USEPA) for issuance of an Underground Injection Control Class III (Area) Permit (UIC Permit) for the planned Production Test Facility (PTF), to be located at the Florence Copper Project (FCP) in Pinal County, Arizona. This Attachment describes the aquifer exemption issued to BHP Copper, a previous site owner, in conjunction with UIC Permit No. AZ396000001. UIC Permit No. AZ396000001 was issued for operation of an in-situ copper recovery (ISCR) facility at the FCP property which is inclusive of the currently proposed PTF area and the broader mineralized area which is approximately 212 acres in size. The horizontal extent of the existing aquifer exemption coincides with the horizontal extent of the mineralized area permitted under UIC Permit No. AZ396000001 (212 acres), plus a 500-foot circumscribing area around that mineralized area. The vertical extent of the aquifer exemption conforms to criteria included in UIC Permit No. AZ396000001.

S.2 Historical Context

The USEPA originally issued UIC Permit No. AZ396000001 to BHP Copper Inc. (BHP Copper) on May 1, 1997. When the USEPA issued the UIC Permit, it also granted an "Underground Injection Control Aquifer Exemption for EPA Permit #AZ39600001" (Aquifer Exemption), designating the BHP Copper permitted area as exempt from provisions in the Safe Drinking Water Act as they pertain to protecting underground sources of drinking water (USDWs). The 1997 Aquifer Exemption is included for reference in Exhibit S-1.

UIC Permit No. AZ396000001 was amended on April 26, 2000 to establish permit limits for Alert Levels, Aquifer Quality Limits, and baseline water quality characteristics for Point of Compliance (POC) wells located around the Aquifer Exemption zone. The FCP property was subsequently sold and the permit was transferred from BHP Copper to the new owner in December 2001. None of the requirements of the UIC Permit were changed during the transfer process.

S.3 Required Criteria for Exempted Aquifers

Criteria for determining whether an aquifer qualifies as an "exempted aquifer" are listed under 40 Code of Federal Regulations (CFR) Sections 144.07 and 146.04. The criteria applicable to the Aquifer Exemption issued to BHP Copper are listed under 40 CFR 146.04(a) and (b). The criteria were evaluated during the USEPA review of BHP Copper's 1996 Application and resulted in the granting of the Aquifer Exemption in 1997.

Florence Copper is not aware of any change in aquifer conditions or planned operations that would require a change in the criteria used to determine the Aquifer Exemption area. Florence Copper has recently completed a report entitled "*NI 43-101 Florence Copper Project, Technical Report, Pre-Feasibility Study*". The report provides a broad range of information including the aquifer's potential for economic mineral development as per requirements in 40 CFR Sections 144.07(c)(1) and 146.04(b)(1), and as required for this Attachment. The report provides data regarding the delineation of the injection zone, general information on the mineralogy and geochemistry of the injection zone, the amenability of the in-situ process to recover copper, and a timetable for proposed development. An electronic copy of the Pre-Feasibility report is provided on a CD in Exhibit S-2 of this Attachment.

S.4 Original Aquifer Exemption

The horizontal limits of the proposed aquifer exemption coincide with the original Area of Review described in Attachment A and B of the original UIC Permit issued to BHP in 1997, and are shown on Figure S-1 of this Attachment. The vertical limits of the aquifer exemption are depicted in Figure S-2 and the lateral and vertical limit are described in Exhibit S-1.
