Remedial Investigation Report
LCP Chemicals, Inc. Superfund Site
Linden, New Jersey
Volume II of V
Appendices A through G

Prepared for
ISP Environmental Services, Inc.
500 Hercules Road
Wilmington, Delaware 19808-1599

July 2013

Project Number: 137005

Brown AND Caldwell
2 Park Way, Suite 2A
Upper Saddle River, New Jersey 07458

Appendix A: Property Transfers

TABLE OF DOCUMENTS SUPPLIED

No.	Date	Book	Page	Grantee	Grantor	Description	Property	Easement	
1	7/27/1909	533	233	Borough of Linden	Grasselli Chemical Company	trunk sewer line through property to Staten Island Sound		X	
2	9/27/1909	533	589	Borough of Linden	Tremley Point Corporation	Trunk Sewer line through property		X	
3	2/28/1912	588	499	Borough of Linden	Edward F. Robinson	Trunk Sewer line through property		X	
4	10/20/1928	1165	576	Grasselli Dyestuff Corporation	The Grasselli Chemical Company	conveys two tracts as shown	X		
5	10/20/1928	1165	582	Grasselli Dyestuff Corporation	The Grasselli Chemical Company	conveys two tracts as shown	X		
6	11/30/1928	1162	250	E.I. duPont de Nemours and Company	The Grasselli Chemical Company	conveys lands not previously conveyed to Grasselli Dystuff Corp. (exceptions to Tract 5)	X		
7	10/31/1939	1391	302	General Aniline & Film Corporation	General Aniline & Film Corporation	consolidates and renames General Aniline Works And American I.G. Chemicals into General Aniline & Film	X		
8	5/5/1942	1458	210	General Aniline & Film Corporation	E.I. duPont de Nemours and Company	additional acquisition from DuPont	X		
9	9/15/1949	1776	7	General Aniline & Film Corporation	E.I. duPont de Nemours and Company	additional acquisition from DuPont	X		
10	7/7/1950	1847	79	duPont de Nemours	Central Railroad Company of New Jersey	irrevocable license to keep, maintain and use a private access road across railroad property		X	
11	4/18/1951	1898	168	Linden Roselle Sewerage Authority	Sinclair Refining Company	Block 587, Lots 5 & 21	X		
12	1/27/1958	2356	634	General Aniline & Film Corporation	Central Railroad Company of New Jersey	copy not included. believed to convey the railroad property highlighted	X		
13	7/9/1963	2648	319	General Aniline & Film Corporation	E.I. duPont de Nemours and Company	Block 587, Lots 2.01, 2.02	X		
14	1/10/1964	2681	229	City of Linden	General Aniline & Film Corporation	easement for 36" Linden storm sewer		X	
15	11/19/1965	2771	858	Allied Chemical Corporation	Central Railroad Company of New Jersey	grants permission to maintain and use pipeline bridge and pipelines crossing railroad (location uncertain)		X	
16	11/19/1965	2771	862	Allied Chemical Corporation	Central Railroad Company of New Jersey	grants permission to use raodway crossing railroad (location uncertain)		X	
17	1/19/1967	2794	745	General Aniline & Film Corporation	The Central Railroad Company of New Jersey	conveys two tracts as shown	X		
18	5/15/1967	2802	839	General Aniline & Film Corporation	Allied Chemical Corporation	(see next below) - assigns all previous agreements in area from Allied to G .A.& F.		X	
19	5/15/1967	2802	536	General Aniline & Film Corporation	Allied Chemical Corporation	transfers ownership of southeasterly portion of G.A.& F property	X		
20	11/3/1967	2821	929	Union Carbide Corporation	General Aniline & Film Corporation	pipeline eaement in railraod R.O.W.		X	
21	8/20/1970	2909	697	Elizabethtown Gas Company	GAF Corporation	easement following Centerline of Gas Main on north & west sides of property		X	
22	2/24/1971	2917	226	Elizabethtown Water Company	GAF Corporation	amending previous ROW and easement made on 2/26/65 db2739 p590		X	
23	6/1/1971	2924	209	City of Linden	GAF Corporation	amending previous ROW and easement made on 1/10/64 DB 2681 PG 225		X	
24	8/12/1971	2928	677	Buckeye Pipe Lins Company	GAF Corporation	petroleum pipeline easement on west side of property		X	
25	4/17/1972	2946	162	City of Linden	GAF Corporation	amending previous ROW and easement made on 1/10/64 db2681 p225 and 6/1/71 (above)		X	
26	7/21/1972	3093	335	Kuehne Chemical Company, Inc.	Linden Chlorine Products, Inc.	cross easement agreement between LCP and Kuehne Chemical Co. (lessor)		X	
27	8/24/1972	2954	273	Linden Chlorine Products	GAF Corporation	P.Q. deed for LCP, Lots 3.01, 3.02, 3.03 Block 587, references many easements in last 2 pages	X		
28	8/24/1972	2954	284	Linden Chlorine Products	GAF Corporation	right to use 24' roadway known as Linde Road		X	
29	8/24/1972	2954	296	Linden Chlorine Products	GAF Corporation	reciprocal rights over various roadways		X	
30	8/24/1972	2954	312	Linden Chlorine Products	GAF Corporation	rights to use railroad tracks		X	
31	8/24/1972	2954	323	Linden Chlorine Products	GAF Corporation	rights to use Utility Poles and install new ones		X	
32	8/24/1972	2954	331	GAF Corporation	Linden Chlorine Products	ROW/easement for driveway, pipelines, poles, power lines, bridges, and passage ways of any kind		X	
33	8/24/1972	2954	340	GAF Corporation	Linden Chlorine Products	right to use flume and outfall ditch for disposal of its wastewater		X	
34	1/17/1974	2995	280	Northvile Linden Terminal Corp.	GAF Corporation	rights to driveway/road		X	
35	5/8/1975	3033	986	Elizabethtown Water Company	Linden Chlorine Products	two 10' wide water main easements		X	
36	5/22/1975	3034	974	Northvile Linden Terminal Corp.	GAF Corporation	120' x 50' easement, formerly passed on from LCP to GAF in 1972. DB 2954 PG 331		X	
37	3/5/1976	3061	4	Elizabethtown Water Company	Linden Chlorine Products	two 10' wide water main easement		X	
38	12/14/1979	3207	82	LCP Chemicals--New Jersey, Inc.	LCP Chemicals & Plastics, Inc	Lot 3.01, Block 587	X		
39	12/14/1979	3207	93	LCP Chemicals--New Jersey, Inc.	LCP Chemicals & Plastics, Inc	Lot 3.03, Block 587	X		
40	12/14/1979	3207	97	LCP Chemicals--New Jersey, Inc.	LCP Chemicals & Plastics, Inc	Lot 3.02, Block 587	X		
41	8/11/1983	3331	219	Linden Chlorine Products	Kuehne Chemical Company	quit-claim deed releases rights, ROWs, easements and right to purchase... lease made 7/21/1972, db3093 p335		X	
42	9/17/1986	3499	97	GAF Corporation	Linden Chlorine Products	GAF is now leasing the substation from LCP		X	
43	9/23/1994	4228	125		Linden Chlorine Products	Block 587 Lot 3 Environmental Restrictions			
44	7/21/1972	3093	335	Kuehne Chemical Company, Inc.	Linden Chlorine Products	lease agreement

LIST OF FIGURES

Figure 1 Typical Multiple-Cased Bedrock Well Installations

1. INTRODUCTION

The field methods utilized for the Remedial Investigation (RI) field investigation at the LCP Chemicals Inc., Superfund Site (LCP site) are described, herein in Section 2. Section 2 represents the consolidation of the following six (6) USEPA-approved documents:

1. "Final Sampling and Analysis Plan, Field Operations Plan, Part I, Draft Sampling and Analysis Plan", (URS, April 12, 2001).
2. "Addendum No. 1, Field Operations Plan for the LCP Chemicals, Inc. Superfund Site, Cased Deep Borings", (Brown and Caldwell, October 2001).
3. "Addendum No. 2, Field Operations Plan for the LCP Chemicals, Inc., Superfund Site, Subsurface Utility Clearance", (Brown and Caldwell, November, 2001).
4. "Addendum No. 3, Field Operations Plan for the LCP Chemicals, Inc. Superfund Site, Sampling Beneath Buildings 230 and 240", (Brown and Caldwell, March 2002).
5. "Addendum No. 4, Field Operations Plan, LCP Chemicals, Inc. Superfund Site (Bedrock Monitoring Wells, Soil Vapor Testing, Groundwater Sampling)", (Brown and Caldwell, April 2006, Revised October 2006).
6. "Addendum No. 5, Field Operations Plan for the LCP Chemicals, Inc. Superfund Site, Ecological Sampling", (Brown and Caldwell, August 2006, Revised October 2006).

The text in Section 2 is structured from the original URS (2001) document. However, various sections are inserted and/or superseded by the Brown and Caldwell FOP addenda which are noted, respectively. The tense of the text contained in the original document (generally future tense) has been retained in Section 2. However, it should be noted that tables and figures contained in the aforementioned documents that referred to proposed locations are not provided herein, as they are superseded by information provided in the RI report.

2. FIELD PROCEDURES

The methods and procedures used to conduct the field investigation will be in accordance with standard environmental practice and consistent with current USEPA and NJDEP guidelines and requirements. The investigation will be consistent with guidance contained in the following regulatory documents:

- USEPA Compendium of Superfund Field Operations Methods, 1987
- USEPA CERCLA Quality Assurance Manual, October 1989
- USEPA Low Stress Purging and Sampling Procedure, March 1998
- NJDEP Field Sampling Procedures Manual, 2005
- NJDEP Field Analysis Manual, July 1994
- NJDEP Alternative Ground Water Sampling Techniques Guide, July 1994 (if required)

Changes to the procedures and protocols described in this section may become necessary based on actual conditions encountered in the field. These changes have been accomplished through the inclusion of FOP addenda that were described in Section 1 and noted herein. The USEPA will be informed of major changes to the field program through Technical Memoranda or other forms of communication. Major deviations from the field procedures described below will be documented and a rationale supporting the change will be provided. Proposed modifications will not be implemented in the field without USEPA approval.

2.1 Reconnaissance and Site Preparation Activities

This section describes the activities that will be conducted before the field investigation.

2.1.1 Site Reconnaissance

A reconnaissance of the site was made before the RI to survey the site for potentially hazardous conditions (e.g., exposed waste, overhead obstructions, physical hazards, etc.). Based on the results of the reconnaissance, ISP Environmental Services Inc. developed a work scope to cleanup and remove potential structural and environmental hazards (e.g., presence of potential asbestos containing material, unsafe tank structures, etc.) through an Interim Removal Action (IRA). The IRA began in October 2000 in accordance with an USEPA approved work plan (URS, August 14, 2000). As part of the IRA, the integrity of the cap for the brine sludge lagoon was evaluated. Seven small areas (nominally 5 ft by 5 ft) required erosion control, which consisted of covering the affected area with top soil, seeding, and securing the area with a net. The results of the IRA will be submitted to the USEPA under separate cover.

A survey of South Branch Creek will also be conducted before the RI to determine general sampling accessibility and to perform a preliminary assessment of the ecological resources of the area. The general conditions of the site and surrounding areas will be documented and the information will be used to refine the general approach of the RI.

2.1.2 Development of Site Facilities

A storage, lay-down, and decontamination area will be established west of the main switch yard in the former employee parking lot at the west end of the site. This location has space for equipment, for a decontamination pad, and for drums or tanks of water that will be used to store decontamination and monitoring well development water.

2.1.3 Subsurface Utility Locations

Section 2.1.3 inserted from FOP Addendum No. 2 (Brown and Caldwell, November 2001) – Supersedes Previous Section

New Jersey "One-Call" System Notification

The drilling or excavation contractor will be responsible for contacting the New Jersey "One-Call" System prior to performing any subsurface drilling or excavation work by calling **1-800-272-1000**. The utility company mark outs provided by the "One-Call" service are required to address underground public utility lines (e.g., gas, water, electric, communications, etc.) regardless of whether or not they are on private property. The notification to "One-Call" must be made by the drilling or excavation contractor. This notification may not be made by other parties (e.g., consultant, property owner, government agency, etc.).

It is recognized that LCP Chemicals Inc. Superfund Site is difficult to locate and access. Therefore, special efforts must be made to confirm that the applicable utility companies have evaluated the presence of underground utility lines at the correct site and have performed the appropriate subsurface utility mark-outs, including the following:

- Provide explicit site location directions are provided to the "One-Call" service.
- Obtain a written confirmation from "One-Call" of the notification that includes the "Sequence Number" and a list of the utilities that have been notified.
- Independently determine that applicable utility companies have actually visited the site (e.g., through a review of guardhouse sign-in records, follow up phone conversations, etc.).
- Review the resultant mark-outs in comparison to known underground utility lines at the site.

Existing Site Documents

Previous site documents and utility maps (where available) will be reviewed to provide clearance for the sampling locations.

Supplemental Utility Clearance

Supplemental utility clearance will be performed in the vicinity of each drilling location in addition to the "One-Call" notifications, as described above. This supplemental clearance is required given the uncertainty of the previous mark-outs provided under the "One-Call" system and/or to locate other on site (non-public) utilities. The supplemental utility clearance will be performed with the use of an inductive pipe locator. Alternatively, a radio frequency pipe locator may be used, as applicable. As an additional safety precaution, drilling and excavation activities within the potential utility window (to a depth of approximately eight feet) will proceed at a slower pace to further reduce risk to subsurface utilities.

2.1.4 Identification of Sampling Locations Before Sampling

The RI/FS sampling points will be measured out in the field relative to building corners or other permanent structures using tape measurements. The sampling points will be established in the field using stakes, flags, surveyors paint, or similar methods before the sampling event. The sampling points will be marked clearly and staked securely until such time that the locations are either surveyed or recorded onto a scaled map of the site.

2.2 Soil Investigation Procedures

This section describes the procedures that will be followed when conducting the investigation of soil at the site. Since the subsurface conditions at the site are relatively unknown different drilling methods are described below so that procedures are in place as a contingency.

2.2.1 Collection of Surface Soil Samples

Before collecting a surface soil sample (0-6 inches below the ground surface or 0-12 inches below the ground surface for ecological risk assessment data) the sample location will be carefully cleared by removing any grass layers, surface debris, or upper one centimeter of soil surface, as applicable. In some areas of the site (e.g., the mercury cell buildings) a jackhammer or a concrete coring device will be needed to penetrate concrete pads or floor slabs to expose the ground surface. The soil samples will be collected using decontaminated stainless-steel scoops, hand augers, trowels, or equivalent tools.

The collection of surface samples for VOCs shall be conducted using an Encore™ Sampler in accordance with USEPA requirements. The sampling device is inserted into a freshly exposed soil surface (ground surface or soil core sampler). The 5-gram plug of soil is then capped and sent to the laboratory where it will be preserved, extracted and analyzed. Three Encore™ vials and one unpreserved 60 ml jar (for percent soil moisture measurement) of soil will be collected per sample location.

To satisfy the volume requirements of multiple bottle sets, surface soil samples (other than those collected for VOCs using the Encore™ sampler) will be homogenized either in situ or in a decontaminated stainless steel mixing bowl or tray before being transferred to bottles. A description of the soil data (e.g., soil description, location, time, etc.) will be recorded on a Surface Soil Description Log or the project field book.

2.2.2 Collection of Subsurface Soil Samples from Soil Borings

Soil samples for laboratory analysis will be collected from three general depth intervals. The sampling intervals will be 0.0 to 0.5 ft below the ground surface (bgs), 0.0 to 1.0 ft bgs, and between 1.0 ft bgs and the water table (estimated to be about 6 feet bgs). Surface soil samples collected from the 0.0 to 0.5 ft interval will provide data for the human health risk assessment and surface soil samples collected from the 0.0 to 1.0 ft interval will provide data for the ecological risk assessment. Subsurface soil samples collected from the 1.0 to 6.0 ft. interval will provide data to define the vertical extent of potential contamination in any given area. Each soil boring will be advanced through the fill to a minimum depth of the top of the water table. If native soils are not encountered at the water table, then the boring will be advanced until native soils are penetrated. The boring data will provide information on the thickness of the fill layer across the site.

In general, only one subsurface soil sample for organic analysis and one subsurface soil sample for inorganic analysis will be collected from each soil boring at the site because of the reportedly shallow depth to the water table.

Continuous split-spoon or direct-push samples will be collected from each soil boring. Upon retrieval of the soil sampling device, each sample shall be screened for organic vapors using a photoionization detector (PID) and for mercury using a mercury vapor analyzer (MVA). Calibrating procedures and instructions for using a PID and MVA are provided in Section 2.9.

For each sample interval, when screening results are above the background levels, a soil sample will be collected and temporarily archived for possible chemical analysis. With the exception of soil samples collected for VOC analysis, each sample collected will be stored in one or more "ziplock" bags. Archive samples for VOC analysis will be collected using the EnCore™ Sampler. Each sample will be labeled and stored appropriately on ice until all of the screening results are evaluation.

One organic and one inorganic archived sample from each soil boring will be submitted to the laboratory for analysis, based on the screening readings, discoloration, or odor. Archived samples selected for chemical analysis will be immediately transferred to the appropriate laboratory bottles and stored and handled according to procedures outlined in Section 2.8. The remaining archived samples will be handled in the same manner as the drill cuttings from each soil boring. If contamination is not evident from the field screening, soil samples will not be archived and the laboratory sample will be collected from just above the water table and submitted for analysis.

If analysis for volatile organic compounds is to be performed on a soil sample collected from a particular sampling depth, then the sample for VOC analysis will be collected before the other samples using the collection procedure described in Section 2.2.5 - Collection of Soil Samples for the Analysis of Volatile Organic Compounds. The remaining soil will be collected for the other analyses with a decontaminated stainless steel spoon or scoop (or equivalent sampling device), placed in a decontaminated stainless steel pan, and homogenized. The homogenized sample will then be placed in the appropriate sample bottles. In addition, soil samples will be observed for physical properties such as color, sorting, etc. This information will be recorded in a field boring log. Soil logging procedures are provided in Section 2.2.4. Sampling equipment shall be disposed of or decontaminated after the collection of each sample in accordance with the procedures outlined in Section 2.5.

Due to limited knowledge of site conditions, the default drilling method selected for the field investigation is hollow-stem auger drilling for each boring location where a monitoring well will be installed and at locations for deeper borings for stratigraphic investigation. Direct-push techniques will be used at the other boring locations unless conditions such as difficult drilling conditions warrant using hollow-stem auger drilling. In addition, portable drill rigs, such as tripod rigs, may be required to collect soil samples along the steep banks of South Branch Creek. The final decision to change drilling methods will be based on the drilling contractor's and environmental consultant's experience with concurrence by the USEPA.

2.2.3 Soil Boring Procedures

Soil borings will be advanced using either hollow-stem auger drilling methods, direct-push techniques or both, depending on the site logistics and the sampling objectives at a given area of concern. Soil samples will be collected from the borings using split-spoon samplers (auger rig) or macro-core samplers with dedicated acetate liners (direct-push rig). The project driller will be responsible for obtaining the required drilling permits for the RVFS investigation.

2.2.3.1 Hollow-Stem Auger Methods

Drilling with a hollow-stem auger is a standard method of subsurface drilling which allows the recovery of representative subsurface samples for identification and laboratory testing. Continuous 2-ft split-spoon samples will be collected from each soil boring. Samples from each spoon will be screened in the field using an HNU-model PI-101 PID and a Jerome 43 1-X MVA, or equivalent instruments. PID and MVA readings for each sample interval will be recorded on a field log. The samples that show the greatest signs of contamination (i.e., elevated PID or MVA readings, discoloration, odor, etc.) will be submitted for analyses. If contamination is not evident from the field screening, then the default sampling depth for soil samples submitted for laboratory analyses will be just above the water table.

When advancing borings using the hollow-stem auger drilling method, 41/4-inch inner diameter (ID) augers will be used. This will result in a borehole diameter that is greater than eight inches, or at least four inches larger than the outside diameter of the casing and well screen in the event that a two-inch diameter monitoring well is to be installed. These specifications are in accordance with NJDEP regulations for the installation of monitoring wells. The borings will be advanced by rotating the augers to the desired depth into the subsurface soils. The borings will be advanced incrementally to permit continuous soil sampling, as required. If heaving sands are encountered, clean potable water will be added to maintain a positive hydraulic head inside the auger.

The drilling rig will be set up and operated in accordance with standard drilling practices and in a manner that will promote the safe and efficient operation of the equipment. The project driller will be a certified test borer and New Jersey-licensed well driller. Safety considerations during equipment operation are addressed in the RIES HASP (Part III of the Field Operations Plan).

The equipment used in the drilling operations will be steam cleaned upon arrival at the site. The equipment and tools that come in contact with soil during drilling will be decontaminated before resampling, before moving to the next drilling location, or before leaving the project site. A source of water to be used for decontamination has not been identified yet, but will likely be water supplied by the City of Linden. The water source may include on-site faucets, the neighboring ISP site, or hydrants owned by the city of Linden. Documentation of the quality of clean potable water to be used for drilling will be submitted to the USEPA or a designated USEPA representative prior to use once a source is identified. Decontamination procedures are described in Section 2.5.

Subsurface soil samples will be continuously collected with a two-inch diameter split-spoon in accordance with American Society for Testing and Materials (ASTM) D-1586-99 methods. Specifically, the following steps will be followed during split-spoon sampling:

1. Measure the sampling equipment lengths and diameters to document that they conform to specifications.
2. Remove the center plug from the augers prior to sampling.
3. Lower the sampler to the bottom of the auger column and check the depth against length of the rods and the sampler to ensure the sampler has not penetrated below the augers under its own weight.
4. Attach the drive head sub and hammer to the drill rods without the weight resting on the rods.
5. Lower the weight and allow the sampler to settle up to 6 inches. If it settles more, consider use of another sampler.
6. Mark four 6-inch intervals on the drill rods relative to a drive reference point on the rig. With the sampler resting on the bottom of the hole, drive the sampler with the 140 lb hammer falling freely 30 inches until 24 inches have been penetrated or 100 blows applied.

7. Record the number of blows per 6 inches.
8. Remove the sampler from the augers, open it, and describe the soil according to the procedures described below. Record the length of the sample recovered.
9. The "N" value, if required for geotechnical purposes, can be calculated by adding the blows from the 6-12 inch and the 12-18 inch interval of each sample attempt.
10. Screen the sample with a PID and a MVA and record the readings. Perform head space screening of the sample as described in Section 2.2.6.
11. Collect soil samples. The soil sample selected for laboratory analysis in a given boring will be the sample with the highest PID reading, MVA reading, or visual/olfactory signs of contamination if instrument readings are background. If the field screening readings in the boring are background, then the sample collected directly above the water table will be sent to the laboratory for analysis. Additional detail on the selection of soil sample for analysis is given in Section 2.2.6 - Field Screening (Head Space) of Soil Samples.
12. Decontaminate split-spoon sampler before using again as described in Section 2.5.

The drillers will be instructed that the boring must be advanced by drilling with the auger bit between the collection of split-spoon samples. This will allow the field inspector to maintain good depth control of samples. The collection of consecutive split-spoons samples will not be permitted except in the case of borings advanced through concrete pads or floor slabs (where the small diameter of the opening in the concrete will prevent the use of augers). This will minimize the chance of sampling slough or wash cuttings, which are not representative of subsurface conditions.

2.2.3.2 Direct-Push Techniques

Depending on site logistics, a direct-push rig may be used to advance borings. Continuous soil samples will be collected from each soil boring using a 4-ft macro-core sampler with a dedicated, clean acetate liner. Each 2-ft portion of soil sample in the 4-ft macro-core sampler will be treated separately to maintain a 2-ft sampling interval for the direct-push boring. Samples from each macro core will be screened in the field and in each area of concern, the samples that show the greatest signs of contamination (i.e., elevated PID or mercury vapor analyzer reading, discoloration, odor, etc.) will be submitted for analyses. If contamination is not evident from the field screening, then the default sampling depth for soil samples submitted for laboratory analyses will be just above the water table.

The direct-push rig (e.g., GeoProbe®, Humcane, etc.) will be set up and operated in accordance with standard drilling practices and in a manner that will promote the safe and efficient operation of the equipment. The project driller will be a certified test borer and New Jersey-licensed well driller. Safety considerations during equipment operation are addressed in the RI/FS HASP (Part III of the Field Operations Plan).

The equipment used in the direct-push operations will be steam cleaned upon arrival at the site. The equipment and tools that come in contact with soil during drilling will be decontaminated before resampling, before moving to the next drilling location, or before leaving the project site. Decontamination procedures are described in Section 2.5.

The general procedures for direct-push sampling are provided below:

1. Clear the area of vegetation and any large surface debris such as rocks that may inhibit sampling and to allow passage of the vehicle on which the equipment is mounted.

2. Before direct-push sampling, a decontaminated trowel may be used to collect a soil Sample from the 0 ft to 0.5 ft below ground surface (bgs) interval if required. Insert a dedicated, hollow acetate liner into the tube sampler and attach the tube sampler to the drill rods (or, if appropriate for the site conditions, a decontaminated split-spoon sampler may be used).
3. Push the sampler to the desired depth. If an obstruction is encountered, offset the location and record the exact direction and location in the project field book.
4. Retrieve the sampler.
5. On a level surface spread out plastic sheeting. Slide the plastic liner out of the tube sampler and place it on the plastic sheeting. Split open the plastic liner with a decontaminated knife or razor to expose the sample.
6. Screen the sample for the presence of contamination through visual and olfactory observation, for organic vapors using a PID, and for mercury vapor using a MVA. To obtain the most representative vapor reading, use a decontaminated stainless steel spoon, knife or other appropriately constructed device to score the length of the core surface or make cross sectional slices to a depth that exposes porous soil. Simultaneously, first move the probe of the PID slowly above the lateral scoring (or into the opened areas being careful not to touch the sample) and record the results. Use the MVA next, using the same procedure as for the PID.
7. After the boring is complete, place the soil not used for analyses back into the sampling borehole.
8. Decontaminate the direct-push sampling equipment.

2.2.3.3 Stratigraphic Borings

Seven stratigraphic borings will be advanced to provide information about site geology. A soil boring will be advanced to a depth of about 25 feet below ground surface at three areas of concern closest to the brine sludge lagoon. Deeper borings are not required in these areas at this time because bedrock borings were already advanced here and the general stratigraphy is known. Four additional borings will be advanced to bedrock in the west portion of the site. The data collected from the seven stratigraphic borings will be used to further develop the current geologic model of the site.

The general procedures for the stratigraphic borings will be to advance the borings using hollow-stem auger techniques to maintain accurate depth information for each sample. Continuous split-spoon samples will be collected through the upper strata (fill material) and through the upper-most layer of native soils, inferred to be marsh-type deposits. Once the marsh deposits are penetrated, split-spoon samples will be collected at five foot intervals until a depth of about 25 feet below ground surface or until bedrock is reached, depending on the location of the stratigraphic boring. Refusal of the borer, presence of weathered bedrock in the tip of the split spoon, and the judgment of the field inspector will be used as indicators that the top of bedrock has been reached. Samples for laboratory analyses will not be collected from the stratigraphic borings. Once completed, the stratigraphic borings will be sealed in accordance with the procedures described in Section 2.2.7 - Borehole Sealing.

2.2.3.4 Cased Deep Borings

Section 2.2.3.4. inserted from FOP Addendum No. 1 (Brown and Caldwell, October 2001)

Boreholes to be drilled below the Tidal March Deposits will be advanced as cased boring to minimize vertical migration during the drilling process. Each deep borehole will be initially advanced through the fill and approximately two feet (2') into the underlying Tidal Marsh Deposits with the use of hollow stem augers. Split-tube ("split-spoon") samples will be collected within the encountered materials at the depth intervals as specified in the Work Plan.

A permanent casing will be installed through the augers that will be terminated within the Tidal Marsh Deposits. The casing will consist of pipe, e.g., four-inch (4") diameter PVC pipe that is grouted into place. The actual casing material and size will be dependent upon the specific drilling equipment that is employed. The annular space around the casing will be sealed with cement/bentonite grout by the tremie method as the augers are removed from the borehole following the procedure as described in Section 2.2.7.

In the event that the Tidal Marsh Deposits are apparently absent at a particular location, the casing will still be installed through the fill to minimize vertical migration of contaminants during the drilling process. In this case, the casing will be installed below the fill at the depth where the Tidal Marsh Deposits were observed in nearby boreholes.

After the grout has set, the boring will be resumed through the casing. This will include drilling through the remaining Tidal Marsh Deposits and into the underlying Glacial Till using the water-rotary drilling method. Drilling mud will be used, as necessary, to maintain the integrity of the borehole during the drilling process.

Split-tube soil samples will be collected at the intervals, as specified in the Work Plan. Upon completion, the entire borehole, including the casing will be sealed with cement/bentonite grout by the tremie method as described in Section 2.2.7. The handling of the drill cuttings and fluids from the portion of the borehole drilled by the water-rotary method are described in Section 2.6.

2.2.3.5 Subsurface Conditions Beneath Building Nos. 230 and 240

Section 2.2.3.5 inserted from FOP Addendum No. 3 (Brown and Caldwell, March 2002)

The LCP site has been constructed on fill soil that has been placed over the Marine Tidal Marsh Deposit soils. The geotechnical characteristics of these underlying soils dictate the use of pile foundations for each of the buildings and other structures at the site. A review of available engineering design drawings has been performed in order to determine the locations of various subsurface foundation elements for Building Nos. 230 and 240 and the adjacent transformer and rectifier pads. Particular attention has been paid to the location of the foundation piles. The material of construction of the piles is not known, although there is a reasonable likelihood that they are made of wood.

It is likely that the fill soil beneath the concrete slabs in each building has settled since the construction of the buildings. Accordingly, it is presumed that there is a void space beneath each of the building slabs. The height of these voids is not known.

The subsurface components of the foundations for each pertinent structure are described briefly below.

- **Building No. 230** - Foundation details for Building No. 230 are depicted on Drawing No. D-411 [FD-5155]. Closely spaced pile clusters (4 to 15 in a cluster/cap) are located beneath each wall column. Pile caps along the exterior walls are tied together with concrete grade beams that extend below the ground surface. The thickness of the floor slab is estimated to be 1.5 feet and the thickness of the floor slab and pile cap combined is estimated to be 4.0 feet.
- **Previous Transformer and Rectifier Pads – Building No. 230** - An array of foundation pads previously existed immediately west of Building No. 230 (Drawing No. D-418 [FD-5216]) in a configuration that was different than the currently existing pads. It is likely that piles for these pads were not removed upon the construction of the current pads. The location of these olds piles is not known.
- **Existing Transformer and Rectifier Pads – Building No. 230** - An array of equipment pads currently exists immediately west of Building No. 230 (Drawing No. D416 [FD-5160]) that is different than the

previous transformer and rectifier pads depicted on Drawing No. 418. The locations of the piles beneath the existing transformer and rectifiers pads west of Building No. 230 are depicted on Drawing No. D416.

