Subject: Toxic Substances Control Act (TSCA) Work Plan
Boston Convention & Exhibition Center
Phase 2, West of C Street (MassDEP RTN 3-16211)
Boston, Massachusetts

Dear Ms. Tisa:

Haley & Aldrich, Inc. (Haley & Aldrich) is pleased to submit this Toxic Substances Control Act (TSCA) Work Plan ("Work Plan") for the above-referenced TSCA Site. This document has been prepared pursuant to 40 CFR 761.61 of the regulations under TSCA and is being submitted in accordance with the requirements at 40 CFR 761.61(a)(3) and 761.61(c) for notification and management of bulk PCB remediation waste. This Work Plan supersedes the TSCA Work Plan dated 4 May 2015, which was previously submitted to the United States Environmental Protection Agency (EPA) on 5 May 2015.

This Work Plan was prepared for a portion of the Boston Convention & Exhibition Center (BCEC) Phase 2 Site by Haley & Aldrich on behalf of our client and the Site owner, the Massachusetts Convention Center Authority (MCCA). The MCCA plans to commence the activities described in this Work Plan (to achieve site closure under TSCA) prior to the expiration of the Short Term Approval in May 2017.

We have very much appreciated your guidance and assistance with this project to date. Please do not hesitate to contact us should you have any questions or require additional information.

Sincerely yours,
HALEY & ALDRICH, INC.

Executive Summary

This Toxic Substances Control Act (TSCA) Work Plan ("Work Plan") was prepared for a portion of the Boston Convention & Exhibition Center (BCEC) Phase 2 Site. The BCEC Phase 2 Site consists of a portion of the overall BCEC property and is located in an urban area of South Boston, Massachusetts.

Based on the historic use of the BCEC Phase 2 Site and the concentrations of PCBs detected in soil, a portion of the BCEC Phase 2 area (the "TSCA Site") is subject to regulation under TSCA (40 CFR 761). The TSCA Site was historically used as a metal scrapyard operated as The Boston Junk Company and SAK Recycling Corporation until 1996, when it was ordered by the Massachusetts Department of Environmental Protection (MassDEP) to cease activities at the property. During these operations, unknown quantities and types of oils and hazardous materials (OHM) were stored and/or used at the TSCA Site. The OHM stored at the TSCA Site and the historical Site usages are known to have impacted the TSCA Site. Although specific releases at the TSCA Site were not documented at the time, records of various incidents were recorded by previous consultants and regulators relating to the TSCA Site activities, dating back to 1982. Incidents were reported to have included storage of transformers and debris on property as well as adjacent properties, disassembly of transformers by blowtorch, leaking transformers, and on-site fires. Several investigations conducted by various environmental consultants at the TSCA Site detected the presence of total petroleum hydrocarbons (TPH), polychlorinated biphenyls (PCBs), and metals in TSCA Site soils.

In 2000, soil and debris stockpiles were removed from the SAK Site for off off-site disposal, and a protective asphalt cap (EM-1 Cap) was built as a temporary installation by the (Boston Redevelopment Authority) BRA. The EM-1 Cap was considered a temporary measure designed to provide a paved surface for the construction laydown area for Phase 1 of the BCEC and to eliminate potential exposure to underlying soils. The EM-1 Cap was constructed in response to elevated levels of PCBs, metals, and petroleum within the TSCA Site.

Following the construction of Phase 1 of the BCEC in 2005, excess historic fill soils generated from the construction of Phase 1 of the BCEC were graded across the Phase 2 area (including the TSCA Site) and used to raise the grade in the Phase 2 area by up to 7 ft (current TSCA Site grades range from El. 16 to 22) for the construction of the existing BCEC parking lot. The soils used to raise the grade (referred to as Parking Area Backfill) contain low levels of PCBs (generally less than 10 mg/kg) that, in our opinion, are not regulated by TSCA. The BCEC Phase 2 Site currently consists of an active, controlled access parking lot.

Based on the historic use of the TSCA Site and the concentrations of PCBs detected in soil, our current understanding of the portion of the BCEC Phase 2 area that is subject to regulation under 40 CFR 761 is defined laterally by PCBs that are present at concentrations greater than or equal to 1 mg/kg within and vertically below the ground surface that existed at the completion of EM-1 Cap in 2000 (either at the bottom of the EM-1 Cap or El. 17 in areas where the EM-1 Cap is not present). The TSCA Site as currently understood consists of an approximately 296,700 sq ft (7± acre) area in Phase 2 of the BCEC.

The Massachusetts Convention Center Authority (MCCA) was previously planning to redevelop the BCEC Phase 2 area. Redevelopment plans envisioned the construction of an expansion to the existing Convention Center building which would cover the majority of the TSCA Site. It is now clear

that the BCEC expansion plans have been placed on indefinite hold and it appears unlikely it will occur in the near future. The current and future foreseeable use of the BCEC Phase 2 area is a controlled access parking lot and truck marshalling area.

Haley & Aldrich evaluated a Risk-Based Cleanup approach that takes into consideration the current and planned future use of the Phase 2 area as a vehicle parking lot and truck marshalling area, as well as a comparison to the Self-Implementing Cleanup approach (40 CFR 761.61(a)) of removing all soils with PCB concentrations greater than 100 mg/kg. The selected remedial approach consists of the Risk-Based Cleanup whereby soils with PCB concentrations greater than or equal to 500 mg/kg will be excavated and disposed of off-site, to attain a site average PCB concentration of 100 mg/kg.

The Risk Based Cleanup is anticipated to begin in March 2017, prior to the expiration of the Short Term Approval in May 2017. If performed on schedule, remedial excavation of PCB-contaminated soils at the TSCA Site and Site restoration are expected to be complete in the Summer of 2017.

1. Introduction

1.1 TSCA SITE LOCATION AND CONDITIONS

The limits of the Site subject to this Toxic Substances Control Act (TSCA) Work Plan (the "TSCA Site") are located on a portion of the Boston Convention & Exhibition Center (BCEC) Phase 2 area. The BCEC Phase 2 area consists of a portion of the overall BCEC property and is located in an urban area of South Boston, Massachusetts, as shown on Figure 1. The BCEC Phase 2 area is surrounded by a mixture of residential, industrial, and commercial properties, and consists of a portion of the surface parking lot within the statutory BCEC project limits. The Phase 2 area is located southwest of the existing BCEC building and adjacent access road, northwest of D Street, northeast of and including a portion of New Cypher Street, and southeast of rail land adjacent to the South Boston Haul Road (Figure 2).

The limits of the TSCA Site are within the Phase 2 area and are generally bounded by New Cypher Street to the southwest, a portion of the BCEC Phase 2 parking lot to the southeast (starting around the former C Street location), railroad right-of-way adjacent to the South Boston Bypass Haul Road to the northwest (Parcel 20B), and an access roadway to the northeast (beyond which is the existing BCEC building). The limits of the TSCA Site are shown on Figures 3 and 4.

Currently the TSCA Site consists of a portion of New Cypher Street and a portion of an active, controlled access, parking lot (referred to as the South Lot) servicing the BCEC. The entire TSCA Site is covered with asphalt, and/or crushed stone rip rap placed for management of storm water. Two small parking lot attendant booths are also present on the TSCA Site.

Existing ground surface elevations are referenced in feet and range from approximately El. 22 to El. 16 Boston City Base (BCB) datum.

1.2 HISTORICAL SITE USAGE

1.2.1 Overview

The TSCA Site and Phase 2 of the BCEC were originally part of the tidelands of Boston Harbor. This area was created by various stages of filling conducted around the mid-to-late 1880's. Material used to fill the Phase 2 area consists of miscellaneous Historic Urban Fill and hydraulic fill.

According to a review of historical documents, including Sanborn Fire Insurance Maps, the Phase 2 area was largely undeveloped until about 1899. In 1899, C Street bisected the Phase 2 area from southwest side to the northeast side. The area to the west of C Street contained several roadways; however, no buildings are depicted on the Sanborn Maps.

Between approximately 1899 and 1922, several railroad tracks and buildings were constructed on or adjacent to the TSCA Site. The Phase 2 area was primarily used by NYNH&H Railroad as a freight yard and the Brooklyn Cooperage Company cooper shop. Anchor Street (more recently known as the former Louis Street) was located in the south portion of the TSCA Site. The Boston Transit Commission and Supreme Wines Company utilized the area between Anchor Street and Cypher Street as a stock yard, and included storage warehouses, a machine shop, and several sheds. The

railroad tracks associated with NYNH&H Railroad were present at the TSCA Site until between 1964 and 1988.

Between 1922 and 1950, the buildings utilized by the Brooklyn Cooperage Company became occupied by a grocer's warehouse. Additionally, a freight house was constructed to the northeast of the former Brooklyn Cooperage Company along C Street.

Between 1950 and 1964, Anchor Street was renamed Louis Street. The 1964 Sanborn Map shows that a new building was constructed between the grocer's warehouse and the freight house that was utilized as a tomato warehouse. A small area located to the north of the grocer's warehouse is labeled "scrap metal." The Boston Transit Commission was replaced by the Boston Iron and Metal Company scrap metal yard.

The area remained substantially unchanged from 1964 through the 1990's. In the late 1990's to early 2000, existing buildings on the TSCA Site were demolished in preparation for the construction of the BCEC (Phase 1). The TSCA Site and the rest of BCEC Phase 2 were used as a soil stockpile and construction staging area from 2000 until completion of the Phase 1 BCEC in 2004. In 2005, excess soils generated from the construction of Phase 1 of the BCEC were spread across the Phase 2 area to raise the grade by up to 7 ft (current TSCA Site grades range from El. 16 to 22) for the construction of the existing BCEC parking lot.

Figure 5 shows the approximate locations of the former buildings and other structures at the TSCA Site.

1.2.2 Former Site Operations - Boston Junk Company/SAK Recycling Facility

From 1947 to 1985, the TSCA Site at 14 Louis Street and Cypher Street was operated as The Boston Junk Company and was owned by Louis Freedman. SAK Recycling Corporation bought the property in 1992, and continued to use the property as a junkyard until 1996, when it was ordered by the Massachusetts Department of Environmental Protection (MassDEP) to cease activities at the property. During these operations, unknown quantities and types of oils and hazardous materials (OHM) were stored and/or used at the TSCA Site. The OHM stored at the TSCA Site and the historical Site usages are known to have impacted the TSCA Site.

According to a 1996 report by New England Environmental Technologies Corporation (NEET) and a 2000 report from Weston & Sampson Engineers, Inc. (WSEI), although specific releases at the SAK Recycling Corporation Site were not documented at the time, records of various incidents were recorded by previous consultants and regulators relating to the TSCA Site activities, dating back to 1982. Incidents were reported to have included: "observation of transformers and debris on property as well as adjacent properties, identification of strong odors, several fires, disassembly of transformers by blowtorch, and sampling of soil and leaking capacitors which contained 96-100% PCBs." Several investigations conducted by various environmental consultants at the SAK Recycling Corporation Site detected the presence of total petroleum hydrocarbons (TPH), PCBs, and metals in TSCA Site soils.

The TSCA Site was originally assigned Release Tracking Number (RTN 3-0580) by MassDEP, and was designated as a Tier IA Disposal Site. The area of the former operations of Boston Junk/SAK Recycling Corporation were also the subject of litigation by the Commonwealth of Massachusetts,

Boston Redevelopment Authority and Massachusetts Convention Center Authority, Plaintiffs, v. Boston Edison Company, SAK Recycling Corporation, Fiore Construction Co., Inc. and Walter Fiore, Defendants, Mass. Sup. Ct., Civ. Action No. 96-0673A, and in a companion case, SAK Recycling Corporation, Plantiff, v. Boston Edison Company, Defendant, Mass. Sup. Ct., Civ. Action No. 96-628D.

The BCEC Phase 2 area was historically comprised of multiple separately owned parcels. These parcels were purchased by the Boston Redevelopment Authority (BRA) and ownership of the property was transferred to the Massachusetts Convention Center Authority (MCCA) after enactment of the enabling legislation to create the BCEC. As part of the development of the BCEC Phase 1 area, buildings remaining at the TSCA Site were demolished in 1999-2000. Following remedial activities and construction of EM-1 Cap in 1999, the Phase 2 area was used as staging area for the Phase 1 BCEC construction during 2000-2004, and the parking lot supporting the Phase 1 BCEC was constructed in 2005.

1.3 REGULATORY BACKGROUND

1.3.1 MassDEP Regulatory Background

As indicated above, the BCEC property is composed of several parcels that have been used for industrial and commercial purposes for over 100 years. Under enabling legislation for the BCEC Project, property within the BCEC project limits was acquired and made ready for development by the BRA. The BRA was then charged with transferring the project property to the MCCA for the MCCA's subsequent construction and operation of the Phase 1 BCEC. Responsibilities of the BRA and the MCCA regarding oil and hazardous materials regulated under the Massachusetts Contingency Plan (MCP) were set forth in an Application for Special Project Designation (SPD), dated 18 November 1999. The SPD encompasses the entire BCEC Project Site – Phase 1, Phase 2, and the Boston Convention Center Hotel (BCCH) Phase 1 Ground Lease Area (Figure 2) – and defined the progression of MCP regulatory submittals up to Permanent Solution for the BCEC Project. SPD was granted for the BCEC by the Massachusetts Department of Environmental Protection (MassDEP) in their letter dated 10 February 2000 (Transmittal No. W003640). MassDEP granted an extension of the SPD for Phase 2 through May 2008, and on 1 July 2008, MassDEP extended the SPD Permit for Phase 2 until 30 June 2009 with the condition that the Phase 2 area must be Tier classified prior to this date. A MCP Phase I Initial Site Investigation Report and Tier II Classification Submittal for the BCEC Phase 2 area west of C Street (including the former SAK Site) was submitted to MassDEP and the United States Environmental Protection Agency (EPA) on 30 June 2009.

The BCEC Property is currently tracked by four Release Tracking Numbers (RTNs): RTN 3-16211, RTN 3-16215, RTN 3-16224, and RTN 3-16230. A brief discussion of each RTN is provided below.

1.3.1.1 RTN 3-16211

The majority of the TSCA Site (approximately 6.5 acres) is included within the limits of RTN 3-16211. The RTN 3-16211 Disposal Site ("RTN 3-16211 Site") consists of approximately 9.4 acres of land located in Phase 2 of the BCEC that is bounded by Cypher Street to the southwest, a portion of the BCEC Phase 2 parking lot to the southeast (starting at the former C Street location), rail land adjacent to the South Boston Bypass Haul Road to the northwest, and an access roadway to the northeast (beyond which is the existing BCEC building) and excludes the limits of RTN 3-16224 located in the southwest corner of the BCEC property.

Many Release Notification Forms (RNF, BWSC103) have been submitted to MassDEP for releases identified within the limits of the RTN 3-16211. The RTNs assigned to these releases were 3-16211, 3-16212, 3-16213, 3-16219, 3-16218, 3-16225, and 3-16226. Per communication with MassDEP on 7 and 12 May 2009, these RTNs were linked to RTN 3-16211 since this RTN was the first RTN issued within the area of the subject Site. Therefore, the parcel identified herein as BCEC Phase 2 West of C Street, including the majority of the TSCA Site, is addressed cumulatively under RTN 3-16211.

The RTN 3-16211 Site is covered with historic urban fill material, which is considered to be a source of oil and hazardous materials detected in soil and groundwater with the exception of the portion of the RTN 3-16211 Site over which operations were conducted by the former Boston Junk/SAK Recycling facility, where elevated concentrations of PCBs and other hazardous materials have been identified. In addition, underground and above-ground storage tanks were formerly present at the RTN 3-16211 Site, all of which were previously removed by Weston and Sampson Engineers, Inc. (WSEI) and the Boston Redevelopment Authority (BRA) prior to the transfer of the property to the MCCA. Other sources of potential contamination include former oil/water separators, floor drain outlets, and historic waste management and disposal practices.

