Subject:	Priority Notification 21-FRE-16: Eight Field Workers Developed Illness Symptoms After Entering a Vineyard before REI Expired
Date:	Wednesday, April 20, 2016 4:18:44 PM
Attachments:	PENR 21-FRE-16.pdf

On April 19 at 6:00 am, 33 field workers entered a vineyard to conduct cane tipping work 2 ½ hours after a ground application of Microthiol Disperss (sulfur), Quintec (quinoxyfen), and LI 700 (adjuvant). On April 20, the Fresno CAC interviewed the workers and were found that eight of the workers experienced symptoms of numb lips, itchiness, trouble breathing, headache, and rash. Four of the eight were taken by their employer for medical attention. The Fresno CAC has interviewed the field workers and collected foliage samples. Fresno CAC is continuing the investigation.