- **Building No. 240** - Foundation details for Building No. 240 are depicted on Drawing Nos. H-5058 and H-5059, as presented in the back pocket. Concrete pile caps located beneath the floor are depicted on these drawings. Pile caps along exterior walls are tied together with concrete grade beams that extend below the ground surface. The depth of these grade beams is not known. The thickness of the floor slab is estimated to be 1.5 feet and the thickness of the floor slab and pile cap combined is estimated to be 4.0 feet.
- **Transformer and Rectifier Pads – Building No. 240** - An array of equipment pads located immediately west of Building 240 are depicted on the areal topographic survey. No engineering design drawings depicting the locations of piles have been found.

It should be noted that the aforementioned engineering design drawings provide a valuable tool for decision-making regarding the horizontal borings. However, some uncertainly still exists with regard to subsurface conditions due to limitations of the referenced drawings, as follows:

- The drawings are engineering design drawings and do not represent actual "as-built" conditions.
- The drawings to not include all pertinent foundation details.
- Drawings are not available for all pertinent areas.

Based on these limitations, test excavations will be used to address specific areas of uncertainty, as described in the following section.

2.2.3.6 Test Excavations

Section 2.2.3.6 inserted from FOP Addendum No. 3 (Brown and Caldwell, March 2002)

Test excavations will be used in an attempt to clarify specific issues with regard to foundation elements beneath the buildings and adjacent concrete transformer pads. The test excavations will be performed using a small backhoe. The backhoe will be operated in a manner that will promote the safe and efficient operation of the equipment. The equipment used for the test excavations will be steam cleaned before leaving the project site. Decontamination procedures are described in Section 2.5 of the existing FOP.

It is intended that the test excavations will be employed in the following areas to:

- Determine the depth of the grade beam adjacent to each of the inclined borings and horizontal borings.
- Determine the thickness of the transformer pads in the area of the horizontal borings adjacent to Building Nos. 230 and 240.
- Attempt to excavate beneath the transformer pads adjacent to Building No. 240 in order to determine the locations of the supporting piles.

In no case will test excavations be performed in the areas immediately above the horizontal borings. The general procedures for test excavations are provided below:

1. Excavate the soil immediately adjacent or beneath the building foundation and/or concrete pads to the necessary depth to view the subsurface piles.

2. For excavations below the water table, water that accumulates with the test excavation will be pumped out using a suitable pump, as required. If the water does not have an observable sheen or odor and if the PID readings of the water remain at background levels, the water will be discharged to the ground surface and allowed to percolate back to the groundwater system. The water will not be discharged to the ground in areas where it may run off the site. If the water has signs of gross contamination, it will be collected in U.S. Department of Transportation (DOT) approved (or equivalent) 55-gallon drums and stored at the site staging area. These suspected fluids would be analyzed to determine their toxicity characteristics. After the analytical results are received, these fluids will be disposed of in accordance with applicable local, state, and federal regulations.
3. Mark the location of the subsurface piles on the building or concrete slabs.
4. After the excavation is complete, place the soil back into the test excavation.
5. Place clean gravel at the test excavation locations upon completion to minimize subsequent contact with the newly exposed soil.
6. Decontaminate the excavating equipment before it is removed from the site.

2.2.3.7 Wet-Rotary Drilling Methods

Section 2.2.3.7 inserted from FOP Addendum No. 4 (Brown and Caldwell, October 2006)

Drilling with wet-rotary drilling methods will allow the installation of multiple casings within each deep borehole. In addition, this method allows the use of conventional soil and rock sample collection methods to provide samples for visual identification and laboratory testing. In the event that evidence of free, metallic mercury is observed in the split-barrel samples while drilling the borehole, drilling will immediately be discontinued and the borehole will be sealed. The drill rig will then move laterally and the well drilling will be resumed.

Continuous soil sample collection will be performed in each boring with the use of a 2-foot, split tube sampler. Samples from each split-tube sample will be screened in the field and the samples showing the greatest signs of contamination (e.g., elevated PID or MVA readings, discoloration, odor, etc.) will be submitted for analyses. If contamination is not evident from the field screening, then the default interval will be the base of each stratigraphic unit, with the exception of the fill. The default collection depth for the fill will be just above the water table.

When advancing borings using the wet-rotary drilling method, the borehole diameter will be sized in accordance with the NJDEP requirements (i.e., 2-inch minimum annular space) for the installation of monitoring wells and with the top-of-bedrock well requirements provided in Section 2.3.1.1.

The drilling rig will be set up and operated in accordance with standard drilling practices and in a manner that will promote the safe and efficient operation of the equipment. The project driller will be a New Jersey-licensed well driller. Safety considerations during equipment operation are addressed in the HASP.

The equipment used in the drilling operations will be steam cleaned upon arrival at the site. The equipment and tools that come in contact with soil during drilling will be decontaminated in accordance with Section 2.5 of the FOP.

Split-barrel soil samples will be collected at the intervals, as specified in the Work Plan. Subsurface soil samples will be continuously collected with a two-inch diameter split-barrel in accordance with American Society for Testing and Materials (ASTM) D-1586 methods.

The drillers will be instructed that the boring must be advanced by wet-rotary methods between the collection of each split tube sample (per ASTM D-1586). This will allow the field inspector to maintain good depth control of samples. This will minimize the chance of sampling slough or wash cuttings, which are not representative of subsurface conditions.

Upon completion, the entire borehole, including the casing will be sealed with cement/bentonite grout by the tremie method as described in Section 2.2.7. The handling of the drill cuttings and fluids from the portion of the borehole drilled by the water-rotary method are described in Section 2.6.1.

2.2.3.8 Inclined Conventional Borings

Section 2.2.3.8 inserted from FOP Addendum No. 3 (Brown and Caldwell, March 2002)

Three (3) inclined conventional borings will be performed near the eastern edge of the exterior of the buildings to characterize the soil fill conditions beneath the concrete pads or floor slabs of the buildings. The inclined borings will be performed by the direct push technique or the hollow-stem auger drilling method with angle drilling capabilities following the methods as described in Sections 2.2.3.2 and 2.2.3.1, respectively, of the existing FOP. The maximum angle of the inclined borings is 45° for either the direct push or the hollow-stem auger technique.

Soil samples will be collected continuously through the fill to the top of Tidal Marsh Deposit (if present). If the Tidal Marsh Deposit is not present, then the default boring depth will be to the top of native soils. Regardless of the stratigraphy, each boring will be advanced at least to the depth of the water table, which is assumed to be within the fill unit.

Soil samples from the 4.0 to 4.5 ft interval, which corresponds to the interval directly below the estimated combined depth of the concrete floor slab and pile cap or the grade beam, will be collected for laboratory analysis for TCL/TAL parameters. One (1) additional sample may be submitted from each boring for laboratory analysis for TCL/TAL parameters, if field screening indicates elevated levels of mercury and/or organic vapors and/or obvious visual or olfactory signs of contamination. The sample depth will be adjusted, as applicable, if additional information reveals the depth of the floor slab and/or the building foundation to be incompatible with a 4.0 to 4.5 ft interval.

The drilling contractor will be responsible for contacting the New Jersey "One-Call" System prior to performing any subsurface drilling work. Supplemental utility clearance will be performed in the vicinity of each drilling location in addition to the "One-Call" notifications, as described in Addendum No. 2 to the FOP.

Soil Sample Collection Locations

The inclined conventional borings are described as follows:

- Boring IB-1 inclined conventional boring will be drilled in close proximity to the eastern edge between Buildings 220 and 230.
- Boring IB-2 inclined conventional boring will be drilled in close proximity to Building 230 on the eastern edge of the exterior of the building.
- Boring IB-3 inclined conventional boring will be drilled in close proximity to Building 240 on the eastern edge of the exterior of the building, north of the southern addition to Building 240.

2.2.3.9 Horizontal Borings

Section 2.2.3.9 inserted from FOP Addendum No. 3 (Brown and Caldwell, March 2002)

Horizontal borings will be drilled beneath Building Nos. 230 and 240 to characterize the soil fill conditions. The borings will start from the ground surface outside of the buildings, entering the ground at an angle and proceeding downward until the necessary depth is attained. The bore's path is then leveled, and the bore head is steered to the desired completion point.

The drilling will be performed using a horizontal drill rig (Ditch Witch Model No. JT 2720 or JT 4020 manufactured by The Charles Machine Works). The drilling is advanced using a rotary technique developed for, and commonly used in the underground utility industry. A bentonite slurry is used to stabilize the borehole and to remove cuttings.

The sample locations for each borehole are predetermined as three-dimensional points in space. Accordingly, the drilling assembly is steered to the predetermined point in both the vertical and horizontal plane. Drill head depth and location can be monitored by electronic tracking equipment, which also provides information necessary for making steering adjustments. Sections of drill stem are added as the bore progresses.

A horizontal soil sampler tool manufactured by Ditch Witch® Environmental Systems will be used to obtain discrete-interval samples. The sampler can collect a two-inch (2") diameter sample that is one foot (1') in length. The sampler will be decontaminated prior to each use to allow the collection of representative samples for chemical analysis and geologic evaluation at each intended interval following the decontamination method as described in Section 2.5 of the existing FOP.

The soil samples are collected by advancing the borehole to a point approximately two to three feet (2 to 3') from the desired sample location. The drilling assembly is removed from the borehole and the soil sample tool is attached to the drill string. The tool is then reinserted into the hole and pushed back to the sample location. Once the end of the borehole is reached, the sample tool is then pushed to the undisturbed formation and then retracted slightly to trigger the sampler to open. The open soil sampler is then pushed forward approximately one foot (1') further into the undisturbed soil to collect the soil sample. The drill string is then pulled out of the hole and the sample is recovered. If another sample is required along the same axis, the drill head is fitted back onto the drill string and the drilling assembly is then drilled to the next target and the procedure is repeated. If a sample is required at a deeper depth at the same location, the drilling head is retracted and the hole may be "side tracked" to the deeper depth. The hole is then drilled back to the target location and once again the sample procedure is repeated.

The drill head is normally tracked and steered using radio detection, where the drill head is tracked from above the boring and alignment readings are taken every ten feet (10'). The utility of the radio tracking will be limited at the LCP site, however, given the access limitations in the buildings and the likely presence of reinforcing steel in the thick concrete slab. In order to address this limitation, it is intended to initiate each boring on a straight and level course prior to drilling beneath the buildings. The borings will be computer-controlled on a straight and level line to the extent possible beneath the buildings using the radio data that can be received from the drill tool. This is anticipated to allow the collection of samples within a reasonable range of the proposed locations.

The horizontal borings will be sealed after completion to prevent contaminant migration. Sealing will be achieved by backfilling the borehole with bentonite slurry. The bentonite will be pumped into the borehole as the drill string is removed from the borehole.

Efforts will be made to avoid drilling into the piles and other subsurface foundation materials on which the buildings and exterior transformer pads are supported. This has been accomplished by a review of historic building design drawings that provide information regarding the subsurface piles and other subsurface details. Other visible structural clues have also been considered regarding the piles including the positions of columns, and other structural details. Additionally, test excavations will be performed around the building foundation and concrete equipment pads in an attempt to locate the subsurface piles and other subsurface details. The boring locations, as described below, have been determined based on the aforementioned foundation information.

The drilling or excavation contractor will be responsible for contacting the New Jersey "One-Call" System prior to performing any subsurface drilling or excavation work. Supplemental utility clearance will be performed in the vicinity of each drilling location in addition to the "One-Call" notifications, as described in Addendum No. 2 to the FOP.

Soil Sample Collection Locations

The horizontal boring locations, described below, have been designed to provide optimum sample placement within the constraints of the subsurface conditions. This is based on the site reconnaissance and the review of the available engineering design drawings. If the locations described below are found to be inaccessible based on field conditions or observations, an immediate field decision to relocate the boring will be made in consultation with the on-site USEPA oversight person.

The horizontal drilling will be performed on west to east trending borings starting at points located approximately 30 feet from the west side of Bldg. Nos. 230 and 240. The bores will be advanced as described below:

- A "shallow" borehole, HB-1, approximately 13 feet long, will be advanced along the northwestern portion of Building No. 230 that encounters the former "sump area". This bore will be advanced as close to the bottom of the slab as conditions allow. Samples will be collected from the western and eastern edges of the former sump (approximately 4.5 ft and 13 ft from the interior wall).

  The structural conditions that have been considered to locate this boring include the locations of the piles beneath the stairwell and foundation of Building 230, as depicted on Drawing No. D-411 (FD-5155).
- A "deep" horizontal borehole, HB-2, approximately 13 feet long, will be advanced beneath Building No. 230 parallel and approximately five feet (5') beneath the first bore that will encounter the former "sump area". It is intended that this boring will be advanced as close to the base of the fill as possible with samples collected from the western and eastern edges of the sump (approximately 4.5 ft and 13 ft from the interior wall).

  The structural conditions that have been considered to locate this boring are the locations of the piles beneath the stairwell and foundation of Building 230, as depicted on Drawing No. D-411 (FD-5155). It will not be possible to extend this boring beyond the sump to the east, as was intended, due to the presence of piles.
- A "shallow" borehole, HB-3, approximately 100 feet long, will be advanced within Building No. 230 between the trench and the common wall between Building Nos. 230 and 240 with samples collected at approximately 25-foot intervals. This bore will be advanced as close to the bottom of the slab as conditions allow.

The structural conditions that have been considered to locate this boring are the piles located beneath the transformer and rectifier pads west of Building No. 230, the piles beneath the foundation and floor, including the piles located in close proximity to the trench, as depicted on Drawing Nos. D-411 [FD-5155] and D-416 [FD-5160].

- A "shallow" borehole, HB-4, approximately 100 feet long, will be advanced approximately 25 feet south of the division between Bldg. Nos. 230 and 240 with samples collected at approximately 25-foot intervals.

  This bore will be advanced immediately below the slab. The structural conditions that have been considered to select the location of this boring are the piles located beneath the rectifier pads west of Building 240 and the piles beneath the foundation and floor, including those beneath the common wall between Building Nos. 230 and 240, as depicted on Drawing Nos. H-5058 and D-411 [FD-5155]. It will not be possible to advance the boring directly beneath the division between the buildings, as was intended, due the presence of a large number of piles below the side supports for the buildings.
- A "shallow" borehole, HB-5, approximately 100 feet long, will be advanced within the center of Building No. 240 with samples collected at approximately 25-foot intervals.

  The structural conditions that have been considered to select the location of this boring are the piles located beneath the rectifier pads west of Building 240 and the piles beneath the foundation and floor, including those in close proximity to the trench, as depicted on Drawing No. H-5058.
- A "shallow" borehole, HB-6, approximately 75 feet long, will be advanced beneath the southern addition to Building No. 240 with samples collected at approximately 25-foot intervals.

  The structural conditions that have been considered to locate this boring are the unknown locations of piles beneath the "shed", the piles beneath the foundation and floor, as depicted on Drawing No. H-5059, and the active Elizabethtown Water Company water main located partially below ground surface in this area.
- A "shallow" borehole, HB-7, approximately 6 feet long, will be advanced along the northwestern portion of Building No. 240 that encounters the former "sump area". This bore will be advanced as close to the bottom of the slab as conditions allow with a sample collected beneath the middle of the former sump.

  The structural conditions that have been considered to locate this boring are the rectifier pads west of Building No. 240 and the piles beneath the foundation and floor, including those beneath the common wall between Building Nos. 230 and 240, as depicted on Drawing Nos. H-5058 and D-411 [FD-5155]. It will not be possible to extend this boring further east due to the presence of piles.
- Additional deep, horizontal boreholes will be drilled, as required, based on the field screening results and visual character of samples from the shallow boreholes. The locations of these borings would be made in consultation with USEPA.

Each of the soil samples will be field screened using a PID and a MVA as described in Section 2.2.6 of the existing FOP. The horizontal drilling program will result in the collection of approximately 20 samples for laboratory analysis of TCL/TAL parameters. This number of samples for laboratory analysis exceeds that as prescribed in the Work Plan. However, no laboratory analysis for mercury will be performed on samples containing visible metallic mercury, consistent with previous RI work.

2.2.3.10 Field QA/QC Samples

Section 2.2.3.10 inserted from FOP Addendum No. 3 (Brown and Caldwell, March 2002)

Field QA/QC samples will be collected in accordance with Section 2.8 of the FOP. These samples will consist of:

- One field blank sample will be prepared per matrix for each day that samples are collected.
- Five percent of the samples collected shall be field duplicates (one duplicate for every 20 samples).
- A temperature blank will be used in each sample shuttle to measure the temperature of the samples upon shipment arrival to the laboratory.
- Matrix spike/matrix spike duplicate samples (MS/MSDs) will be analyzed for each matrix for every 20 environmental samples (five percent) or one per batch.

2.2.3.11 Penetrating Concrete Pads or Floor Slabs

To collect soil samples beneath concrete pads or the floor slabs of buildings, a portable electric or gas-powered core drilling machine will be used to core an access hole having a minimum diameter of 6 inches. Water will be used to wet the work area as required to prevent the generation of dust. Once the concrete core is removed, the soil beneath the slab will be collected for screening or analysis using a split-spoon sampler. Once the sample is collected from the required depth, the hole will be backfilled with the original soil and the core hole in the concrete slab will be grouted, from the bottom of the slab to the top, to seal the hole and to prevent surface water or debris from entering it.

If an electric core drilling machine is not suitable for the job because of excessive slab thickness or because of the presence of metal reinforcing bars within the slab, a jackhammer or similar pneumatic device will be used to penetrate the slab. Regardless of the equipment used, dust generation will be minimized with the application of water and the hole in the slab will be repaired with grout or patched with quick-drying cement.

2.2.4 Logging of Soil Borings

Soil samples will be described by the field inspector. The format for describing a soil sample will be in accordance with ASTM D2488-93: Standard Practice for Description and Identification of Soils (Visual-Manual Procedure) and consistent with ASTM D2487-98: Standard Classification of Soils for Engineering Purposes (Unified Soil Classification System).

A record of significant information related to drilling operations for each boring will be maintained as the boring advances. This information will be recorded on a field boring log. The following information will also be recorded on the log:

- Names of soil materials shall follow the name of the predominant particle size (e.g., clay, silt, sand).
- The grain size and name of the deposit shall be accompanied by the predominant mineral content, accessory minerals, color, moisture, density, plasticity, odor, particle angularity, and other characteristics.
- Symbols of the Unified Soil Classification System (USCS) will be included with the description.

Unified Soil Classification System

Soils are classified for engineering purposes according to the USCS adopted by the U.S. Corps of Engineers and Bureau of Reclamation. The following soil properties form the basis for the USCS:

- Percentage of gravel, sand, and fines
- Shape of the grain-size distribution curve
- Plasticity and compressibility characteristics

According to this system, all soils are divided into three major groups: coarse-grained, fine-grained, and highly organic (peat). The boundary between coarse-grained and fine-grained soils is taken to be the 200-mesh sieve. In the field, this distinction is based on whether the individual particles can be seen with the unaided eye. If more than 50% of the soil by weight is judged to consist of grains that can be distinguished separately, the soil is considered to be coarse-grained.

The coarse-grained soils are divided into gravelly (G) or sandy (S), depending on whether more or less than 50% of the visible grains are larger than the No. 4 sieve (3116 inch). They are each divided further into four groups:

W: Well graded; fairly clean (<5% finer than 0.074 mm)

P: Poorly graded (gap-graded); fairly clean (~ 5 %finer than 0.074 mm)

C: Clayey (42% finer than 0.074 mm); plastic (clayey) fines. Fine fraction above a line with plasticity index above 7.

M: Silty (>12%finer than 0.074 mm); non-plastic or silty fines. Fine fraction below a line with plasticity index below 4.

The soils are represented by symbols such as GW or SP. Borderline materials are represented by a double symbol, as GW-GC.

The fine-grained soils are divided into three groups: inorganic silts (M), inorganic clays (C), and organic silts and clays (O). The soils are divided further into those having liquid limits lower than 50% (L), or higher (H).

The distinction between the inorganic clays C and the inorganic silts M, and organic soils O is made on the basis of a modified plasticity chart. Soils CH and CL are represented by points above the line, whereas soil OH, OL, and MH correspond to positions below the line. Soil ML, except for a few clayey fine sands, are also represented by points below the line. The organic soils 0 are distinguished from the inorganic soils M and C by their characteristics odor and dark color.

Visual Identification

Soil properties required to define the USCS are the primary features to be considered in field identification. These properties and other observed characteristics normally identified in describing a soil are:

a. Color

b. Moisture conditions

c. Grain size
   1 Estimated maximum grain size
   2 Estimated percent by weight of fines (material passing No. 200 sieve)
d. Gradation (Sorting)
e. Grain shape
f. Plasticity
g. Predominant soil type
h. Secondary components of soil
i. Classification symbol
j. Other features such as:
   1 Organic, chemical, or metallic content
   2 Compactness
   3 Consistency
   4 Cohesiveness near plastic limit
   5 Dry strength
   6 Source-native or transported (aeolian, waterborne, glacial deposit, etc.)

2.2.5 Collection of Soil Samples for Analyses of Volatile Organic Compounds

Soil samples that will be analyzed for VOCs will be collected in accordance with the procedures outlined in USEPA Method 5035. This method allows the use of an air-tight, hemetically-sealed vial to collect the soil sample. The seal of the vial is never broken from the time of sampling to the time of analysis. A patented tool called the EnCore™ Sampler (approved by the USEPA) will be used to collect soil samples for VOC analyses.

Encore™ Sampling Procedure

Soil sample collection for VOC shall be performed with the use of the EnCore™ sampler. The sample collection procedure for soil volatiles using the EnCore™ sampler is as follows:

1. Collect three EnCore™ samples and one percent moisture sample (60ml wide mouth glass container with no head space) for each sample point location.
2. Remove the sampler and cap from the EnCore™ package and attach the T-handle to the sampler body.
3. Turn the handle and coring body down, to position the plunger so that the bottom is flush with the bottom of the freshly exposed surface of soil (ground surface or soil core sample). Quickly push the sampler into the soil until the coring body is completely full. When full, the small o-ring will be centered in the handle viewing hole. Remove the sampler from the soil and scrape any excess soil flush with the edge of the sampler using a dedicated decontaminated stainless steel trowel.
4. Use a paper towel to quickly and carefully wipe the sampler head so that the cap can be tightly attached and sealed.
5. To attach the cap, push the cap on with a twisting motion. The cap is properly sealed when the two locking arms are completely seated over the ridge on the body of the sampler.
6. Record the sample identification and time in the field book or log.

7. Complete the sample label on the EnCore™ zipper lock package.
8. Fill in the sample identification number on the self-adhesive label attached beneath the sample label on the EnCore™ package.
9. Tear the self-adhesive label at the perforation and attach the label to the rim of the sampler cap.
10. Place the sampler back into the EnCore™ zipper lock package and seal the zipper lock. The sample label is placed over the opening of the EnCore™ zipper lock package to ensure sample integrity.
11. Repeat the procedure above for the other two samplers.
12. Once all three samplers have been filled, labeled and packaged, place the three EnCore™ packages into one large zipper lock bag with a completed sample tag.
13. Collect the percent moisture sample in a separate sample container (60ml wide mouth glass container). Label the container with the sample designation.
14. Store the samples in a cooler with bagged ice to maintain 4 degrees Celsius while storing on site and during shipment to the laboratory.
15. Samples must be shipped off site to the laboratory within 24 hours.
16. Samples must be received by the laboratory for preservation and preparation for extraction within 2 days from the date of sample collection.

2.2.6 Field Screening of Soil Samples

Field screening methods will be used to screen soils for VOC or mercury contamination. Soil samples will be screened at 2-ft intervals, regardless of whether a 2-ft split-spoon sampler or 4-ft macro core sampler is used. In each area of concern, the sample showing the highest field screening result for VOCs and the sample showing the highest result for mercury will be submitted for laboratory analyses. The field screening procedures are described below.

Volatile Organic Compounds

After a PID (HNU model PI-101, or equivalent) is calibrated (Section 2.9), it is ready to be used. A baseline scan (i.e., scan on "clean air", "clean water" or "clean soil", as appropriate) should be run each day before analyzing site samples and the results recorded.

A background meter reading will be obtained and recorded at the time of field screening. If a concentration above several parts per million (ppm) is detected as background, the source of the reading will be investigated and controlled, if possible, or other appropriate actions taken as provided for in the RI/FS HASP.

The following general procedures will be used to screen for organic vapors using a PID:

- With the calibrated PID turned on, hold the tip of the probe extension approximately one inch from the material being screened. Special care must be exercised not to place the probe extension into the sample or close enough for any soil particles or liquid to be drawn into the probe and contaminate the probe. *(Note: For health and safety procedures, the probe is generally located in the breathing zone for determination of the level of personal protection required.)*
- Hold the tip of the probe extension above the sample being screened for at least ten seconds or long enough for the instrument readings to stabilize so a reliable reading is obtained.

- Record PID readings either manually on the appropriate field data forms (e.g., sample log, boring log, or the field note book) or electronically (as a data point in the instrument's memory). On newer PID models, data may be stored in the PID memory or downloaded through an external downloading port onto a personal or portable computer.
- Once the PID has been calibrated and turned on, the PID should remain on in the "stand-by" mode when not in use.

PID readings and visual observations will be used to identify the presence or absence of VOC contamination within each split-spoon soil sample. The PID reading and visual observations will be recorded on the boring log and in the project field book. The results of the screening surveys will be used to provide a qualitative assessment of subsurface soil contamination.

Mercury

After the MVA (Jerome model 431-X MVA, or equivalent) is calibrated (Section 2.9), it is ready to be used. A baseline scan (i.e., scan on "clean air", "clean water" or "clean soil", as appropriate) should be run each day before analyzing site samples and the results recorded.

A background meter reading will be obtained and recorded at the time of field screening. If a concentration above several ppm is detected as background, the source of the reading will be investigated and controlled, if possible, or other appropriate actions taken as provided for in the site-specific RI/FS HASP.

The following general procedures will be used to screen for mercury vapors using an MVA:

- With the calibrated MVA turned on, hold the tip of the probe extension approximately one inch from the material being screened. Special care must be exercised not to place the probe extension into the sample or close enough for any soil particles or liquid to be drawn into the probe and contaminate the probe.
- Press the sample button and hold the tip of the probe extension above the sample being screened for at least twelve seconds or long enough for the instrument readings to stabilize so a reliable reading is obtained.
- Record MVA readings either manually on the appropriate field data forms (e.g., sample log, boring log, or the field note book).
- Turn the MVA off when not in use and install the zero air filter in the instrument intake during storage.

MVA readings and visual observations will be used to give a preliminary assessment of the presence or absence of mercury contamination within each split-spoon soil sample. The MVA reading and visual observations will be recorded on the boring log and in the project field book. The results of the screening surveys will be used to provide a qualitative assessment of subsurface soil contamination.

Note if free elemental mercury is observed in a given sample, the headspace analyses will not be conducted. Instead, the depth interval and nature of the sample will be carefully documented and the sample will be archived for later evaluation. The presence of free mercury indicates that gross contamination is present far above regulatory criteria and consequently, neither headspace screening nor laboratory analyses of that sample would provide useful information.

2.2.7 Borehole Sealing

The RI/FS borings that penetrate the Tidal Marsh Deposit (TMD), described in the RI/FS Work Plan (Section 1.9.2), or are greater than 25 feet in depth will be sealed prior to abandonment to prevent downhole contamination. Sealing will be achieved by backfilling the borehole with bentonite or with a cement/bentonite grout. The grout will be pumped into the boring from bottom to top using either a tremie pipe or the drill rods. Borings with depths of less than 25 feet or which do not penetrate the TMD will be backfilled with the original soil and tamped. It is also anticipated that the monitoring wells MW-1 through MW-6 installed in 1981 (Geraghty & Miller, 1982) will be sealed because of poor construction, pending approval from the USEPA.

The boreholes will be sealed by a NJ licensed well sealer in accordance with N.J.A.C. 7:9-9, Sealing of Observation Wells. The following procedure will be used when sealing boreholes:

1. The grout slurry composition to be used is as follows:
   Pounds of Bentonite: 5.0,
   Pounds of Cement: 94.0
   Gallons of Water: 8.3
2. Calculate the volume of the borehole based on the bit or auger head diameter plus 10%, and determine the volume of grout to be injected. Generally, the total mixed volume is the borehole volume plus 20%.
3. Identify the equipment to be used for the preparation and mixing of the grout. Document that the volume of the tanks to be used for mixing is appropriate for the borehole sealing work.
4. Identify the source of the water to be used for the grout. Water with high sulfate or chloride levels, or heated water, should not be used. These types of waters can cause operational difficulties or modify the set-up time for the grout.
5. Identify the equipment to be used for injecting the grout. Confirm with the driller that the pump to be used has adequate pressure to enable complete return to surface.
6. Identify the volumes to be pumped at each stage or in total if only one stage is to be used.
7. Begin mixing the grout to be injected using a grout mixture specified in 1), above.
8. Record the type and amount of materials used during the mixing operation. Document that the ratios are within specification tolerance. Ensure the grout is thoroughly mixed and free of lumps. Record the consistency of the mixture.
9. Begin pumping the grout through the return line bypass system to confirm that all pump and surface fittings are secure.
10. Begin pumping the grout into the boring. Leave rods or tremie pipes in borehole (and withdraw slowly as pumping, if required) until grout level reaches the surface. Record the times and volumes injected.
11. Top off the grout level in the borehole after the rods or tremie pipe is removed.
12. Clear and clean the surface near the borehole. Level the ground to approximately the pre-existing grade. Add grout or cement as necessary to the area near the borehole. If feasible, document the setup time of the of the mixture.

Note: In most cases there may be some settling of the grout which takes place over several days. If settling occurs, the natural soils from the immediate vicinity or additional grout will be used to restore the area to grade. If a survey of the location has not yet been performed, the location will be staked prior to filling with natural soils so that it could be surveyed at a later time.

2.3 Groundwater Investigation Procedures

The monitoring wells will be installed by a New Jersey licensed well driller. The project driller will be responsible for obtaining the required NJDEP well permits for the RI/FS investigation. NJDEP well permits will be obtained for borings extending beyond 25 feet below the ground surface or for shallow temporary borings with temporary casing left in the ground for a period longer than 48 hours.

2.3.1 Monitoring Well Installation

Overburden monitoring wells with screens positioned across the water table will be installed during the RI. The well materials will be steam cleaned before installation. Well casings will consist of 2-inch ID, Schedule 40, polyvinyl chloride (PVC) pipe with flush-mount threaded joints. The well screens will typically be a 5-ft long section of 2-inch diameter PVC. In no case will the screen length exceed 10 feet. The slot size will correlate to the particle size of the material being screened. If the well is screened in clay, the smallest slot size available will be used with the appropriate size sand for the filter pack. If the well is screened in sand and/or gravel, a 0.010-inch slot screen will be used with a No. 1 filter pack. The filter pack material shall be certified clean, inert, and well-rounded, containing less than two percent flat particles or fines. The bentonite seal shall consist of 100% sodium bentonite. The overburden monitoring wells will be screened across the water table. As-built monitoring well logs will be prepared by the field inspector after each well is completed. Specifically, the procedure described below will be followed during the installation of groundwater monitoring wells.