A Phase II Comprehensive Site Assessment (CSA) and Phase III Remedial Action Plan (RAP) were submitted to MassDEP and the EPA for RTN 3-16211 (BCEC Phase 2 Area West of C Street) on 30 June 2011. The Phase II CSA provided information relative to the source, nature, extent and potential impact of the release, as well as information relative to the risk of harm posed by the RTN 3-16211 Site to health, safety, public welfare, and the environment and the need to conduct remedial actions at the RTN 3-16211 Site. The Phase II concluded that, although a condition of “No Significant Risk” of harm to human health exists at the RTN 3-16211 Site for current and foreseeable Site uses as well as for safety and ecological receptors, a condition of No Significant Risk does not exist for public welfare or the environment in the future because one or more soil exposure point concentrations (EPCs) for antimony, Aroclor 1248, Aroclor 1254, Aroclor 1260, lead, and zinc exceed applicable MCP Upper Concentration Limits. Therefore, Comprehensive Remedial Actions are necessary at the RTN 3-16211 Site to achieve a Permanent Solution under the MCP.

The Phase III RAP documented the identification, evaluation, and selection of a comprehensive remedial action alternative that addresses the identified risk and which is likely to achieve a Permanent Solution or Temporary Solution. The selected remedial action alternative is Long-Term Monitoring to achieve a Temporary Solution. Although a Temporary Solution was selected because it was more cost-effective and timely than a Permanent Solution, the Phase III also anticipated that soil excavation to achieve a Permanent Solution would be implemented in the future, in some manner, during planned redevelopment of the Phase 2 portion of the BCEC.

A Class C-2 Response Action Outcome (RAO) Statement (Temporary Solution), dated 29 June 2012, was submitted to MassDEP and EPA on 29 June 2012 for RTN 3-16211. Per 310 CMR 40.0861(2)(h), “definitive and enterprising steps” to achieve a Permanent Solution must be presented when the selected remedial alternative is a Temporary Solution. An existing Maintenance and Monitoring Program (groundwater sampling) being performed as part of the EPA Short-Term approval has been effective at demonstrating that TSCA Site conditions are stable and contaminants are not migrating off-site (see details below). Accordingly, the Maintenance and Monitoring Program is continuing as a Post-Permanent Solution activity.

1.3.1.2 RTN 3-16215

Approximately 5,040 sf (0.12 acres) of the TSCA Site is located within the limits of RTN 3-16215. The RTN 3-16215 Disposal Site ("RTN 3-16215 Site") consists of an approximately 8.7-acre area of Phase 2 of the overall BCEC property that is bounded by Cypher Street to the southwest, a portion of the BCEC Phase 2 parking lot to the northwest (starting at the former C Street location), and an access roadway to the northeast (beyond which is the existing BCEC building), and D Street to the southeast (Figure 2). A Class B-2 Response Action Outcome (RAO) Statement (Permanent Solution with Conditions per 310 CMR 40.1055(2)), dated 16 February 2011, was previously submitted to MassDEP for the RTN 3-16215 Site. An Activity and Use Limitation (AUL) was filed with the Suffolk County Registry of Deeds to restrict certain Site uses such as single- or two- family residences, schools, kindergartens, daycares, outdoor active recreation or outdoor playgrounds.

1.3.1.3 RTN 3-16224

RTN 3-16224 was formerly part of the TSCA Site. RTN 3-16224 consists of approximately 0.3 acres of land located in the southwest corner of the BCEC Phase 2 Site that is bounded by the South Boston Haul Road to the northwest, rail land to the northeast, a portion of the BCEC Phase 2 parking lot to the southeast, and undeveloped former rail land to the southwest (Figure 4).

On 21 November 2000, Haley & Aldrich submitted a Construction RAM Plan to MassDEP for the construction of an approximately 19,210 square foot (sf) portion of New Cypher Street at its junction with the South Boston Bypass Road (SBBR). Because this work was not addressed in the SPD's pre-approved, Site-wide RAM Plan, the Construction RAM Plan was assigned RTN 3-16224 by MassDEP. A proposal was also submitted to the EPA for TSCA compliance for this portion of Cypher Street on 7 March 2001 by Palmer & Dodge and Haley & Aldrich, Inc. Following EPA's approval, RAM activities were conducted between 4 April 2001 and 18 June 2001, and consisted of excavating to predetermined depths within the RAM area. Confirmatory samples collected from the finished excavations indicated that concentrations of PCBs greater than 1.0 mg/kg had been removed, with the exception an approximately 1,800 sf area (known as Area D) located on the southeast portion of the RAM area. PCBs remained in this 1,800 sf area at concentrations up to 43 mg/kg. A Class A-2 RAO (Permanent Solution with No Conditions per 310 CMR 40.1055(1)), dated 15 August 2001, was submitted to MassDEP for RTN 3-16224, which did not include Area D. As an alternative to further excavation in Area D, the roadway cap (i.e., New Cypher Street) was considered a temporary solution, as described in the EPA-approved plan. The decision was made to consider Area D in future remediation activities.

1.3.1.4 RTN 3-16230

Approximately 10,350 sf (0.24 acres) of the TSCA Site is located within the limits of RTN 3-16230. RTN 3-16230 consists of approximately 37 acres of the BCEC Site (sometimes referred to as Phase 1) which is generally bounded by Summer Street to the northeast, D Street to the southeast, Phase 2 of the BCEC to the southwest, and rail land to the northwest, beyond which is the South Boston Haul Road. Following construction of the existing BCEC in 2004, a Class A-3 RAO Statement (Permanent Solution with Conditions per 310 CMR 40.1055(2)), dated 1 December 2008 was submitted to MassDEP. An Activity and Use Limitation was filed with the Suffolk County Registry of Deeds to restrict certain Site uses such as single- or two- family residences, schools, kindergartens, daycares, outdoor active recreation or outdoor playgrounds.

1.3.2 EPA Regulatory Status and Prior PCB Cleanup

Based on concentrations of PCBs detected in soils, portions of RTNs 3-16211, 3-16215 and 3-16230 are subject to regulation under TSCA.

Several response actions have been conducted at the TSCA Site as part of construction and/or remediation activities. In 1992, as part of the remediation of the Haul Road, PCBs within the planned Haul Road area and the adjacent "PCB runoff area" were remediated to less than 2 mg/kg in soil. The PCB runoff area consisted of the area where North Shore Recycling/ Ferragamo firefighting water was reported to have spread PCBs to the north off of a (then) paved area. This soil remediation was performed under the Central Artery (I-93)/Tunnel (I-90) Project (CA/T) in preparation of constructing the South Boston Bypass Road. Under the CA/T Project, approximately 5,200 tons of PCB-contaminated soil was excavated and transported to a disposal facility from an area which currently includes a portion of the BCEC South Lot. This work was performed in March and April 1992 under the direction of Camp Dresser and McKee, Inc., (CDM). The work was performed under the review and approval of MassDEP as a Short Term Measure. The Short-Term Measure removed PCB-contaminated soil to a cleanup standard of 2 mg/kg PCBs and achieved a Permanent Solution within the Right-of-Way (ROW) of the South Boston Bypass Road and PCB runoff area, which is currently occupied by a portion of the BCEC parking lot. The extent of the remediation is shown on Figure 4.

In 1998, Boston Edison Company completed an Immediate Response Action (IRA) within the former Boston Junk/SAK Recycling Corporation property (RTN 3-0580) to address elevated levels of PCBs in soil in this area. The purpose of the IRA was to abate a potential imminent hazard (IH) condition on the former SAK property and to assess the nature and extent of PCB contamination in soil on and adjacent to the property. The SAK property was secured with fencing and locked in 1997 to abate the IH condition. Assessment activities were conducted in September 1997 and January 1998 to assess the nature extent of PCB contamination. The results of the assessment indicate that releases of PCBs occurred on the former SAK property during its operation as a junkyard. Further, active rail yard activities (including the accidental release of PCBs resulting from transportation of transformers on property adjacent to the former SAK property) were confirmed and were considered to be a source of the PCBs and urban fill contamination. Completed IRA activities also included the removal of approximately 7.5 tons of soil from catch basins by Clean Harbors in 1998.

In 2000, a Release Abatement Measure (RAM) Plan was submitted to MassDEP by WSEI to manage surficial debris and soil/debris stockpiles at the SAK property and to construct a protective cap at the property. Approximately 3,500 cy of soil/debris was fed through a screen/crusher to separate large debris from the soil. The soil/debris mixture was then treated by Maxymillion Technologies using indirect thermal desorption to reduce the concentration of PCBs to less than 10 mg/kg. The treated soil was further treated to reduce TCLP lead levels to below the 0.75 mg/L RCRA threshold. Following off-site disposal of the soil and debris, a protective asphalt cap (EM-1 Cap) was built as a temporary installation by the BRA to provide a paved surface for the construction laydown area for Phase 1 of the BCEC and to eliminate potential exposure to underlying oil and hazardous materials, including PCBs, detected in soil. The EM-1 Cap was constructed in response to elevated levels of PCBs, metals, and petroleum with the former SAK property. The extent of the EM-1 Cap is shown on Figure 4.

The EM-1 Cap was installed under MassDEP and United States Environmental Protection Agency (EPA) (19 May 2000 Short-Term Risk-Based Approval) oversight; however, the EM-1 Cap is not considered a Permanent Solution for releases at the SAK Site. Following construction of the EM-1 Cap, WSEI submitted a Monitoring and Maintenance (M&M) Plan dated 14 November 2000 to EPA on behalf of the BRA. The M&M Plan identified groundwater monitoring locations and a biannual sampling program for PCBs in groundwater. WSEI submitted groundwater monitoring data in reports dated July 2001, March 2002, and January 2003. Haley & Aldrich submitted a revised groundwater monitoring plan to EPA dated 26 August 2003 to modify the planned monitoring locations to certain downgradient and perimeter wells, and began implementation of and reporting on the revised groundwater monitoring plan in April 2004. Thereafter, Haley & Aldrich has submitted groundwater monitoring data (to EPA and MassDEP) in reports on a biannual basis from June 2005 through December 2014.

At the time the Short Term Approval was being discussed, all of the parties envisioned the potential of extending the approval to link to the BCEC construction schedule and the potential expansion into the Phase 2 area at a later date. As a result, the Short Term Approval explicitly recognizes that it may be extended by EPA if requested by MCCA or Boston Redevelopment Authority. Since the original Approval of the Short Term Risk-Based Remedy was granted for the EM-1 Remediation Site in by the EPA in 1999, the Short Term Approval has been extended a total of four times, the most recent was requested in a letter from Haley & Aldrich dated 6 May 2014 for extension through 11 May 2017.

As described above, Haley & Aldrich performed remediation of PCBs in an approximately 19,210 sf portion of New Cypher Street at its junction with the South Boston Bypass Road (SBBR). This remediation work was conducted under approvals by MassDEP and EPA. Excavation to predetermined depths removed concentrations of PCBs greater than 1.0 mg/kg, with the exception an approximately 1,800 sf area (Area D) located on the southeast portion of the area. PCBs remained in this 1,800 sf area at concentrations ranging from 1 mg/kg to 43 mg/kg. The roadway cap (i.e., New Cypher Street) was considered a temporary solution, as described in the EPA-approved plan, and Area D was to be considered in future remediation activities.

1.4 ANTICIPATED FUTURE PROPERTY USE

The current use of the BCEC Phase 2 area is a controlled access parking lot and truck marshalling, and the future foreseeable use of the BCEC Phase 2 area is the same as its current use.

There are no current redevelopment plans for the BCEC Phase 2 area. Although redevelopment plans were made in 2015 for the construction of a large-scale expansion to the existing Convention Center building which would cover the majority of the TSCA Site, it is now clear that the expansion of the BCEC is placed on indefinite hold for the foreseeable future.

1.5 LIMITATIONS

This Work Plan was prepared by Haley & Aldrich in accordance with our Proposal to the Massachusetts Convention Center Authority dated 8 March 2016. This Work Plan was prepared for the exclusive use of MCCA, MassDEP, and the EPA in connection with the subject BCEC Phase 2 project. There are no intended beneficiaries other than the MCCA, the MassDEP and the EPA.

Haley & Aldrich shall owe no duty whatsoever to any other person or entity on account of the Proposal or the Work Plan. Use of this Work Plan by any person or entity other than MCCA, MassDEP, and the EPA for any purpose whatsoever without the express written authorization of the Massachusetts Convention Center Authority and Haley & Aldrich shall be at such other person's or entity's sole risk, and shall be without legal exposure or liability to the Massachusetts Convention Center Authority or Haley & Aldrich.

2. TSCA Site Characterization

2.1 SUBSURFACE EXPLORATION PROGRAMS

Numerous subsurface explorations have been conducted at the TSCA Site to characterize the nature and extent of contamination and to classify the soils for potential off-site disposition. Details regarding the subsurface exploration programs are provided below.

2.1.1 GZA, Inc., Environmental Site Assessment (1984-1985)

In 1984 and 1985, GZA, Inc. (GZA) conducted an assessment of soil and groundwater quality at the former Conrail Property located to the southwest of the former SAK Site, adjacent to the former Energy International parcel. The subsurface investigation program included the excavation of 12 test pits, installation of five test boring/monitoring wells, and collection and screening analysis of subsurface soil and groundwater samples for VOCs as well as laboratory analysis of PCBs. The results were presented in a report entitled "Environmental Site Assessment, Conrail Properties, South Boston, Massachusetts," dated 26 November 1985. The results of the investigation detected PCBs up to 240 mg/kg on the Conrail property near its property boundary with Energy International, where GZA staff had observed transformers being disassembled with a blow torch, and then the subsequent fire being extinguished with water. GZA reported observed water with an oily film flow from the Energy International property on to Conrail property. Therefore, GZA concluded that the Conrail property had been impacted by PCBs due to runoff from the adjacent scrap metal operation (Boston Junk/SAK).

2.1.2 ABB Environmental Services, Inc. Draft Report, Preliminary Site Assessment (1990)

In 1990, ABB Environmental Services, Inc. (ABB) conducted a preliminary site assessment which included a review of existing historic site data, site observations, and additional soil sampling and analyses at the Energy International property at 430 C Street. The subsurface investigation program included the advancement of 7 test boring explorations located northeast of former Louis Street (adjacent to SAK Site), three surficial test pit excavations (two located west, and one further north of the SAK Site), and collection and analysis of subsurface soil samples for PCBs, TPH, and VOCs. Soil samples were collected from each test boring location, with each sample composited from 0 to 4 ft depths, submitted for PCB analysis. Surficial soils were also collected at three additional locations, with samples submitted for PCB, TPH, and VOC analysis. The results were presented in a report entitled "Draft Report, Preliminary Site Assessment, Energy International, Inc., 430 C Street, South Boston, Massachusetts," dated 8 May 1990. The results of the investigation detected PCBs up to 1,500 mg/kg on the Energy International property, with concentrations increasing in a southwestern pattern towards the SAK Site. The surficial samples collected west and further north of the SAK Site indicated lower PCB concentrations ranging from non-detect (ND) to 2 mg/kg.

