Alexandra Dunn
Assistant Administrator
Office of Chemical Safety and Pollution Prevention
Environmental Protection Agency
Via Email: dunn.alexandra@epa.gov

Dear Ms. Dunn,

This letter is in support of the registration of low volatility dicamba products for use in crops where weeds can be difficult to control in production. I am writing to encourage approval as soon as possible of a new label for over the top application of dicamba for soybeans so growers can continue to use this affective tool in their crop production strategies now and into the future.

Seed decisions for Spring 2021 are currently happening and our Sales Account Managers and dealers across the country are working diligently with growers to provide products and services that not only maximize production but provide them with effective tools to minimize weed pressures as well. The uncertainty in approvals of effective herbicide solutions has put pressure on the entire supply chain process. In turn, potentially leaving our customers with less effective solutions to control resistant weeds.

Through extensive training and education, we have experienced significant success with our employees, dealers and customers in safely using this product and system to safely control weeds in their soybean crop. We again encourage and support the renewing of the over the top label and hope that a verdict can be made sooner rather than later.

Thank you for your consideration.

Sincerely,

Andy Montgomery
Vice President Commercial – LG Seeds