1. Advance the subsurface boring to the desired depth in accordance with ASTM D-1586-99 procedures, by means of hollow-stem auger drilling (Section 2.2.3).
2. Remove the center plug from the augers and measure the borehole depth using a weighted measuring tape.
3. Add approximately one foot of appropriately sized filter media to the base of the borehole.
4. Insert a 2-inch diameter PVC well screen and riser pipe into the borehole through the hollow-stem augers. The well screens will be capped with threaded caps at the bottom.
5. Add sand to screen section of well while slowly removing the augers. The sand pack should extend at least two feet above the screen section within the borehole. Measure with a weighted tape.
6. Slowly add bentonite slurry to the borehole as the augers are slowly removed. The bentonite seal should extend at least two feet above the top of the sand pack section. Measure with a weighted tape.

   Note: The rate of removal of the auger from the borehole should closely follow the rate that the sand pack and bentonite fill the borehole.

7. The remainder of the borehole will be grouted to the ground surface using grouting materials through a tremie pipe as described below.
8. A cement/bentonite grout mixture will be prepared according to the NJDEP Field Sampling Procedures Manual, 2005 for monitoring well specifications.
9. Pump cement/bentonite grout to the borehole through a side-discharge tremie pipe (i.e., pipe with a short, 90 degree elbow attached) from the top of the bentonite seal to the ground surface. The side discharge will avoid disturbing the bentonite seal.
10. Remove the tremie pipe and remaining augers from the borehole.
11. Top off grout in the borehole. Grout should extend to approximately two feet below the ground surface.
12. Cut the well riser pipe to about two feet above the ground surface where a stickup casing will be used or just below the ground surface for a flush-mounted well.

13. Backfill the remaining two feet of borehole with concrete.
14. The top of the riser will be notched to be used as a reference point for water level measurements. A well cap will be installed.
15. Install a protective 6-inch diameter steel casing equipped with a locking cap or a flush-mounted manhole cap over the well riser pipe and set it into the concrete backfill. Label the casing permanently with the well identification.
16. Lock the protective casing cap.
17. Construct a 2-ft by 2-ft by 4-inch concrete pad around the protective casing. Slope the pad away from the protective casing.

Allow the grout for the protective casing to set for at least 24 hours before developing the new monitoring well.

2.3.1.1 Triple-Cased Top-of-Bedrock Monitoring Well Installation

Section 2.3.1.1 inserted from FOP Addendum No. 4 (Brown and Caldwell, October 2006)

The use of triple-cased monitoring wells will be required for the installation of bedrock monitoring wells as shown on Figure 1. The subsurface units to be cased-off include the fill and the entire thickness of the soils. A conventional two-inch, PVC well will be installed within the upper bedrock.

The specific procedure for triple-cased monitoring wells completed within the top of bedrock is as follows:

- Advance a fourteen-inch (14") diameter borehole through the fill and approximately two feet (2') into the underlying Tidal Marsh Deposits with the use of the wet-rotary drilling method in accordance with "Addendum No. 1, Field Operations Plan For the LCP Chemicals, Inc. Superfund Site, Cased Deep Borings (Brown and Caldwell, October 12, 2001).
- Measure the borehole depth using a weighted measuring tape.
- Install a ten-inch (10") diameter permanent casing within the boring approximately two feet (2') into the underlying Tidal Marsh Deposits.
- Grout the casing in place using the tremie method by placing a cement/bentonite grout in the annular space between the casing and the borehole from the base of the borehole to a depth approximately four feet (4') below existing ground surface. In the event that the Tidal Marsh Deposits are apparently absent at a particular location, the casing will still be installed through the fill to minimize vertical migration of contaminants during the drilling process. In this case, the casing will be installed below the fill at the depth where the Tidal Marsh Deposits were observed in nearby boreholes.
- After the grout has set, the boring will be resumed through the ten-inch (10") casing. This will include drilling through the remaining Tidal Marsh Deposits and through the underlying Glacial Till until refusal, using the wet-rotary drilling method. The borehole drilling mud will be used, as necessary, to maintain the integrity of the borehole during the drilling process.
- Flush the borehole with potable water and continue approximately three to five feet[1] (3' to 5') into rock by means of an NX (3" O.D.).

[1] The three to five foot (3' to 5') bedrock casing socket, as described, is required to adequately characterize the upper, fractured zone of the bedrock. This socket depth conflicts, however, with the New Jersey bedrock well construction standards that require a minimum depth bedrock casing socket of ten feet (10') [N.J.A.C. 7:9D(b)1.]. Accordingly,

- Measure the borehole depth using a weighted measuring tape.
- Ream the corehole to a nominal 10-inch (10") diameter using the wet-rotary method.
- Install a six-inch (6") diameter permanent casing within the bedrock.
- Grout the casing in place using the tremie method by placing a cement/bentonite grout in the annular space between the casing and the borehole from the base of the borehole to a depth approximately four feet (4') below existing ground surface.
- After the grout has set, the boring will be resumed through the 6-inch (6") casing approximately fifteen to twenty feet (15 to 20') by means of an NX (3" O.D.) rock core.
- Ream the corehole to a nominal 6-inch (6") diameter using the wet-rotary method.
- Insert a flush-threaded, two-inch diameter, Schedule 40 PVC monitoring well screen and riser casing in the borehole, with a well screen that is positioned across the hydrostratigraphic zone targeted for monitoring.

Develop and install the monitoring wells in accordance with Sections 2.3.1 and 2.3.2, respectively, of the "Final Sampling and Analysis Plan, Field Operations Plan, Part I" (URS, April 12, 2001).

- The handling of the drill cuttings and fluids are described in Section 2.6.1.

2.3.2 Well Development

After drilling, and no sooner than 24 hours after well installation to allow the grout for the protective casing to cure, each new monitoring well will be developed by pumping or bailing until the discharged water is visually free of suspended particles, and if possible, achieves a nephelometric turbidity unit (NTU) of less than 5.0. Well development is the process of flushing the interface between the aquifer and the well. In addition, the filter pack and screen slots are cleaned, allowing ground water to flow into the monitoring well with a minimum of retardation. Development is required to (1) restore the natural permeability of the formation adjacent to the borehole, (2) remove clay, silt and other fines from the filter pack and well screen so that subsequent water samples will not contain excessive suspended matter; and (3) remove remnant drilling fluids and contaminants potentially introduced during drilling activities.

The development process is best accomplished by causing the natural formation water inside the well screen to be moved vigorously in and out through the screen in order to agitate the clay and silt. This causes clay and silt particles to be moved into the well where they can be removed or lodged into the sand pack and/or formation. Formation water will be used for surging the well. As required by the USEPA (October 24, 2000) for this RI/FS, well development will be in accordance with the RCRA Ground Water Monitoring Draft Technical Guidance, November 1992 – Section 6.7, Well Development. If the well goes dry during development, it will then be developed with alternating cycles of purging and recovery. If, after reasonable repeated attempts, a turbidity reading of 5.0 NTUs is not achieved at any given well, then the USEPA will be informed and recommendations for additional action will be presented.

---

written authorization for the well construction deviation will be required to be obtained from NJDEP, Bureau of Water Allocation in accordance with N.J.A.C. 7:9D-2.8 prior to commencing drilling. Assistance in this regard may be required from the case manager.

Equipment used for well development will be cleaned before each use to prevent possible cross contamination of the wells. Decontamination procedures are described in Section 2.5.

Development of each well will be performed by pumping or bailing. Either of these methods will remove silt-laden water. A bailer which is heavy enough to sink rapidly through the water can be raised and lowered through the water column to produce an agitating action that is similar to that caused by a surge block. The bailer has the added capability of removing turbid water and fines each time it is brought to the surface.

A submersible pump can be used effectively where recharge is rapid. Surging can be accomplished by switching the power source on and off while pumping, causing ground water to move in and out through the screen, achieving the desired cleaning action. The size of the pump used is dependent upon the well design and associated recharge rate.

An inertial lift pump may also be used for development. This is a reciprocating pump, which recovers groundwater through a tube and foot valve assembly, utilizing the inertial lift principle. This method is especially effective for pumping water heavily laden with silt and clay.

The well development procedure selected for use by the field inspector will be based on conditions encountered during well installation and the construction details of a given monitoring well. The well development water recovered from each well will be handled as described in Section 2.6 – Investigation-Derived Waste Handling.

Specific development procedures are as follows:

- Well development equipment will be assembled, decontaminated, as outlined in Section 2.5, and installed in the monitoring well. Care will be taken not to introduce contaminants to the equipment during installation.
- Monitoring wells will be developed using pumps with dedicated tubing. If a well yield is very low and is pumped dry, a dedicated bailer may be used to continue development after each recovery. No air or water will be injected into the well during development. The development will continue until the field inspector determines that the water is clear and free of solids based on NTU readings of 5.0 or less.
- Field observations, including the volume of water removed and the discharge water color will be recorded on a Well Development Log and also in the field log book. Field measurement of pH, temperature, and conductivity will be recorded periodically during well development.

ISP Environmental Services Inc. will make every reasonable attempt to develop the monitoring wells in accordance with the RCRA groundwater monitoring guidance (USEPA, November 1992). As noted in Section 1.9.3 of the RI/FS Work Plan (Hydrogeology), however, the groundwater appears to exist in overburden under perched conditions over the Tidal Marsh Deposit, with a saturated thickness of only 1-2 feet. Compliance with the 5.0 NTU criterion may not be possible if the yield of a given well is poor. Other factors may prevent achievement of low turbidity such as natural turbidity in pore water or tidal influences. In these cases, the attempts made to develop the well will be documented, the USEPA will be notified, and recommendations for additional action will be presented.

2.3.3 Groundwater Level Measurement

Groundwater levels will be measured in each monitoring well at the site within a short time period (i.e., synoptic water level round) to determine the elevation of the water table across the site. These measurements

will be collected after a period of two weeks or more after the last well was installed and developed to allow the water table aquifer to stabilize.

Water level measurements will be collected with electric sounders, interface probes, pressure transducers, or water level recorders. The measuring device will be decontaminated according to the specifications in Section 2.5.

Groundwater levels will be measured to the nearest 0.01 foot from a referenced point, usually the top of the riser pipe or inner casing. Static water levels will be measured each time a well is sampled and before equipment is introduced into the well.

2.3.4 Collection of Groundwater Samples

Section 2.3.4 inserted from FOP Addendum No. 4 (Brown and Caldwell, October 2006) – Supersedes Previous Section

The low-flow purging and sampling method will be used to collect groundwater samples.

2.3.4.1 Equipment

Various field instruments will be used during the implementation of the LTGMP. They may include but are not limited to the following:

- Electronic water level meter
- pH meter
- Turbidity meter
- Specific conductivity meter
- Oxidation Reduction Potential (ORP) meter
- Thermometer
- Dedicated purging and/or sampling pumps
- Non-dedicated purging pumps

Monitoring equipment will be protected (as much as practical) from contamination without hindering operation of the unit.

2.3.4.2 Preparatory Activities

Preparatory Office Activities

Physical aspects of the sampling program will be organized in the office prior to embarking on a field sampling project. The time spent in the field is very valuable and should be spent on sample collection, making field measurements and recording data and not on the organization of equipment and containers.

- **Sampling Sequence** - The sequence of sampling will be pre-determined on the basis of existing groundwater quality data. Generally, the least contaminated wells will be sampled first, proceeding to the progressively more contaminated wells, based upon the last event's water quality data.

- **Initiation of Field Data Records** - Field data sheets will be initiated prior to the start of sampling. Examples of initial data to be recorded include site and sampling location identification, well depth and construction, and purging and sampling collection methods.

Preparatory Field Activities

The following procedures will be conducted in the field prior to well purging and sampling. This will be coordinated with the ongoing Hydraulic Monitoring such that a round of water levels is collected just before the groundwater sampling event commences. Measurements shall be collected on the same day so the water level data may be used to generate groundwater flow maps.

- **Well Maintenance Check** - A well maintenance check that includes visual observation of the condition of the protective casing and surface seal will be performed. In addition, the well will be checked for other signs of damage or unauthorized entry.
- **Preparation of Well Area** - A suitable work area will be established around the perimeter of the well. This will provide a clean surface on which sampling equipment can be placed such that it will not become inadvertently contaminated. This work area will be prepared by placing new polyethylene (PE) sheeting on the ground around the well, taking care not to step on it. Alternatives can include the placement of a clean PE lined trash can or a clean PE covered table adjacent to the well.
- **Water Level Measurements** - The depth to water will be measured prior to initiation of sampling activities. Water level measurements will also be made during purging in order to monitor well drawdown, and special care will be taken to thoroughly decontaminate the probe prior to use.

2.3.4.3 Low-Flow Purging and Sampling Method

Introduction

The use of a low-flow purging and sampling method will minimize stress on the water-bearing zone, thereby minimize the disturbance of any sediment that has settled at the bottom of the well. Accordingly, groundwater samples will be more representative of actual aquifer conditions.

The low-flow purging and sampling method to be applied during this monitoring program is described in detail below. It is consistent with the low-flow procedure described in NJDEP's August 2005 *Field Sampling Procedures Manual* with the exception of NJDEP's five-foot sampling interval requirement. Instead of collecting one low-flow sample for every five-foot of well screen length, only one low-flow sample will be collected per monitoring well.

This variance is consistent with the USEPA references that were cited in the *Field Sampling Procedures Manual.* The two USEPA references cited, *Region 1 Low Stress (Low Flow) SOP* (USEPA, 1996) and *Region II Ground Water Sampling Procedure; Low Stress (Low Flow) Purging and Sampling* (USEPA, 1998), state that low-flow procedures may be applied to well screen intervals of up to 10 feet in length. Since the screens of the wells to be sampled at the site are 10 feet in length, the collection of only one low-flow sample from each well would be consistent with USEPA procedure.

Furthermore, this variance is consistent with peer-reviewed scientific research. This research has indicated that there is significant vertical mixing within a well casing even under low-flow purging conditions, making it impossible to define groundwater quality at specific depth intervals by simply adjusting the depth of a pump's intake. Research performed by Varljen, *et al.* (2006), for example, had demonstrated that that the location of a pump's intake within the well screen does not influence the zone sampled, and that neither the intake depth

nor the screen length matter, as the groundwater along the entire length of the screen would be drawn uniformly into the well and sampled, even under low-flow purging conditions. The findings of Varljen, *et al.* (2006) are consistent with Reilly, *et al.* (1989), Puls and Paul (1998), Hutchins and Acree (2000) and Martin-Hayden and Robbins (2000), who all found significant vertical flow and mixing within a well casing under very small head changes or low purging rates.

Based on these research findings, sampling at five-foot intervals in accordance with NJDEP policy would not satisfy the NJDEP's intent of vertically profiling contaminant distribution within a well's screen, but rather would result in the generation of redundant data that would not add any technical value to the monitoring program. Therefore, only one groundwater sample per monitoring well will be sampled using the low-flow purging and sampling method.

Pump Intake Location

The sampling pump intake will be installed within the well screen at the halfway point between the top of the screen and the bottom of the screen, or at a depth that is at least two feet below the static water level if the well is screened across the water table.

Water Quality Indicator Parameters

The following parameters will be measured in order to determine when well stability has been achieved prior to sampling. Their respective measurements will fall within the stated range for three consecutive readings. If the anticipated "third" reading of any individual parameter does not fall within the stated range, then the process to achieve three consecutive readings for that parameter will be restarted. If, after four hours, stability has not been achieved for the parameters listed below, the recommendations presented below will be followed.

Water Level Drawdown	< 0.3 ft*[2]
pH	± 0.1 unit
Specific Conductance	± 3%
Temperature	± 3%
Dissolved Oxygen	± 10%
Turbidity	± 10% for values greater than 1 NTU
ORP/Eh	± 10 millivolts

Measurements should be taken once every 5 to 6 minutes. This interval is based upon the time it takes for purge water to replace one flow-through-cell volume (generally 250 ml) and the time it takes to measure and record the data. If the purge rate decreases or if the flow cell volume is increased, the time required for purge water replacement will increase. Water Quality Indicator Parameters will be collected in a manner that will ensure integrity of the data being collected. To ensure consistency of the data, consideration of the following will be made: 1) tubing diameter, length, and material of construction; 2) flow-through cell design, capacity, decontamination, and "purge-train" set-up; 3) pump selection and plumbing fittings; 4) calibration of flow-through cell probes; 5) purge rate; and, 6) water-level-measurement technique.

[2] During pump start-up, drawdown may exceed the 0.3-ft target and then recovers as flow-rate adjustments are made.

Purge Volume vs. Stabilization Time

In some cases, it may take considerable time to achieve stabilization of the Water Quality Indicator Parameters. In other cases, they may never stabilize. However, as provided in USEPA guidance, the following options are available if stability has not been achieved after four hours of purging: 1) continue purging until stabilization occurs, no matter how long it takes; 2) discontinue purging, do not collect a sample and document the attempts to reach stabilization; or 3) discontinue purging, collect a sample and document the attempts to reach stabilization. In situations where the Water Quality Indicator Parameters do not stabilize, the sampler will document that low-flow purging and sampling could not be performed and document how the samples were collected.

If a Water Quality Indicator Parameter is not accurately measured during the monitoring process or if a certain Water Quality Indicator Parameter does not stabilize, and that particular Water Quality Indicator Parameter is not significant with respect to the type of contaminant of concern, sample collection will still proceed. Any Water Quality Indicator Parameters that are affected by field conditions or instrument malfunction will be discussed in the text of the report in order to alert the end-user of potential data bias.

Tubing

The inside diameter (ID) of tubing will be no greater than three-eighths of an inch (3/8-in). Larger tubing diameters will reduce flow velocity resulting in a corresponding increase of pump speeds to maintain flow. Increased pump speed may, in turn, elevate the potential for turbulent flow across the screened interval and this may affect the quality of the water being sampled. Conversely, any reduction in flow velocity may allow air to become trapped in the tubing, which may ultimately affect air-sensitive parameters or allow particulates to settle, which may affect turbidity values. The length of tubing, from the top of the well casing to the flow-through chamber, will be the shortest length manageable. Attention to this detail will help ensure that: 1) exposure to ambient temperature, direct sunlight, and bubble formation are kept to a minimum, and 2) deposited solids or air bubbles will less likely be trapped in tubing bends and re-mobilized after accidental movement. Occurrence of any one or combination of these factors can cause variations in Water Quality Indicator Parameter measurements, which could increase stabilization time. Therefore, tubing will be completely full of water at all times.

The tubing's material of construction will be either Teflon® or Teflon®-lined polyethylene up to the flow-through cell. Tubing downstream of the flow cell may be constructed of a lower-quality, more flexible material. Tubing "reuse" will not be permitted.

Flow-Through Cell

Cells are required to be transparent in order to "see" the physical condition of the purge water or air bubbles passing through the system. The cell will be sealed against unwanted exposure to the atmosphere, thus ensuring accurate measurement of air-sensitive parameters (dissolved oxygen, pH, etc.). The total capacity of the cell will be small (300-1,000 ml) in order to maintain a desirable turnover rate of water coming into the cell to ensure real-time data integrity. The in-line design will allow for purge water to enter the flow cell from a bottom port and exit at the top. The discharge may be fitted with a check valve.

The pump discharge line will not be connected to the flow-through cell upon initial pump startup. This will allow the sampler time to monitor drawdown, stabilize the flow rate and prevent fouling of probes by bacteria, sediment, or NAPL. Once drawdown measurements indicate that the flow rate has been controlled and a few minutes (<10) have been allowed to clear any unwanted material, the pump discharge line can then be connected to the flow cell.

The cell and probes will be rinsed with distilled/deionized water between each monitor well as accumulation of suspended material may impact probe performance. The probes will then be rinsed using a mild detergent or laboratory glassware cleaning solution, and then rinsed again with distilled/deionized water. Because the location of the flow cell or cells in relation to the sample port is critical, samples for turbidity measurement, general chemistry and laboratory analysis will be collected ahead of the flow cell. If two cells are used in series, the dissolved oxygen probe will be located in the first cell.

The flow-through cells will be located as close as possible to the well head in order to minimize the length of tubing needed between the well head and flow-through cell. The flow-through cell will be protected from ambient conditions and the ground surface.

Pump Selection

Pumps used for monitoring Water Quality Indicator Parameters will be submersible, positive-displacement pumps, and may include bladder, variable-speed submersible-centrifugal, reciprocating-piston, progressive-cavity, or gear pumps. Peristaltic pumps will not be used. The pump discharge will be fitted appropriately to receive either 1/4 or 3/8-inch inside-diameter (ID) Teflon® or Teflon®-lined polyethylene tubing.

Pumps constructed with impellers, helicoils, or gears, which are difficult to clean or are constructed of unacceptable plastic parts, will not be used for sampling. In addition, the power or gas supply line for the pump will be isolated from the sample tubing.

Plumbing Fittings

A check valve will be incorporated into the tubing train, within the pumps, or within the flow cell discharge to eliminate accidental drainage and subsequent aeration of the flow cell. More importantly, a check valve will prevent a back-surge of purged water being reintroduced at the screen interval of the well should the power source or pump experience mechanical failure. A ¼- or 3/8-inch ID barbed "T" or "Y" fitting, placed ahead of the flow cell, may be used to establish the line which will receive a needle valve for turbidity, general chemistry and analytical sample collection. The "T" or "Y" fitting used will be constructed of Teflon® or stainless steel and decontaminated between each use. The fitting may be constructed of polyethylene and decontaminated between each use if it is only used to sample for turbidity and general chemistry parameters. If analytical samples are collected through the "T" or "Y" fitting and needle valve, then those parts will be incorporated into the field blank collection technique. When collecting a sample at the port ahead of the flow cell, a flow control valve (stainless-steel needle valve [preferred] or stainless steel/Teflon® ball valve [optional]) will be used to prevent back pressure and air bubbles from forming in the tubing

The "needle valve" offers versatility as it can be used for collection of turbidity, general chemistry and analytical samples. It can be used with Teflon® tubing and can be used to control sample flow rate because the design significantly reduces any back pressure gradient. Like all other sampling equipment, the "needle valve" will be decontaminated before use at any well.

Calibration of Probes

Calibration of the probes used to monitor water quality indicator parameters will take place in the field prior to the day's events. All manufacturers' instructions for proper care and calibration of the probes will be followed. Solutions for probe calibration will be held to the temperature of the liquid (groundwater) being measured as temperature correlation is critical in calculating conductivity, dissolved oxygen and pH. As an alternative, tables and equations to compensate for the difference between ambient groundwater and

calibration solution temperature may be used if provided in the operating manuals or with the calibration solutions. No sampling will commence until all instruments are calibrated and operating properly. The calibrations steps utilized will be recorded.

Water Level Measurements

The depth to the top of the water column will be recorded prior to pump installation and/or prior to purging. If the total depth of the well needs to be determined (e.g., to verify the correct well designation and/or to determine if silt has accumulated in the bottom of a well), then it will be measured at least 48 hours prior to sample collection or after the sample has been collected and the pump removed. Total depth measurements must never be taken immediately before purging as this may cause the re-suspension of solids in the well and prolong the purge time. Once the initial water-level measurement has been recorded and the pump installed, the water-level probe will be suspended in the well at the point at which drawdown is equivalent to a 0.3-foot drop. The water levels will be recorded simultaneously with water quality instrument parameter measurements once every five minutes. Water-level-measurement devices, which may impart some disturbance to the water column (i.e., stainless steel "popper" or coated tape) will not be used.

Pump Installation

Once pumps have been properly decontaminated and fitted with appropriate tubing, installation of the pump can begin. Pumps will be installed in such a manner as to ensure that any disturbance in the well is kept to an absolute minimum. Once a pump reaches the top of the water column, its descent will proceed very slowly through the water column. The pump will be lowered until the pump's intake reaches the halfway depth between the top and bottom of the screen, or installed at least two feet below the static water level if the well screen intercepts the water table. The actual level where the pump intake will be suspended will be predetermined based upon well construction logs or prior analytical data. Under no circumstance will the pump make contact with, or be "bounced" off, the bottom of the well.

Purge Rates

The purge rate will range between 100 to 500 ml/min. The water will be initially purged prior connecting the tubing to the flow-through cell in order to prevent any fouling of the cell. Tubing will then be connected to the cell with the pump running. After making the connection, the cell will be inspected to verify that purge water has filled cell and that all air is purged from system. The pump speed will remain constant such that flow rates never exceed 500 ml/min and, once stabilized, the flow rate will not be varied. If drawdown exceeds 0.3 ft., then the pump speed will be reduced until the drawdown has stabilized; however, the pump speed will not be reduced to lower than 100 ml/min. If drawdown does not come under control at 100 ml/min, then a field decision will be rendered as to how far to allow drawdown to continue until sample collection. At no time will evacuation allow any portion of the well screen to be exposed (for wells screened below the water table) or bring the well to dryness. Well stabilization indicators parameters will be measured once the water level has stabilized.

Purge rates will be monitored by measuring the flow from the discharge side of the flow cell with a graduated cylinder. All of the required water quality indicator parameters will be recorded on appropriate filed data sheets once every 5 to 6 minutes. Once stability has been attained and recorded, sampling will begin.

Sampling

Once the water quality indicator parameters have stabilized, or once a four-hour (4-hr) time decision has been rendered, sampling can proceed. The same pumping rate used during well purging will be maintained during

sample collection. The sample will be collected directly from the flow control valve at the sample port. A final set of water quality indicator parameter measurements will be recorded immediately after sample collection.

In the event that wells do not stabilize within a four-hour (4-hr) time frame, purging may be considered to be complete in these wells after three to five (3 - 5) well volumes of water have been purged. Accordingly, purging will be considered to be complete in wells in which parameters do not stabilize after three to five (3 - 5) well volumes have been purged and/or after purging for four (4) hours, whichever is a shorter time period.

2.3.4.4 Ultra-Clean Sample Collection and Handling

"Ultra-clean" sample collection and handling methods will be used for the collection of mercury samples from groundwater. The ultra-clean approach provides an additional level of quality assurance in the field to minimize false positive results. The ultra-clean sample collection and handling methodology, as presented below, are consistent with USEPA Method 1669 "Sampling Ambient Water for Trace Metals at USEPA Water Quality Criteria Levels" (USEPA, 1996).

Ultra-Clean Sample Handling

The sampling handling will be performed according to the following steps:

- The sampling team (minimum of 2 people) will be organized into two parties designated as "Clean-Hands" and "Dirty-Hands". The establishment of these roles is intended to minimize potential interference such that the detection of constituents in groundwater samples is a reflection of actual groundwater conditions at the Site and is not biased because of cross-contamination.
- Upon arrival at the sampling location, the team will have already completed the required office preparation activities (See preparation activities section above). Both team members will don clean gloves.
- A work area will be prepared around the monitoring well area by establishing a perimeter around the well. Inadvertent cross-contamination of the sampling equipment will be minimized by placing fresh polyethylene (PE) sheeting on the ground around the monitoring well; the sampling team must not step on the PE sheeting. Alternatives can include the placement of a clean PE lined trash can or a clean PE covered table adjacent to the well. This activity should be performed by the Dirty-Hands team member since there will be potential contact with the surrounding environment.
- Dirty-hands will change gloves. A static water level will be taken by Dirty-Hands and recorded on the field-data sheets by Clean-Hands.
- The pump will be removed from the storage container by Dirty-Hands.
- The tubing to be used will be connected to the pump by Clean-Hands while NOT touching the pump.
- Clean-Hands will then lower the pump slowly through the well to the sample-depth and connect the tubing to the water quality instruments while again NOT touching the instruments. Both will change gloves.
- Dirty-Hands will secure the pump and operate all equipment for purging (water-level meter, pump control box, etc.). Clean-Hands will record the information from the display of the water quality instruments and the water-level and flow-rate given by Dirty-Hands.
- When it is time to sample both will change gloves. Dirty-Hands will remove the sample containers from the cooler (sample containers will have already been placed inside of an inner and outer zipped bag as part of the office preparation activities).

- If filtering the sample, Clean-Hands will attach the inline filter to the sample tubing. Dirty-Hands will open the outer bag and Clean-Hands will open the inner bag and remove the sample container.
- Once filled, Clean-Hands will secure the container lid and return it to the inner bag and zip it shut. Dirty-Hands will then shut the outer bag and place it in the cooler.
- Sampling is now complete and Dirty-Hands will remove all sampling equipment from the well, secure all purge-water and clean the perimeter in preparation of moving to the next location. Clean-Hands will complete all paperwork.

Ultra-Clean Preparatory Office Activities

Physical aspects of the sampling program will be organized in the office prior to embarking on a field sampling project. The time spent in the field is very valuable and should be spent on sample collection, making field measurements and recording data and not on the organization of equipment and containers.

- **Sampling Sequence** - The sequence of sampling will be pre-determined on the basis of existing groundwater quality data. Generally, the least contaminated wells will be sampled first, proceeding to the progressively more contaminated wells, based upon the last event's water quality data.
- **Initiation of Field Data Records** - Field data sheets will be initiated prior to the start of sampling. Examples of initial data to be recorded include site and sampling location identification, well depth and construction, and purging and sampling collection methods.
- **Sampling Equipment Preparations** – All sampling equipment to be used when sampling for mercury will be cleaned initially and placed into two clean, disposable storage bags for transportation to the Site.
- **Analytical Sampling Container Preparation** – When sampling for mercury all containers used will be placed into two clean zipped, plastic bags and transported to the Site inside coolers with ice. This step initiates the Clean-Hands / Dirty-Hands procedures for sampling for mercury.

Ultra-Clean Decontamination

The ultra-clean decontamination procedure is essentially the same as the 9-step decontamination procedure in Section 2.5.3 of the FOP with several exceptions, including glove changes between various steps a more rigorous method of decontaminating non-dedicated pumps.

The cleaning process will consist of the following:

- Change gloves. Disassemble pump, wash parts (except used bladder and O-rings) in laboratory detergent and potable water solution.
- Rinse the pump and parts with potable water.
- Change gloves. Rinse the pump with distilled/deionized water.
- Rinse the pump and parts with 10% nitric acid (if sampling for metals).
- Change gloves. Rinse the pump with distilled/deionized water.
- Rinse the pump and parts with reagent-grade methanol.
- Allow the pump and parts to air dry fully.
- Change gloves. Rinse the pump with distilled/deionized water.
- Assemble the pump with a new bladder and new O-rings and place into two clean, disposable storage bags.

Non-dedicated bladder pumps will be disassembled and the pump and its parts will be cleaned prior to and between each use. The bladder, O-rings and pump tubing will be replaced after each use. Pump tubing will be discarded after each use unless saved and reused for the same monitoring well (dedicated to sampling location).