2.1.3 GZA, Inc., Environmental Site Assessment (1995)

In 1995, GZA conducted an assessment of soil quality at the former Energy International C Street property, to further assess extent of PCB contamination in soil. The subsurface investigation program included the excavation of 17 shallow test pit locations and the collection of soil samples for laboratory analysis of PCBs from 6-in depth interval and/or from surficial soils. The results were

presented in a report entitled "Results of PCB Sampling and Analysis, C Street Property, Boston, Massachusetts," dated 6 November 1995. The results of the investigation indicated PCBs were detected in all samples collected on the C Street Energy International property (both in the surficial and 6-in depth samples), with concentrations up to 370 mg/kg. The majority of the sample locations where PCB concentrations were detected above 10 mg/kg were noted as being "directly adjacent to the property boundary with Boston Junk".

2.1.4 Harding and Lawson Associates (1998)

In 1998, Boston Edison Company completed an Immediate Response Action (IRA) within the former Boston Junk/SAK Recycling Corporation Site (RTN 3-0580) to address elevated levels of PCBs in soil in this area. The purpose of the IRA was to abate a potential imminent hazard (IH) condition on the former SAK property and to assess the nature and extent of PCB contamination in soil on and adjacent to the property. The SAK Site was secured with fencing and locked in 1997 to abate the IH condition. Assessment activities were conducted in September 1997 and January 1998 to assess the nature extent of PCB contamination. The results of the assessment indicate that releases of PCBs occurred on the former SAK property during its operation as a junkyard. Further, active rail yard activities including the accidental release of PCBs resulting from transportation of transformers on property adjacent to the former SAK property were confirmed and were considered to be another source of the PCB and urban fill contamination. The "Immediate Response Action Completion Report, Boston Edison Company, Release Tracking Number 3-580, Boston Junk Site, Boston, Massachusetts", dated October 1998 provides a summary of soil sampling an analysis performed by Harding and Lawson Associates, formerly ABB Environmental Services, Inc., during September 1997 and January 1998 sampling programs.

2.1.4.1 SAK Properties – September 1997

In 1997, Harding and Lawson conducted an assessment of soil quality at the SAK properties (including the SAK Site), to assess extent of PCB contamination in surficial soil, in existing soil/junk piles and from site catch basins.

- Surface soil: Surficial soil samples were collected from 0-1 ft depth intervals from 51 locations, in approximate 50-ft grids within the SAK Site, as well as the SAK property located southwest of Cypher Street. Samples were collected from each location for PCB analysis, with 25 of the samples also analyzed for TPH (or EPH). One sample was collected from each location at a depth of 1 to 2 ft below ground surface, where staining was observed. Results of the PCB analysis indicated concentrations ranging from non-detect to 3,321 mg/kg, with the highest concentrations generally located in the southeastern portion of the SAK property.
- Soil/Junk Piles: A total of 6 composite soil samples were collected from three separate soil/junk piles present onsite. Each soil sample was submitted for PCBs, TPH, Metals, and EPH analysis. Results of the PCB analysis indicated concentrations ranging from 116 mg/kg to 288 mg/kg.
- Catch Basins: One sediment/soil sample was collected from each of the three catch basin present onsite. Each sediment/soil sample was collected from the top 1 ft of sediment present in each of the catch basins, and was submitted to a laboratory for analysis of PCBs, TPH, Metals, and EPH. Results of the PCB analysis indicated concentrations of PCBs ranging from 28 mg/kg to 61 mg/kg.

2.1.4.2 SAK and Adjoining Properties – January 1998

In 1998, Harding and Lawson conducted an additional assessment of soil quality at the SAK properties as well as in adjacent properties, including: Energy International located north of the SAK site, Cypher Street/MassPort property at the southern limit if the SAK site, and the Casey and Hayes property located across Cypher Street. Samples were collected to further delineate the extent of contamination at the SAK site, as well as at adjoining properties.

- SAK properties: Thirteen of the surficial soil sampling locations sampled within the SAK properties during the September 1997 Harding and Lawson sampling round were re-sampled at 1 to 2 ft and 2 to 3 ft depth intervals. An additional four test borings were advanced within Louis Street with soil samples collected from depths of 3 to 5 ft bgs and 6 to 8 ft bgs. Each soil sample was submitted for PCBs and TPH analysis. Results of the PCB analysis indicated concentrations ranging from non-detect to 1,933 mg/kg at the Louis Street property and from 3 mg/kg to 66 mg/kg at the Cypher Street property.
- Energy International: Surficial soil samples were collected from 0 to 1 ft bgs from 35 locations, in approximate 50-ft grids within the Energy International property. Samples were collected from each location for PCB analysis, with 25 of the samples also analyzed for TPH (or EPH). At 29 of the sampling locations, soil samples were collected from 1 to 2 ft bgs and at 15 locations soil samples were also collected from 2 to 3 ft bgs. Each sample was submitted for PCB analysis, with 23 of the samples also submitted for TPH analysis. Results of the PCB analysis indicated concentrations ranging from non-detect to 407 mg/kg.
- Cypher Street/MassPort property: Surficial soil samples were collected from 0 to 1 ft bgs from 10 locations in Cypher Street and five locations on the MassPort property, in approximate 50-ft grids. Samples were collected from each location for PCB analysis. Four of the samples collected from within the MassPort property were also analyzed for TPH. Results of the PCB analysis indicated concentrations ranging from non-detect to 0.56 mg/kg on Cypher Street, and from non-detect to 1.3 mg/kg on the Massport property.
- Casey and Hayes property: Surficial soil samples were collected from 0 to 1 ft bgs from four locations in the Casey and Hayes property, in approximate 50-ft grids. Samples were collected from each location for PCB analysis. Results of the PCB analysis indicated concentrations ranging from non-detect to 1.45 mg/kg.

2.1.5 Biannual Well Sampling

As described in Section 1.3.2 above, WSEI submitted a Monitoring and Maintenance (M&M) Plan to EPA on behalf of the BRA to monitor the potential migration of PCBs from the TSCA Site. WSEI conducted three groundwater sampling events and submitted groundwater monitoring data reports to MassDEP and EPA in July 2001, March 2002, and January 2003.

Haley & Aldrich began groundwater sampling for PCBs in April 2004 and has conducted sampling on a biannual basis from April 2004 through May 2016. One unfiltered sample and one field filtered sample (using a 0.45-micron filter) is collected from monitoring wells 272-B08/W08, 272-B05/W05, 272-B01/W01A, 271-B01/W01A, 221-B01/W01, 274-B02/W02A, and CST-B11/W09. Groundwater is purged from each monitoring well using a peristaltic pump and dedicated HDPE tubing. In general, groundwater parameters including pH, temperature, turbidity, conductivity, salinity, and oxidation/reduction potential are measured to confirm that a sufficient volume of groundwater has been removed and that conditions have stabilized within the well.

The results of this groundwater sampling, along with the laboratory reports and groundwater sampling records, have been submitted to MassDEP and EPA in biannual Maintenance and Monitoring Reports. Locations of the monitoring wells are shown on Figure 6.

In general, since Haley & Aldrich started the groundwater sampling in 2004, PCBs were either not detected above laboratory reporting limits in the filtered or unfiltered samples, or low concentrations (less than 3.45 ug/L) of PCBs were detected in unfiltered samples only. Given the comparison to concentrations detected in filtered versus unfiltered samples over 10 years of data, we have concluded that the concentrations of PCBs in unfiltered samples are due to the presence of PCBs as part of the suspended solids (turbidity) of the sample and are not representative of PCBs dissolved in groundwater. Accordingly, the results of groundwater sampling indicate that PCBs are not present in the dissolved state in groundwater, and that PCBs are not migrating via groundwater flow.

The results of the groundwater sampling from the biannual PCB groundwater sampling program have been provided to EPA and MassDEP in semi-annual Status Reports, and are summarized in Table I.

2.1.6 Haley & Aldrich, TSCA Precharacterization (2010-2015)

Haley & Aldrich has considerable knowledge of the TSCA Site from our over 15-year involvement in the BCEC project, and our review of the historical work conducted at the TSCA Site by WSEI and other consultants. Based on our understanding of the limits of the TSCA Site, Haley & Aldrich conducted four extensive subsurface exploration programs at the TSCA Site between 2010 and 2015 to delineate the nature and extent of PCBs and other contamination. The comprehensive TSCA soil characterization program was designed with modifications to the TSCA-prescribed Self-Implementing sampling frequency as allowed by 40 CFR 761.61(c), in consideration of the large size of the TSCA Site, the nature of the release, and the distribution of highest PCB detections primarily within three distinct areas.

As discussed with EPA, based on review of the existing data and assuming that the data collected to characterize the extent of PCB contamination are consistent with the lateral extent of previously collected data and known areas of PCB releases, we concluded that the TSCA Site would be considered adequately characterized for PCBs if characterization was conducted as follows:

- Collect PCB data on 30 ft by 30 ft sampling grids where elevated PCB concentrations were known to exist or were likely to exist based on historical data and the known limits of the former SAK Site.

- Collect one soil sample from the existing ground surface (ranging from El. 22 to El. 16) to the top of the EM-1 cap or the former ground surface in areas where the EM-1 Cap was not present (estimated to be approximately EL. 17). This material consists of soil that was primarily generated from Phase 1 of the overall BCEC Site.

- Collect soil samples at two-foot intervals from the top of the EM-1 Cap or former ground surface in areas where the EM-1 Cap was not present (conservatively estimated to be

approximately EL. 17) to the top of naturally-deposited soils (i.e., through the fill material) or the anticipated depth of PCB impacts based on laboratory data.

- Analyze the samples for PCBs using manual soxhlet extraction and EPA Method 8082.

Haley & Aldrich field representatives observed the advancement of the test borings and direct push probes, and installation of the monitoring wells. Continuous soil sampling was performed in each test boring or direct push probe and screened for volatile organic compounds (VOCs) using a photoionization detector (PID) with a 10.6 or 11.7 eVolt lamp. The termination depth for each test boring was determined based on the estimated depth of contamination, PID readings, geology, and the intent of the exploration.

A copy of the Test Boring Reports, Direct Push Probe Logs, and Monitoring Well Installation Reports completed by Haley & Aldrich are provided in Appendix B. Locations of the explorations are shown on Figure 4, Site and Subsurface Exploration Location Plan.

2.1.6.1 Haley & Aldrich, TSCA Precharacterization (2010-2011)

Between May 2010 and January 2011 Haley & Aldrich conducted two subsurface exploration programs to assess the extent of soil and groundwater contamination at the TSCA Site. A total of 201 test borings were conducted at the TSCA Site. Monitoring wells were installed in 15 of the completed test borings.

- **Environmental Test Borings** - One hundred ninety-three (193) test borings were advanced through fill soils to the approximate top of the underlying naturally deposited soils to collect environmental soil samples to characterize TSCA Site soils. The depth of test borings ranged from 6.5 to 30 ft below existing ground surface (bgs), with an average depth of approximately 20 ft bgs.

- **Geotechnical/Environmental Test Borings** - Eight (8) geotechnical/environmental test borings were advanced into bedrock to obtain Site-specific geotechnical information for use in planning and design of the formerly planned expansion of the BCEC, and to collect environmental soil samples to characterize TSCA Site soils. The depth of test borings ranged from 68.5 to 94 feet (ft) below ground surface (bgs). Approximately 20 ft of rock core sample was collected at each of the geotechnical/environmental test borings.

- **Groundwater Monitoring Wells** - Fifteen (15) monitoring wells were installed in selected completed test boring exploration locations to collect hydrologic information and groundwater quality data. Monitoring wells were typically screened across the water table.

A total of 1,777 soil samples were analyzed for PCBs using manual soxhlet extraction and EPA Method 8082. In addition, 358 soil samples were analyzed for one or more of the following: volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), extractable petroleum hydrocarbons (EPH), volatile petroleum hydrocarbons (VPH), metals, and waste characteristics (corrosivity, ignitablity, reactivity). Toxicity characteristic leaching procedure (TCLP) testing was conducted on samples exhibiting metals concentrations greater than 20 times (20x) the applicable RCRA standard.

Two rounds of groundwater sampling were conducted in October 2010 and February through April of 2011. Groundwater samples were collected and submitted to Groundwater Analytical Laboratory (GWA) of Buzzards Bay, Massachusetts for chemical analysis of one or more of the following: VOCs, SVOCs, EPH with target analytes, VPH, PCBs, and MCP 14 metals. Results of the laboratory analysis indicated low levels of VOCs, SVOCs, EPH, VPH, and metals were present in several of the groundwater samples collected. PCBs were detected in unfiltered groundwater samples at concentrations of 6.8 and 3.5 ug/L in two of the nine monitoring wells sampled for PCBs. As indicated above, given the comparison to concentrations detected in filtered vs unfiltered samples in the biannual M&M sampling, we have concluded that the concentrations of PCBs in unfiltered samples are due to the presence of PCBs as part of the suspended solids (turbidity) of the sample and are not indicative of PCBs dissolved in groundwater.

2.1.6.2 Haley & Aldrich, Supplemental TSCA Precharacterization (2015)

Between January and March 2015 and between November and December 2015, Haley & Aldrich conducted two supplemental subsurface exploration programs to further assess the extent of PCB contamination at the TSCA Site and to characterize soils for future offsite disposal. A total of 204 subsurface explorations were conducted at the TSCA Site. Subsurface explorations were generally advanced from the top of the EM-1 Cap or former ground surface to approximately El. 10.

A total of 650 soil samples were analyzed for PCBs using manual soxhlet extraction and EPA Method 8082. In addition, 114 soil samples were analyzed for one or more of the following: volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), extractable petroleum hydrocarbons (EPH), volatile petroleum hydrocarbons (VPH), metals, and waste characteristics (corrosivity, ignitablity, reactivity). Toxicity characteristic leaching procedure (TCLP) testing was conducted on samples exhibiting metals concentrations greater than 20 times (20x) the applicable RCRA standard.

A summary of the groundwater and soil quality data obtained during the 2010/2011 and 2015 soil characterization programs are attached as Tables II and III, respectively. A copy of the laboratory data reports from the 2010/2011 soil and groundwater sampling program were previously provided to EPA and MassDEP. Copies of the laboratory data reports from the 2015 soil sampling programs are included in Appendix C.

2.2 GEOLOGIC SITE CHARACTERISTICS

The subsurface exploration programs indicate a complex geologic history at the TSCA Site resulting in stratigraphic units of varying depths and thicknesses, as well as areas where one or more stratigraphic units may not be present.

2.2.1 Soil Types

Based on the subsurface conditions encountered across the TSCA Site, the following major soil units (in order of increasing depth below ground surface) were encountered:

- Fill
  - *Parking Area Backfill*
  - *Historic Urban Fill*
  - *Hydraulic Fill*

- Organic Deposits
- Marine Deposits
- Glacial Deposits
- Bedrock

One or more of the soil (overburden) units may be absent at any specific location. Subsurface soil profiles were generated based on the Haley & Aldrich subsurface explorations and groundwater monitoring well installation reports. The subsurface exploration locations are shown on Figure 4 and the subsurface profiles are shown on Figure 7. A generalized description of each stratigraphic unit is provided below:

- Fill
  - *Parking Area Backfill* – The Phase 2 area was used as a soil stockpile and construction staging area for the Phase 1 BCEC construction between 2000 and 2004. In 2005, excess historic fill generated from construction of Phase 1 of the BCEC was used to establish the existing grades for the South Lot. For the purposes of Site description and soil management, we have labelled the fill below the surface pavement and the EM-1 Cap as Parking Area Backfill.

    The bituminous asphalt EM-1 Cap was encountered at the majority of the subsurface exploration locations in the central and southern portion of the Site, below the Parking Area Backfill. The EM-1 Cap asphalt layer, where encountered, was typically observed at 3 to 5 ft below the existing ground surface, and varied in thickness from 0.2 to 1.8 ft. The remaining subsurface explorations were conducted in unpaved areas of the parking lot where an approximate 0.3 to 0.6 ft layer of crushed stone material was present at the ground surface, or in paved areas along New Cypher Street.

  - *Historic Urban Fill* **-** Historically placed Urban Fill material (i.e., at the former ground surface prior to construction of the existing parking area) typically consisted of a silty sand to sandy silt material, with varying amounts of silt, sand, gravel, cobbles, and intermixed with debris, bricks, cobbles, granite blocks, ash, wood, cinders, concrete, ceramics, and other miscellaneous materials. Layers of gravel, debris, and rubble fill were observed within the Historic Urban Fill material in varying thicknesses at several subsurface exploration locations.

  - *Hydraulic Fill* - A layer of Hydraulic Fill material was typically encountered below the Historic Urban Fill soils. The Hydraulic Fill was generated from dredging activities in Boston harbor and consisted of a gray to brown organic soil, with varying amounts of sand, clay, silt, wood, peat, organic fibers, and shells.

    The thickness of the Fill materials placed at the TSCA Site ranges from 6 to 25 ft bgs.

- Organic Deposits - Organic Deposits were encountered below the Fill in the majority of the subsurface explorations. This deposit consists of very soft to soft organic silt or peat with trace amounts of sand. The thickness of the deposit ranged from 4 to 17 ft thick where fully penetrated.

- Marine Deposits - Several of the deeper subsurface explorations encountered Marine Deposits beneath the organic deposit, consisting primarily of very soft to hard gray to brown lean clay with traces of silt, sand, and gravel. The Marine Deposits, where fully penetrated in the test borings, ranged in thickness from 3 to 18 ft.

- Glacial Deposits - Glaciomarine/Glacial Till Deposits were encountered in several of the deeper subsurface explorations, encountered beneath the Marine Deposits. The Glacial Deposits typically consisted of stiff to hard lean clay with varying amounts of sand and gravel, medium dense to very dense silt with varying amounts of sand and gravel, and medium dense to very dense silty sand with gravel. The thickness of the deposit ranged from 15 to 26 ft thick where fully penetrated.

- Bedrock - Bedrock was cored in eight of the subsurface explorations starting at depths ranging from 48 to 73 ft below existing ground surface. The bedrock core samples are described as moderately hard to hard, fresh, gray, fine-grained aphanitic Argillite.

2.2.2 Stratigraphy

As indicated above, the general stratigraphy at the TSCA Site consists of a various layers of Fill material underlain by successively deeper layers of naturally deposited Organic Deposits, Marine Deposits, Glaciomarine/Glacial Till Deposits, and Bedrock, as shown on Figure 7. The stratigraphy is typically consistent across the TSCA Site, with the exception of the non-contiguous EM-1 Cap which is generally only located in the southern and central portion of the TSCA Site.

This information and general stratigraphy is consistent with the geologic history of the area wherein glacial advancement and possibly re-advancement was followed by one or more periods of sea-level rise that submerged low-lying areas in the Boston basin.

2.2.3 Groundwater Conditions

Groundwater throughout most of the TSCA Site is located within the Fill material. Groundwater elevations measured within or adjacent to the EM-1 Cap between May 2013 and May 2016 range from El. 13.6 to 2.7 BCB (4.0 to 14.3 ft bgs), with elevations generally averaging around El. 9 to 7. The groundwater elevations as measured between May 2013 and May 2016 indicate a general groundwater flow direction from the east toward west (Figure 8), consistent with groundwater flows measured throughout the area west of C Street in October 2010, and February and April 2011.

The results of the water level readings indicate that a perched water table is present at the Site, and that groundwater accumulates above the relatively low permeability, fine-grained cohesive and/or organic Fill located at a shallow depth below the more permeable granular fill. It is expected that regional flow directions of the perched system are dependent on the amount of building and pavement area present locally, proximity of utilities, soil conditions, proximity to Fort Point, Reserved, and Boston Main Channels , and other factors. As such, directions of groundwater flow are likely to be variable.

3. Applicability and Notification Under 40 CFR 761

According to 40 CFR 761.3, *PCB remediation waste* means waste containing PCBs as a result of a spill, release, or other unauthorized disposal, at the following concentrations:

- materials disposed of prior to April 18, 1978, that are currently at concentrations ≥50 ppm (parts per million) PCBs, regardless of the concentration of the original spill;
- materials which are currently at any volume or concentration where the original source was ≥500 ppm PCBs beginning on April 18, 1978, or ≥50 ppm PCBs beginning on July 2, 1979; and
- materials which are currently at any concentration if the PCBs are spilled or released from a source not authorized for use under this part.

PCB remediation waste means soil, rags, and other debris generated as a result of any PCB spill cleanup, including, but not limited to: environmental media containing PCBs, such as soil and gravel; dredged materials, such as sediments, settled sediment fines, and aqueous decantate from sediment.

3.1 TSCA REGULATED PCBS

The majority of the historic PCB-related release is present in the Historic Urban Fill soils located below the EM-1 Cap area, specifically corresponding with the portion of the TSCA Site identified where operations were conducted by the former Boston Junk/SAK Recycling facility. Further, accidental releases of PCBs resulting from transportation of transformers on property adjacent to the former SAK property have been confirmed and are considered a source of the PCB and Historic Urban Fill contamination.

The central and southern portions of the TSCA Site under the EM-1 Cap appear to contain the most elevated concentrations of PCBs from the former ground surface (El. 15 to 17) to approximate El. 8 (about 7 to 9 ft below the former ground surface). Lesser concentrations of PCBs were detected in the Historic Urban Fill soils down to approximately El. -10. The vertical and horizontal limits of PCBs at the TSCA Site appear consistent with the historic use of this area and the historic documentation reviewed.

Based on the historic use of the TSCA Site and the concentrations of PCBs detected in soil, our current understanding of the portion of the BCEC Phase 2 area that is subject to regulation under 40 CFR 761 is defined:

- laterally by PCBs that are present at concentrations greater than or equal to 1 mg/kg within the former Boston Junk/SAK Site and a portion of the adjacent former Energy International property, and
- vertically below the ground surface that existed at the completion of EM-1 Cap (either at the bottom of the EM-1 Cap or El. 17 if no Cap is present).

More specifically, the TSCA regulated area extends laterally to the southwest up to the BCEC property limits, to the southeast by C Street or the former buildings located on the west side of C

Street, to the northeast by the BCEC Phase 1 limits (with the exception of approximately 10,350 sf of BCEC Phase 1 in the vicinity of the "PCB Hot Spot" identified during BCEC Phase 1 construction), and northwest up to the Right of Way remediation conducted by the MassDOT in 1992 for the Central Artery (I-93)/Tunnel (I-90) Project (CA/T) in preparation for the construction of the South Boston Bypass Road. These limits are shown on Figure 4.

Although PCBs were detected at concentrations greater than 1 mg/kg (but less than 50 mg/kg) at the southern property line along New Cypher Street, additional characterization is not planned beyond the property line to the south as the MCCA is not liable for the release from the SAK Site as determined by the Massachusetts Supreme Judicial Court Decision in the case of The Commonwealth & Others v Boston Edison Company & Others, decided on 25 May 2005. Specifically, the MCCA is not liable as owner or operator of the Site within the meaning of M.G.L.c.21E, s. 5 (a) (1) and (2), where the legislation giving rise to the BRA's and MCCA's association with this area explicitly excluded them from the definition of "owner or operator" for any pollution occurring before they acquired ownership of the BCEC Site. Nor is the MCCA liable as a person who otherwise caused or was legally responsible for a release of hazardous materials at the Site within the meaning of M.G.L.c.21E, s.5(a)(5).

Based on the results of the TSCA characterization program, the TSCA regulated area as currently understood generally consists of an approximately 296,700 sq ft (7± acre) area. The limits of the TSCA-regulated area are shown on Figure 4.

3.2 OTHER PCBS

The Phase 2 area was used as a temporary soil staging area during construction of the existing BCEC building. Approximately 250,000 cy of Fill material excavated from Phase 1 was temporarily stockpiled above the EM-1 cap and former ground surface in Phase 2. The majority of the Phase 1 Fill stockpiled on Phase 2 was characterized and removed during construction of the BCEC; however, approximately 25,000 cy of excess Phase 1 Fill material (Parking Area Backfill) was used to raise the grade of the Phase 2 area to create the existing parking lot in Phase 2. The Parking Area Backfill contains very low levels of PCBs (where detected, at generally less than 10 ppm) that, in our opinion, were not due to a TSCA regulated release. As demonstrated below, the PCBs detected in the Parking Area Backfill are consistent with PCBs detected in Historic Urban Fill material in BCEC Phase 1 and with PCBs detected in several other properties in this area of South Boston, none of which were subject to TSCA regulation. In addition, the average concentration of PCBs in the Parking Area Backfill is approximately 1.3 mg/kg, well below Site-specific risk thresholds for the BCEC.

As requested by EPA, Haley & Aldrich conducted a comprehensive review of historical information to document that the PCB impacts in the Parking Area Backfill generated from Phase 1 and placed on top of the EM-1 Cap between 2001 and 2004, then graded to establish existing grades in 2005, are not subject to regulation under TSCA. Information reviewed included records from an electronic database service (Environmental Data Resources (EDR)), Sanborn Maps, aerial photographs, environmental data reports, available regulatory documents, and other available information on the Phase 1 Site and surrounding area.

3.2.1 Sanborn Maps and Aerial Photographs

The Phase 1 portion of the BCEC is in an area identified as the South Boston Flats, which were originally tidelands of Boston Harbor. The Phase 1 area encompasses approximately 40 acres of relatively flat land. It was created by various stages of filling conducted between the mid-to-late 1880's through 1900. In its most recent past, the western one-third of the Phase 1 Site contained a rail yard and industrial buildings. The remaining two-thirds consisted of single to multi-story industrial and commercial buildings.

According to Sanborn Maps and aerial photographs, the BCEC Phase 1 Site was historically composed of numerous parcels which were used for industrial and commercial purposes for over 100 years. Historical use of the BCEC Phase 1 Site included the Boston Market Terminal which primarily consisted of railroad tracks, truck parking, and food storage warehouses; gas stations; vehicle storage, service and repair; a bindery; a plumbing supply house; a paint warehouse; furniture storage; and a steel and iron warehouse. The Phase 1 portion of the BCEC property currently consists of the Boston Convention & Exhibition Center building. With the exception of the historical use of the BCEC Phase 1 Site as a rail yard and a small paint storage warehouse, the Phase 1 Site history does not indicate a potential for significant PCB releases to have occurred.

3.2.2 Characterization of Parking Area Backfill

As part of the TSCA Site precharacterization program to support the future BCEC expansion into Phase 2 (now on hold) and to delineate the extent of PCBs from the historic SAK Site release, Haley & Aldrich collected 134 soil samples for chemical analysis of PCBs from the Parking Area Backfill generated from BCEC Phase 1 and placed above the EM-1 cap and the former ground surface. The results of the soil samples collected from the Parking Area Backfill detected contaminants consistent with contamination encountered in Phase 1 of the BCEC, including low levels of PCBs (generally less than 10 ppm, where detected, and with an average concentration of 1.3 mg/kg). In our opinion, the low levels of PCBs detected in the Parking Area Backfill above the EM-1 cap and the former ground surface are not subject to regulation under TSCA since these materials were generated from Phase 1 of the BCEC, where TSCA regulated soils were not previously identified. Information regarding other Phase 1 site characterization and Fill soils testing are discussed in Section 3.2.3.

It should be noted that only four out of the 134 soil samples collected from the Parking Area Backfill contained a total PCB concentration greater than 10 ppm. Samples F7_S1_0-4.4, L12_S1_0-4.5, O17_S1_0.5-1.3, and Q15_S1_0.5-7.5 detected PCBs at 11.9 mg/kg, 14.7 mg/kg, 47 mg/kg, and 14 mg/kg respectively). A discussion of each of these samples is provided below.

- Soil sample F7_S1_0-4.4 was collected from test boring F7 and detected PCBs at a concentration of 14.7 mg/kg. A review of the test boring log associated with sample F7_S1_0-4.4 indicates that the EM-1 Cap was not observed in this test boring; therefore, the field geologist approximated the former ground surface at grid F7 at El. 14. A review of test borings surrounding F7 (borings E7, E8, F8, G7, and G8) observed the EM-1 Cap between El. 16.9 and 14.6 (0.6 to 2.9 ft higher than at boring F7). In our opinion, it is likely that soil sample F7_S1_0-4.4 was collected from soil both above and below the EM-1 Cap. However, to be conservative, soil within grid F7 will be managed as TSCA remediation waste starting at the existing ground surface if excavation should be required at some point in the future.

- Soil sample L12_S1_0-4.5 was collected from test boring L12 and detected PCBs at a concentration of 11.9 mg/kg. A review of the test boring log associated with sample L12_S1_0-4.5 indicates that asphalt was observed at El. 15.3, below approximately 1.3 ft of "cobbles." A review of test borings surrounding L12 and located within the limits of the EM-1 Cap (borings K11, K12, K13, L13, M12, and M13) observed the EM-1 Cap between El. 17.5 and 16.2 (0.9 to 2.3 ft higher than at boring L12). It is likely that the EM-1 Cap is present at the top of the "cobbles" around El. 16.6, consistent with the surrounding test borings. In our opinion, soil sample L12_S1_0-4.5 was collected from soil both above and below the EM-1 Cap. However, to be conservative, soil within grid L12 will be managed as TSCA remediation waste starting at the existing ground surface if excavation should be required at some point in the future.

- Soil sample O17_S1_0.5-1.3 was collected from test boring O17 and detected PCBs at a concentration of 46 mg/kg. A review of the test boring log associated with samples O17_S1_0.5-1.3 indicates that the sample was collected from soil above the EM-1 cap. The source of the PCBs is not known. Soil within grid O17 will be managed as TSCA remediation waste starting at the existing ground surface.

- Soil sample Q15_S1_0.5-7.5 was collected from test boring Q15 and detected PCBs at a concentration of 14 mg/kg. A review of the test boring log associated with sample Q15_S1_0.5-7.5 indicates that the EM-1 Cap was not observed in this test boring. Further review of the test boring log also indicates that the field geologist misidentified the former ground surface as being the transition from Historic Urban Fill to Hydraulic Fill at El. 10.5. It is likely that the former ground surface was at approximately El. 16, where approximately 0.8 ft of "rubble fill" was identified overlying approximately 5.5 ft of Historic Urban Fill. Additionally, El. 10.5 is very close to the water table which, combined with the geotechnical characteristics of the Hydraulic Fill (i.e., soft, clayey soil), could not be used as a ground surface. Based on a review of the test boring log for Q15, we concluded that soil sample Q15_S1_0.5-7.5 was collected from soil both above and below the former ground surface. However, to be conservative, soil within grid Q15 will be managed as TSCA remediation waste starting at the existing ground surface if excavation should be required at some point in the future.

The results of soil samples collected from the Parking Area Backfill soils and placed above the EM-1 Cap and the former ground surface are summarized in Table IV and depicted in Figure 9.