2.3.5 Field Permeability Testing (Slug Tests)

In-situ permeability tests using the slug test method will be conducted on the monitoring wells. The data will be recorded using an electric pressure transducer and digital data recorder (e.g., Hermit Data Logger). Slug tests will be conducted to determine the hydraulic characteristics of the water table and bedrock aquifer. Slug testing generally involves quickly submerging a solid cylinder of known volume (the "slug") into the water column (falling-head test). After the slug is inserted and as the water column drops to reach equilibrium, the change in water level versus time is recorded by an electric pressure transducer and data processor. After the water level has recovered, the slug is removed (rising-head test) and the response is recorded. The procedures to be followed during slug testing are described below.

Slug In – Falling Head Test

1. Record well number, time, and date; unlock protective casing
2. Check the well headspace with a PID immediately upon opening the well cap
3. Obtain an accurate static water level
4. Place the pressure transducer near the bottom of the well and hook up data logger
5. Place slug (solid PVC or equivalent cylinder) in the well and quickly lower the slug below static water level.
6. The electronic data logger will record the water levels under the Standard Log Schedule. Manual water levels, if used to support the digital data, will be measured according to the following time schedule:

Time since beginning of slug test, in minutes	Intervals between measurement, in minutes
0 – 2	0.5 (30 sec.)
2 – 5	1.0
5 - 30	5.0

7. Leave the slug in place until the well has recovered to within at least 90 percent of its original static water level. In cases of very slow recharge, a 90 percent recovery is not practical, and the test will be run for a minimum of ½ hour to attempt to accumulate sufficient test data.

The falling head or "slug in" method is suitable only for a well in which the screen is fully submerged. If the screen is partially submerged, the test data will overestimate the hydraulic conductivity of the aquifer. After the drawdown phase of the slug test has recovered to within 90 percent; the "slug out" test is initiated.

Slug Out – Rising Head Test

1. Quickly remove slug from the well.
2. Allow the water level to recover to at least 90 percent of the original static water level or until the requirements of paragraph seven above have been met.
3. Clean and dry all equipment (slug, rope, tape) used in the test.

The data results of the permeability tests are interpreted based on the Bouwer and Rice Method (Bouwer and Rice, 1976, Bouwer, 1989). The following formula (Bouwer and Rice, 1976) will be used to calculate hydraulic conductivity (K):

$$K = \frac{r_e^2 (R_e / r_w)}{2L_e} - \frac{1}{t} \ln \frac{y_o}{y_t}$$

Where: r_e = well radius (ft)
R_e = effective radial distance over which the head difference is dissipated (ft)
r_w = radial distance between well center and undisturbed aquifer (ft)
L_e = length of saturated screen (ft)
y_o = water level y at time zero (ft)
y_t = water level y at time t (ft)
t = time since y_o (minutes)

As stated above, falling head tests are suitable only for those wells with a completely saturated screen interval. Therefore, only rising head tests will be performed on the shallow wells because they will be screened across the water table.

2.3.6 Tide Investigation

It was noted during RI-scoping site reconnaissances that surface water is not present along the entire length of South Branch Creek at all times. Surface water is periodically absent from the LCP bulk head area, presumably during low tide. South Branch Creek is apparently more of a drainage channel than an established, perennial, flowing stream. The effects of Arthur Kill tides on South Branch Creek will be assessed and documented through the installation and periodic monitoring of a staff gauge. A commercial staff gauge (e.g., Ben Meadows Company graduated model) will be affixed to the bridge that spans South Bridge Creek between the two tank farms (Figure 3-2).

The groundwater levels of 9 monitoring wells will be monitored to compare tidal variations in surface water and groundwater, determine the tide fluctuations in groundwater across the site, and determine mean groundwater elevations and hydraulic gradients at the site. The nine monitoring wells will be monitored for an approximate one-week period to record a range of daily tidal cycles. The staff gauge installed in South Branch Creek will be surveyed so that surface water levels and tidal variations can be monitored and compared to groundwater levels at the site.

The groundwater measurements will be collected from the wells and from the staff gauge using In-Situ brand Troll model pressure transducers and data loggers (or equivalent equipment). The transducers will be programmed to collect and record a time and pressure head reading once per hour during the monitoring time period. Three additional transducers will be placed along the channel of South Branch Creek (bulkhead area, mid stream, and by Arthur Kill) to monitor the amount of water that actually inundates the channel during high and low tides.

Tidal fluctuations in surface water bodies produce progressive pressure waves in adjacent aquifers. As these pressure waves propagate inland, groundwater levels and hydraulic gradients continuously fluctuate, creating a situation where a single set of water level measurements cannot be used to accurately characterize groundwater flow. At any measuring point (e.g., monitoring well) where groundwater fluctuates because of tides, the magnitude and direction of the hydraulic gradient fluctuates about the mean or regional hydraulic gradient. The net effect of these fluctuations on groundwater flow can be determined calculating the mean hydraulic gradient for that measuring point. This is done by filtering groundwater level measurements

recorded over a period of time to obtain a mean groundwater elevation for that measuring point. A filtering method, described by Serfes (1991), using 71 consecutive hourly water level observations will be used on the data to calculate the mean water level for each monitoring point.

The filtering method (Serfes, 1991) removes the diurnal and semidiumal lunar and solar harmonics from 71 consecutive hourly observations. Using moving averages it yields a filtered mean level for the median time of the 71 hours. First, a sequence of mean is computed for 24 observations, starting with observation one for the first mean and observation 48 for the last, yielding a total of 48 means. Second, a similar series of means is computed for 24 of those means yielding 25 means. Last, the mean of those 25 means is computed yielding the mean level at hour 36.

The filtering method can be expressed mathematically as:

Let the consecutive hourly water level values be O (1), O (2), O (3)…, O (7):

The first sequence of means (Xi) is:

$$X_i = \sum_{K=0}^{23} \frac{O(K+i)}{24}$$

Where I = 1, 2, 3,…, 48;

The second sequence of means (Yj) is

$$Y_j = \sum_{i=0}^{23} \frac{X_i + j}{24}$$

Where j = 1, 2, 3,…, 25;

Then the mean level (M) at hour 36 is

$$M = \sum_{j=1}^{25} \frac{Y_j}{25}$$

The mean groundwater elevations from the 71-hour period will be used to construct groundwater elevation contour maps for the site. Recommendations for or against additional tide investigations will be made on the basis of an evaluation of the data and presented in the RI report.

2.4 Surface Water and Sediment Investigations

Surface water and sediment sampling of South Branch Creek is proposed at six locations. When sampling for both surface water and sediment at the same location, the surface water sample will be taken first with care not to disturb bottom sediments. When possible, surface water grab samples will be collected in the actual container to be used to transport the sample to the laboratory. Therefore, pre-preserved containers are not to be used as collection vessels. Required preservatives will be added after the samples are collected. Surface water samples will be collected at mid-depth of the water column. A horizontal sample collector, such as a pond sampler, may be used to access a surface water sampling location otherwise inaccessible. The samples will be collected following the guidelines described in the NJDEP Field Sampling Procedures manual

(NJDEP, 1992). Surface water and sediment samples will be collected in a "downstream" to "upstream" direction (i.e., in a direction opposite the flow direction of the Arthur Kill tides), to minimize the chance of spreading disturbed sediment to unsampled locations.

Surface Water

The following procedure will be used to collect surface water directly in sample containers provided by the project laboratory:

1. Don a clean pair of latex gloves.
2. Estimate sampling depth by visual observation (for shallow samples) or measure depth using a weighted, flexible measuring tape or a rigid gage.
3. Invert the laboratory-supplied sample container (without preservatives), insert the sample container into the water to the desired level, and then turn the mouth of the sample container up and towards the upstream direction thus allowing the container to fill.
4. Cap sample container while container is still underwater, if possible.
5. Remove sample container from water body and cap if not already capped.
6. Rinse the exterior of the sample container thoroughly with deionized water and label container.
7. Add preservatives and check for appropriate pH.

Record all appropriate data (including sampling location, sampling depth, time of sampling, and description of sample) in field logbook or the Surface Water Sampling Log.

Sediment

The procedures for collecting surface and subsurface sediment samples for analytical and physical parameters are provided below. Based on stream characteristics and logistics, a hand corer (or equivalent device) is selected as the default sampling method for sampling sediment because this method can be used to collect a relatively undisturbed sample that shows a profile of stratification. The procedure to collect a sample using a hand corer is described below.

1. Record the sample location on a site map and in the field logbook.
2. Decontaminate stainless steel sampling equipment in accordance with the procedures outlined in Section 2.5.
3. Don a clean pair of latex gloves.
4. Push core tube into the surface of sediment.
5. Measure length of core tube above surface of water
6. Manually push or hammer the core tube into the sediment to the two-A depth.
7. Fill core tube with water (to remove air above sediment/water interface) and cap top of core tube.
8. Pull core tube out of sediment, as bottom tube breaks water surface, cap bottom of core.
9. Measure the sediment in the core tube to determine depth of penetration and recovery.
10. Transfer (using a decontaminated spoon) each selected depth interval of sediment into separate stainless steel bowls.
11. Decontaminate stainless steel sampling equipment in accordance with the procedures outlined in Section 2.5.

Repeat the steps for pushing and retrieving the core tube to obtain a sufficient quantity of sediment for all chemical and physical analyses. Sediment samples may also be collected using decontaminated stainless steel sampling scoops, trowels, or petit ponar samplers.

The following steps will be performed once the sample is collected:

- Label the sampling jars
- (New bullet inserted from FOP Addendum No. 5 (Brown and Caldwell, October 2006)) Sediment samples targeted for AVS/SEM analysis will be collected with minimum disturbance and exposure to air. These sediment aliquots will be immediate grab samples collected at a depth of 0-0.5 ft, and will be packaged in wide-mouth jars or retained as core segments capped at both ends. In either case, overlying surface water will be retained and the sampling containers will be filled to the maximum extent possible to avoid air space.
- Homogenize sediment from each depth interval and transfer the sediment into appropriate sample containers using the decontaminated spoon.
- Store and document sample.
- Mark sampling location with a buoy, stake, or other indicator for subsequent surveying of sample locations.

Sampling equipment shall be decontaminated after the collection of each sample in accordance with the procedures outlined in Section 2.5. Record all appropriate data (including sampling location, sampling depth, time of sampling, and description of sample) in field logbook or the Sediment Sampling Log.

2.5 Equipment Decontamination

To minimize the chance of cross-contamination, the equipment used during the field investigation will be decontaminated in accordance with NJDEP guidelines (May 1992). The decontamination water will be collected and containerized in 55-gallon drums or in a larger portable storage tank or tote. The cleaning procedures described in the following sections will be used for the RI/FS. The equipment used to collect samples for laboratory analyses will be precleaned in a laboratory (e.g., sampling spoons, etc.) and dedicated for that sampling point. Whenever feasible, all field sampling equipment will be laboratory cleaned, wrapped, and dedicated to a particular sampling point. For this RI, stainless steel sampling spoons and trowels that are used to collect soil or sediment samples submitted for chemical analysis will be laboratory decontaminated whenever possible. Disposable Teflon bailers, if used to collect water samples (although not likely with the use of low-flow sampling techniques), will also be dedicated, vendor decontaminated, and wrapped in autoclaved aluminum foil. The field-cleaning of sampling equipment used to collect samples for analyses will be avoided to the extent possible.

The decontamination water will be sent for disposal in accordance with the analytical results of the waste characterization tests that will be performed at the end of the field investigation. If approved by the USEPA, the decontamination water will be treated at the Stormwater treatment unit located on site.

2.5.1 Large Equipment

Large equipment, such as backhoes, drill rigs, and ancillary equipment, will be decontaminated upon arrival at the site, between borings, and before demobilization. Decontamination will consist of a high pressure hot water or "steam" wash and brushing to remove encrusted material. Potable water obtained from fire

hydrants or a local source located near the site will be used. The drill rig equipment and tools used during these activities will be pressure cleaned after the completion of each soil boring to minimize the potential for cross-contamination.

2.5.2 Soil Sampling Equipment

Non-dedicated soil sampling equipment, with the exception of the Direct-push samplers, used for collecting samples for laboratory analysis (i.e., split-spoon samplers, specialized soil samplers, spoons, and scoops) will be decontaminated using the nine-step decontamination procedure as follows:

1. Alconox or low-sudsing detergent scrub and potable water wash
2. Generous tap water rinse in a second wash tub
3. Distilled and deionized (ASTM Type II) water rinse
4. Ten percent nitric acid rinse (only if sample is to be analyzed for metals)
5. Distilled and deionized (ASTM Type II) water rinse (only if sample is to be analyzed for metals)
6. Acetone (pesticide grade) rinse (only if sample is to be analyzed for organics)
7. Distilled and deionized (ASTM Type II) water rinse (only if sample is to be analyzed for organics)
8. Total air dry
9. Aluminum foil wrap equipment (if not reused immediately)

Soil sampling equipment used for stratigraphic soil sampling only (i.e., split-spoon samplers, Shelby tubes, and specialized soil samplers) will be decontaminated using the following procedure:

1. Alconox or low-sudsing detergent scrub and potable water wash
2. Generous tap water rinse in a second wash tub
3. Distilled and deionized (ASTM Type II) water rinse
4. Total air dry
5. Place equipment in aluminum foil or wrap in plastic (if not reused immediately)

Grossly contaminated soil sampling equipment will be decontaminated using the nine-step procedure described above.

2.5.3 Water Sampling Equipment

If field cleaning of aqueous sampling equipment is required, then the following nine-step decontamination procedure shall be used:

1. Alconox or low-sudsing detergent scrub and potable water wash
2. Generous tap water rinse in a second wash tub
3. Distilled and deionized (ASTM Type II) water rinse
4. Ten percent nitric acid rinse (only if sample is to be analyzed for metals)
5. Distilled and deionized (ASTM Type II) water rinse (only if sample is to be analyzed for metals)
6. Acetone (pesticide grade) rinse (only if sample is to be analyzed for organics)

7. Distilled and deionized (ASTM Type II) water rinse (only if sample is to be analyzed for organics)
8. Total air dry
9. Aluminum foil wrap equipment (if not reused immediately)

2.5.4 Monitoring Well Riser and Screen

Before installation, field cleaning of PVC well riser and screen will consist of a manual scrubbing to remove foreign material and steam cleaning, inside and out. The PVC riser and screen will then be handled and stored in such a manner so as to prevent cross-contamination prior to installation.

2.5.5 Pumps and Lines

Pumps and lines are the most difficult items to clean because they are awkward to handle in the field and require large volumes of cleaning agents. It is important that contaminants not be carried from well to well. If the wells are found to contain only "clear" water with no observable organic film or phase, decontamination will be accomplished between each well as described below. Grossly contaminated pumps will not be reused at the site and an alternate sampling approach for the well containing free product will be considered.

To decontaminate submersible pumps the coiled lines and pump will be drained of water as best as possible. The pump and lines will be placed in a large bucket and scrubbed with dilute non-phosphate detergent. The pump will then be placed in a plastic overpack drum or plastic garbage can (metal drums should be avoided if using electric pumps) and a minimum of 20 gallons of water will be flushed through it. After the flush, the outside of the pump will be rinsed with distilled and deionized water. Pump tubing cleaned in this manner will be used solely for well purging, not for sample collection.

Surface pumps (e.g., centrifugal, inertial lift, etc.) used at the site for well purging or well development will not require decontamination because dedicated tubing will be used together with a dedicated foot valve, to prevent backflow of water from the pump into the well.

2.6 Investigation-Derived Waste Handling

The disposal of wastes generated during the RI/FS, such as soil cuttings and groundwater development water, will follow the guidelines in the NJDEP Field Sampling Procedures Manual (NJDEP, 1992).

For monitoring well development and purge water, if there is no obvious contamination observed during drilling and well installation, if the development water does not have an observable sheen or odor, and if the PID readings of the water remain at background levels, the development/purge water will be discharged to the ground surface and allowed to percolate back to the groundwater system. In general, the water will be discharged to the ground upgradient of each monitoring well and not in areas where it may run off the site. If development/purgewater has signs of gross contamination, it will be collected in U.S. Department of Transportation (DOT) approved (or equivalent) 55-gallon drums and stored at the site staging area. These suspected fluids would be analyzed to determine their toxicity characteristics. After the analytical results are received, these fluids will be disposed of in accordance with applicable local, state, and federal regulations. USEPA will be informed before wastewater generated at the site is removed off site for disposal.

Other disposable materials such as personnel protective gear (e.g., gloves, Tyveks) will be collected in plastic bags or DOT-approved 55-gallon drums for subsequent disposal.

The unused shallow soil drill cuttings and soil samples will either be drummed for disposal (if visually grossly contaminated or exhibiting high field screening results), stockpiled at the staging area under tarps and plastic for later characterization (if samples appear uncontaminated), or saved and archived for soil description and stratigraphic identifications.

Containerized materials will be transported to the site storage area, placed on pallets, and the contents labeled with weather-resistant labels or markers on the drum exteriors. The field inspector will maintain a log of the drums, their contents, and associated analytical data.

The project consultant will coordinate disposal of investigation-derived waste with a disposal contractor. These materials will be handled, transported, and disposed of according to requirements mandated by applicable federal, state, and/or local hazardous waste regulations. The disposal of non-hazardous waste materials generated at the site will be the responsibility of the each subcontractor that generated that material (e.g., drilling and sampling disposables, grout bags, excess monitoring well materials, etc.).

2.6.1 Investigation-Derived Waste

Section 2.6.1 inserted from FOP Addendum No. 1 (Brown and Caldwell, October 2001)

A "mud" slurry will be generated when advancing the portion of the cased deep borings (Section 2.2.3.4) below the permanent casing using the water rotary method. This mud will consist of drill cuttings and fluids. The drilling waste will be contained during the drilling process (e.g., using a mud tub). Upon completion of the borehole, the drilling waste will be placed in DOT approved drums, pending characterization and appropriate disposal.

2.7 Surveying

A land survey will be performed by a New Jersey State licensed surveyor to horizontally and vertically locate the sampling points established during the RI (i.e., monitoring wells, soil borings, sediment sample locations, etc.). The inner casing (riser) of monitoring wells, as well as the ground elevation and elevation of the outer casing, will be surveyed for both horizontal and vertical control, to a degree of accuracy of 0.01 foot. The survey data will be referenced to the 1983 New Jersey State Coordinate System (North American Datum of 1983) and to the North American Vertical Datum of 1988.

2.8 Sample Handling

Numerous environmental samples will be collected during the RI/FS and submitted for laboratory analyses. The matrix of the samples will consist of soil, sediment, groundwater, and surface water. The requirements for sample containers, identification of samples and packaging and shipping of samples are described below.

2.8.1 Quality Control Samples

An important aspect of the field investigation is to document and preserve the quality of the analytical data that will be generated through sample collection and laboratory analyses. Therefore, field QA/QC samples will be collected at regular intervals during the sampling program to partly satisfy this objective. The QA/QC samples will be collected in such a way that a clear association between the environmental samples and the associated QA/QC sample is established. Field records of the association will be documented and maintained. Definitions, sampling requirements, and frequency of collection of the QA/QC samples are described below.

2.8.1.1 Field Blanks

A field blank is deionized water that is poured into or pumped through the dedicated or field decontaminated sampling device, transferred to the appropriate sample containers, and transported to the laboratory for analysis. Field blanks will be prepared on sampling equipment used to collect aqueous and soil samples. Sampling equipment for aqueous samples include tubing. Sampling equipment for soil samples include stainless steel trowels and split-spoons, but not EnCore™ samplers. Field blanks are not required for Encore™ samplers (USEPA Region II, personal communication to URS, Telecon November 1, 2000). The field blank samples will be analyzed for the same parameters as the samples being collected at the time of the preparation of the field blank, with the exception of VOCs that are associated with Encore™ sampling. At a minimum, one field blank sample will be prepared per matrix for each day that samples are collected, in accordance with the NJDEP guidelines (May 1992, February 1997).

2.8.1.2 Duplicate Samples

A duplicate sample is a second sample collected independently at the same location as the original sample during a single sampling event. Duplicate sample results are used to assess precision, including variability associated with both the laboratory analysis and the sample collection process. Duplicate samples are collected simultaneously or in immediate succession, using identical recovery techniques, and treated in an identical manner during storage, transportation, and analysis. Five percent of the samples collected shall be field duplicates (one duplicate for every 20 samples). Both the duplicate and the sample shall be analyzed for the same parameters in the laboratory.

The duplicate sample will be submitted to the laboratory without their knowledge of the sample designation (i.e., "blind" duplicate sample). The field logbook shall identify the duplicate sample locations. This information will not be indicated on the label, the chain-of-custody, or any other documents that accompany the sample to the laboratory so that the laboratory cannot establish the association of a duplicate sample.

2.8.1.3 Trip Blanks

This section describes the trip blank procedures for the collection and shipment of samples that are collected for the laboratory analysis of VOCs. Trip blanks will not be used if VOC samples are not collected on a given day.

For aqueous samples, a trip blank is a volatile sample vial filled in the laboratory with organic-free water (Type II, reagent grade water), transported to the site, handled like a sample, and returned to the laboratory for analysis. Trip blanks are used only for aqueous volatile samples and are subjected to the same handling as other samples. Trip blanks are not required for samples collected with EnCore™ sampler (USEPA, October 24, 2000). Trip blanks will be prepared and preserved with Hydrochloric Acid (HCl) to pH less than 2.0 by the laboratory and will arrive on site within one day of their preparation. Trip Blanks will not be held on site longer than two calendar days. Trip blanks will not be opened in the field. Trip blanks serve to identify contamination from sample containers or transportation and storage procedures. For every cooler containing water samples collected for VOC analysis, one trip blank will be added to the cooler and analyzed for the presence of VOCs.

2.8.1.4 Temperature Blank

A temperature blank will be used in each sample shuttle to measure the temperature of the samples upon shipment arrival to the laboratory. The temperature blank consists of a small vial filled with water. The vial will be labeled Region II Temperature Blank. If, upon arrival to the laboratory, the temperature of the blank is below 10 degrees Celsius, the samples will be accepted for analysis. If the temperature is at or greater than

10 degrees Celsius, the laboratory will notify the Project Manager or the designated Project Chemist immediately. The potential impacts to data usability of those samples will be discussed with the project chemist to decide whether or not additional samples would be required.

2.8.1.5 Matrix Spike and Matrix Spike Duplicate Samples

An aliquot of a matrix (water or soil) is fortified (spiked) with a known concentration of compounds of interest. The matrix spike and matrix spike duplicate (MS/MSD) are subjected to the entire analytical procedure in order to indicate both accuracy and precision of the method for the matrix by measuring the percent recovery and the relative percent difference (RPD) of the two spiked samples. These samples are used to assess matrix interference effects on the method, as well as to evaluate instrument performance. The MS/MSD data are used to evaluate the matrix effect, not to control the analytical process. MS/MSDs are analyzed for each matrix for every 20 environmental samples (five percent) or one per batch in order to maintain continuous surveillance of acceptable method performance. No extra field samples (just triple volume) are required for MS/MSDs.

2.8.2 Sample Container, Preservatives, and Holding Time Requirements

The selection of sample containers is based on both the media being sampled and the analytes of interest. The sample preservatives and laboratory holding times before analyses are also based on media and analytes of interest. The NJDEP four-day handling time requirement for laboratory blanks (NJDEP, 1992) will be adhered to during this investigation. In general, the minimum preservation requirement for any sample is to store it at 4 degrees Celsius immediately after collection. A temperature blank (a vial filled with clean water) will be included with each cooler so that the project laboratory can document compliance with the temperature-preservation requirements immediately upon receipt of the samples.

2.8.3 Sample Designation and Labeling

The following procedures will be used to identify and track environmental samples collected during the field investigation. An unremovable and waterproof label will be affixed to each sample container. The following information will be written on the label with permanent marker:

- Site name
- Sample identification
- Consultant Project number
- Date/time
- Sampler's initials
- Sample preservation
- Analysis required

Typically, a label is filled out with the above information, affixed to the bottle, and then covered with wide clear tape for additional protection against accidental erasure.

2.8.4 Field Sample Numbering

The groundwater, surface water, and sediment samples collected at the site will be assigned the following, relatively standard designations:

- MW-XXX for groundwater monitoring well samples
- SW-XXX for surface water samples
- SED-XXX for sediment samples

The "XXX" shown above represents a numerical suffix that will be assigned to each sample in consecutive order.

Soil samples will be assigned a designation based on the name of the area of concern that they are associated with. For example, a sample collected from the former Waste Water Treatment Unit will be designated WWT-XXX while a sample collected from the area of the Bullet Tanks will be designated BT-XXX.

Field QA/QC samples will consist of field blanks, trip blanks, blind duplicate samples, matrix spike samples and matrix spike duplicate samples. The following designations will be used to identify these samples following a "year (xx)-month (xx)-day (xx)" scheme:

- **FB01-000415:** First field blank prepared for the RI/FS on April 15, 2000.
- **TB02-001115:** Second trip blank used for the RI/FS on November 15, 2000.
- **DUP-1:** First blind duplicate sample of the RI/FS field investigation. The actual sample designation of the blind duplicate will be tracked by the field inspector through his or her field notes and recorded in the daily inspection report.

Matrix Spike and Matrix Spike Duplicate samples will be identified as needed by adding letters "MS" and "MSD", respectively to the end of the sample identification code (e.g., MW-1MS, MW-1MSD, etc.).

2.8.5 Sample Custody

At the time of the sampling, the field inspector will record the sample information in the field book and on a chain-of-custody form, noting on each any difficulties encountered in sampling. The label, logbook, and chain-of-custody form entries shall be made in waterproof ink. The sample information recorded in the logbooks should be at least as detailed as that recorded on labels, and should indicate the type of sample (e.g., groundwater, soil, waste, etc.), preservation technique, and sampling location, with sufficient detail as to allow resampling at the same location, if necessary.

Immediately after a sample is collected and transferred to the appropriate laboratory-supplied container, the field inspector will place the filled container in ice chests or coolers that contain ice for preservation. The field inspector will maintain custody of the samples until they are shipped or hand delivered to the laboratory. Samples submitted to the laboratory will be accompanied by a chain-of-custody form to provide documentation of the sampling event. These forms will be completed and sealed inside the cooler sent to the project laboratory. The following information will be included on the chain-of-custody form:

- Date and Time Sample was Collected
- Client or Consultant
- Project Name
- Sample Identification Kumber
- Sample Description
- Sample Container Numbers and Volumes
- Cooler Identification Number (if applicable) Analysis Required
- Preservatives (if applicable)
- Signatures of Persons Involved in Chain-of-Custody
- Date and Time of Possession
- Date and Time of Relinquishing Sample Custody

The entries on the chain-of-custody form will correspond to the field logbook and sample labels. Custody seals will be used to detect tampering with the samples before laboratory acceptance. Custody seals will be affixed to the cooler in a manner that requires seal breakage in order to open the cooler as discussed in Section 2.8.6. Unauthorized seal breakage indicates possible tampering and may render the analytical results of a sample suspect.

2.8.6 Sample Packaging and Shipping

This section describes the packaging and shipping procedures that will be used for the RI field samples.

2.8.6.1 Sample Packing

The samples collected for laboratory analysis will be shipped or hand delivered to the laboratory within 48 hours of the sample collection. Sample packaging and shipping procedures are summarized as follows:

1. Samples will be accompanied by a properly completed chain-of-custody form. The sample numbers and locations will be listed on the chain-of-custody form. When transferring the possession of samples, the individuals relinquishing and receiving will sign, date, and note the time on the record. This record documents transfer of custody of samples from the sampler to another person, to the laboratory, or to/from a secure storage area. Commercial, overnight carriers (e.g., Federal Express Corporation) will not be involved in the Chain-of-Custody procedures because the custody form will be sealed inside the cooler at the time of shipment. .
2. Samples will be properly packaged to avoid breakage, stored on ice at 4 degrees Celsius for shipment and dispatched to the appropriate laboratory for analysis. A separate signed custody record will be enclosed and secured to the inside top of each sample box or cooler. The chain-of-custody and any additional paperwork will be placed in a plastic "ziplock" bag to prevent them from getting wet.
3. Shipping containers will be secured with strapping tape and custody seals for delivery to the laboratory. The preferred procedure includes use of a custody seal attached to the front right and back left of the cooler. The custody seals are covered with clear plastic tape. The cooler is strapped shut with strapping tape in at least two locations.
4. Courier or overnight carrier will transport samples to the laboratory.

For this investigation, it is anticipated that the laboratory samples collected at the site will be hand delivered to the laboratory by courier.

2.8.6.2 Hazardous Sample Shipping

The DOT and the International Air Transport Association (1998) have promulgated regulations for the packaging and shipping of DOT-defined hazardous materials under 49 Code of Federal Regulations (CFR) Parts 171 through 179 and IATA-defined dangerous goods. The USEPA established three categories for samples:

- **LOW-Concentration Samples** - samples containing less than 10 ppm of any known contaminant. Examples include background soil, sediment, surface water, and groundwater samples that are collected from locations not expected to have been grossly impacted by or come in contact with hazardous materials. Low-concentration samples are considered environmental samples and are not regulated by the DOT or IATA since they do not pose a transportation hazard.
- **Medium-Concentration Samples** - samples containing greater than 10 ppm but less than 15 percent (150,000 ppm) of the contaminant of highest concentration. Special regulations govern the shipment of medium-concentration samples; the field inspector will contact the environmental consultant's project manager for further instructions if medium-concentration samples require shipment.
- **High-Concentration Samples** – samples containing greater than 15 percent of at least one contaminant. Special regulations govern the shipment of high-concentration samples; the field inspector will contact the environmental consultant's project manager for further instructions if high-concentration samples require shipment.

For this investigation, it is anticipated that the laboratory samples collected at the site will be low-concentration samples and that special shipping arrangements will not be required for the RI. The field inspector will notify the environmental consultant's project manager for instructions in the event that medium- or high-concentration samples are collected and require overnight shipment.

2.9 Field Measurements and Equipment Calibration

Electronic instruments that are anticipated to be used during this field investigation include the following equipment (or equivalent equipment):

- Photoionization detector (e.g., HNU PI-I01 with a 10.2 electron volt lamp)
- Flow-through water quality meter (e.g., YSI model 6820)
- Particulate dust monitor (e.g., MIE Miniram PDM-3)
- Water level indicator (e.g., Solinst water level meter)
- Slug test probes and data recorder (e.g., In-Situ, Inc. Hermit data logger and Pressure transducers)
- Mercury Vapor Analyzer (Jerome 431-X)

Quality assurance requires that the devices and equipment used to perform field testing or data recording be calibrated before use. Calibration documentation will include identification of the instrument, serial number, date, reference standard, adjustments or repairs made, and the signature of the person performing the calibration. The calibration data will be recorded in the project field book or in an appropriate field calibration log. The calibration procedures will follow the manufacturer's guidance.

On-site field calibration activities include the use of calibration standards and field equipment checks, as appropriate, for the equipment being used. Field calibration and/or field checking of each meter will be accomplished by following the procedures outlined in the operating manual for the instrument. At a minimum, field calibration and/or field equipment checking will be performed both prior to and after equipment use. Field calibration will be documented in the field notebook.

Equipment that fails calibration or becomes inoperable during use will be removed from service and segregated to prevent inadvertent utilization. The equipment will be properly tagged to indicate that it is out of calibration. Such equipment will be repaired and recalibrated to approved standards by qualified personnel. Equipment that cannot be repaired will be replaced.

Results of activities performed using field equipment that has failed recalibration will be evaluated by the environmental consultant's Project Manager or his/her designee. If the activity results are adversely affected, the results of the evaluation will be documented, appropriate personnel notified, and a decision made of the validity of the results.

Off-site calibration and maintenance of field instruments will be the responsibility of the owners of their respective instruments (i.e., subcontractors, the USEPA, or any group working on site) and will be performed by the owners as appropriate throughout the duration of project activities. The field instrumentation, sampling equipment, and accessories will be maintained in accordance with the manufacturer's recommendations and specifications and established field equipment practice. Off-site calibration and maintenance will be performed by qualified personnel. A logbook will be kept to document that established calibration and maintenance procedures have been followed. Documentation will include both scheduled maintenance and unscheduled maintenance.

2.10 Field Documentation

The details of field investigations will be recorded in a waterproof field book. The project field book will be a controlled, formal document that will record the events of the field investigation. Ancillary field data may be recorded on field logs specific to a given task. The subsurface borings will be logged on a Soil Boring Log, monitoring well construction will be logged on a Monitoring Well Construction Log, and purging and development of wells will be logged on Well Development/Purging Log. Soil boring logs will include descriptions of subsurface material encountered during drilling, sample numbers, types of samples recovered from the borehole, water elevation data, and PID/MVA (headspace and sample screening) information.

2.10.1 Field Book and Field Logs

They following types of information will be recorded in the field book:

1. Location of sample
2. Date and time of sample collection
3. Identity of people performing activities
4. Weather conditions
5. Boring identification
6. Location of borings in relation to easily identifiable landmark
7. Sampling intervals
8. Blow counts

9. Sample descriptions (Based upon USCS)
10. Identity and calibration of field instruments
11. Depth at which saturated conditions were encountered
12. Field instrument readings, background, borehole, and samples
13. Drilling method
14. Size of downhole equipment
15. Drilling rates
16. Materials used to backfill the boreholes and quantities
17. Personnel present on site
18. Visitors to the site
19. Chronology of daily events
20. Level of personnel protection
21. Field problems, solutions, and corrective actions

The field inspector, or person making entries on a given day, will date and sign each completed page of the project field book. The field book will be completed using indelible, water proof ink. The pages of the field book will be consecutively numbered and the pages will not be removed.

If changes in the field book are necessary, changes will be indicated by a single line drawn through the affected text. The individual responsible for the change will initial and date the entry. Each day's activities or separate sampling episodes will be signed. The logbook will be protected, stored in a safe file or other repository, and retained as a permanent record.

Upon completion of daily field activities, the field inspector will complete a daily inspection record form and initiate chain-of-custody on any samples collected for geotechnical or chemical laboratory testing. After the RI drilling program, the field team will transfer information from the field logs onto standard boring log forms for the Remedial Investigation Report. The field notes will be kept in the project files.

The following types of logs, forms, and field books will be used to document activities during the field investigation.

1. **Field Book** - weatherproof bound field book
2. **Daily Inspection Record** - will be filled out by the field inspector to provide a daily chronology of site events
3. **Soil Boring Log** - one log will be completed for each boring advanced at the site
4. **Monitoring Well Construction Log** - one log will be completed for each monitoring well installed at the site
5. **Well Development/Purging Log** - one log will be completed for each well developed or purged at the site
6. **Well Sampling Form** - one form will be completed for each monitoring well sampled at the site
7. **Surface Soil Sampling Log** - will record the location and physical description of the soil sample
8. **Surface Water/Sediment Sampling Log** - will record the location and description of the surface water and sediment sample
9. **Equipment Calibration Log** - will document the calibration of a given measuring instrument
10. **Log of Photographs** - will provide a description of photographs taken at the site

11. **Slug Test Data Sheet** - will record the data generated during a slug test
12. **Chain-of-Custody Form** - will accompany each set of coolers sent to the project laboratory on a given day
13. **Water Level Log** - the water level in each well will be recorded on these sheets.

The field book and field logs will provide QA/QC documentation for the general adherence to the sampling and data collection procedures established for the LCP Chemicals, Inc. RI and will also serve to document deviations from the anticipated scope of work. This information will be used for the Data Usability Summary report discussed in Section 14.0 of the RI/FS QAPP.

2.10.2 Photographic Documentation

Pertinent field activities and sample locations may be documented with photographs, subject to approval by ISP Environmental Services, Inc. The picture number and roll number will be logged in the field book to identify the area and activity depicted in the photograph. A separate photographic documentation log form will be maintained by the Site Manager or designee. The log of photographs will include the date, the roll number, the picture number and a description of the area and activity depicted in the photograph. For cameras that use film, this information, exclusive of the description, will also be recorded on the back of each photograph and the photographs will be stored in the project file. For digital cameras, the photographic image will be stored in the project consultant's project computer directory and backed up during routine maintenance of their computer network system.

Videotape recording cameras may also be used during some field activities to provide an additional type of documentation. Videotapes will be labeled with pertinent project information and stored in the project file.

2.11 Soil Vapor Sample Collection

Section 2.11 inserted from FOP Addendum No. 4 (Brown and Caldwell, October 2006)

Note: The soil vapor sampling that was performed in May and June 2007 also followed the guidance contained in the NJDEP Vapor Intrusion Guidance, (March 2007).

Soil vapor (SV) samples will be collected from material above the water table at locations throughout the Site Work Plan Phase II Remedial Investigation LCP Chemicals Inc. Superfund Site) following the procedure outlined below:

2.11.1 Installation of Soil Vapor Probes

Soil vapor probes will be installed from which soil vapor samples will be collected. The soil vapor probes will installed as follows:

- A direct-push drill rig (e.g., GeoProbe®) will be used to advance a 2-inch soil -core sampler 5 feet into the subsurface immediately adjacent to selected proposed soil vapor probe location to observe the depth to the water table near the soil vapor sampling locations. This information will be used to select the depth to which the sample screens will be set at the surrounding sample points.
- Once the local depth to the water table is determined a 2-inch diameter borehole will be advanced using the direct-push rig to just above the water table.

- Once the borehole is complete a 1-inch diameter PVC slotted screen 0.010" will be set in the borehole with clean silica sand filter pack material placed in the annulus surrounding the screen. The length of screen used at the sample locations will depend on the depth of the water table, but is generally assumed to be between 3 and 5 feet across the Site.
- A hydrated bentonite slurry will be placed in the annular space above the filter pack to provide a seal in the borehole from surface contamination and to minimize infiltration of ambient air.
- The top of the soil vapor probe will be completed with a male-threaded, appropriately sized tubing-barb to be used with the sampling tubing. No organic thread lubricant of any kind will be used when constructing this to minimize the chance of sample contamination. The barb will be completed with a cap so that infiltration by outside air will be minimized.
- Upon completion of soil vapor sampling, described below in Section 2.11.2, the soil vapor probes will be abandoned by pulling the temporary well screen out of the ground and backfilling the borehole with a hydrated bentonite slurry.

2.11.2 Collection of Soil Vapor Samples

Soil vapor samples will be collected no less than two weeks following the installation of the soil vapor probes. Samples will not be collected on days in which high humidity or rainfall may impact the readings from the field monitoring equipment.

- One (1) Teflon®-lined polyethylene sampling tube will be connected to the tubing-barb for use in sampling. The tube will be secured to not allow debris to clog the tube and/or potentially contaminate the sample.
- Prior to Sampling for VOCs (USEPA Method TO-15), the sampling probe will be purged for approximately 10 minutes. This is intended to exchange air from the sampling tubing, which could potentially dilute or otherwise bias the sample.
- After purging, the tubing will be attached to a one-liter SUMMA canister provided by the analytical laboratory. The canister will have been evacuated by the laboratory prior to shipment to the site. After the canister is attached to the tubing, the canister valve is opened, and the vacuum in the canister causes the soil gas to flow into the canister. The canister will be allowed to fill for approximately one (1) hour. The vacuum pressure in the canister will be checked at the conclusion of sampling with a pressure gauge to confirm that sample collection was complete. A vacuum pressure reading of -5 Hg indicates that the canister is filled and under some pressure to better allow the lab to extract the sample.
- After the SUMMA canister is filled, a reading will be taken with the mercury vapor analyzer to measure mercury vapors. At locations with mercury below the detection capability of the meter, selected samples will be analyzed by Method IO-5 to quantify the lower levels.
- To collect a sample for laboratory analysis for total mercury by IO-5, gold-coated bead traps are used with a Teflon particulate filter before the trap so that no particulate can be trapped and skew results. When assembling, installing and removing the traps particle-free gloves will be worn at all times and samplers will stand down-wind to prevent contamination by shedding particles from clothing, etc.
- The trap with filter will be connected to a pump which will draw air through the trap at a constant rate of 0.3 L/min. The calibrated range of the method is 5 ng to approximately 7.5 mg depending on the variety of trap used in sampling. Therefore, to target the method range, the pumping duration will likely be the minimum practical.
- The samples will be sent to a specialized mercury laboratory for analysis.

2.12 Biota Sampling

Section 2.12 inserted from FOP Addendum No. 5 (Brown and Caldwell, October 2006)

2.12.1 Sampling Timeline

Mummichog and fiddler crabs will be collected during the biologically active season which in Linden, New Jersey, typically spans from May through September. The samples will be collected during a single sampling event as defined below for each species. It should be noted that if the target mass for laboratory analyses is not met during the time frames provided for each species then analyses will be prioritized as provided in this document.

2.12.2 Sample Locations

Six biota sampling transects will be established that coincide with sediment and surface water sampling transects Work Plan, October 2006). A single mummichog sampling station will be located at the center of each transect. Crab sampling stations will be located along both of the creek banks at each transect.

Each transect will be identified by inserting metal poles into the bank at each end of the transect. The poles will be labeled using metal tags. The horizontal locations of the transect termini will be surveyed by a licensed surveyor to the New Jersey State Plane Grid (NAD 1983). The locations of the individual sampling locations will be referenced by the field sampling personnel to the applicable transect stakes from which the coordinates of the field samples will be determined. Alternatively, the sample locations will be identified using a GPS instrument (e.g., Trimble GeoXT or equivalent).

2.12.3 Mummichog Samples

Mummichog samples will be collected from the approximate channel center at each transect. These fish will be collected utilizing either minnow traps or a seine net. The specific method to be used will depend upon site conditions and the technique's overall capture effectiveness (i.e., number of fish caught). The specific protocol to be used for each of these techniques is provided below.

Minnow Traps

Traps will typically consist of standard 17 x 9-inch cylindrical galvanized wire enclosures with an inverted funnel at each end and a mesh size of ¼ inch, or equivalent. The traps will be decontaminated prior to each use (see below) and baited. One trap will be utilized per transect. Traps will be deployed during high tide. Each trap will be handled wearing a clean pair of Nitrile gloves.

Seining

Seining may also be used to obtain mummichog samples. This technique will utilize a stationary net located approximately 10 feet downstream of the center of the transect. A mobile seine located approximately 10 feet upstream of the centerline of the transect will then move towards the stationary seine. One end of the mobile seine will be held by a biologist in a boat, while the other end will be held by personnel walking along the bank of South Branch Creek. The mobile seine will herd the fish towards the stationary seine where they will then be collected by personnel in the boat using 16 x 12 x 16-inch dip nets, or equivalent. The seines will be 20 x 4 feet with a mesh size of 3/16 inch, or equivalent. Seining will be conducted during high tide or at period when the tide is in flux (e.g., incoming or outgoing tide).

In the event that neither method yields sufficient tissue, one additional collection attempt will be made during a subsequent tidal cycle. If two tidal cycles do not provide sufficient mass for all analyses, analyses will be prioritized, as described in Section 2.12.5.

Mummichog Sample Processing

Upon collection, the fish will be identified as to species. Only mummichog will be collected; other species will be returned to South Branch Creek. The mummichog will then be rinsed in a bucket containing ambient water to remove excess sediment. The length of each individual mummichog will be measured and recorded. In addition, the mass of a representative size range of mummichog in each sample will be measured and recorded. New, disposable Nitrile or latex gloves will be worn during fish collection and processing, and new gloves will be used at each sampling station.

As mummichog are small fish (i.e., generally less than 8 cm in length), whole-fish composite samples will be utilized to provide the mass necessary for the analysis of the target analytes. The USEPA recommends that composite samples consist of similarly-sized individuals so that the smallest individual in the composite is no less than 75% of the size of the largest.[3] However, if sample mass becomes a limiting factor, or if the size range encountered in the field makes the size distinction impractical, all individuals collected will be included in the sample. The mass required for analysis is determined by the laboratory and is presented in the Quality Assurance Project Plan (QAPP) Addendum (to be submitted under separate cover). Once the necessary mass for the sample is obtained, the fish will be placed on a decontaminated surface, transferred to Ziploc™ bags, labeled, and shipped on ice to the laboratory.

A replicate sample will be collected if sufficient mass of fish is obtained. The replicate sample will provide back-up against the loss of data if the original sample is compromised in some manner (e.g., lost in transit, broken container) and provide additional sample to allow for re-analysis or analysis of additional analytes. The replicate sample will be processed in a manner identical to the original sample and then maintained in a freezer on site or at the laboratory at a temperature less than -18°C.

2.12.4 Fiddler Crab Samples

Fiddler crabs samples will be collected from the intertidal zone along the northern and southern banks at each transect (i.e., 12 total samples). Each crab sampling station will encompass a zone extending approximately 25 feet upstream or downstream from the centerline of the transect. Crabs will be collected using either traps or by hand. The specific method to be utilized will depend on its capture effectiveness (i.e. number of crabs caught in each trap).

Fiddler Crab Traps

Folding commercial 30 x 10-inch crab traps, or equivalent, will be lined with fiberglass window screen to prevent the fiddler crabs from escaping and from predation. One trap will be deployed at each sampling location (i.e., 2 traps per transect) during low tide and retrieved prior to the next incoming tide.

[3] Guidance for Assessing Chemical Contaminant Data for Use in Fish Advisories, Volume 1: Fish Sampling and Analysis, Second Edition. USEPA. 1995.

Hand Capture

Crabs can also be collected by hand using a trowel, shovel, or other digging device. During low tide, crabs will be chased into their burrows by walking towards them. Once in their burrows, the crabs will be excavated using the hand tools and collected by hand.

Sampling at a reasonable level of effort (e.g., two sampling crews) will continue as necessary over a period of one week. If, after that time, neither capture method results in collection of sufficient mass for all analyses at all 12 stations, analyses will be prioritized, as described in Section 2.12.5.

Crab Sample Processing

Crabs will be handled wearing new disposable Nitrile or latex gloves. Upon collection, crabs will be placed in a bucket containing ambient water to remove excess sediment. The mass of each individual fiddler crab will be measured and recorded. On addition, the length and width of a representative size range of crabs in each sample will be measured and recorded. Preference will be given to the collection of adult crabs (carapace ¾ to 1 inch in length); however, if necessary, smaller individuals will be collected to achieve the target weight for analysis. The mass required for analysis is determined by the laboratory and is presented in the Quality Assurance Project Plan (QAPP) Addendum. As with mummichog, whole crab composite samples will be collected. Crabs will be placed in Ziploc™ bags, labeled, and shipped on ice to the laboratory. If a sufficient mass of crabs is collected to allow for a replicate sample, this sample will be processed in a manner identical to the original sample and then kept frozen for contingency use, as described for mummichog.

2.12.5 Laboratory Analysis

The mummichog and fiddler crab samples will be tested for the analytical constituents as described in the Phase II Work Plan and QAPP Addenda.

In the event that sufficient mass is not obtained to complete all analyses, analyses will be performed in the following order of preference (as applicable):

1. Mercury
2. Methyl mercury
3. Other Target Analyte List (TAL) analytes
4. Arsenobetaine (fish)
5. PCBs
6. Additional parameters, as applicable

2.12.6 Decontamination

Reusable sampling equipment (i.e., scale, measuring board, buckets, nets) will be decontaminated before each sample is processed. Decontamination will consist of the following sequence: rinse with tap water, wash with a detergent solution (i.e., Alconox), rinse with tap water, and rinse with deionized water. Work surfaces will be cleaned with a detergent solution and rinsed with tap and deionized water between samples. Alternatively, the work surface may be lined with new aluminum foil before each sample is processed.

2.12.7 Field Data Records

The following information will be included on the field data sheet for each sample collected:

- Project Name
- Date
- Field personnel present
- Transect Number
- Sampling Station
- Approximate tidal stage
- Pertinent meteorological information, e.g., temperature, wind direction, and precipitation
- Sampling technique
- Species
- Mass of individual specimen.
- Lengths and widths of a representative size range of specimens in each sample
- Noticeable abnormality in appearance and/or behavior
- Field observations
- Health and safety protocols, (e.g., level of protection)
- Work Performed
- Deviations from established protocols, if any

Upon return to the office, photocopies shall be made of all field logbook pages and placed in the site file. This will ensure a record exists in the office of all field and sampling activities, and limits the potential loss of field notes due to the loss or destruction of the log book in the field.

2.12.8 Permits

The collection of all fish and crab samples will be in accordance with state regulations. A Permit to Collect Marine and Estuarine Organisms for Scientific Purposes from the Division of Fish and Wildlife of the New Jersey Department of Environmental Protection (NJDEP) has been applied for. This permit is not strictly required under CERCLA but has been requested for NJDEP records. It is anticipated that this permit will be received prior to the commencement of sampling activities.

URS Corporation, August 14, 2000, Work Plan, Interim Removal Action (IRA), for LCP Chemicals, Inc. Superfund Site, Linden, New Jersey.

URS, April 12, 2001. "Final Sampling and Analysis Plan, Field Operations Plan, Part I, Draft Sampling and Analysis Plan"

U.S. Environmental Protection Agency, 1987, A Compendium of Superfund Field Operations Methods, EPN540iP-871001, OSWER Directive 9283.1-2.

U.S. Environmental Protection Agency, October 1988, Guidance for Conducting Remedial Investigations and Feasibility Studies under CERCLA, Interim Final, USEPA 540 G-89 004, OSWER Directive 9355.3-01.

U.S. Environmental Protection Agency, October 1989, Region II CERCLA Quality Assurance Manual, Final Copy, Revision 1.

U.S. Environmental Protection Agency, November 1992, RCRA Ground-Water Monitoring: Draft Technical Guidance, Office of Solid Waste, U.S. Environmental Protection Agency, 401 M Street, S.W., Washington, D.C., 20460.

U.S. Environmental Protection Agency, Region II, March 16, 1998, Ground Water Sampling Procedure, Low Stress (Low Flow) Purging and Sampling, GW Sampling SOP, Final.

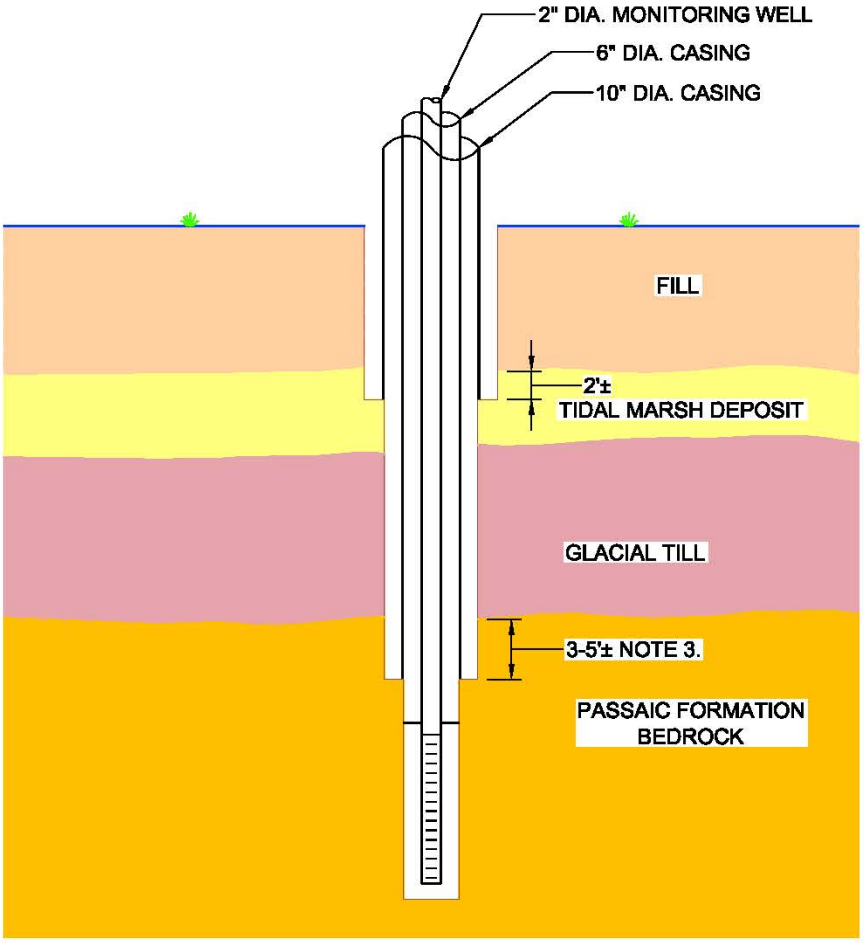
U.S. Environmental Protection Agency, October 24, 2000, Letter to ISP re: Approval of the Final WFS Work Plan, and Comments on the Draft RI/FS Field Operations Plan (Parts I and II) for the LCP Chemicals, Inc. Site, Linden, New Jersey, with Draft USEPA EnCore Sampling Procedures attached.

U.S. Geological Survey, 1966, Photo revised 1981, Arthur Kill, N.Y.-N.J. Quadrangle, Scale 1:24000.

Varljen M.D, Barcelona M.J, Obereiner J and Kaminski D, 2006. Numerical simulations to assess the monitoring zone achieved during lowflow purging and sampling. Ground Water Monitoring & Remediation 26 (1), 44-52.

FIGURES

TRIPLE-CASED WELL



SCALE: NONE

NOTES:

1. NOMINAL ANNULAR SPACE AROUND EACH CASING IS 2".
2. ANNULAR SPACE IS FILLED WITH TREMIE-EMPLACED GROUT.
3. THE BEDROCK CASING SOCKET DEPTH CONFLICTS WITH THE NJ CONSTRUCTION STANDARDS THAT REQUIRE A MINIMUM DEPTH BEDROCK CASING SOCKET OF 10' [N.J.A.C. 7:9D(b)1.]. ACCORDINGLY, WRITTEN AUTHORIZATION FOR THE WELL CONSTRUCTION DEVIATION WILL BE REQUIRED TO BE OBTAINED FROM NJDEP BUREAU OF WATER ALLOCATION IN ACCORDANCE WITH N.J.A.C. 7:9D-2.8 PRIOR TO COMMENCING DRILLING.

Appendix C-3: Off-Site Ditch Logs

Appendix C-3
SEDIMENT SAMPLE PHYSICAL DESCRIPTIONS
LCP Chemicals, Inc. Superfund Site, Linden, New Jersey

Sample Location	Top Depth	Bottom Depth	Burmeister Description	% Gravel	%Sand	% Fines
South Branch Creek						
SED-7	0	0.5	Black SILT, some f sand, some organic matter, saturated	13.8	75.9	10.2
SED-8	0	0.5	Black SILT, some fm sand, some organic matter, saturated	0.78	86.7	12.6
SED-9	0	0.5	Black SILT, mfc sand, some organic matter, little gravel and pebbles, saturated	9.2	86.3	4.5
SED-A-1	0	0.5	Black, fine ClayeySILT, trace (+/-) fine sand, some organic, saturated	7	75.6	17.5
SED-A-2	0	0.5	Dark grey to black, SILT, some fmSand, little odd shaped (ceramic) stones, wet. Petroleum like smell.	15.8	70.2	14
SED-A-2	0.5	1	Dark grey, SiltyCLAY, trace fmsand, trace(-) pebbles, some organic matter, moist	0	78.9	21.1
SED-A-2	1	1.5	Dark grey CLAY, some silt.	0.47	75.7	23.9
SED-A-3	0	0.5	Black, fine ClayeySILT, little fine sand, some organic, saturated	3	74.7	22.3
SED-B-1	0	0.5	Black, very fine SILT, trace mcsand, saturated	50.7	42.9	6.4
SED-B-2	0	0.5	Black, fm SILT, some fmsand, little gravel, saturated	1.6	95.3	3.1
SED-B-2	0.5	1	Black, CLAYandSILT, fmsilt, some (-)fmsand, saturated	4.7	91.5	3.9
SED-B-2	1	1.5	Dark grey, Silty CLAY, fine Silt, trace sand, little organic matter, moist	11	62.1	26.9
SED-B-2	1.5	2	Light grey, Silty CLAY, Silt, trace f sand, trace organic matter, moist	1.6	54	44.5
SED-B-3	0	0.5	Black, fine to medium SILT, some msand, saturated	4	87.3	8.7
SED-C-1	0	0.5	Black, SILT, some mSand, some organic matter, saturated	0.72	74.1	25.2
SED-C-2	0	0.5	Dark grey to black, SiltyClay, some f Sand, little organic matter, moist	1.9	78.6	19.5
SED-C-2	0.5	1	Dark grey, SiltyClay, some fsand, little organic matter, moist	0	67.5	32.5
SED-C-2	1	1.5	Dark grey, CLAY, some silt, trace fsand, trace organic matter	0	69.8	30.2
SED-C-3	0	0.5	Black, fine SILT, some fSand, little organic matter, saturated	4.8	82.3	12.9
SED-D-1	0	0.5	Black to dark grey, Silt&Clay, some f Sand, some organic matter, wet	1.1	82	16.9
SED-D-2	0	0.5	Black SILT, some f Sand, some organic matter, saturated	0	79	21
SED-D-2	0.5	1	Black SILT, some f Sand, little organic matter, saturated	1.3	82.8	15.9
SED-D-2	1	1.5	Black SILT, some f Sand, little organic matter, saturated	6.5	77.2	16.3
SED-D-2	1.5	2	Black SILT, f Sand, saturated	0.84	92.7	6.5
SED-D-2	2	2.5	Black SiltyClay, some f Sand, some organic matter	0	88	12
SED-D-3	0	0.5	Black to dark grey, Silt&Clay, some f Sand, some organic matter, saturated	26.1	65.6	8.4
SED-E-1	0	0.5	Dark grey to black, SILT&ORGANICS, some clay, some sand, wet	3.2	89.2	7.6
SED-E-2	0	0.5	Dark grey to black, SiltyClay, some f Sand, little organic matter, moist	0.5	85.9	13.7
SED-E-2	0.5	1	Dark grey to black, SiltyClay, some f Sand, little organic matter, wet	0.46	94.6	4.9

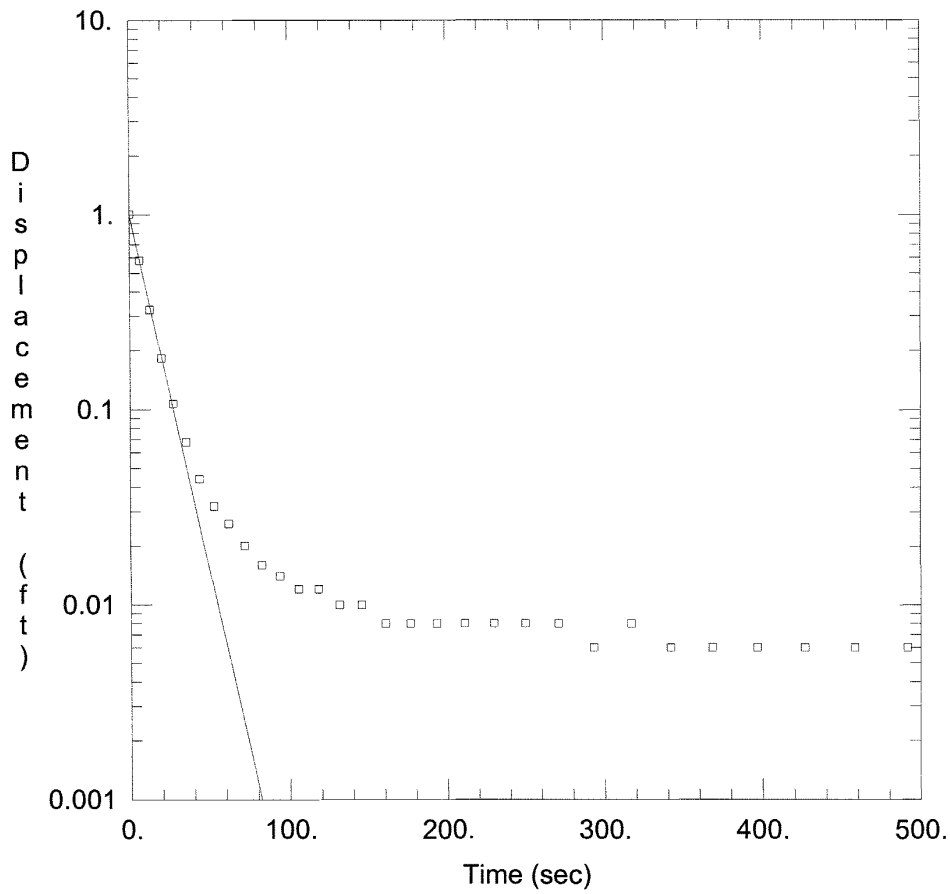
Appendix D: Hydrogeologic Data

D-1 – Hydraulic Conductivity Reports
D-2 - Hydrographs

Appendix D-1: Hydraulic Conductivity Reports



MW-6

Data Set: P:\LCP\21405\Data\Slug_Test_Data\mw-6.aqt
Date: 08/20/02 Time: 12:43:31

PROJECT INFORMATION

Company: Brown and Caldwell
Client: ISP Environmental Services Inc
Project: LCP Superfund Site
Test Location: Linden, NJ
Test Well: MW-6
Test Date: 12/5/01