3.2.3 Electronic Database and Other Available Information

3.2.3.1 WSEI Final Comprehensive Site Characterization (CSC) Report

Under enabling legislation for the BCEC Project, property within the BCEC project limits was acquired and made ready for development by the BRA. The BRA retained WSEI to conduct a Comprehensive Site Characterization (CSC) study of the entire BCEC Site (both Phases 1 and 2) in support of parcel acquisition. The CSC study was designed to evaluate the nature and extent of oil and hazardous materials on the BCEC Site's 57 individual parcels. WSEI performed four phases of subsurface investigations from August 1998 through March 2000. In addition to the CSC sampling performed by WSEI, soil samples were also collected by Ogden Environmental & Energy Services (Ogden) on behalf of CSX Transportation, Inc. (CSX) from an area located at the northwest end of

Phase 1. These samples were collected as part of a settlement agreement between the parcel owner/operator (CSX) and the BRA.

The results of the CSC study indicate that chemical constituents such as polycyclic aromatic hydrocarbons (PAHs), petroleum hydrocarbons, metals, PCBs, and to a lesser extent, volatile organic compounds (VOCs), have been identified in the Historic Urban Fill at the BCEC Site. WSEI's Site characterization included the collection and analytical testing of approximately 300 soil samples from test borings, test pits, and UST removals in Phase 1. PCBs were detected in soil samples ranging from 0.025 ppm to 3.6 ppm across the Phase 1 Site, excluding a detection of Aroclor 1260 of 1,800 ppm on the border of the Phase 1 and Phase 2 areas (the PCB Hot-Spot). During a re-design of the BCEC Phase 1 building, the limits of Phase 1 were shifted approximately 90 ft to the northeast (toward the existing BCEC building) resulting in the PCB Hot-Spot being located within the limits of Phase 2 and within the currently designated TSCA Site. A source of PCB contamination in Phase 1 was not identified in the WSEI CSC.

The results of soil samples collected in Phase 1 of the BCEC during the WSEI CSC are summarized in Table V.

3.2.3.2 Haley & Aldrich Construction Release Abatement Measure and Associated Documents for RTN 3-16230

Haley & Aldrich reviewed information contained in the Construction RAM Plan, RAM Status Reports, and RAM Completion Report for Release Tracking Number (RTN) 3-16230, assigned to Phase 1 of the BCEC Site by MassDEP. In addition, Haley & Aldrich reviewed the Class A-3 Response Action Outcome (RAO) Statement for RTN 3-16230, dated December 2008.

As documented in the Construction Release Abatement Measure (RAM), RAM Status Reports, RAM Completion Report, and Response Action Outcome (RAO) Statement for Phase 1 BCEC (RTN 3-16230), low levels of PCBs were detected in soils generated during construction of the existing BCEC Phase 1 building. Approximately 250,000 cy of excavated material generated from construction of the BCEC building which could not be reused on site was stockpiled in a staging area on the Phase 2 portion of the Site and sampled prior to off-site disposal. The stockpiled soil was divided into approximately 500 cy cells to obtain representative data of the material and 488 soil samples were collected for off-site disposal of approximately 225,000 cy of the stockpiled soil. Of the 488 soil samples, 452 soil samples were analyzed for PCBs. Of the 452 PCB soil samples, 241 soil samples did not detect PCBs greater than the laboratory reporting limit, 184 soil samples detected PCBs above the laboratory reporting limit but less than 1 mg/kg, 25 soil samples exhibited PCBs between 1 and 10 mg/kg, and only two soil samples exhibited PCBs greater than 10 mg/kg (16.89 and 76.6 mg/kg).

Although one of the 452 soil stockpile samples collected from soil generated during construction of the BCEC Phase 1 building and analyzed for PCBs detected PCBs greater than 50 mg/kg (representing approximately 0.2 percent of all stockpile soil tested from Phase 1), our review of historical records for the Phase 1 portion of the BCEC has not identified sources for releases of PCBs to the Phase 1 soils or the presence of TSCA sites. Additionally, twenty separate RTN's were issued by MassDEP during the parcel acquisition phase and during construction of Phase 1 of the BCEC. These RTNs addressed urban fill (metals, PAHs, TPH) and/or petroleum releases. None of the twenty RTNs identified during parcel acquisition or during construction encountered PCBs above the MassDEP RCS-1 Reportable Concentration of 2 mg/kg. Prior to parcel acquisition, six existing RTNs were

associated with Phase 1 of the BCEC and none of the six RTNs addressed PCBs. No leaking transformers or other potential PCB-containing equipment were identified during demolition of existing buildings or construction of the building.

The results of soil samples collected in from stockpiles of Phase 1 soil during construction of the BCEC are summarized in Table VI.

3.2.3.3 Environmental Data Resources Database Report and Document Reviews

Haley & Aldrich reviewed an EDR Report to evaluate releases of oil and/or hazardous materials at MCP Disposal Sites within and around the BCEC. The EDR report indicated that there were no National Priority List (NPL) Sites, proposed NPL Sites, or Delisted NPL Sites within one mile of the BCEC. There were two Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) Sites and six CERLIS No Further Remedial Action Planned (NFRAP) Sites located with ½ mile of the BCEC Project Site. Finally, only one RCRA Corrective Action (CORRACTS) Sites within 1 mile of the BCEC Project site. Limited information was available in the EDR Report regarding these releases, and online searches did not provide additional detail.

Haley & Aldrich also reviewed several RTNs in the vicinity of the BCEC Site. PCBs were detected at several Disposal Sites at low levels and were generally attributed to the quality of the Historic Urban Fill. PCBs were detected between 1 and 66.9 mg/kg, with most Disposal Sites have a maximum PCB concentration of less than 10 mg/kg. The PCBs detected at these Disposal Sites were associated with the quality of the Historic Urban Fill by the consultant performing the work. RTNs detecting PCBs in soil within ½ mile of the BCEC Phase 1 Site include but are not limited to:

RTN	Location	Max PCB Concentration
3-14810	371-401 D Street	3.8 mg/kg
3-3124/3-16782	310-312 Northern Ave	38.9 mg/kg
3-31115	380 E Street	0.06 mg/kg
NA	460 E Street	0.113 mg/kg
3-1918/3-31101	A Street	0.0397 mg/kg
3-31092	Pier 4	0.09 mg/kg
3-31799	Parcel H, Fan Pier	66.9 mg/kg
3-31818	Parcel I, Fan Pier	3.68 mg/kg
3-32153	100-104 Northern Ave	3 mg/kg
3-19647	Northern Ave	2.06 mg/kg
3-30038	Parcel B, Fan Pier	7 mg/kg

As shown above, PCBs are consistently present in Historic Urban Fill material in this area of South Boston. Releases of PCBs that may be regulated under TSCA were not identified for the Disposal Sites reviewed. The detection of low levels of PCBs in the Historic Urban Fill material in surrounding properties supports the hypothesis that low-levels of PCBs are generally a constituent of urban fill material in the Seaport District of South Boston and are not the result of PCB releases that should be regulated under TSCA.

3.2.4 Summary of Risk Characterization for Parking Lot Backfill

As described in Section 4.3, the Parking Area Backfill is planned for reuse as backfill material in the excavation following removal of TSCA PCBs planned for off-site disposal. This soil also represents the layer of soil that is nearest to the ground surface. Therefore, the Human Health Risk Assessment (Appendix D) assumed that commercial workers, visitors, and construction and utility workers could be potentially exposed to Parking Area Backfill during hypothetical future activities that expose the soil.

In accordance with the National Contingency Plan (NCP), cancer risk estimates for a site are compared to an ELCR range of 10-6 (one in a million) to 10-4 (one in ten-thousand). Risks at or below 10-6 do not warrant a response action, risks greater than 10-4 generally warrant a response action, and the decision to require a response action for risks that are between 10-6 and 10-4 is a risk management decision that is made by USEPA. Non-cancer risks are compared to a HI value of 1, which corresponds to levels of exposure that people (including sensitive individuals such as children) could experience without expected adverse effects.

The HHRA evaluated an adult commercial worker who is assumed to contact soil every work day (250 days per year) over a 25-year period, as well as visitors from birth to age 26 who are assumed to contact soil twice per week during the spring, summer, and fall. These exposures are conservative (protective) for a construction worker who might be in earthwork and other activities. The results of the HHRA indicate that, for workers and visitors, the Parking Area Backfill does not pose risks in excess of EPA risk management thresholds.

3.2.5 Summary and Conclusions

Based on the information provided above, it is our opinion that the low levels PCBs in the Parking Area Backfill above the EM-1 Cap are associated with the overall quality of the Historic Urban Fill material and consistent with the industrial historical usage of this area of South Boston. PCBs were detected at low levels in the Historic Urban Fill at properties surrounding the BCEC property; however, no specific PCB releases have been documented in BCEC Phase 1 or the surrounding properties (with the exception of the Boston Junk/SAK Site). The distribution of PCB sample results is similar between the in-situ soil samples collected during WSEI's CSC, the soil samples collected from stockpiles of Phase 1 soils during construction of the BCEC, and the soil samples collected in-situ from the Parking Area Backfill placed over the EM-1 Cap and former ground surface, as shown in Table VII.

The contaminants detected are considered typical of non-point source, Historic Urban Fill present in the Seaport District of South Boston and are generally attributed to historical usage. The BCEC Phase 1 Site history and usage indicates limited potential for PCB use does not indicate a potential for significant PCB releases to have occurred.

It is our opinion that the low-levels of PCB-impacted soils encountered in the Parking Area Backfill used as backfill above the EM-1 cap are not considered part of the TSCA Site. It is the intent of this TSCA Work Plan to use Parking Area Backfill as backfill material over the more contaminated soils that will remain in place following TSCA remediation. The data provided above indicate that the Parking Area Backfill is consistent with soils generated from Phase 1 of the BCEC, and similar to Historic Urban Fill throughout the Seaport District of South Boston. Given the low concentration of

PCBs (average of 1.3 mg/kg) in the Parking Area Backfill, the lack of a specific release of PCBs to the Parking Area Backfill, and the results of the HHRA that indicate no unreasonable risk of injury to site-specific receptors for exposure to the Parking Area Backfill, following remediation, potential construction activities (none are currently planned) that may be required within the Parking Area Backfill should not be subject to the rigorous TSCA decontamination requirements. Future construction over the Parking Area Backfill will be managed in accordance with the MCP, 310 CMR 40.0000. A Health & Safety Plan will be prepared by the Contractor that will address the site-specific contaminants.

This document serves as the "notification" required by 40 CFR 761.61(a)(3). The nature and extent of contamination and sampling procedures are summarized below.

3.3 NATURE OF CONTAMINATION

The discussion of the source and extent of oil and hazardous materials at the TSCA Site is based on the cumulative information obtained from historical research, subsurface explorations, groundwater elevations, and chemical analyses of selected soil and groundwater samples.

As indicated above, a portion of the BCEC Phase 2 area located at 14 Louis Street and Cypher Street was operated as The Boston Junk Company and was owned by Louis Freedman from 1947 to 1985. SAK Recycling Corporation bought this property in 1992, and continued to use the property as a junkyard until 1996, when it was ordered by MassDEP to cease activities at the property. During these operations, unknown quantities and types of oils and hazardous materials (OHM) were stored and/or used at the SAK Site. The OHM stored at the SAK Site and the historical Site usages are known to have impacted the TSCA Site.

Although specific releases at the SAK Site have not been documented, records of various incidents have been recorded by previous consultants and regulators relating to the SAK Site activities, dating back to 1982. Incidents were reported to have included: "observation of transformers and debris on property as well as adjacent properties, identification of strong odors, several fires, disassembly of transformers by blowtorch, and sampling of soil and leaking capacitors which contained 96-100% PCBs." Several investigations conducted by various environmental consultants at the SAK Site detected the presence of TPH, PCBs, and metals in SAK Site soils.

Elevated concentrations of PCBs have been identified over a portion of the TSCA Site where operations were conducted by the former Boston Junk/SAK Recycling facility and immediately adjacent to the former Boston Junk/SAK Recycling facility. The most elevated concentrations of PCBs were detected in the Historic Urban Fill material at the central and southern portions of the TSCA Site, below the EM-1 Cap area, from the former ground surface to approximate El. 8 (approximately 0 to 14 ft bgs, currently). Although PCBs have been detected below the groundwater table, due to the low solubility of PCBs and as shown by the results of groundwater sampling, PCBs are not present in the dissolved state and are not migrating off-site via groundwater.

3.4 LOCATION AND EXTENT OF CONTAMINATION

3.4.1 Soil

As part of the programs performed by Haley & Aldrich since 2010, a total of 2,427 soil samples have been collected from the TSCA Site and submitted for chemical analysis of PCBs. The results of the laboratory data indicate that:

- PCBs were not detected above laboratory reporting limits for the majority of the samples (57%).
- PCBs were detected at concentrations less than 1 mg/kg in 22% of the samples.
- PCBs were either not detected or were detected at less than 1 mg/kg in approximately 79% of the 2,427 total samples collected.

These and other data regarding PCB results are summarized below.

Number PCB Samples Analyzed:	2,427
Number Samples Non-Detect for PCBs:	1,381
Number Samples Detected PCB≤1:	523
Number Samples Detected PCBs>1 & ≤10:	291
Number Samples Detected PCBs>10 & ≤50:	111
Number Samples Detected PCBs>50 & ≤100:	29
Number Samples Detected PCBs>100:	92

The highest PCB detections are concentrated in the Historic Urban Fill soils located below the EM-1 Cap. The data are consistent with the known release history of the TSCA Site and correspond with the portion of the TSCA Site identified where operations were conducted by the former Boston Junk/SAK Recycling facility. Further, accidental releases of PCBs resulting from transportation of transformers on property adjacent to the former SAK property have been confirmed and are considered a source of the PCB and Historic Urban Fill contamination.

The majority of the PCB impacts are located are located in Historic Urban Fill soils from the former ground surface to approximately El. 8. Lesser concentrations of PCBs were detected in the Historic Urban Fill soils down to approximately El. -10. The vertical and horizontal limits of PCBs at the TSCA Site appear consistent with the historic use of this area and the historic documentation reviewed.

Although the release of PCBs is primarily attributed to activities at the SAK Site, PCBs were also detected at various concentrations in the Parking Area Backfill placed above the former ground surface. As discussed above, there is no known release of PCBs to the Phase 1 soils, and the PCBs are considered to be associated with the quality of the Historic Urban Fill material and consistent with the historical usage of the Phase 1 area and this area of South Boston. These PCB-impacted soils will be managed under the MCP, 310 CMR 40.0000.

Figures 9 through 12 show the distribution of PCB samples collected at the TSCA Site and the ranges of total PCB concentrations detected. A summary of the soil quality data collected from the Historic Urban Fill is provided in Table III. A copy of the laboratory data reports is included in Appendix C.

3.4.2 Groundwater

The Historic Urban Fill is considered to be a source of oil and hazardous materials detected in groundwater at the TSCA Site. In addition, underground and above-ground storage tanks were formerly present at the TSCA Site, all of which were previously removed by WSEI and BRA prior to the transfer of the property to the MCCA. Other sources of potential contamination include former oil/water separators, floor drain outlets, and historic waste management and disposal practices.

As described above, Haley & Aldrich has been conducting a semi-annual groundwater sampling program for PCBs since 2004. PCBs have either not been detected above laboratory reporting limits in the filtered or unfiltered samples, or low concentrations (less than 3.45 ug/L) of PCBs were detected in unfiltered samples only. In addition, during the comprehensive TSCA Site characterization program, PCBs were detected in unfiltered groundwater samples from two of the nine monitoring wells sampled at concentrations of 6.8 and 3.5 ug/L.

Given the comparison to PCB concentrations detected in filtered vs unfiltered samples over 12 years of groundwater monitoring as part of the semi-annual groundwater sampling program, we have concluded that the concentrations of PCBs in unfiltered samples are due to the presence of PCBs as part of the suspended solids (turbidity) of the sample and are not indicative of PCBs dissolved in groundwater. Accordingly, the results of groundwater sampling indicate that PCBs are not present in the dissolved state in groundwater, and that PCBs are not migrating via groundwater flow.