AQUIFER DATA

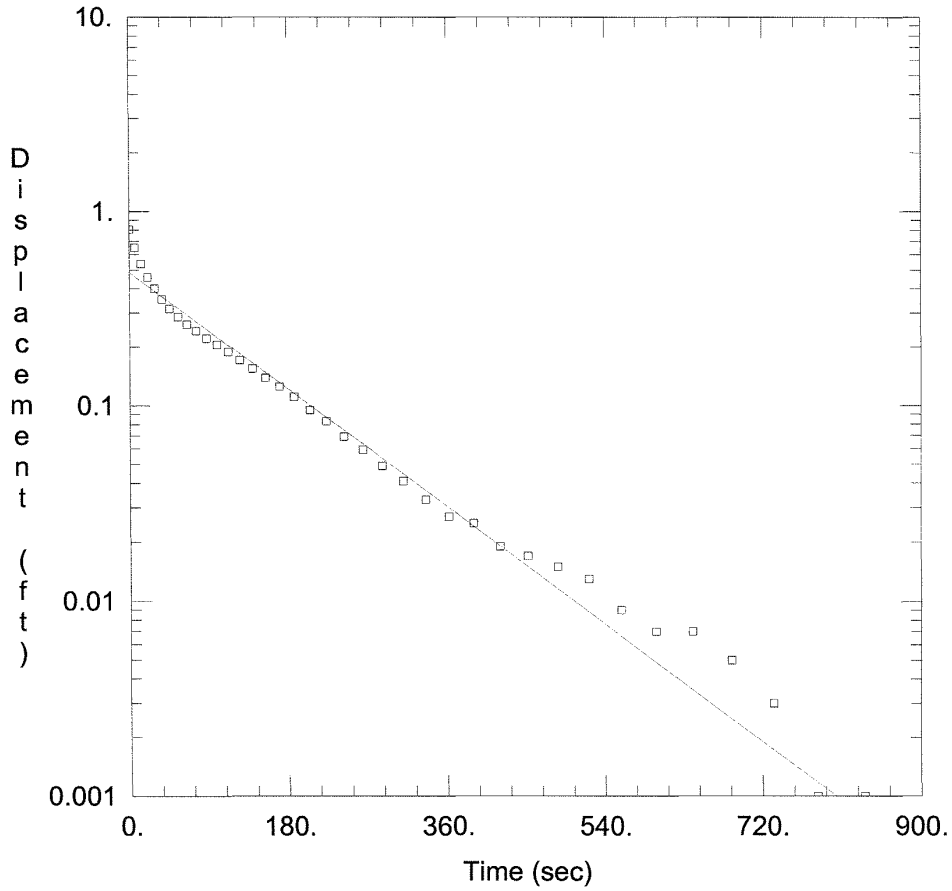
Saturated Thickness: 5.07 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-6)

Initial Displacement: 1.003 ft
Casing Radius: 0.083 ft
Screen Length: 5. ft
Water Column Height: 5.07 ft
Wellbore Radius: 0.177 ft
Gravel Pack Porosity: 0.3

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 0.01218 cm/sec
y0 = 0.9965 ft



MW-7

Data Set: P:\LCP\21405\Data\Slug_Test_Data\mw-7.aqt
Date: 08/20/02 Time: 12:43:36

PROJECT INFORMATION

Company: Brown and Caldwell
Client: ISP Environmental Services Inc
Project: LCP Superfund Site
Test Location: Linden, NJ
Test Well: MW-7
Test Date: 12/5/01

AQUIFER DATA

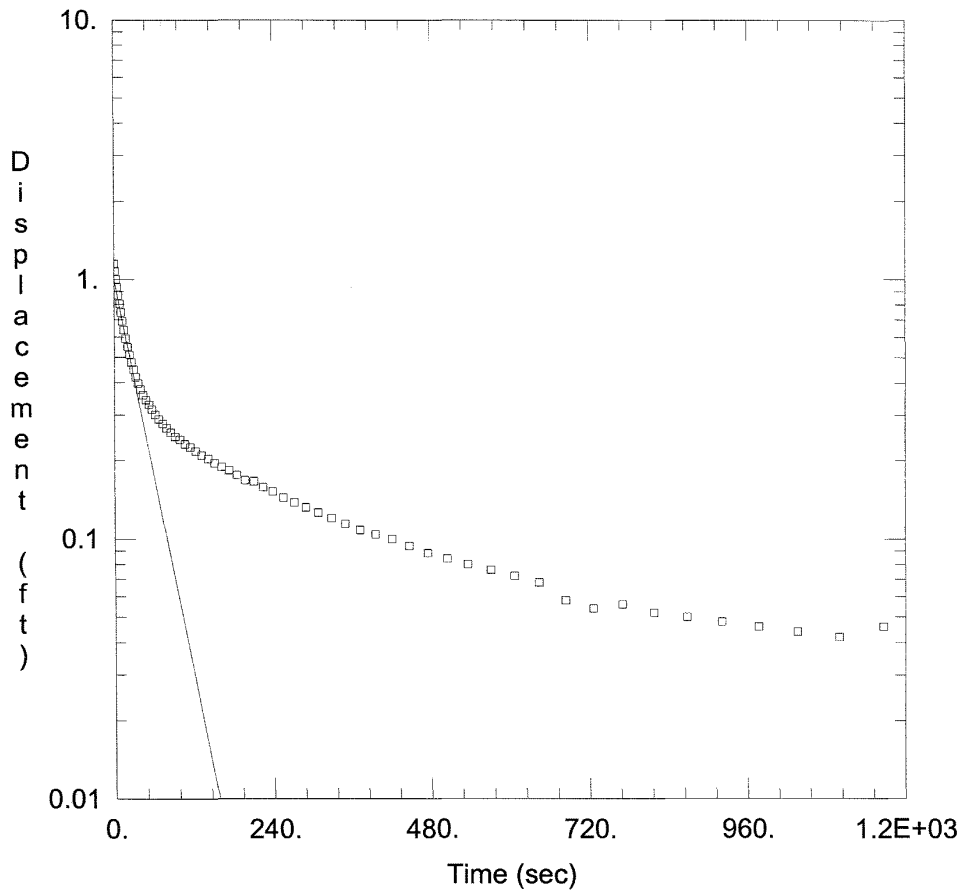
Saturated Thickness: 5.46 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-7)

Initial Displacement: 0.804 ft
Casing Radius: 0.083 ft
Screen Length: 5. ft
Water Column Height: 5.46 ft
Wellbore Radius: 0.177 ft
Gravel Pack Porosity: 0.3

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 0.001115 cm/sec
y0 = 0.4856 ft



MW-8

Data Set: P:\LCP\21405\Data\Slug_Test_Data\mw-8.aqt
Date: 08/20/02 Time: 12:43:40

PROJECT INFORMATION

Company: Brown and Caldwell
Client: ISP Environmental Services Inc
Project: LCP Superfund Site
Test Location: Linden, NJ
Test Well: MW-8
Test Date: 12/5/01

AQUIFER DATA

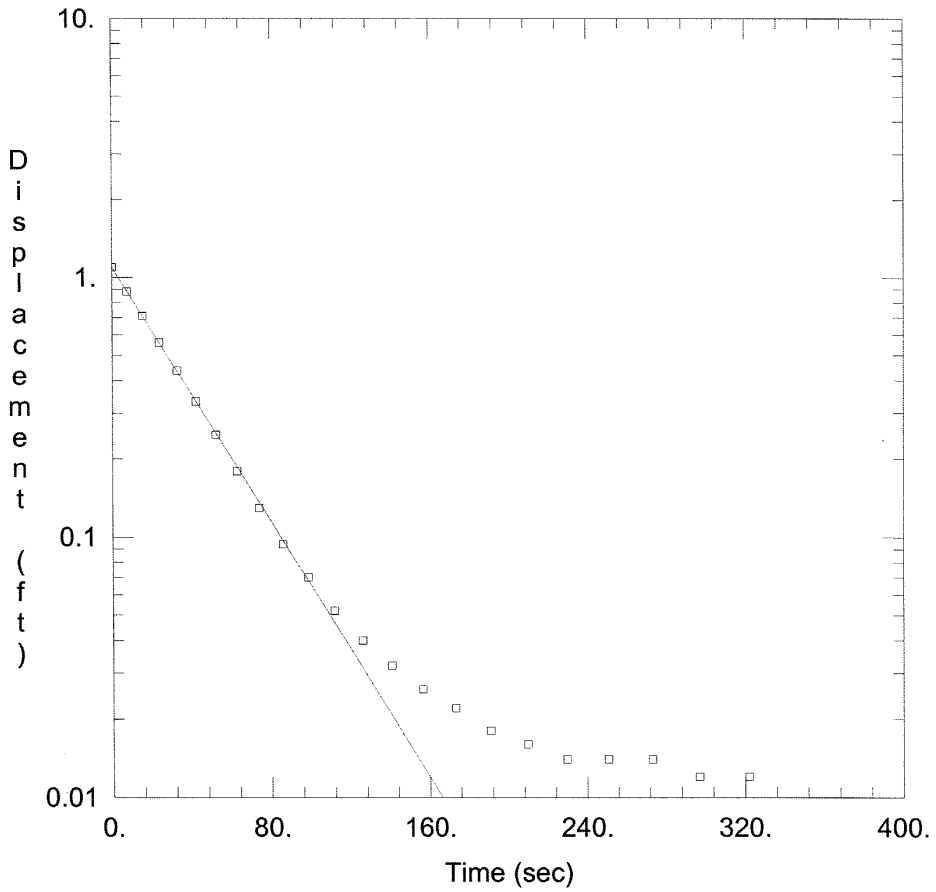
Saturated Thickness: 6.41 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-8)

Initial Displacement: 1.149 ft
Casing Radius: 0.083 ft
Screen Length: 5. ft
Water Column Height: 6.41 ft
Wellbore Radius: 0.177 ft
Gravel Pack Porosity: 0.3

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 0.004275 cm/sec
y0 = 1.002 ft



MW-9

Data Set: P:\LCP\21405\Data\Slug_Test_Data\mw-9.aqt
Date: 08/20/02 Time: 12:43:46

PROJECT INFORMATION

Company: Brown and Caldwell
Client: ISP Environmental Services Inc
Project: LCP Superfund Site
Test Location: Linden, NJ
Test Well: MW-9
Test Date: 12/5/01

AQUIFER DATA

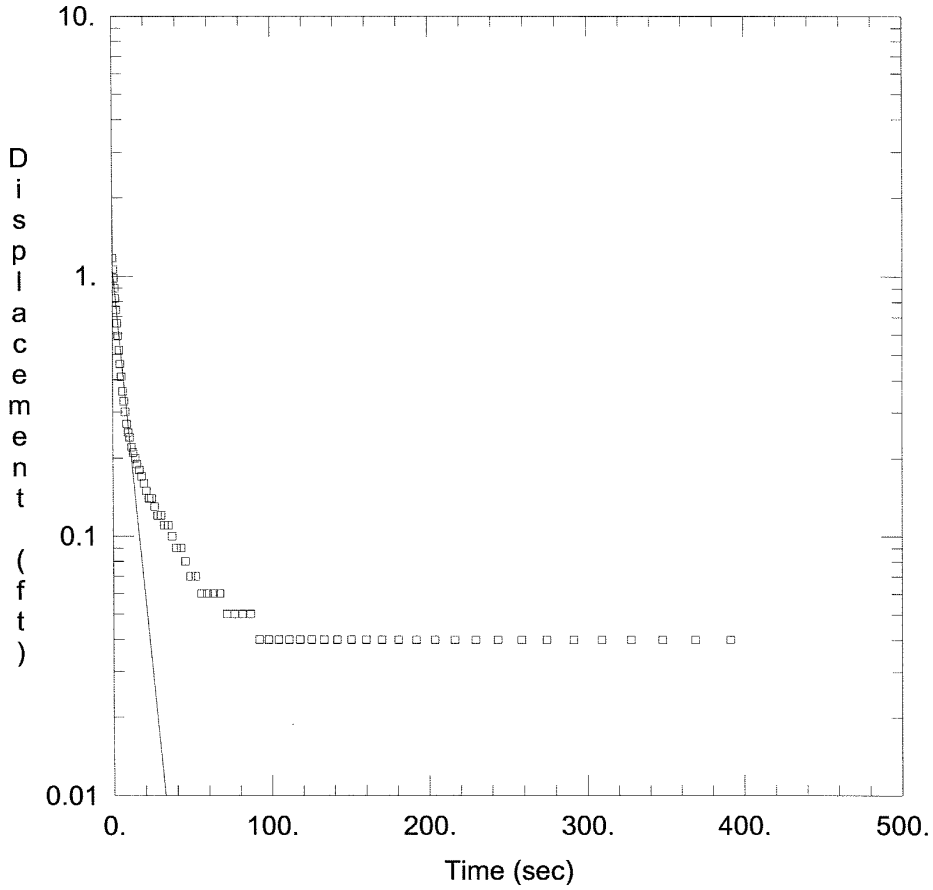
Saturated Thickness: 4.59 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-9)

Initial Displacement: 1.095 ft
Casing Radius: 0.083 ft
Screen Length: 5. ft
Water Column Height: 4.59 ft
Wellbore Radius: 0.177 ft
Gravel Pack Porosity: 0.3

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 0.004089 cm/sec
y0 = 1.093 ft



MW-10

Data Set: P:\LCP\21405\Data\Slug_Test_Data\mw-10.aqt
Date: 08/20/02 Time: 12:42:17

PROJECT INFORMATION

Company: Brown and Caldwell
Client: ISP Environmental Services Inc
Project: LCP Superfund Site
Test Location: Linden, NJ
Test Well: MW-10
Test Date: 12/5/01

AQUIFER DATA

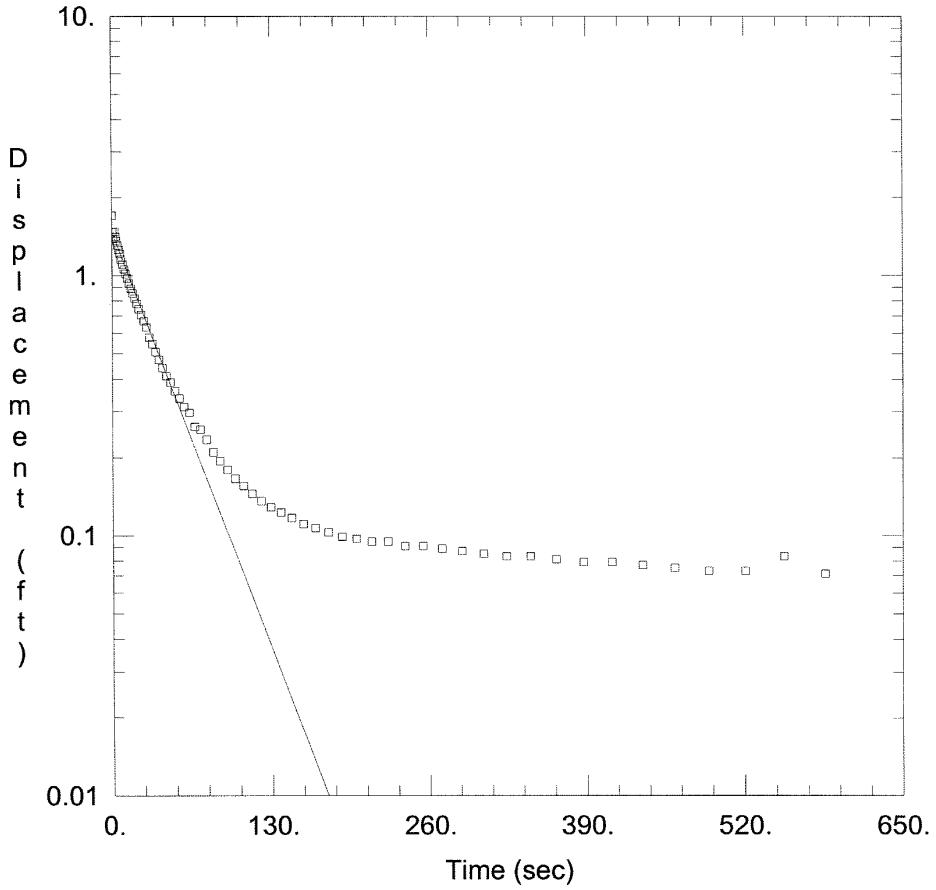
Saturated Thickness: 3.79 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-10)

Initial Displacement: 1.17 ft
Casing Radius: 0.083 ft
Screen Length: 6. ft
Water Column Height: 3.79 ft
Wellbore Radius: 0.177 ft
Gravel Pack Porosity: 0.3

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 0.01826 cm/sec
y0 = 1.068 ft



MW-11

Data Set: P:\LCP\21405\Data\Slug_Test_Data\mw-11.aqt
Date: 08/20/02 Time: 12:42:27

PROJECT INFORMATION

Company: Brown and Caldwell
Client: ISP Environmental Services Inc
Project: LCP Superfund Site
Test Location: Linden, NJ
Test Well: MW-11
Test Date: 12/4/01

AQUIFER DATA

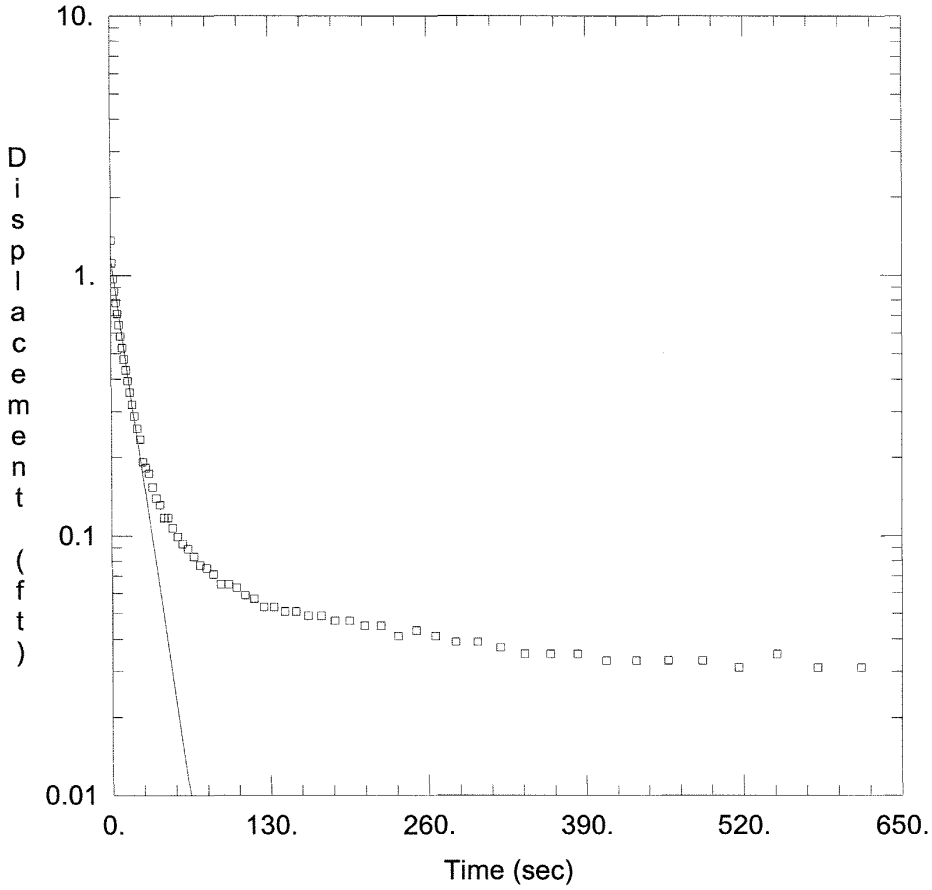
Saturated Thickness: 7.66 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-11)

Initial Displacement: 1.702 ft
Water Column Height: 8.66 ft
Casing Radius: 0.083 ft
Wellbore Radius: 0.177 ft
Screen Length: 5.5 ft
Gravel Pack Porosity: 0.3

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 0.003843 cm/sec
y0 = 1.472 ft



MW-12

Data Set: P:\LCP\21405\Data\Slug_Test_Data\mw-12.aqt
Date: 08/20/02 Time: 12:42:34

PROJECT INFORMATION

Company: Brown and Caldwell
Client: ISP Environmental Services Inc
Project: LCP Superfund Site
Test Location: Linden, NJ
Test Well: MW-12
Test Date: 12/4/01

AQUIFER DATA

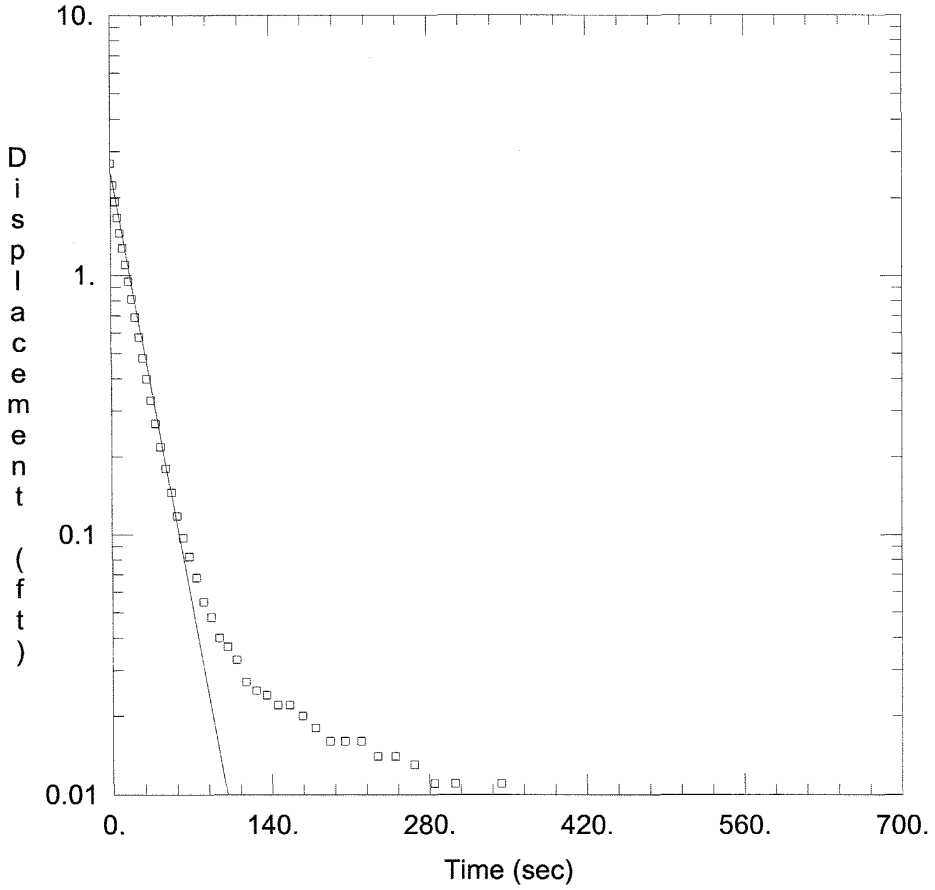
Saturated Thickness: 8.52 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-12)

Initial Displacement: 1.36 ft
Casing Radius: 0.083 ft
Screen Length: 8. ft
Water Column Height: 8.82 ft
Wellbore Radius: 0.177 ft
Gravel Pack Porosity: 0.3

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 0.007658 cm/sec
y0 = 1.151 ft



MW-13

Data Set: P:\LCP\21405\Data\Slug_Test_Data\mw-13.aqt
Date: 08/20/02 Time: 12:42:45

PROJECT INFORMATION

Company: Brown and Caldwell
Client: ISP Environmental Services Inc
Project: LCP Superfund Site
Test Location: Linden, NJ
Test Well: MW-13
Test Date: 12/4/01

AQUIFER DATA

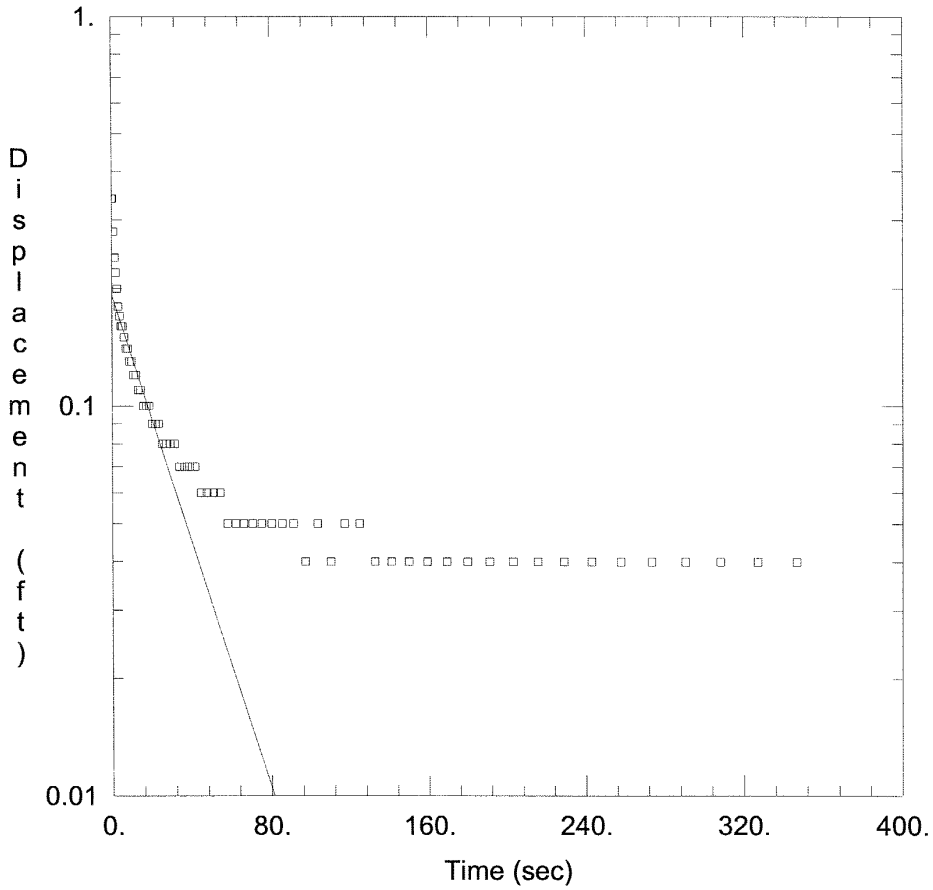
Saturated Thickness: 6.77 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-13)

Initial Displacement: 2.699 ft
Water Column Height: 6.77 ft
Casing Radius: 0.083 ft
Wellbore Radius: 0.177 ft
Screen Length: 5. ft
Gravel Pack Porosity: 0.3

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 0.007962 cm/sec
y0 = 2.504 ft



MW-14

Data Set: P:\LCP\21405\Data\Slug_Test_Data\mw-14.aqt
Date: 08/20/02 Time: 12:42:51

PROJECT INFORMATION

Company: Brown and Caldwell
Client: ISP Environmental Services Inc
Project: LCP Superfund Site
Test Location: Linden, NJ
Test Well: MW-14
Test Date: 12/4/01

AQUIFER DATA

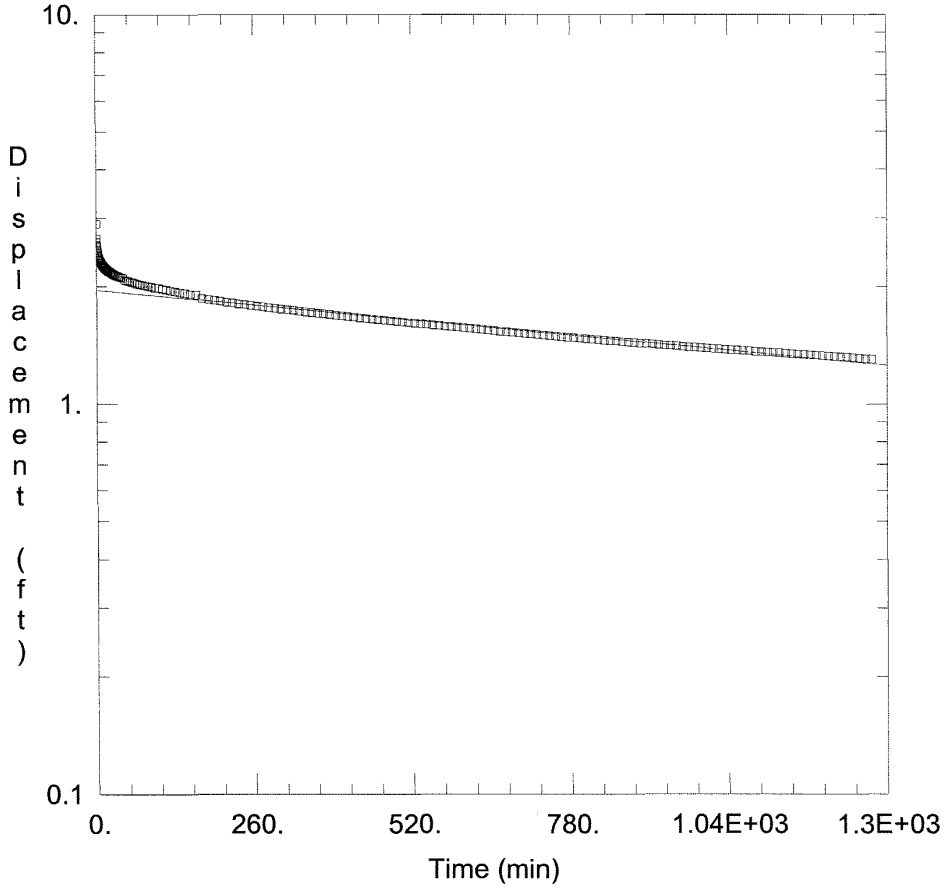
Saturated Thickness: 1.61 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-14)

Initial Displacement: 0.34 ft
Casing Radius: 0.083 ft
Screen Length: 3.5 ft
Water Column Height: 1.61 ft
Wellbore Radius: 0.177 ft
Gravel Pack Porosity: 0.3

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 0.006717 cm/sec
y0 = 0.192 ft



MW-15

Data Set: P:\LCP\21405\Data\Slug_Test_Data\mw-15.aqt
Date: 08/20/02 Time: 12:42:56

PROJECT INFORMATION

Company: Brown and Caldwell
Client: ISP Environmental Services Inc
Project: LCP Superfund Site
Test Location: Linden, NJ
Test Well: MW-15
Test Date: 12/5/01

AQUIFER DATA

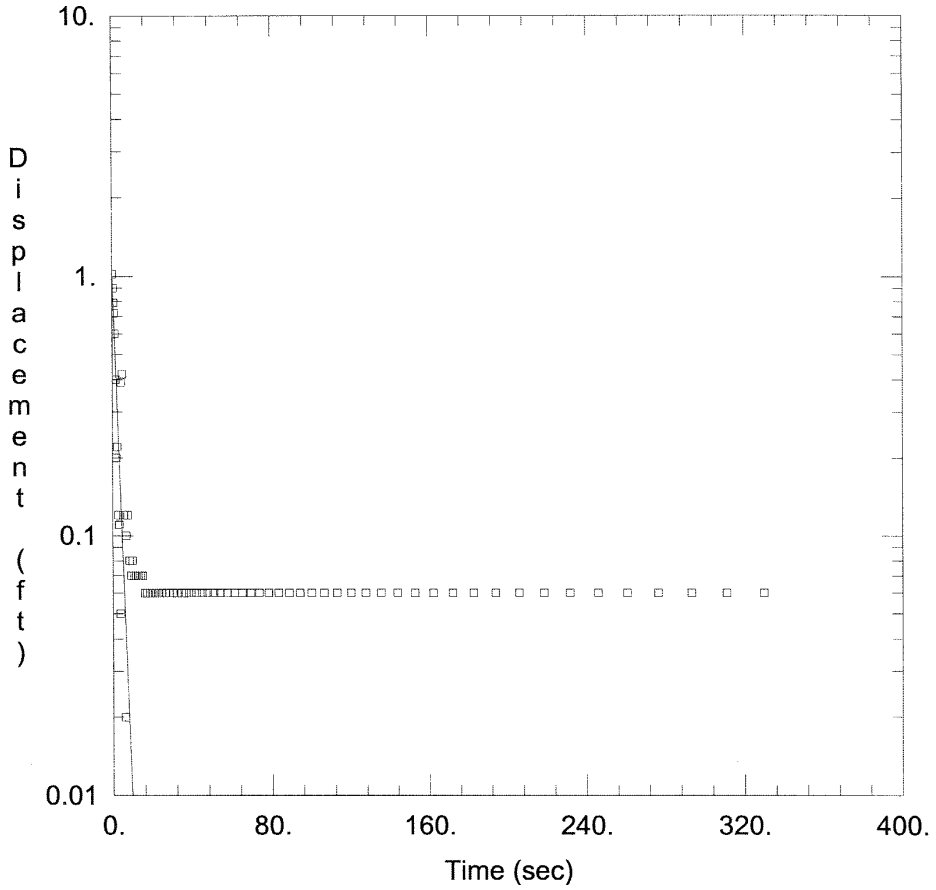
Saturated Thickness: 3.42 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-15)

Initial Displacement: 2.895 ft
Water Column Height: 3.92 ft
Casing Radius: 0.083 ft
Wellbore Radius: 0.177 ft
Screen Length: 8.5 ft
Gravel Pack Porosity: 0.3

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 5.602E-07 cm/sec
y0 = 1.957 ft



MW-16

Data Set: P:\LCP\21405\Data\Slug_Test_Data\mw-16.aqt
Date: 08/20/02 Time: 12:43:01

PROJECT INFORMATION

Company: Brown and Caldwell
Client: ISP Environmental Services Inc
Project: LCP Superfund Site
Test Location: Linden, NJ
Test Well: MW-16
Test Date: 12/4/01

AQUIFER DATA

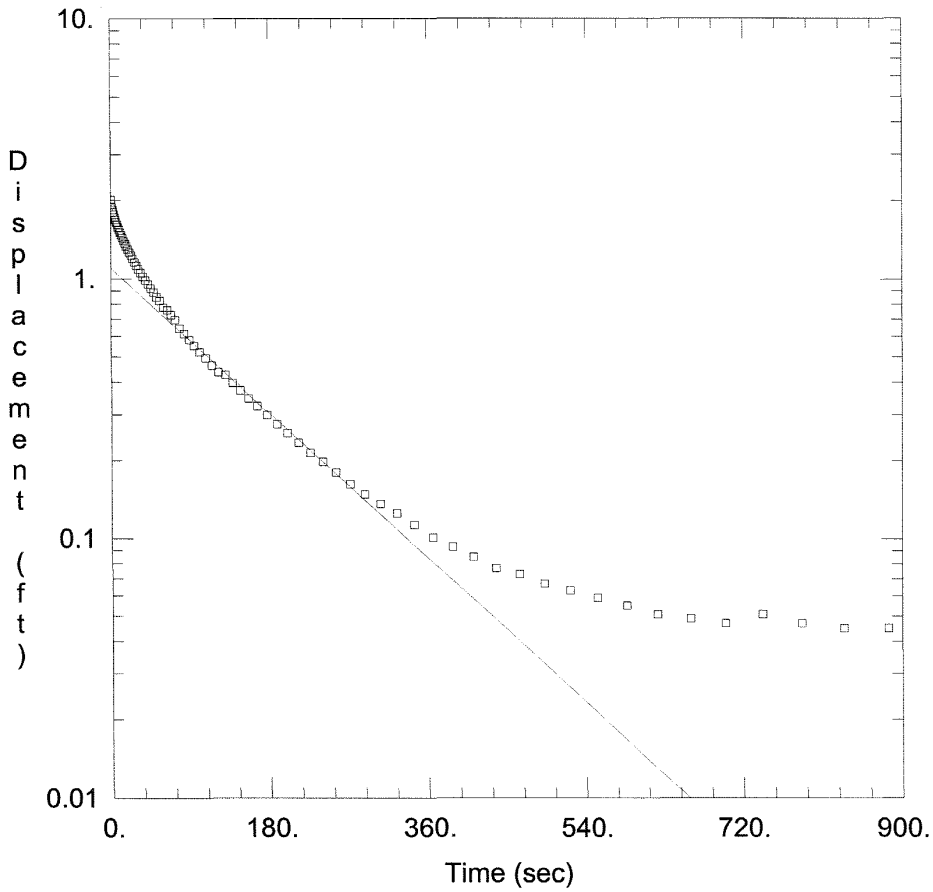
Saturated Thickness: 10.39 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-16)

Initial Displacement: 1.019 ft
Casing Radius: 0.083 ft
Screen Length: 9. ft
Water Column Height: 10.39 ft
Wellbore Radius: 0.177 ft
Gravel Pack Porosity: 0.3

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 0.0467 cm/sec
y0 = 1.019 ft



MW-17

Data Set: P:\LCP\21405\Data\Slug_Test_Data\mw-17.aqt
Date: 08/20/02 Time: 12:43:08

PROJECT INFORMATION

Company: Brown and Caldwell
Client: ISP Environmental Services Inc
Project: LCP Superfund Site
Test Location: Linden, NJ
Test Well: MW-17
Test Date: 12/4/01

AQUIFER DATA

Saturated Thickness: 9.1 ft
Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (MW-17)

Initial Displacement: 2.008 ft
Casing Radius: 0.083 ft
Screen Length: 8. ft
Water Column Height: 9.1 ft
Wellbore Radius: 0.177 ft
Gravel Pack Porosity: 0.3

SOLUTION

Aquifer Model: Unconfined
Solution Method: Hvorslev
K = 0.0007374 cm/sec
y0 = 1.097 ft

RE: Letter of Interpretation; Line Verification
File No.: 2009-02-0005.3FWW060001
Applicant: ISP Environmental Services, Inc.
Block: 587; Lots: 3.01, 3.02 & 3.03
Linden City, Union County

Dear Mr. Kovacs:

This letter is in response to your request for a Letter of Interpretation to verify the jurisdictional boundary of the freshwater wetlands and waters on the referenced property.

In accordance with agreements between the State of New Jersey Department of Environmental Protection, the U.S. Army Corps of Engineers Philadelphia and New York Districts, and the U.S. Environmental Protection Agency, the NJDEP, Division of Land Use Regulation is the lead agency for establishing the extent of State and Federally regulated wetlands and waters. The USEPA and/or USACOE retains the right to reevaluate and modify the jurisdictional determination at any time should the information prove to be incomplete or inaccurate.

Based upon the information submitted, the Division of Land Use Regulation has determined that the wetlands and waters boundary line(s) as shown on the plan map entitled "TOPOGRAPHIC SURVEY LCP CHEMICALS & PLASTICS, INC. BLOCK 587 LOTS 3.01, 3.02 & 3.03 CITY OF LINDEN, UNION COUNTY, NEW JERSEY", dated March 14, 2001, last revised October 17, 2006, and prepared by Keller & Kirkpatrick is accurate as shown.

Any activities regulated under the Freshwater Wetlands Protection Act proposed within the wetlands or transition areas or the deposition of any fill material into any water area, will require a permit from this office unless exempted under the Freshwater Wetlands Protection Act, N.J.S.A. 13:9B-1 et seq., and implementing rules, N.J.A.C. 7:7A. A copy of this plan, together with the information upon which this boundary determination is based, has been made part of the Division's public records.

Pursuant to the Freshwater Wetlands Protection Act Rules (N.J.A.C. 7:7A-1 et seq.), you are entitled to rely upon this jurisdictional determination for a period of five years from the date of this letter.

The freshwater wetlands and waters boundary line(s), as determined in this letter, must be shown on any future site development plans. The line(s) should be labeled with the above LUR file number and the following note:

"Freshwater Wetlands/Waters Boundary Line as verified by NJDEP."

In addition, the Department has determined that the wetlands on the subject property are of intermediate resource value. The standard transition area or buffer required adjacent to intermediate resource value wetlands is 50 feet. This classification may affect the requirements for an Individual Wetlands Permit (see N.J.A.C. 7:7A-7), the types of Statewide General Permits available for the wetlands portion of this property (see N.J.A.C. 7:7A-5) and the modification available through a transition area waiver (see N.J.A.C. 7:7A-6). Please refer to the Freshwater Wetlands Protection Act (N.J.S.A. 13:9B-1 et seq.) and implementing rules for additional information.

It should be noted that this determination of wetlands classification is based on the best information presently available to the Department. The classification is subject to change if this information is no longer accurate, or as additional information is made available to the Department, including, but not limited to, information supplied by the applicant. Under NJSA 13:9B-7a)(2), if the Department has classified a wetland as exceptional resource value, based on a finding that the wetland is documented habitat for threatened and endangered species that remains suitable for use for breeding, resting or feeding by such species, an applicant may request a change in this classification. Such requests for a classification change must demonstrate that the habitat is no longer suitable for the documented species because there has been a change in the suitability of this habitat. Requests for resource value classification changes and associated documentation should be submitted to the Division of Land Use Regulation, P.O. Box 439, Trenton, New Jersey 08625.

This letter in no way legalizes any fill which may have been placed, or other regulated activities which may have occurred on-site. Also this determination does not affect your responsibility to obtain any local, State, or Federal permits which may be required.

In accordance with N.J.A.C. 7:7A-1.7, any person who is aggrieved by this decision may request a hearing within 30 days of the decision date by writing to:

New Jersey Department of Environmental Protection
Office of Legal Affairs
Attention: Adjudicatory Hearing Requests
401 East State Street
P.O. Box 402
Trenton, NJ 08625-0402

This request must include a completed copy of the Administrative Hearing Request Checklist.

Please contact Tina Wolff of our staff at (609) 633-6754 or e-mail at Tina.Wolff@dep.state.nj.us should you have any questions regarding this letter. Be sure to indicate the Division's file number in all communication.

Sincerely,

Christopher Jones
Section Chief
Bureau of Inland Regulation

SURVEY NOTES:

THE WORD CERTIFY, AS USED HEREON, IS UNDERSTOOD TO BE AN EXPRESSION OF PROFESSIONAL OPINION BY THE SURVEYOR, WHICH IS BASED ON HIS BEST KNOWLEDGE, INFORMATION AND BELIEF. AS SUCH, IT CONSTITUTES NEITHER A GUARANTEE NOR A WARRANTY, EXPRESSED OR IMPLIED.

THE NEW JERSEY BOARD OF PROFESSIONAL ENGINEERS AND LAND SURVEYORS PROHIBITS ENGINEERING OR SURVEYING DOCUMENTS PREPARED BY ONE LICENSEE FROM BEING ALTERED, AMENDED, EXPANDED, FINALIZED OR OTHERWISE ADJUSTED BY ANOTHER LICENSEE WHO WAS NOT IN RESPONSIBLE CHARGE OF THE INITIAL WORK PRODUCT. THE ONLY EXCEPTION TO THE PROHIBITION IS THE USE OF PLANS PREPARED BY OTHERS FOR AS-BUILT PURPOSES WHERE THE NATURE OF THE AS-BUILT ALLOWS THE AS-BUILT DATA TO BE ADDED TO THE PREVIOUSLY PREPARED PLAN WHERE THERE IS, THEREFORE, NO NEED TO ADJUST OR CHANGE THE UNDERLYING DESIGN DOCUMENT.

IF THIS SURVEY DOES NOT CONTAIN THE RAISED SEAL OF THE SURVEYOR, IT IS AN UNAUTHORIZED REPRODUCTION OF THE SURVEY.

THE WETLAND DELINEATION SHOWN HEREON IS AS MARKED BY ECOLSCIENCES, INC. IN MAY, 2006 AND LOCATED BY KELLER & KIRKPATRICK ON MAY 17 & 18, 2006.

THE BOUNDARY LINES SHOWN HEREON ARE TAKEN FROM A MAP ENTITLED "RESUBDIVISION MAP OF LOT 3 IN BLOCK 587 OF THE TAX MAP OF THE CITY OF LINDEN, UNION COUNTY, N.J., INTO THREE LOTS". SAID MAP WAS PREPARED BY GRASSMANN, KREH & MIKER, UNION, N.J. DATED OCT. 26, 1976.

LOT AND BLOCK NUMBERS SHOWN HEREON ARE BASED UPON THE CURRENT TAX MAPS OF THE CITY OF LINDEN, SHEET No. 128.

PLANIMETRIC AND TOPOGRAPHIC INFORMATION SHOWN HEREON SUPPLIED BY ATLANTIS AERIAL SURVEY CO., INC. PER AERIAL PHOTOGRAPHY DATED DECEMBER 5, 2000.

HORIZONTAL DATUM BASED ON NAD83, VERTICAL DATUM BASED ON NGVD29 ESTABLISHED USING GLOBAL POSITIONING METHODS. HOLDING NJT COORS STATION AS FIXED.

KELLER & KIRKPATRICK DID NOT PERFORM A BOUNDARY SURVEY ON THE ABOVE PARCEL.

LOT LINES SHOWN HEREON ARE APPROXIMATE.

IF DIGITAL INFORMATION IS ALSO SUPPLIED, IT IS DONE SO FOR INFORMATIONAL PURPOSES, ONLY. THE ORIGINAL SIGNED AND SEALED DOCUMENT IS THE DOCUMENT OF RECORD.

UTILITY LOCATIONS SHOWN HEREON ARE FROM ABOVE GROUND OBSERVATIONS THE TYPE AND LOCATION OF UNDERGROUND AND OTHER UTILITIES IS NOT GUARANTEED TO BE ACCURATE OR ALL-INCLUSIVE. THE USER OF THIS SURVEY IS RESPONSIBLE FOR MAKING HIS OWN DETERMINATIONS AS TO THE TYPE AND LOCATIONS OF UNDERGROUND AND OTHER UTILITIES AS MAY BE NECESSARY.

SOIL BORING LOCATIONS ARE AS MARKED IN THE FIELD BY ECKENFELDER, BROWN & CALDWELL PERSONNEL AND LOCATED BY KELLER & KIRKPATRICK.

ELEVATIONS ON STAFF GAUGES ARE TO REFERENCE MARKS ON WOODEN SUPPORTS.

SOIL BORING LOCATIONS SB-1 TO SB-4 AND PHOTO LOCATION AND DIRECTION POSITIONS WERE PROVIDED TO KELLER & KIRKPATRICK BY ECOLSCIENCES, INC.

EXECUTIVE SUMMARY

This Ecological Assessment (EA) Report was completed by The Chazen Companies (TCC) for ISP Environmental Services, Inc. as part of the Phase II Remedial Investigation of the 26-acre LCP Chemicals Inc. Superfund Site in the City of Linden, Union County, New Jersey. The following sections of this report describe the methodologies used in the EA and provide a detailed description of the Site and the ecological resources present within the project area.

The methodology utilized to complete this EA consisted of gathering information from federal, state, and local agencies, supplemented by site visits designed to identify and characterize the Site's flora and fauna. Additionally, the Site was studied for the presence of endangered, threatened, and/or rare (ETR) species and their habitats.

The Site is a 26-acre abandoned chlor-alkali chemical plant. A man-made ditch (South Branch Creek) with associated wetlands is located in the eastern portion of the Site. The creek flows to the east, connecting to the Arthur Kill. Pralls Island, located approximately 1,200 feet to the east of the Site, is an uninhabited island owned by the NYC Department of Parks and Recreation and is part of the Harbor Herons Rookery Complex.

During this EA, 79 species of plants, 42 species of wildlife, and 3 ecological communities were identified within the Site. No ETR species or significant ecological communities were identified within the Site.

Correspondence with the New Jersey Department of Environmental Protection (NJDEP) indicated that there are no records of any rare wildlife or plant species or ecological communities within the Site. The NJDEP reported that foraging habitat for black (*Nycticorax nycticorax*) and yellow-crowned night herons (*Nyctanassa violacea*) and colonial waterbirds was located within ¼ mile of the Site. Based on information from the NJDEP, no records of any rare plants or ecological communities were recorded within ¼ mile of the Site. According to the New York State Department of Environmental Conservation (NYSDEC), yellow-crowned night herons and pied-billed grebes (*Podilymbus podiceps*) are located within ¼ mile of the Site. These species were not observed during the EA.

A review of the Comprehensive List of Endangered and Threatened species provided on the USFWS's website indicated that the federally-threatened bog turtle (*Glyptemys muhlenbergii*) and the federally-endangered Indiana bat (*Myotis soldalis*) historically occurred in Union County, New Jersey. These species were not observed, nor was any suitable habitat for these species observed during the EA.

Overall, the flora and fauna found on the Site are species typically found in heavily industrialized areas within intertidal marsh ecosystems. Vegetative species found within the Site are very common to highly disturbed areas and possess no Federal or New Jersey State protection.

1.0 Introduction

This Ecological Assessment (EA) Report was completed by The Chazen Companies (TCC) for ISP Environmental Services, Inc. as part of the Phase II Remedial Investigation of the 26-acre LCP Chemicals Inc. Superfund Site located in the City of Linden, Union County, New Jersey (hereafter "Site"). Figure 1.0-1, "Site Location Map," illustrates the "Site" on the *USGS Arthur Kill River, NY-NJ (1966, photorevised 1981) Topographic Quadrangle*.

The Site is located on Tremley Point along the Arthur Kill in the City of Linden. The site area has historically been developed for heavy industrial use. The coordinates of the center of the Site are Latitude 40.6032, Longitude -74.21163. The Arthur kill is located immediately east of the Site and receives flow from the Site, through South Branch Creek.

Currently, the Site is vacant, containing several abandoned industrial buildings in the western portion of the Site. A former brine sludge lagoon containing an impervious cap approximately 1.6 acres in size is located in the eastern-central portion of the Site adjacent to South Branch Creek.

South Branch Creek is a man-made tidal ditch that originates near the east-central portion of the Site and flows approximately 1,200 feet to the east, discharging into the Arthur Kill. The ditch is approximately 15 feet wide at the head of the stream and becomes as wide as 30 feet on the eastern end of the Site. The tidal flux of the Arthur Kill and South Branch Creek is approximately four to five feet. The substrate consists of very soft, organic muck up to three feet in depth. Some rip-rap is present along the banks of the creek and some construction debris along the bottom and banks of the creek.

The following sections of this report describe the methodologies used in the EA and provide a detailed description of the Site, surrounding area, and the ecological resources present at the Site.

1.1 Surrounding Landscape

The primary active land use in the surrounding area is bulk storage and transport of petroleum products and aggregate. The transport of these materials occurs by ship and barge using on-site dockage on the Arthur Kill as well as by truck and pipeline. Other active facilities in the area include a municipal wastewater treatment plant, trucking and warehousing, and truck repair. A number of large chemical manufacturing facilities formerly operated within one mile of the site, each of which is currently inactive and in various stages of demolition and site remediation. The industrial properties located immediately adjacent to the LCP site include:

- Valero Linden Terminal located north and south of South Branch Creek along the Arthur Kill.

- The former GAF Chemicals chemical manufacturing facility to the north which is currently being remediated by ISPESI. The site remediation included demolition of site structures, grading and drainage improvements, construction of a fully circumferential shallow groundwater barrier and groundwater collection system, installation of bedrock groundwater extraction wells, and the construction and operation of a groundwater conveyance and treatment system.

- Citgo Petroleum Corp, Linden Transload Terminal located to the south and southwest.

Various undeveloped areas are located within one mile of the Site, much of which is either vacant former chemical manufacturing facilities or tidal wetlands. The only area of residential development within one mile of the Site is the Tremley section of Linden which is located west of the New Jersey turnpike approximately 4,700 feet from the center of the Site. Zoning regulations are in effect for the City of Linden. All of the land located west of the New Jersey Turnpike on Tremley Point is zoned H1 - Heavy Industrial. Figure 1.1-1, "Surrounding Land Use Map" depicts the land-use patterns surrounding the Site.

Several watercourses are located in the area surrounding the Site. Piles Creek is located approximately 2350 feet north of the Site and the Rahway River is located approximately 1550 feet to the south. Both watercourses have tidal marshes associated with them. Piles Creek and Rahway River are mapped as estuarine, subtidal, unconsolidated bottom, subtidal rivers [E1UBL] by the National Wetland Inventory (NWI) program. The tidal marshes associated with Piles Creek are mapped as estuarine, intertidal, emergent, persistent, irregularly flooded, partially drained/ditched wetlands [E2EM1Pd]. According to the NJDEP, Piles Creek is

classified as a SE3 watercourse. The SE3 classification is given to estuarine waters designated for secondary contact recreation, maintenance and migration of fish populations, migration of diadromous fish, maintenance of wildlife, and any other reasonable uses.[1] The section of the Rahway River nearest to the Site is classified as SE3.

The Arthur Kill is located immediately east of the Site. The Arthur kill is a large river, approximately 300-600 feet wide and greater than 30 feet deep that flows from north to south, discharging into the Raritan Bay. The Arthur Kill is frequently dredged to maintain a passageway for commercial ships. It is mapped as an estuarine, unconsolidated bottom, subtidal river [E1UBL]. According to the NJDEP, the Arthur Kill is classified as a SE3 watercourse. The stretch of the Arthur Kill adjacent to the Site is classified as SD by the NYSDEC. The SD classification is for saline waters that are suitable for fish survival. This classification is given to waters that, because of natural or man-made conditions, cannot meet the requirements for primary and secondary contact recreation and fish propagation.[2]

Pralls Island is located approximately 1,200 feet to the east of the Site within the Arthur Kill. It is an approximately 80-acre uninhabited island that was created from former dredge spoil deposits. The central portion of the island is forested and dominated primarily by tree-of-heaven (*Ailanthus altissima*), gray birch (*Betula populifolia*), and black cherry (*Prunus serotina*), all less than 30 feet in height. Tree-of-heaven is an aggressive invasive species. The perimeter of the island contains tidal wetlands. The wetlands are mapped as estuarine, intertidal, emergent, persistent, regularly exposed [E1EM1N]; and estuarine, intertidal, unconsolidated shore, sand, irregularly flooded wetlands [E1US2P]. The island is owned by the City of New York Department of Parks and Recreation and is part of the Harbor Herons Sanctuary.

Since 1987, the New York City Audubon Society has overseen a study on the breeding success of wading birds on this island. According to a 1989 study by the NYS DOS Division of Coastal Resources, there was an estimated 200 pairs of herons nesting on the island, including 7 pairs of cattle egrets (*Bubulcus ibis*), 88 pairs of glossy ibis (*Plegadis falcinellus*), and 77 pairs of black-crowned night herons (*Nycticorax nycticorax*)[3]. Over the past sixteen years, the number of herons nesting on the island has significantly decreased. During the NYC Audubon's Harbor Herons 2005 Interim Nesting Survey, a total of 39 black-crowned night heron nests were located[4]. Five of the nests were occupied and 34 of the nests were inactive[5].

[3] NYS DOS Division of Coastal Resources. 1989. Designated Habitat: Pralls Island.
[4] Bernick, A.J. 2005. New York City Audubon's Harbor Herons Project: 2005 Interim Nesting Survey.

The island is subject to chemicals (i.e., heavy metals, DDT, and petrochemicals), nutrient pollution stresses, and stormwater and sewage discharges[6]. All of these pollutants have negative effects on the habitat used by the herons and may be a cause for their decreased use of the island.

Other avian species observed on Pralls Island include great blue (*Ardea herodias*) and little blue herons (*Egretta caerulea*); great (*Ardea alba*), cattle, and snowy egrets (*E. thula*); glossy ibis; yellow- (*Nyctanassa. violacea*) and black-crowned night herons; herring (*Larus argentatus*) and great black-backed gulls (*Larus marinus*); water fowl species such as American black duck (*Anas rubripes*), gadwall (*Anas strepera*), mallard (*Anas platyrhynchos*), and Canada geese (*Branta canadensis*); and American woodcocks (*Scolopax minor*).

Scale:	1:11,650
Project #:	70620.00

2.0 Methodology

As part of this EA, information was gathered from federal, state, and local agencies and was supplemented by a literature review and an on-site field investigation. The field investigation was designed to catalog the Site's flora and fauna. A brief description of the methods used follows.

2.1 Federal and State Agencies and Literature Review

The NJDEP was contacted on August 8, 2006, and the NYSDEC was contact on October 3, 2006, to obtain information concerning known occurrences of endangered, threatened, and/or rare (ETR) species located on, or within the vicinity of, the Site. Copies of these letters are included in Appendix A, "Correspondence." On August 31, 2006, the NJDEP Natural Heritage Program responded in a letter stating that no rare wildlife or plant species, or ecological communities were located within the Site. Within a ¼ mile of the Site, the NJDEP has records of foraging habitat for black and yellow-crowned night herons and colonial waterbirds. However, no records of any rare plants or ecological communities were reported within a ¼ mile of the Site.

On October 27, 2006, the NYSDEC responded in a letter stating that the New Jersey State-endangered pied-billed grebe (*Podilymbus podiceps*), and New Jersey State-threatened yellow-crowned night herons were located within a ¼ mile of the LCP Chemicals Inc. Superfund Site. In addition, several endangered and threatened vascular plants including rose-pink (*Sabatia angularis*), persimmon (*Diospyros virginiana*), Nantucket juneberry (*Amelanchier nantucketensis*), sweetbay magnolia (*Magnolia virginiana*), featherfoil (*Hottonia inflata*), thicket sedge (*Carex abscondita*), glaucous sedge (*Carex glaucodea*), primrose-leaf violet (*Viola primulifolia*), southern dodder (*Cuscuta obtusiflora* var. *glandulosa*), swamp cottonwood (*Populus heterophylla*), possum-haw (*Viburnum nudam* var. *nudum*), and American strawberry bush (*Euonymus americanus*) were recorded within two miles of the Site (Confidential correspondence with NYSDEC). Due to the sensitivity of some of the information provided within this letter, pages describing the locations of species will not be provided.

To determine if any federally-listed species occur in the project area, TCC reviewed the Comprehensive List of Endangered and Threatened species as provided on the USFWS's New Jersey Field Office website.[7] This list identifies federally-listed species by the counties and municipalities in which they occur. According to this document, the federally-threatened bog turtle (*Clemmys muhlenbergii*) and the federally-endangered Indiana bat (*Myotis soldalis*) are known to occur in Union County. However, bog turtles are known to only occur in four municipalities in

[7] http://www.fws.gov/northeast/njfieldoffice/Endangered/munlist.pdf

Union County: Berkeley Heights Township, Mountainside Borough, Scotch Plains Township, and Summit City. The Site is located in the City of Linden municipality, which does not border any of the abovementioned municipalities. Indiana bats may occur in any municipality in Union County; therefore, they may occur in the vicinity of the Site. However, suitable habitat was not found on-site except for several abandoned buildings.

Below, TCC presents a brief review of the habitat requirements of the ETR species identified as potentially occurring in the project area.

2.2 Endangered and Threatened Species

Indiana Bat

Indiana bat habitat is composed of both hibernacula and summer roosting areas. Hibernacula typically are located in abandoned mines or caves. Summer roosting habitat is characterized by wooded areas with trees that have a southern exposure, are ≥ 5 inches in diameter, and that exhibit specific physical characteristics (e.g., exfoliating bark, crevices, dead limbs, snags) that provide refuge for bats during the day for both resting and maternity purposes.[8]

Pied-billed Grebe

Primary nesting habitat typically includes dense stands of emergent vegetation or low-lying aquatic vegetation. Open water is usually found near nesting habitat. Pied-billed grebes may nest in heavily populated areas as along as nesting-habitat requirements are met.[9] During the nonbreeding season, they can be found in a variety of habitats including brackish marshes and tidal creeks.

Yellow-crowned Night Heron

Yellow-crowned night herons typically nest and roost on dredge spoils, barrier and bay islands that contain forested wetlands and shrub thickets.[10] Nesting areas with insufficient cover are usually avoided; however, recently yellow-crowned night herons have been observed nesting in residential neighborhoods, parks, and other areas near humans.[11] Primary foraging habitat includes the shores of tidal creeks and pools within salt and brackish tidal marshes dominated by smooth cordgrass (*Spartina alternifolia*).[12]

2.3 Field Investigation

Biologists from The Chazen Companies (TCC) conducted on-site investigations of the Property on the following dates, shown below.

Table 2.3.1 Work Field Days

LCP Chemicals Inc. Superfund Site Work Field Days and Activity Sheet			
Dates	**Staff**	**Man Hours**	**Work Conducted**
07/20/2006		10	Habitat Assessment
08/24/2006		24	Habitat Assessment and Pilot Biota Sampling
09/18/2006		16	Habitat Assessment and Biota Sampling
09/19/2006		23	Habitat Assessment and Biota Sampling
09/20/2006		23	Habitat Assessment and Biota Sampling
09/21/2006		12	Habitat Assessment and Biota Sampling
09/26/2006		10	Habitat Assessment
09/27/2006		10	Habitat Assessment
Total Field Days		8	
Total Man Hours		136	*Total man hours does not include drive time

During the field investigations, plant and animal species were inventoried to characterize existing populations, habitats, and communities. The potential for rare plants and animals, as well as general observations regarding overall plant community composition and structure, wetlands and watercourses, the degree of site disturbance, and other site characteristics were noted and recorded during the site inspection. The Site was transected in its entirety excluding entering hazard zones (i.e., on-site buildings) to ensure that each vegetative community type was surveyed.

In addition to investigating the Site, other areas within a half mile perimeter from the Site were investigated to document vegetation and the presence of wildlife species which live in the area.

Moreover, a literature review was conducted to provide supporting documentation for use in the EA. Information gathered included topographic maps, soil and geology maps, aerial photographs, pertinent plant and animal species information (i.e., known species in the area, characteristics required for identification, etc.), historical information, and information on the Pralls Island heron rookery.

2.3.1 Ecological Communities

Community (habitat) types described herein generally follow those utilized by the NJDEP and New York Natural Heritage Programs as described in *A Preliminary*

Natural Community Classification For New Jersey[13] and *Ecological Communities of New York.*[14] Vegetation identified within the Site is described in the following sections in terms of strata (layers – "overstory;" "understory;" and "groundcover").

Overstory vegetation represents the canopy tree species greater than six inches in diameter. Understory/shrub vegetation is comprised of woody tree species between two and six inches in diameter, and saplings and shrubs less than two inches in diameter and three to 12 feet in height. Ground layer vegetation consists of both woody and herbaceous vegetation less than three feet in height.