A summary of the groundwater quality data is provided in Tables I and II.

4. Cleanup and Disposal of PCB Remediation Waste

This section presents a cleanup plan for the TSCA-regulated area. In summary, the cleanup plan involves excavation and off-site removal of PCB-contaminated soils to achieve the cleanup levels described herein.

Please note that a Remediation Contractor has not yet been selected to implement the work described herein. A letter will be prepared by the Remediation Contractor, when selected, to provide additional information regarding the means and methods for TSCA Site cleanup activities and excavation sequencing control.

4.1 REMEDIAL GOAL EVALUATION AND JUSTIFICATION FOR 761.61(C)

Under a Self-Implementing Cleanup (761.61(a)) it is presumed that cleanup to the levels specified in 761.3 for High Occupancy Areas (1 to 10 mg/kg) and Low Occupancy Areas (1 to 100 mg/kg) will not pose an unreasonable risk of injury to health or the environment. To evaluate remedial goals in excess of those specified (at 761.3) for High Occupancy Areas and Low Occupancy Areas, a Risk Based Disposal Approach (761.61(c)) must be used and a quantitative risk characterization must be performed to evaluate TSCA Site-specific receptors and exposures pathways.

As described in Section 3.1, the TSCA regulated area as currently understood generally consists of an approximately 296,700 sq ft (7± acre) area in Phase 2 of the BCEC. Consistent with the EPA January 2009 Revisions to the PCB Q&A Manual, the Self-Implementing Cleanup and Disposal procedure was developed for moderately sized sites (approximately one acre), and a Risk Based Approach may be more appropriate for sites larger than one acre. Given the large size of the TSCA Site, Haley & Aldrich evaluated a Risk-Based Cleanup under 761.61(c) that takes into consideration the current and future use of the Phase 2 area as a parking lot. As requested by EPA, the Risk-Based Cleanup (40 CFR 761.61(c)) and its approximate cost is outlined herein, as well as a comparison to the Self-Implementing Cleanup approach (40 CFR 761.61(a)) of removing all soils with PCB concentrations greater than 100 mg/kg.

4.1.1 Evaluation of Self-Implementing Cleanup to 100 mg/kg

4.1.1.1 Summary of Self-Implementing Cleanup Approach and Risk Evaluation

Under a Self-Implementing Cleanup (40 CFR 761.61(a)), it is presumed that cleanup to the levels specified in 761.3 for High Occupancy Areas (1 to 10 mg/kg) and Low Occupancy Areas (1 to 100 mg/kg) will not pose an unreasonable risk of injury to health or the environment.

A ***High Occupancy Area*** is defined by 40 CFR 761.3 as follows:

> "any area where PCB remediation waste has been disposed of on-site and where occupancy for any individual not wearing dermal and respiratory protection for a calendar year is: 840 hours or more (an average of 16.8 hours or more per week) for non-porous surfaces and 335 hours or more (an average of 6.7 hours or more per week) for bulk PCB remediation waste."

Under the Self-Implementing Cleanup approach (40 CFR 761.61(a)), High Occupancy Cleanup Levels for bulk PCB remediation waste are as follows:

- ≤1 ppm "without further conditions".
- >1 ppm and ≤10 ppm if covered with a cap meeting the requirements of 40 CFR 761.61(a)(7) and a deed restriction is implemented as per 40 CFR 761.61(a)(8).

A ***Low Occupancy Area*** is defined by 40 CFR 761.3 as follows:

> "any area where PCB remediation waste has been disposed of on-site and where occupancy for any individual not wearing dermal and respiratory protection for a calendar year is: less than 840 hours (an average of 16.8 hours per week) for non-porous surfaces and less than 335 hours (an average of 6.7 hours per week) for bulk PCB remediation waste."

Under the Self-Implementing Cleanup approach (40 CFR 761.61(a)), Low Occupancy Cleanup Levels for bulk PCB remediation waste are as follows:

- ≤25 ppm if a deed restriction is implemented as per 40 CFR 761.61(a)(8).
- >25 ppm and ≤50 ppm if the site is secured by a fence and marked with a sign including the M_L mark and a deed restriction is implemented as per 40 CFR 761.61(a)(8).
- >25 ppm and ≤100 ppm if the site is covered with a cap meeting the requirements of 40 CFR 761.61(a)(7) and a deed restriction is implemented as per 40 CFR 761.61(a)(8).

As described in Section 1.4, the current and future foreseeable use of the BCEC Phase 2 area is a controlled access parking lot. There are no current redevelopment plans for the BCEC Phase 2 area. Accordingly, the TSCA Site is currently and will be in the future considered a Low Occupancy Area.

Based on the above information, the Self-Implementing Cleanup approach consists of the removal of soil containing PCB concentrations greater than 100 mg/kg within the TSCA Site. We estimate that approximately 15,900 cy of PCB-impacted soil would be removed from the TSCA Site under the Self-Implementing Cleanup approach. Following remediation, a marker layer would be placed over the excavated areas and the excavated areas would be backfilled with Parking Area Backfill and imported soils to create a subbase for an asphalt cap. An asphalt cap meeting the requirements of 40 CFR 761.61(a)(7) would be placed over residual PCBs in excess of 25 mg/kg within the TSCA Site. The asphalt cap would match surrounding Site grades and would serve as the parking lot surface.

4.1.1.2 Confirmatory Samples

For this approach, confirmatory soil samples would not be collected in areas where soil has been previously characterized to less than 100 mg/kg. In areas where soil characterization data did not result in a bottom sample of less than 100 mg/kg, confirmatory soil samples would be collected from the bottom of the excavation using the procedures outlined in TSCA Subpart O, modified for a 5-ft horizontal grid. The samples would be composited and analyzed for PCBs using manual soxhlet extraction and EPA Method 8082 at a frequency of one sample per 15-ft grid to evaluate the concentration of PCBs left in place at the base of the excavation. If post-excavation soil testing results indicate that the cleanup levels (i.e., less than 100 mg/kg) have not been attained, further soil excavation and confirmatory sampling would be conducted.

4.1.1.3 Groundwater Sampling/Maintenance and Monitoring

EPA has requested that the MCCA continue the Maintenance and Monitoring Program consisting of the collection and analysis of groundwater samples for PCBs to evaluate whether PCBs remain in the dissolved or colloidal state during remediation. Accordingly, the MCCA would conduct semi-annual sampling of groundwater from monitoring wells located outside of the remediation limits for a calendar year following remediation. We have assumed two rounds of groundwater sampling would be required. The groundwater samples would be submitted to a laboratory for analysis PCBs by EPA Method 8082 using extraction method 3510C.

4.1.1.4 Cost Estimate for Self-Implementing Cleanup

Haley & Aldrich performed an engineer's cost estimate to provide an order of magnitude understanding of the cost to perform the remediation described above. This estimate is for remediation only and does not include additional soil characterization, environmental consulting, design, or construction monitoring services.

Off-site Disposal of PCB Impacted Soil	Imported Backfill	General Conditions/ Excavation Costs	Confirmatory Samples (if collected)	Site Restoration (including asphalt cap)	Uncertainty Allowance	Groundwater Monitoring (one year)	Total Cost
$11,644,150	$497,400	$5,013,500	$39,900	$2,633,000	$1,722,700	$25,000	**$21,575,650**

4.1.2 Evaluation of Risk Based Cleanup

4.1.2.1 Summary of Risk Based Remedial Approach

The proposed remedial approach under the Risk Based Cleanup consists of the removal of Hot Spots and the localized excavation and off-site disposal of soil containing the highest concentrations of PCBs (between 500 and 11,000 mg/kg) to achieve a 95% Upper Confidence Limit (95% UCL) value of the mean of residual (post-remediation) PCB concentration of less than 100 mg/kg within the top 3 ft of soil at the TSCA Site. Following excavation, a marker layer would be placed over the excavations and the excavated areas would be backfilled with Parking Area Backfill and imported soils to the bottom of the existing EM-1 Cap or to the subgrade elevation for areas outside the EM-1 Cap. A 6-in thick asphalt cap will be placed above the backfill material within the limits of the existing EM-1 Cap, followed by additional backfill to achieve the subgrade elevation. The excavated areas will then be restored to match their existing conditions (paved parking lot with 6 inches of dense graded crushed stone and 3.5 inches of asphalt, or a rip rap in drainage areas).

The removal of soil containing PCB concentrations greater than 500 mg/kg would result in the following residual total PCB concentrations:

	Arithmetic Mean (mg/kg)	95% UCL (mg/kg)
TSCA Soil (0 – 2 ft bgs) [a]	3.3	6.6
Beneath EM-1 Cap	13	23.7
Outside of EM-1 Cap [b]	3.5	6.3

[a] Excludes samples that are beneath the EM-1 Cap
[b] Soil deeper than EL 17

We estimate that approximately 8,200 cy of PCB-impacted soil (and 600 cy of lead-impacted soil) would be removed from the TSCA Site under the Risk-Based Cleanup approach. A detailed summary and sequence description of the Risk-Based remedial approach is provided in Section 4.3 below.

4.1.2.2 Summary of Risk Assessment

The concept of human health risk resulting from exposure to a toxic substance is predicated on the fundamental concept that a complete exposure pathway must exist between the location of the toxic substance and a human receptor. An exposure pathway requires: (1) a source and mechanism of chemical release, (2) a retention or transport medium, (3) a point of potential human contact with the contaminated medium (known as the exposure point), and (4) an exposure route at the contact point (e.g., ingestion of soil, inhalation of dust) (USEPA, 1989). In order for the exposure pathway to be considered potentially complete, all four elements must be present. In other words, at the TSCA Site, there must be PCBs present at a location where human contact can occur in order for an exposure pathway to be complete. When any one of these elements is not present, the exposure pathway is incomplete and, therefore, poses no unacceptable health risk.

The current and future use of the TSCA Site is a secured, controlled access parking lot and truck marshalling area. The soil beneath the EM-1 Cap will remain located beneath an asphalt cap, and portions of the Cap will also be covered with several feet of soil. The remainder of the TSCA Site will also be covered with asphalt and small areas of crushed stone and rip rap for drainage. Deed restrictions in the form of an MCP Activity and Use Limitation (AUL) and TSCA Deed Restriction will prevent soil excavation into the TSCA soil, and will limit use of the Site to being a paved parking lot where part-time parking attendants will only be present during events held at the BCEC. Therefore, there are (and will continue to be) no complete exposure pathways to soil associated with the TSCA Site, and therefore no unacceptable risks to human health.

However, remediation of soil will occur to reduce the PCB concentrations at the Site. Therefore, the Risk-Based Cleanup is based on the development of an Exposure Point Concentration (EPC) that describes the concentration of PCBs that will remain at the Site. EPCs are derived on the premise that human exposure of an individual to a contaminated medium occurs on a periodic and random basis. Because of the repeated nature of such contact, the human exposure does not really occur at a fixed point but rather at a variety of points with equal likelihood that any given point within the exposure area will be the contact location on any given day. Thus, exposure should be identified in consideration of the likelihood of a receptor contacting a contaminated medium with equal probability, and the EPCs should be the arithmetic averages of the chemical concentrations within the exposure area (EPA, 2002).

Both the MCP and EPA risk assessment guidance (e.g., EPA, 2002) employ the concept of EPCs being based on arithmetic averages within the exposure area. However, the MCP further indicates that areas of elevated concentrations, defined as Hot Spots, be considered as separate areas, and that separate EPCs (average concentrations) be defined for those areas. The MCP defines a Hot Spot as a discrete area where the concentrations of a substance are at least 100 times greater than the immediate surrounding area. EPA risk assessment guidance does not use the term 'Hot Spot' nor does it indicate that separate EPCs should be derived for areas of elevated concentrations. Instead, EPA guidance indicates that a 95% UCL be used to represent the EPC to account for uncertainty in estimating the arithmetic mean concentration (EPA, 2002). The 95% UCL represents a concentration

that equals or exceeds the population arithmetic mean ninety-five percent of the time. Therefore, the 95% UCL conservatively accounts for data sets that may have elevated or highly variable concentrations.

Evaluation of the soil data set for the TSCA Site, based on post-remedial conditions, indicates that no Hot Spots will exist. Therefore, EPCs for the TSCA Site were derived as 95% UCL values for the TSCA Site soil data set. The TSCA Site soil data set used to derive EPCs is based on all soil samples collected beneath the EM-1 Cap or former ground surface remaining following remediation (generally soil with total PCB concentrations less than 500 mg/kg). The 95% UCL values for soil at the TSCA Site were calculated using the ProUCL software (V. 5.0; EPA, 2014). The ProUCL software performs a goodness-of-fit test that accounts for data sets without any non-detect observations, as well as data sets with non-detect observations. The software then determines the distribution of the data set for which the EPC is being derived (e.g., normal, lognormal, gamma, or non-discernable), and then calculates a conservative and stable 95 percent UCL value in accordance with the framework described in "Calculating Upper Confidence Limits for Exposure Point Concentrations at Hazardous Waste Sites" (EPA, 2002). The software includes numerous algorithms for calculating 95% UCL values, and provides a recommended UCL value based on the algorithm that is most applicable to the statistical nature of the data set. The 95% UCLs for the post-remedial conditions are shown in Section 4.1.2.1.

As described above, there will realistically be no exposure to PCBs in soil at the TSCA Site. However, the risk assessment (Appendix D) evaluated potential exposures to Parking Area Backfill soil (non-TSCA Site soil), TSCA Site soil 0 - 2 ft bgs, and TSCA Site soil 0 – 15 ft bgs along Cypher Street, to demonstrate that post-remedial conditions will not pose unacceptable health risks to human receptors that may hypothetically contact soil at these exposure points. Based on this remedial plan, the results of the risk assessment indicate that none of the potentially complete exposure pathways that could exist after TSCA Site remediation would be associated with cancer and non-cancer risks that exceed EPA risk management thresholds. Specifically:

- For a commercial worker and visitor, the only exposure pathways that may realistically be complete at the site are those associated with surface soil (Parking Area Backfill) at small unpaved areas, which do not pose risks in excess of EPA risk management thresholds. However, the HHRA demonstrates that surface soil (0 – 2 ft) at the TSCA Site could remain unpaved in the future and would not pose risks in excess of EPA risk management thresholds if exposure were to hypothetically occur.

- For a construction worker, the TSCA Site does not pose risks in excess of EPA risk management thresholds for:
  - soil beneath and adjacent to Cypher Street;
  - surface soil (0 – 2 ft) at the TSCA Site

- Potential exposures to subsurface soil at the Site, both beneath and outside of the EM-1 Cap, will not occur because deed restrictions will require soil management and health and safety plans that will mitigate potential exposures.

4.1.2.3 Confirmatory Samples

Consistent with the conceptual site model and our understanding of the PCB release at the TSCA Site, the majority of sampling grids with PCBs at concentrations greater than or equal to 500 mg/kg are adjacent to one another and have PCB impacts at similar depths. Confirmatory soil samples would not be collected as soil within the TSCA area has been characterized to less than 500 mg/kg.

4.1.2.4 Groundwater Sampling/Maintenance and Monitoring

We anticipate that the Maintenance and Monitoring Program would be the same for the Risk-Based Cleanup Approach as it would for the Self-Implementing Cleanup.

4.1.2.5 Cost Estimate for Risk-Based Cleanup

Haley & Aldrich performed an engineer's cost estimate to provide an order of magnitude understanding of the cost to perform the remediation described above. This estimate is for remediation only and does not include additional soil characterization, environmental consulting, design, or construction monitoring services.

Off-site Disposal of PCB Impacted Soil	Imported Backfill	General Conditions/ Excavation Costs	Confirmatory Samples (if collected)	Site Restoration (including asphalt cap)	Uncertainty Allowance	Groundwater Monitoring (one year)	Total Cost
$5,635,400	$252,300	$2,543,600	$18,900	$1,917,000	$932,000	$25,000	**$11,324,200**

4.2 REMEDIAL GOAL SELECTION

An evaluation was conducted comparing the Self-Implementing Cleanup and the Risk-Based Cleanup approaches described above, including consideration of their impacts on risk to receptors post-remediation, the complexity of remediation activities, and approximate remediation cost.

As shown above, the cost for the Self-Implementing Cleanup approach is approximately two times (2x) the cost for the Risk-Based Cleanup. Although the Self-Implementing Cleanup would result in a post-remediation EPC of 9.5 mg/kg (based on the 95% UCL for detected values), there would be no exposure to soil at the TSCA Site under future use conditions for the Self Implementing Cleanup or the Risk-Based Cleanup, and therefore no unacceptable health risk. Consequently, the Self-Implementing Cleanup option achieves no additional reduction in health risk, yet costs twice as much to implement. Accordingly, the selected remedial approach for the TSCA Site is Risk-Based Cleanup to 500 mg/kg under 761.61(c).

4.3 RISK-BASED REMEDIAL APPROACH

As noted earlier, the proposed remedial approach for the TSCA Site under the Risk-Based Cleanup consists of the removal of Hot Spots and localized excavation and off-site disposal of soil containing the highest concentrations of PCBs to achieve a 95% Upper Confidence Limit (95% UCL) value on the mean of residual (post-remediation) PCB concentration of less than 100 mg/kg within the top 3 ft of soil at the TSCA Site. The removal all soil containing PCB concentrations greater than 500 mg/kg would result in a 95% UCL of 23.7 mg/kg beneath the EM-1 Cap and 6.3 mg/kg in areas outside of

the EM-1 Cap. We estimate that approximately 8,800 cy of PCB-impacted soil would be removed from the TSCA Site.

A summary of the remedial approach and sequencing are provided below and details are provided in the following sections:

1. Strip asphalt from the existing parking lot surface to expose the Parking Area Backfill that was placed over the EM-1 Cap and former ground surface in 2005.
2. Excavate and temporarily stockpile Parking Area Backfill to expose the EM-1 Cap and former ground surface in areas where excavation will occur to remove Hot Spots and soil with PCB concentrations greater than or equal to 500 mg/kg.
3. Excavate through the EM-1 Cap and below the EM-1 Cap or former ground surface for those areas outside of the EM-1 Cap (conservatively assumed to be El. 17) to remove Hot Spots and soil containing PCB concentrations greater than or equal to 500 mg/kg and dispose of the soil and asphalt (generated from EM-1 Cap removal) off-site (Figure 13).
4. Place a marker layer over the excavation and backfill the excavation with Parking Area Backfill and imported soils to the bottom of the existing EM-1 Cap or to the subgrade elevation for areas outside the EM-1 Cap.
5. Place a 6-in thick asphalt cap above the backfill material within the limits of the existing EM-1 Cap, followed by additional backfill to achieve the subgrade elevation within the EM-1 Cap.
6. Restore the TSCA Site to its previously existing condition (paved parking lot with 6 inches of dense graded crushed stone and 3.5 inches of asphalt, or a rip rap drainage area).

The location of soil planned to be excavated is shown on Figure 13. The location of PCBs with concentrations less than 500 mg/kg which will be left in place post-remediation is shown on Figure 14. Cross-sections depicting the backfilling sequence and asphalt cap are shown on Figure 15.

Based on this remedial plan, the results of the risk assessment (Appendix D) indicate that none of the potentially complete exposure pathways that could exist after TSCA Site remediation would be associated with cancer and non-cancer risks that exceed EPA risk management thresholds

4.3.1 Site Preparation

4.3.1.1 Site Security

Prior to conducting excavations at the TSCA Site, the Contractor will restrict access to the TSCA Site by erecting security fencing around the TSCA Site.

4.3.1.2 Parking Area Backfill Excavation and Stockpiling

The existing parking lot asphalt (at lot surface) will be recycled offsite or milled and stockpiled on-site for future reuse. Following removal of the asphalt, the Parking Area Backfill which was placed over the EM-1 Cap and former ground surface in 2005 will be excavated (as non-TSCA and non-PCB remediation waste) to the top of the EM-1 Cap or to the former ground surface elevation where the EM-1 Cap is not present (El. 17) in areas where excavation will occur to remove Hot Spots and soil with PCB concentrations greater than or equal to 500 mg/kg. The Parking Area Backfill will be temporarily stockpiled on BCEC property for future reuse (see Section 4.5 below)

4.3.2 TSCA Soil Excavation and Related Activities

The treatment, excavation, and management of soil and groundwater will be conducted under this TSCA Work Plan and a Release Abatement Measure (RAM) Plan in accordance with the MCP. Haley & Aldrich will observe and document the work on a full-time basis, and will provide the Contractor with guidance relative to the requirements outlined in this TSCA Work Plan.

4.3.2.1 Site Logistics

Prior to the start of excavation of TSCA soils, the Contractor will restrict access to the TSCA Site by establishing and maintaining an Exclusion Zone, a Contamination Reduction Zone (area where truck washing and decontamination stations will be constructed and utilized), and a Support Zone as follows:

- Remedial activities within the Exclusion and Contamination Reduction Zones will be undertaken by 40-hour OSHA HAZWOPER trained Contractors. The Contractor will prepare and comply with a Site-specific Health and Safety Plan (HASP). The HASP will contain health and safety policies and procedures to complete the work described in this TSCA Work Plan and comply with OSHA, NIOSH, local, state, and federal requirements.

- The Exclusion Zone will encompass the excavation areas within the TSCA regulated areas, and personnel entering the Exclusion and Contamination Reduction Zones will have proper training certification and personal protective equipment, as required by the Contractor's HASP.

- Flexible panel fencing will be erected to visibly identify the work zone perimeters. The panel fencing shall be removed upon completion of remedial activities within the TSCA Site. Management and decontamination/disposal of fencing will vary depending upon whether the fencing was in contact with PCB contaminated soils. Fencing in contact with PCB-contaminated soils will be managed in accordance with 40 CFR 761.

- Movement of personnel and equipment between the zones will be regulated through access control points. Trucks and other vehicles entering the Exclusion and Contamination Reduction Zones will be routed through service entrance and exit areas, as shown schematically on Figure 16 (Site Logistics Plan) .

- The Contractor will install a wheel wash at each location in the Contamination Reduction Zone where construction vehicles access and depart. Each truck leaving the Exclusion Zone will have its wheels washed and cleaned of debris at the decontamination stations located in the Contamination Reduction Zone. Decontamination of trucks leaving the Exclusion Zone shall be conducted in accordance with TSCA 40 CFR 761.79.

- Trucks hauling soils to off-site receiving facilities will be loaded in the Exclusion Zone. Loaded trucks will be covered with tight fitting covers, which will be securely fastened prior to leaving the Exclusion Zone. Additionally, each load leaving the Exclusion Zone will require documentation including copies of waste manifests, bills of lading, and vehicle license-plate number.

- Figure 16 depicts our conceptual understanding of the potential locations of the zones and the access and egress routes. These locations may vary based on input from the Contractor.

4.3.2.2 Soil Excavation Activities and Sequencing

Prior to excavation of soils, the Contractor will be required to establish horizontal and vertical control of the excavation areas via survey. The Remediation Contractor will determine the layout of the lateral extent of excavation using global positioning system (GPS) or survey equipment, and will conduct engineering level surveys as excavation proceeds vertically. The bottom of excavation will be surveyed and recorded in an as-built drawing upon completion to verify that the target depth has been achieved.

The Contractor will excavate soils within the designated remediation areas from the EM-1 Cap or former ground surface for those areas outside of the EM-1 Cap (conservatively assumed to be El. 17) to remove Hot Spots and soil containing PCB concentrations greater than or equal to the TSCA Site-specific remedial goal 500 mg/kg at identified remedial excavation areas.

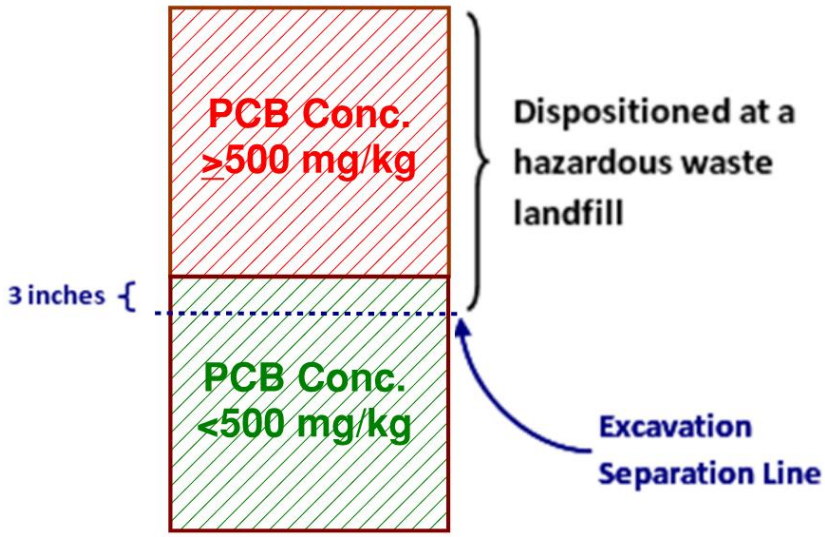
Prior to off-site disposal of PCB remediation waste, the Contractor will conduct treatment of soils that exceed RCRA Hazardous Waste Criteria for leachable metals. Following treatment and subsequent stabilization of the leachable metals, confirmatory samples will be collected by the Contractor to assess whether the treatment was successful.

We anticipate that excavation and backfilling activities will be performed from north to south (from the BCEC Phase 1 building toward New Cypher Street). The Exclusion Zone, Contamination Reduction Zone, and Support Zone will be adjusted as the work is completed. The intent is to re-establish use of the remediated areas as a parking lot as soon as possible after the paving has been completed and potential exposure to PCB impacted soils has been eliminated.

4.3.2.3 Vertical Excavation Limits

The vertical extent of excavation will be determined by the elevation of the deepest soil sample in each sampling grid exhibiting concentrations of PCBs greater than or equal to 500 mg/kg.

Where an interval may exist between the deepest soil sample exhibiting concentrations of PCBs greater than or equal to 500 mg/kg and the sample beneath it exhibiting concentrations of PCBs less than 500 mg/kg, the excavation will be extended to the top of the deeper sample exhibiting concentrations of PCBs less than 500 mg/kg. In addition, the bottom of the excavation will be over-excavated by 3 inches below the target elevation in each sampling grid, as shown below:



4.3.2.4 Lateral Excavation Limits

As shown on Figure 13, soil exhibiting PCB concentrations greater than or equal to 500 mg/kg will be over-excavated laterally, beyond the limits of the 30 ft by 30 ft sampling grids, to the nearest "clean" boring(s) where PCBs were not detected above the cleanup goal of 500 mg/kg. Remediation of MCP Hot Spots, which do not contain PCBs greater than or equal to 500 mg/kg, will be excavated to the limits of the 30 ft by 30 ft sampling grid.

4.3.2.5 Equipment Decontamination

During excavation of soils with concentrations of PCBs greater than or equal to 50 mg/kg, the excavator bucket will be decontaminated using the double-wash rinse method in accordance with TSCA Subpart S, Double Wash/Rinse Method for Decontaminating Non-Porous Surfaces. During excavation of soils with concentrations of PCBs less than 50 mg/kg, if encountered, the excavator bucket will be decontaminated in accordance with TSCA 40 CFR Ch. 1 §761.79. Alternately, separate dedicated excavation buckets may be used for excavation of soils greater than or equal to 50 mg/kg and excavation of soils less than 50 mg/kg.

Wastewater from decontamination procedures within the TSCA area will be collected and managed as described in Section 4.6 below.

4.3.2.6 Dust Monitoring

Haley & Aldrich has prepared an Ambient Air Monitoring Plan (AAMP) to be followed by the remediation Contractor during intrusive work. A Dust Action Level of 60 µg/m^3 has been developed for the TSCA Site based on the types and nature of contaminants detected in Site soils. This value is based on particle concentrations measured as PM10, which includes particles with an aerodynamic diameter of 10 micrometers (µm) and less. A description of how this value was identified is provided in the AAMP, which is included in Appendix E.

Haley & Aldrich will conduct dust monitoring during the course of the work in accordance with the AAMP. Anticipated activities that are planned to be conducted as part of the AAMP are real-time

and time-averaged ambient air monitoring using weatherproof, 24-hour, time weighted average (TWA) dust monitoring devices. Real time monitoring will be used to evaluate daily conditions at the Site and to identify and respond to unacceptable short-term impacts to ambient air quality due to remedial activities, if any. Up to four (4) dust monitoring stations will be setup at selected locations during excavation in a particular area. The locations will be dependent on the wind direction at any given time, however, at least one station will be set up at a predominantly downwind location. Daily time-weighted average ambient air concentrations from these stations will be recorded at the end of each day for the duration of the remedial activities. In addition, visual observations of potential fugitive dust will be made on an ongoing basis during the course of the work.

The detection or observation of elevated dust levels above the developed Action Level potentially originating from the soil removal activities will be considered to be a potential excursion of the dust control measures, and Haley & Aldrich will work with the Contractor to immediately evaluate and mitigate the potential source of detected dust. The work may be stopped as required to mitigate potential excursions of fugitive dust.

Mitigation measures, if needed, are anticipated to include use of water spray suppression as needed to control dust. Additional dust control measures that may be implemented as needed during the work include: use of hygroscopic salts; biodegradable tackifiers; minimizing the areas of excavation that are exposed at a given time; backfilling and stabilizing excavated areas as soon as possible; temporary erosion control mats/netting/geotextiles; and, suspension of work during windy conditions. In the event the Action Level is exceeded, work will not be allowed to proceed until the dust level is mitigated and maintained below the Action Level.

4.3.3 Soil Management and Off-Site Disposition

Off-site disposition of soils will be based on characterization data obtained for the sampling grids established during the TSCA characterization program. As noted above, soils containing PCB concentrations less than 500 mg/kg present below the EM-1 Cap (or El. 17 where cap is not present) but above soils with PCB greater than or equal to the TSCA remedial goal 500 mg/kg will be excavated, managed and disposed of as if was characterized as having PCBs greater 500 mg/kg.

- In excavation areas where soils have been designated for disposal because they contain concentrations of PCBs greater than or equal to 500 mg/kg, soil within the designated excavation area will be transported to a hazardous waste landfill permitted by EPA under Section 3004 of RCRA or state authorized under Section 3006 of RCRA, or a PCB disposal facility approved under 40 CFR 761.61(a)(5)(i)(B) regardless of the concentration of PCBs in the soil samples.

- Soils with concentrations of PCBs greater than or equal to 1 mg/kg, but less than 50 mg/kg and generated from MCP Hot Spots will be transported to a RCRA Subtitle D landfill (Waste Management TREE in Rochester, New Hampshire) or (if approved) to ESMI in Loudon, New Hampshire. Other RCRA Subtitle D landfill or permitted treatment facilities may also be considered; if so, they will be provided to EPA for approval.

- Soils that contain PCBs less than 1 mg/kg, if present, will be disposed of at appropriate facilities based on soil precharacterization data for other constituents.

As discussed above, the majority of the soil within the TSCA Site limits has been precharacterized to facilitate direct loading and off-site disposition without stockpiling or additional laboratory testing. However, if necessary due to TSCA Site logistics and scheduling, TSCA regulated soils may be stockpiled within the Exclusion Zone. In the event soil needs to be stored on-site prior to transportation and disposal, it will either be stored in lined roll-off containers or placed on and covered with double-lined polyethylene sheeting to prevent water intrusion into the stockpile. Soil stockpiles will be surrounded by silt fence or hay bales to prevent migration of PCB-contaminated soil. Haley & Aldrich will conduct supplemental on-site testing, if necessary.

If direct-loaded soil is too wet for transport, the Contractor will be required to take measures to stabilize the soil, using methods such as applying lime or cement. Note that because the majority of excavation will occur above the water table it is not likely that the Remediation Contractor will need to stabilize wet soil prior to loading.

All operators and trucks will have proper Department of Transportation certifications and vehicle inspection certifications. Trucks transporting PCB-contaminated soils off-site to an EPA-approved facility are anticipated to enter the TSCA Site from construction entrances situated along Cypher Street.

We anticipate that the Remediation Contractor will propose to transport soils with PCBs less than 50 mg/kg to Turnkey Recycling and Environmental Enterprises ("TREE"), a RCRA Subtitle D facility in Rochester, NH. We understand that, pursuant to 40 CFR 761.61, EPA approval is required for use of that facility for soils containing PCBs less than 50 mg/kg. We respectfully request approval from EPA for the use of TREE as a soil receiving facility for disposal of soils containing PCBs at concentrations less than 50 mg/kg.

We anticipate that the Remediation Contractor will proposed to transport soils with PCBs greater than or equal to 50 mg/kg to a hazardous waste landfill permitted by EPA under Section 3004 of RCRA or state authorized under Section 3006 of RCRA, or a PCB disposal facility approved under 40 CFR 761.61(a)(5)(i)(B).

4.3.4 Decontamination and On-Site Reuse of Concrete and Nonporous Materials

Concrete debris excavated within the limits of the TSCA Site will be segregated and stockpiled within the TSCA Site. Concrete with visual evidence of contamination, such as oil staining, will be stockpiled and evaluated separately. The concrete debris will be processed to remove loose soil, and samples of the concrete will be collected and submitted to a laboratory for analysis for PCBs using manual soxhlet extraction and EPA Method 8082. Sample collection will be conducted by drilling into the surface of representative portions of the concrete that were in contact with soils.

The concrete stockpiles will be constructed to be no greater than 250 cy each. The stockpiles will be sampled and tested separately from each other, with one composite sample composed of five subsamples from each pile. Each composite will consist of five individual samples collected from the surface of the concrete, obtained to ½-inch deep. The samples will be collected using the Region 1, EPA-New England "Standard Operating Procedure for Sampling Porous Surfaces for Polychlorinated Biphenyls (PCBs)," dated May 2011. Individual sampling locations will be determined randomly using procedures consistent with the procedures for sampling a conical pile outlined in Subpart R.

If large blocks of concrete encountered in soils with PCB concentrations greater than or equal to 1 mg/kg are removed in one piece and not stockpiled with other pieces, the procedure for sampling a specifically configured pile in Subpart R, modified for a ½-inch sampling depth, will be used to determine individual sample locations and the number of composite samples obtained.

Based on the results of the chemical testing, the concrete may be crushed and reused on-site as backfill, or will disposed of offsite, as follows:

- Concrete may be reused within the remedial excavations, below the EM-1 Cap or former ground surface if the laboratory testing indicates PCBs are less than 500 mg/kg.
- Concrete exhibiting concentrations of PCBs greater than or equal to 500 mg/kg will be removed from the TSCA Site as TSCA regulated material.

Nonporous materials (such as cobblestones, granite blocks, or boulders) in contact with soils containing PCB concentrations greater than 1 mg/kg will be power-washed and sampled in accordance with TSCA Subpart P to confirm efficacy of cleaning. Based on the results of the chemical testing, the non-porous materials may be reused on-site as backfill. Non-porous materials may be reused if the laboratory testing indicates PCBs are less than or equal to 10 ug/100 cm^2. Non-porous materials exhibiting concentrations of PCBs greater than or equal to 10 ug/100 cm^2 will be removed from the TSCA Site as TSCA regulated material.

Where concrete or non-porous materials are not in contact with soils containing PCBs above 1 mg/kg, the material may be reused onsite or transported offsite (as non-TSCA waste) for recycling or disposal.

4.4 CONFIRMATORY POST-EXCAVATION SOIL SAMPLING

4.4.1 Bottom of Excavation Confirmatory Sampling

As discussed above, the TSCA Site was divided into 30 ft by 30 ft grids for characterization of PCBs. Soil samples were analyzed for PCB analysis in two foot intervals starting at the EM-1 Cap or former ground surface and extended until the test boring reached naturally deposited soils or, in some cases, until the PCB analysis did not detect PCBs above laboratory reporting limits.

Consistent with the conceptual site model and our understanding of the PCB release at the TSCA Site, the majority of sampling grids with PCBs at concentrations greater than or equal to 500 mg/kg are adjacent to one another and have PCB impacts at similar depths. Samples containing PCBs at concentrations greater than 500 mg/kg are concentrated within the limits of the former SAK Site and under the EM-1 Cap. Four test borings conducted outside of the EM-1 Cap exhibited concentrations of PCBs greater than 500 mg/kg, as shown on Figure 13.

The existing data was reviewed on a point by point basis and its suitability for use as confirmatory samples was evaluated with consideration of PCB concentrations in surrounding areas both vertically and horizontally. It is our opinion that the existing data set is sufficient to serve as confirmatory samples and demonstrate that PCBs above 500 mg/kg will be removed by the planned excavation. In addition, areas exhibiting PCBs at concentrations greater than 500 mg/kg will be over-excavated by 3 inches below the target depth and the soil will be disposed of off-site. A figure

showing the relative PCB concentrations remaining in soil post-remediation (including greater than 100 mg/kg) is shown on Figure 14. As the TSCA Site has been characterized horizontally and vertically to less than 500 mg/kg, PCB confirmatory soil samples will not be collected. Our opinion of the representativeness of the data is based on:

- our understanding of the release;
- our review of the extensive data set obtained during TSCA Site characterization (including one or more samples collected from the bottom of the majority of explorations indicating PCBs were not detected above laboratory reporting limits);
- the distribution of PCBs at the TSCA Site;
- the large size of the TSCA Site (approximately 7 acres);
- the planned over-excavation of 3 inches of soil containing PCBs greater than or equal to 500 mg/kg;
- the asphalt and rip rap surface that will mitigate exposure to residual PCBs remaining at the TSCA Site post-remediation, and the replacement of the EM-1 Cap in excavated areas;
- the lack of exposure to residual PCB-impacted soils; and
- the demonstration that post-remediation conditions do not pose risk in the event of exposure.

4.4.2 Sidewall Sampling

Sidewall sampling is not planned during remedial excavations because soil containing PCBs greater than or equal to 500 mg/kg within the remedial areas will be over-excavated laterally, beyond the limits of the 30 ft by 30 ft sampling grids, to the nearest boring(s) which exhibit PCB concentrations below the remedial goal of 500 mg/kg.

4.5 BACKFILLING

Following excavation and off-site disposal of PCBs greater than or equal to 500 mg/kg, a marker layer will be placed over those areas of the TSCA Site to provide visual indication of the presence of residual TSCA soils and to prevent excavation into the TSCA soils during hypothetical future construction.

The remedial excavations will be backfilled first with the Parking Area Backfill material (at depth), then with imported backfill material as necessary to raise the grade to the bottom of the EM-1 Cap or to the subgrade elevation for the parking lot surface for areas outside of the EM-1 Cap. A 6-in thick asphalt cap will be placed above the backfill material within the limits of the EM-1 Cap, followed by additional backfill to achieve the subgrade elevation for the parking lot surface within the EM-1 Cap. Following achievement of subgrade elevations within the excavated areas, the TSCA site will be restored to its previously existing condition by the placement approximately six inches of dense graded crushed stone and 3.5 inches of asphalt, or placement of rip rap over previously existing drainage areas. Cross-sections depicting the backfilling sequence and asphalt cap are shown on Figure 15.

If future excavations are required below the marker layer, a remediation Contractor familiar with TSCA and with this TSCA Work Plan will perform the excavations in accordance with the procedures outlined in this Work Plan for remediation of the TSCA regulated area, the MCP, and the Contractor's Site-Specific Health and Safety Plan.

4.6 WATER MANAGEMENT

It is anticipated that water will need to be managed during TSCA Site activities, as described below.

4.6.1 Construction Dewatering Effluent

Construction dewatering effluent will be discharged off-site under a National Pollutant Discharge Elimination System (NPDES) Remediation General Permit (RGP). At a minimum, the Contractor's construction dewatering treatment system will include sedimentation control to remove suspended solids from effluent; tanks to temporarily store effluent prior to discharge; and pH neutralization systems. Additional treatment of constituents to meet the requirements of the discharge permit shall be determined based on testing. Soil entrained in the dewatering effluent that is collected from the TSCA Site and the filtration system components will be managed as TSCA waste.

The proposed approach for management of dewatering effluent and sediment generated during work conducted within the TSCA Site is as follows:

- Dewatering effluent and waste water from decontamination will be pumped through an on-site water treatment system and discharged under a NPDES RGP (to be obtained).
- During excavation of TSCA regulated materials, sediment accumulated in the settlement tank(s) will be collected for sampling and analysis, and the collected sediments will be removed from the TSCA Site in accordance with applicable State and Federal regulations.
- Dewatering effluent generated while excavation occurs in the TSCA Site will be sampled and analyzed for PCBs by EPA Method 608 in addition to the requirements of the NPDES RGP. The sampling frequency will follow the frequency established in the RGP Permit.
- Bag filters and carbon (if any) that are used while dewatering from excavations within the TSCA Site will be disposed as PCB waste with concentrations greater than or equal to 50 mg/kg.
- After the work within the TSCA Site is complete, the sedimentation tank will be cleaned using the procedures outlined in Subpart S, and the decontamination materials will be disposed in accordance with TSCA and with the other decontamination materials used for cleaning equipment.

Alternately, construction dewatering effluent will be recharged onsite in accordance with the 310 CMR 40.0045 Construction dewatering effluent that is recharged on-site wil be treated to achieve total PCB concentrations less than 0.5 ug/l using a treatment system, if necessary.

4.6.2 Decontamination Wastewater

The Contractor has several options for management of decontamination wastewater:

a. Drum independently and transport off-site to an EPA-approved receiving facility.
b. Recharge wastewater on-site using a treatment system to achieve total PCB concentrations less than 0.5 ug/l.
c. Discharge treated water off-Site under the NPDES RGP permit, which establishes a maximum daily discharge limit of 0.5 ug/L PCBs as analyzed using EPA Method 608.

4.6.3 Groundwater Sampling/Maintenance and Monitoring

EPA has requested that the MCCA continue the Maintenance and Monitoring Program consisting of the collection and analysis of groundwater samples for PCBs to evaluate whether PCBs remain in the dissolved or colloidal state. During active remedial excavations, MCCA will conduct sampling of groundwater from monitoring wells located outside of the remediation limits (221-B01/W01, 272-B05/W05, 271-B01/W01(A), and CST-B11/W09) in accordance with the existing groundwater monitoring schedule (annually in May and November). Following remediation, sampling of groundwater from monitoring wells 221-B01/W01, 272-B05/W05, 271-B01/W01(A), and CST-B11/W09 will be conducted every three years.

4.7 SCHEDULE

Work within the TSCA Site is currently anticipated to commence in Spring 2017. If performed on schedule, remedial excavation of PCB-contaminated soils at the TSCA Site and site restoration are expected to be completed during the Summer 2017.

4.8 CERTIFICATION OF OWNER AND PARTY CONDUCTING CLEANUP

The signed original certification required by 40 CFR 761.61(a)(3)(i)(E) is being submitted concurrently with this Self-Implementing Plan. A copy of the executed certification is provided in Appendix A.

5. Closing

TSCA Site cleanup will be conducted in accordance with this TSCA Work Plan. If conditions are encountered that vary substantially from those anticipated, this plan may be revised to accommodate those conditions. Pursuant to 40 CFR 761.61(a)(3)(ii), EPA will be notified of proposed changes to this plan.

ABBREVIATIONS:
ND(2.5): Not detected; number in parentheses is one-half the laboratory detection limit
"J" indicates detected values or reporting limit is estimated.
"UJ" indicates that the detection limit is estimated.

NOTES:
1. This table includes only those compounds detected on the dates indicated.
2. Bold values indicate an exceedance of EPA Site-Specific Notification Standard.
3. Monitoring well 272-B05/W05 could not be sampled during this monitoring period due to an obstruction in the well.

ABBREVIATIONS:
ND(2.5): Not detected; number in parentheses is one-half the laboratory detection limit
"J" indicates detected values or reporting limit is estimated.
"UJ" indicates that the detection limit is estimated.

NOTES:
1. This table includes only those compounds detected on the dates indicated.
2. Bold values indicate an exceedance of EPA Site-Specific Notification Standard.
3. Monitoring well 272-B05/W05 could not be sampled during this monitoring period due to an obstruction in the well.

ABBREVIATIONS:
ND(2.5): Not detected; number in parentheses is one-half the laboratory detection limit
"J" indicates detected values or reporting limit is estimated.
"UJ" indicates that the detection limit is estimated.

NOTES:
1. This table includes only those compounds detected on the dates indicated.
2. Bold values indicate an exceedance of EPA Site-Specific Notification Standard.
3. Monitoring well 272-B05/W05 could not be sampled during this monitoring period due to an obstruction in the well.

ABBREVIATIONS:
ND(2.5): Not detected; number in parentheses is one-half the laboratory detection limit
"J" indicates detected values or reporting limit is estimated.
"UJ" indicates that the detection limit is estimated.

NOTES:
1. This table includes only those compounds detected on the dates indicated.
2. Bold values indicate an exceedance of EPA Site-Specific Notification Standard.
3. Monitoring well 272-B05/W05 could not be sampled during this monitoring period due to an obstruction in the well.

ABBREVIATIONS:
ND(2.5): Not detected; number in parentheses is one-half the laboratory detection limit
"J" indicates detected values or reporting limit is estimated.
"UJ" indicates that the detection limit is estimated.

NOTES:
1. This table includes only those compounds detected on the dates indicated.
2. Bold values indicate an exceedance of EPA Site-Specific Notification Standard.
3. Monitoring well 272-B05/W05 could not be sampled during this monitoring period due to an obstruction in the well.

ABBREVIATIONS:
ND(2.5): Not detected; number in parentheses is one-half the laboratory detection limit
"J" indicates detected values or reporting limit is estimated.
"UJ" indicates that the detection limit is estimated.

NOTES:
1. This table includes only those compounds detected on the dates indicated.
2. Bold values indicate an exceedance of EPA Site-Specific Notification Standard.
3. Monitoring well 272-B05/W05 could not be sampled during this monitoring period due to an obstruction in the well.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.

ABBREVIATIONS:
-: Not Analyzed
mg/kg: milligram per kilogram
mV: millivolts
NA: Not Applicable
ND (2.5): Not detected, number in parentheses is the laboratory reporting limit
NI: Not Ignitable

NOTES:
1. **Bold** values detected exceed the RCS-1 criteria.
2. **Bold ND (2.5)** values indicated the laboratory reporting limit exceeds the RCS-1 criteria.