During the Site evaluation, the distributions of various communities were noted along with the vegetative species composition, plant structure (i.e., layers), and other vegetative characteristics. This information was used to provide a written description of each community type as presented below. Additionally, aerial photographic interpretation was used to assist in preparing a depiction of the ecological communities of the Site.

Plants species were field-identified to genus and species, when possible. Unidentified plant species were collected for later identification. Upon the compilation of the species list, plants identified at the Site were reviewed to determine if any federally- or state-listed plants were documented. Finally, species were categorized by location and general habitat characteristics were documented.

2.3.2 Wildlife

On-site field surveys of wildlife species were conducted for reptiles, amphibians, mammals, fish, bird, and crustacean species. An area of approximately ½ mile from the Site was also surveyed to document species living within close proximity to the Site. The following discussion outlines the methods used.

Reptiles and Amphibians

Methods used to conduct the reptiles and amphibian surveys include turning debris, and large stones to reveal herpetological species underneath.

[13] Breden. T.F. A preliminary natural community classification for New Jersey. Repinted from: Karlin, E.F. [editor]. 1989. New Jersey's Rare and Endangered Plants and Animals. Institute for Environmental Studies, Ramapo College, Mahwah, NJ. 280p.

[14] Edinger, G.J., D.J. Evans, S. Gebauer, T.G. Howard, D.M. Hunt, and A.M. Olivero (editors). 2002. Ecological Communities of New York State. Second Edition. A revised and expanded edition of Carol Reschke's Ecological Communities of New York State. (Draft for review). New York Natural Heritage Program, New York State Department of Environmental Conservation, Albany, NY.136 pgs.

Mammals

Methods to detect mammals were based on visual encounters, vocalization, tracks, scat, remains, or other signs.

Birds

Bird species were identified throughout the Site either visually, by song, and/or by nest evaluations. Associations between bird species and their corresponding preferred habitat types were noted during the investigation.

Fish and Crustaceans

Fish and crustacean species were identified by seining and visual observation in the South Branch Creek. Seining occurred at several locations along the stretch of the South Branch Creek located on-site.

3.0 Existing physical conditions

The Site consists primarily of abandoned industrial buildings. Many of the buildings are decrepit and falling down. Several dirt roads and railroad tracks bisect the Site. A former brine sludge lagoon containing an impervious cap approximately 1.6 acres in size is located in the eastern portion of the Site adjacent to the South Branch Creek. The following section describes the Site's topography, soils, hydrology including wetland mapping, and vegetative communities.

3.1 Topography

According to the *USGS Arthur Kill NY-NJ (1966, photorevised 1981) Topographic Quadrangle* map, the Site is flat and is less than 10 feet above mean sea level (msl). Figure 1.0-1 provides an illustration of the overall Site topography.

3.2 Hydrology and Wetland Mapping

3.2.1 Watercourses

South Branch Creek is a man-made brackish tidal ditch originating in the central portion of the Site and flowing east over 1,200 feet before discharging into the Arthur Kill. The watercourse is approximately 15 feet wide at the head of the stream and becomes as wide as 30 feet on the eastern end of the Site. The substrate consists of very soft, organic muck up to three feet in depth. South Branch Creek has a large tidal change from low to high tide (i.e., 4-5 feet).

3.2.2 Wetland Mapping

NWI Mapping

According to the National Wetland Inventory (NWI) digital data provided by the USFWS there are several watercourses and wetlands mapped within the project area. Only one NWI wetland is mapped within the boundaries of the Site. The wetland is mapped in the locality of South Branch Creek. The wetland is mapped as an estuarine, intertidal, emergent, mesohaline, irregularly flooded wetland [E2EM5P]. A wetland mapped located immediately adjacent to the northwestern Site boundary is mapped as an Estuarine, subtidal, unconsolidated bottom, subtidal, excavated wetland [E1UB1x].

NJDEP Wetland Mapping

According to a Geographic Information System (GIS) dataset provided by the NJDEP, no NJDEP wetlands are mapped on the Site. The closest NJDEP wetland is mapped approximately 100 feet south of the southwestern corner of the Site. This wetland is mapped as a palustrine, emergent, persistent, saturated wetland [PEM1B].

The wetlands and watercourses on-site were delineated by the EcolSciences, Inc. of Rockaway, New Jersey. According to the delineation, one wetland was identified in the eastern portion of the Site and it was delineated with flagging labeled W1 - W62, and WA-1 – WA-20. A Letter of Interpretation was received from the NJDEP and the wetland delineation line was determined to be correct. In addition, the NJDEP determined that the onsite wetland (i.e., South Branch Creek) is of intermediate resource value, thus a 50 foot regulatory buffer is required. Figure 3.2-2, "Wetlands Map", provides an illustration of the mapped wetlands on and adjacent to the Site.

4.0 Results

The Site is a heavily developed area consisting of abandoned industrial buildings and a capped brine sludge lagoon. South Branch Creek is a man-made tidal ditch that originates near the east-central portion of the Site and flows east before discharging into the Arthur Kill. The Site primarily consists of three ecological communities including an urban vacant lot, capped brine sludge lagoon, and brackish tidal marsh.

The following sections provide descriptions of the types of ecological communities located within the Site. Section 4.2 describes the Site's fauna and habitat characteristics.

4.1 Ecological Communities

TCC staff identified 79 plant species within three ecological communities as described in *Ecological Communities of New York*[15] *and A Preliminary Natural Community Classification for New Jersey.*[16] Many of the plant species observed within the urban vacant lot and capped brine sludge lagoon (i.e., successional old field) communities were also observed in adjacent open fields. The mowed fields are located adjacent to the north and northeastern portions of the Site. These fields consist primarily of early successional species. Figure 4.1-1 "Ecological Communities Map" illustrates the approximate location of each of the community types on the Site. Representative photographs of each community type are included as Appendix B "Site Photographs".

During this EA, no federally and/or state endangered or threatened plant species were observed within the boundaries of the Site. The following presents a general description of the ecological communities observed within the Site.

Urban Vacant Lot, With Structures – The community type is located throughout the Site and consists of exposed soil, rubble, and derelict buildings. This community type makes up most of the Site as the Site is completely disturbed and has been abandoned since the early 1990's. Vegetation was sparse and consisted mostly of first successional recruitment species and invasive species typically found in urban areas. Trees are generally sparse and many exist as small saplings. Shrubs

account for approximately 1-5% coverage in this community. The dominant shrub species include groundsel tree (*Baccharis halimifolia*), staghorn sumac (*Rhus typhina*), and white mulberry (*Morus alba*). The groundlayer accounts for approximately 20-25% of this community and is composed of common milkweed (*Asclepias syriaca*), spotted knapweed (*Centaurea maculosa*), pokeweed (*Phytolacca americana*), and common plantain (*Plantago major*). Table 4.1.1 provides a list of the species encountered within the urban vacant lot community.

Table 4.1.1 List of Species observed within the Urban Vacant Lot Community

Scientific Name	**Common Name**
Trees	
Ailanthus altissima	Tree of heaven
Acer rubrum	Red maple (saplings)
Catalpa speciosa	Northern catalpa
Liquidambar styraciflua	Sweet gum
Populus deltoides	Eastern cottonwood (saplings)
Populus tremuloides	Quaking aspen (saplings)
Robinia pseudoacacia	Black locust
Quercus rubra	Red oak
Shrubs	
Baccharis halimifolia	Groundsel tree
Clethra alnifolia	Coastal sweetpepperbush
Diospyros virginiana	Common persimmon
Elaeagnus umbellate	Autumn olive
Morus alba	White mulberry
Polygonum cuspidatum	Japanese knotweed
Rhus copallinum	Winged sumac
Rhus typhina	Staghorn sumac
Rosa multiflora	Multiflora rose
Rubus allegheniensis	Common blackberry
Viburnum recognitum	Southern arrowwood
Herbs	
Apocynum cannabinum	Indian hemp
Asclepias syriaca	Common milkweed
Aster spp.	Aster
Centaurea maculosa	Spotted knapweed
Chenopodium album	Pigweed
Chicorium intybus	Chicory
Cirsium arvense	Canada thistle
Newcomb, Lawrence. 1977. Newcomb's Wildflower Guide. Little, Brown and Company. Boston. Edinger, G.J., D.J. Evans, S. Gebauer, T.G. Howard, D.M. Hunt, and A.M. Olivero (editors). 2002. Table 4.1.1 List of Species observed within the Urban Vacant Lot Community (cont.)

Scientific Name	**Common Name**
Herbs (cont.)	
Cirsium vulgare	Bull thistle
Commelina communis	Asiatic dayflower
Daucus carota	Queen Anne's lace
Fragaria spp.	Strawberry
Hypericum perforatum	Common St. Johnswort
Lactusa serriola	Prickly lettuce
Lepidium virginicum	Wild peppergrass
Leucanthemum vulgare	Oxeye daisy
Linaria vulgaris	Butter-and-eggs
Lychnis alba	White campion
Lycopus americanus	American water horehound
Melilotus officinalis	Yellow sweet clover
Oxalis stricta	Yellow wood-sorrel
Phytolacca americana	Pokeweed
Plantago major	Common plantain
Polygonum hydropiper	Water pepper
Polygonum lapathifolium	Curlytop knotweed
Polygonum persicaria	Lady's thumb
Potentilla simplex	Common cinquefoil
Ranunculus acris	Tall buttercup
Rumex crispus	Curly dock
Solanum dulcamara	Bittersweet nightshade
Solidago canadensis	Canada goldenrod
Solidago juncea	Early goldenrod
Vines	
Celastrus scandens	American bittersweet
Convolvulus sepium	Hedge bindweed
Echinocystis lobata	Wild cucumber
Ipomoea purpurea	Common morning glory
Parthenocissus quinquefolia	Virginia creeper
Toxicodendron radicans	Poison ivy
Vitis aestivalis	Summer grape
Grasses and Sedges	
Cyperus esculentus	Yellow nutsedge
Cyperus strigosus	Strawcolored flatsedge
Digitaria spp.	Crabgrass
Elymus repens	Quackgrass
Phleum pratense	Timothy

New York Natural Heritage Program, New York State Department of Environmental Conservation, Albany, NY.136 pgs.

Successional Old Field (i.e., Brine Sludge Lagoon) – This community is located in the east-central portion of the Site. It consists of a capped brine sludge lagoon that has become vegetated with early successional species. The former brine sludge lagoon has a clean cover and it is a closed RCRA lagoon. It is not part of the contaminated site. Over the years, the cap has become vegetated with early successional species such as daisy fleabane (*Erigeron strigosus*), narrowleaf plantain (*Plantago lanceolata*), clover (*Trifolium* spp.), and brome grass (*Bromus* sp.). A woodchuck (*Marmota monax*) burrow was observed at the western edge of the former brine sludge lagoon.

Table 4.1.1 List of Species observed within the Successional Old Field Community

Scientific Name	**Common Name**
Herbs	
Brassica spp.	Mustard
Chamaesyce maculata	Prostrate spurge
Erigeron strigosus	Daisy fleabane
Leontodon autumnalis	Fall dandelion
Linaria vulgaris	Butter-and-eggs
Lotus corniculatus	Birdsfoot trefoil
Plantago lanceolata	Narrowleaf plantain
Plantago major	Common plantain
Taraxacum officinale	Common dandelion
Trifolium pratense	Red clover
Trifolium repens	White clover
Verbascum thapsus	Common mullein
Vicia villosa	Winter vetch
Grasses and Sedges	
Aleopecurus spp.	Foxtail
Bromus spp.	Brome grass
Digitaria spp.	Crabgrass
Elymus repens	Quackgrass
Phleum pratense	Timothy

New York Natural Heritage Program, New York State Department of Environmental Conservation, Albany, NY.136 pgs.

Brackish Tidal Marsh – This community is located in the eastern portion of the Site and includes South Branch Creek and its banks. South Branch Creek is a man-made ditch that has been excavated in artificial fill and a brackish tidal marsh. Over the years, the ditch has been filled and realigned to its current state. Vegetation within this community was dense and dominated by tall graminoids. Vegetation along the sides of the ditch consists primarily of common reed (*Phragmites australis*) and smooth cordgrass (*Spartina alternifolia*). Several bird

species including a little blue heron (*Egretta caerulea*), green heron (*Butorides virescens*), and swamp sparrow (*Melospiza georgiana*) were observed in this community. Mummichogs (*Fundulus* sp.), fiddler crabs (*Uca pugnax*), and ribbed mussels (*Geukensia demissa*) were relatively abundant in the marsh. Blue crabs (*Callinectes sapidus*) were also noted further out in South Branch Creek, closer to the Arthur Kill.

Table 4.1.2 List of Species observed within the Brackish Tidal Marsh Community

Scientific Name	**Common Name**
Grasses and Sedges	
Lythrum salicaria	Purple loosestrife
Phragmites australis	Common reed
Spartina alternifolia	Smooth cordgrass

Figure 4.1-1
Ecological Communities Map

City of Linden
Union County, New Jersey

Created by:	JFT
Date:	09/14/06
Scale:	1:4,219
Project #:	70620.00

4.2 Fauna

The fauna of the Site was also cataloged during the on-site investigation. In all, 42 species of wildlife were observed during the Site visits.

4.2.1 Mammals

Six mammalian species were either observed or recognized by their sign on or within the immediate vicinity of the Site (Table 4.2.1). A woodchuck burrow was observed at the former sludge lagoon; a mouse (*Peromyscus* sp.) nest was observed near an abandoned building; a raccoon (*Procyon lotor*) track was observed along the main access road through the site; a whitetail deer (*Odocoileus virginianus*) was observed near the abandoned buildings; a red fox (*Vulpes vulpes*) was observed along the railroad tracks; and an eastern cottontail (*Sylvilagus floridanus*) was observed in the vicinity of the Site. No aquatic mammals or endangered, threatened, or special concern mammalian species were observed within the Site.

Table 4.2.1 Mammal Species Observed

Scientific Name	Common Name	Habitat
Marmota monax	Woodchuck	SOF
Odocoileus virginanus	Whitetail deer	UVL
Peromyscus sp.	Mouse	UVL
Procyon lotor	Raccoon	UVL
Vulpes vulpes	Red fox	UVL
Sylvilagus floridanus	Eastern cottontail	OF (Adjacent to Site)
Ecological Communities: **SOF**- Successional Old Field, **UVL**- Urban Vacant Lot		

4.2.2 Reptiles and Amphibians

One reptile and one amphibian species were observed at the Site (Table 4.2.2). No endangered, threatened, or special concern reptile or amphibian species were observed within the Site.

Table 4.2.2 Reptile and Amphibian Species Observed

Scientific Name	Common Name	Habitat
Bufo americanus	American toad	UVL
Thamnophis sirtalis	Common garter snake	UVL
Ecological Communities: **BTM**- Brackish Tidal Marsh, **UVL**- Urban Vacant Lot		

4.2.3 Fish and Crustaceans

Three species of fish and eight species of crustaceans were observed during the field investigation (Table 4.2.3). No endangered, threatened, or special concern fish or crustacean species were observed within the Site.

Table 4.2.3 Fish and Crustaceans Species Observed

Scientific Name	Common Name	Habitat
Fish		
Fundulus diaphanous	Banded killifish	BTM
Fundulus heteroclitus	Mummichog	BTM
Fundulus majalis	Striped mummichog	BTM
Crustaceans		
Balanus spp.	Barnacle	BTM
Callinectes sapidus	Blue crab	BTM
Carcinus maenas	Green crab	BTM
Geukensia demissa	Ribbed mussel	BTM
Neopanopeus sayi	Black-fingered mud crab	BTM
Palaemontetes spp.	Grass shrimp	BTM
Uca minax	Red-jointed fiddler crab	BTM
Uca pugnax	Atlantic Marsh fiddler crab	BTM
Ecological Communities: **BTM**- Brackish Tidal Marsh, **UVL**- Urban Vacant Lot		

4.2.4 Birds

Twenty-three species of birds were observed on or within the immediate vicinity of the Site (Table 4.2.4). Thirteen of the species were observed on-site and 10 species were observed in tidal marshes within ½ mile of the Site. Associations between bird species and their corresponding preferred habitat types were noted during the investigation. All avian species observed are common in New Jersey/New York and are typically found within the communities they were observed in. No ETR bird species were observed during the field investigation.

Since the Site is located within the Atlantic coast migration corridor, numerous migrating land and water birds could potentially use the site or surrounding area as a stopover/overwintering site. The Atlantic coast is regularly used by migrating birds and approximately 50 different kinds of landbirds travel this flyway.[17] Flocks of Canada geese (*Branta canadensis*) and mourning doves (*Zenaida macroura*) were observed in mowed fields adjacent to the Site during the field investigations.

[17] Peterson, S.R. 1979. Atlantic Coast Route and Tributaries. Migration of Birds. Fish and Wildlife Service, Circular 16. pg. 70.

Table 4.2.4 Bird Species Observed

Scientific Name	Common Name	Habitat
Birds		
Agelaius phoeniceus	Red-winged blackbird	BTM
Anas platyrhynchos	Mallard	Arthur kill
Anas rubripes	American black duck	Piles Creek
Ardea herodias	Great blue heron	Piles Creek
Botaurus lentiginosus	American bittern	Rahway Creek
Branta canadensis	Canada goose	UVL, Arthur Kill
Butorides virescens	Green heron	BTM
Calidris minutilla	Least sandpiper	Piles Creek
Casmerodius albus	Great egret	Piles Creek
Charadrius vociferus	Killdeer	UVL
Dumetella carolinensis	Gray catbird	UVL
Egretta caerulea	Little blue heron	BTM
Egretta thula	Snowy egret	Piles Creek
Hirundo rustica	Barn swallow	UVL
Larus atricilla	Laughing gull	Piles Creek
Larus argentatus	Herring gull*	UVL
Melospiza georgiana	Swamp sparrow	BTM
Melospiza melodia	Song sparrow	UVL
Mimus polyglottos	Northern mockingbird	UVL
Phalacrocorax auritus	Double-crested cormorant	Arthur kill
Sterna hirundo	Common tern	Rahway Creek
Sturnus vulgaris	European starling	UVL
Zenaida macroura	Mourning dove	UVL
Ecological Communities: **BTM**- Brackish Tidal Marsh, **UVL**- Urban Vacant Lot * denotes a flyover		

4.2.5 Endangered, Threatened, and Rare Wildlife Species

During this EA, no ETR species were found on the Site. According to the Comprehensive List of Federally Listed, Threatened, and Endangered Species of New Jersey, the Indiana bat (*Myotis soldalis*) is the only federally protected ETR species known historically to be in the City of Linden municipality. Based upon the habitat found within the Site, it is unlikely that Indiana bats are found in the project area. The abandoned buildings throughout the Site could provide suitable habitat for Indiana bats; however, no bats were observed during the site visits.

Indiana bat roosts typically are identified by trees with exfoliating bark in open tree canopies where there is significant exposure to sunlight. There are very few trees on the Site, and the closest black locust was a single tree approximately 1,000 feet north of the Site. Several black locust trees were identified along the Rahway River corridor approximately ½ mile away. These trees were approximately 15 feet high with insufficient diameters and physical structures for roosting.

According to the NYSDEC, pied-billed grebes and yellow-crowned night herons are recorded approximately ¼ from the Site. Based upon the habitat found within the Site, potential nonbreeding habitat for pied-billed grebes and foraging habitat for yellow-crowned night herons exists within the Site. The brackish tidal marsh community located in the eastern portion of the Site is dominated by common reed and smooth cordgrass, which is commonly associated with yellow-crowned night heron foraging habitat. Nesting habitat for both of these species was not observed within the Site.

5.0 CONCLUSIONS

The project area is an abandoned industrial site consisting of deteriorating buildings and disturbed land. One watercourse (i.e., South Branch Creek) flows east, discharging into the Arthur Kill, which eventually flows into the Raritan Bay.

The wildlife species observed during this EA are all fairly common to the area. Pralls Island, located approximately 1,200 feet to the east of the project within the Arthur Kill is part of a Harbor Herons Sanctuary, owned by the NYC Department of Parks and Recreation. The uninhabited island provides a nesting habitat for numerous birds, including herons, shorebirds, gulls, waterfowl, and songbirds. However, declining populations of herons have been noted on this island.

In regards to ETR species, there were no ETR species or significant ecological communities observed within or in the immediate vicinity of the project area. The brackish tidal marsh community, located in the eastern portion of the Site, is the only area onsite which may provide suitable nonbreeding and foraging habitat for the state-endangered pied-billed grebe and state-threatened yellow-crowned night heron. Although this community may provide low-grade habitat for these species, plenty of similar habitat is located in the surrounding area (i.e., Piles Creek, Rahway River). Since both species are highly mobile and because the Site does not provide nesting habitat, it is expected that the both species would migrate and use similar habitat in the surrounding area.

As this Site has been subject to highly industrialized previous land uses, it is highly modified and disturbed. This has led to a species assemblage of generalists and/or early successional/weedy/invasive species. The flora and fauna species found on the site are typical species that would be found in heavily industrialized areas within intertidal marsh ecosystems. As most of the species found on-site are mobile, it is anticipated that they will migrate to higher quality habitat in the surrounding areas such as Piles Creek and the Arthur Kill. Vegetative species found within the Site are very common to highly disturbed areas and possess no special protection. All species observed or documented in the intertidal marsh community are common species in this habitat type and are secure in the region.

Re: Freedom of Information Request, Threatened or Endangered Species
26 Acre Site Located at the foot of South Wood Avenue
City of Linden, Union County, New Jersey

Dear Sir or Madam:

The Chazen Companies are in the process of conducting a natural resource inventory at the above referenced property. The approximately 26-acre site is located at the foot of South Wood Avenue in the City of Linden, Union County, New Jersey. The tax parcel map for this area identifies the property as parcel #'s (i.e., Block and Lot number): 587 3.1, 587 3.2, and 587 3.3. Please find the enclosed USGS topographic map (Arthur Kill Quadrangle) illustrating the approximate location of the subject property.

The project site has been designated a superfund site by the Environmental Protection Agency (EPA). As part of a Phase II Remedial Investigation at the LCP Chemicals Superfund Site, an on site habitat assessment will be conducted. All species will be inventoried on the property.

Please provide any information you have concerning known occurrences of endangered, threatened and/or special concern wildlife species as well as rare plant, animal, natural community occurrences, or other significant habitats either on the site or in the immediate surrounding area. This information will help us focus on habitat which may be critical to endangered or threatened species.

If you have any questions, please do not hesitate to contact me at (845) 567-1133 if you have any questions. Thank you for your assistance.

Sincerely,

Jason Tourscher

Re: LCP Chemicals Superfund Site

Dear Mr. Tourscher:

Thank you for your data request regarding rare species information for the above referenced project site in Linden City, Union County.

Searches of the Natural Heritage Database and the Landscape Project (Version 2) are based on a representation of the boundaries of your project site in our Geographic Information System (GIS). We make every effort to accurately transfer your project bounds from the topographic map(s) submitted with the Request for Data into our Geographic Information System. We do not typically verify that your project bounds are accurate, or check them against other sources.

Neither the Natural Heritage Database nor the Landscape Project has records for any rare wildlife species on the referenced site.

We have also checked the Natural Heritage Database and the Landscape Project habitat mapping for occurrences of any rare wildlife species or wildlife habitat within 1/4 mile of the referenced site. Please see the table below for species list and conservation status.

Species within 1/4 mile of referenced site.

Common Name	Scientific Name	Federal Status	State Status	Grank	Srank
black-crowned night-heron foraging habitat	*Nycticorax nycticorax*		T/S	G5	S3B,S4N
colonial waterbird foraging habitat					
yellow-crowned night-heron foraging habitat	*Nyctanassa violacea*		T/T	G5	S2B

We have also checked the Natural Heritage Database for occurrences of rare plant species or ecological communities. The Natural Heritage Database does not have any records for rare plants or ecological communities on or within 1/4 mile of the site.

Attached is a list of rare species and ecological communities that have been documented from Union County. If suitable habitat is present at the project site, these species have potential to be present.

Status and rank codes used in the tables and lists are defined in the attached EXPLANATION OF CODES USED IN NATURAL HERITAGE REPORTS.

If you have questions concerning the wildlife records or wildlife species mentioned in this response, we recommend that you visit the interactive I-Map-NJ website at the following URL, http://www.state.nj.us/dep/gis/depsplash.htm or contact the Division of Fish and Wildlife, Endangered and Nongame Species Program.

PLEASE SEE THE ATTACHED 'CAUTIONS AND RESTRICTIONS ON NHP DATA'.

Thank you for consulting the Natural Heritage Program. The attached invoice details the payment due for processing this data request. Feel free to contact us again regarding any future data requests.

Sincerely,

Herbert A. Lord

CAUTIONS AND RESTRICTIONS ON NATURAL HERITAGE DATA

The quantity and quality of data collected by the Natural Heritage Program is dependent on the research and observations of many individuals and organizations. Not all of this information is the result of comprehensive or site-specific field surveys. Some natural areas in New Jersey have never been thoroughly surveyed. As a result, new locations for plant and animal species are continuously added to the database. Since data acquisition is a dynamic, ongoing process, the Natural Heritage Program cannot provide a definitive statement on the presence, absence, or condition of biological elements in any part of New Jersey. Information supplied by the Natural Heritage Program summarizes existing data known to the program at the time of the request regarding the biological elements or locations in question. They should never be regarded as final statements on the elements or areas being considered, nor should they be substituted for on-site surveys required for environmental assessments. The attached data is provided as one source of information to assist others in the preservation of natural diversity.

This office cannot provide a letter of interpretation or a statement addressing the classification of wetlands as defined by the Freshwater Wetlands Act. Requests for such determination should be sent to the DEP Land Use Regulation Program, P.O. Box 401, Trenton, NJ 08625-0401.

The Landscape Project was developed by the Division of Fish & Wildlife, Endangered and Nongame Species Program in order to map critical habitat for rare animal species. Natural Heritage Database response letters will also list all species (if any) found during a search of the Landscape Project. However, this office cannot answer any inquiries about the Landscape Project. All questions should be directed to the DEP Division of Fish and Wildlife, Endangered and Nongame Species Program, P.O. Box 400, Trenton, NJ 08625-0400.

This cautions and restrictions notice must be included whenever information provided by the Natural Heritage Database is published.

EXPLANATIONS OF CODES USED IN NATURAL HERITAGE REPORTS

FEDERAL STATUS CODES

The following U.S. Fish and Wildlife Service categories and their definitions of endangered and threatened plants and animals have been modified from the U.S. Fish and Wildlife Service (F.R. Vol. 50 No. 188; Vol. 61, No. 40; F.R. 50 CFR Part 17). Federal Status codes reported for species follow the most recent listing.

LE	Taxa formally listed as endangered.
LT	Taxa formally listed as threatened.
PE	Taxa already proposed to be formally listed as endangered.
PT	Taxa already proposed to be formally listed as threatened.
C	Taxa for which the Service currently has on file sufficient information on biological vulnerability and threat(s) to support proposals to list them as endangered or threatened species.
S/A	Similarity of appearance species.

STATE STATUS CODES

Two animal lists provide state status codes after the Endangered and Nongame Species Conservation Act of 1973 (NSSA 23:2A-13 et. seq.): the list of endangered species (N.J.A.C. 7:25-4.13) and the list defining status of indigenous, nongame wildlife species of New Jersey (N.J.A.C. 7:25-4.17(a)). The status of animal species is determined by the Nongame and Endangered Species Program (ENSP). The state status codes and definitions provided reflect the most recent lists that were revised in the New Jersey Register, Monday, June 3, 1991.

D	Declining species-a species which has exhibited a continued decline in population numbers over the years.
E	Endangered species-an endangered species is one whose prospects for survival within the state are in immediate danger due to one or many factors - a loss of habitat, over exploitation, predation, competition, disease. An endangered species requires immediate assistance or extinction will probably follow.
EX	Extirpated species-a species that formerly occurred in New Jersey, but is not now known to exist within the state.
I	Introduced species-a species not native to New Jersey that could not have established itself here without the assistance of man.
INC	Increasing species-a species whose population has exhibited a significant increase, beyond the normal range of its life cycle, over a long term period.
T	Threatened species-a species that may become endangered if conditions surrounding the species begin to or continue to deteriorate.
P	Peripheral species-a species whose occurrence in New Jersey is at the extreme edge of its present natural range.
S	Stable species-a species whose population is not undergoing any long-term increase/decrease within its natural cycle.
U	Undetermined species-a species about which there is not enough information available to determine the status.

Status for animals separated by a slash(/) indicate a duel status. First status refers to the state breeding population, and the second status refers to the migratory or winter population.

Special Concern applies to animal species that warrant special attention because of some evidence of decline, inherent vulnerability to environmental deterioration, or habitat modification that would result in their becoming a Threatened species. This category would also be applied to species that meet the foregoing criteria and for which there is little understanding of their current population status in the state.

Plant taxa listed as endangered are from New Jersey's official Endangered Plant Species List N.J.S.A. 131B-15.151 et seq.

E Native New Jersey plant species whose survival in the State or nation is in jeopardy.

REGIONAL STATUS CODES FOR PLANTS AND ECOLOGICAL COMMUNITIES

LP Indicates taxa listed by the Pinelands Commission as endangered or threatened within their legal jurisdiction. Not all species currently tracked by the Pinelands Commission are tracked by the Natural Heritage Program. A complete list of endangered and threatened Pineland species is included in the New Jersey Pinelands Comprehensive Management Plan.

HL Indicates taxa or ecological communities protected by the Highlands Water Protection and Planning Act within the jurisdiction of the Highlands Preservation Area.

EXPLANATION OF GLOBAL AND STATE ELEMENT RANKS

The Nature Conservancy has developed a ranking system for use in identifying elements (rare species and natural communities) of natural diversity most endangered with extinction. Each element is ranked according to its global, national, and state (or subnational in other countries) rarity. These ranks are used to prioritize conservation work so that the most endangered elements receive attention first. Definitions for element ranks are after The Nature Conservancy (1982: Chapter 4, 4.1-1 through 4.4.1.3-3).

GLOBAL ELEMENT RANKS

G1 Critically imperiled globally because of extreme rarity (5 or fewer occurrences or very few remaining individuals or acres) or because of some factor(s) making it especially vulnerable to extinction.

G2 Imperiled globally because of rarity (6 to 20 occurrences or few remaining individuals or acres) or because of some factor(s) making it very vulnerable to extinction throughout its range.

G3 Either very rare and local throughout its range or found locally (even abundantly at some of its locations) in a restricted range (e.g., a single western state, a physiographic region in the East) or because of other factors making it vulnerable to extinction throughout it's range; with the number of occurrences in the range of 21 to 100.

G4 Apparently secure globally; although it may be quite rare in parts of its range, especially at the periphery.

G5 Demonstrably secure globally; although it may be quite rare in parts of its range, especially at the periphery.

GH Of historical occurrence throughout its range i.e., formerly part of the established biota, with the expectation that it may be rediscovered.

GU Possibly in peril range-wide but status uncertain; more information needed.

GX Believed to be extinct throughout range (e.g., passenger pigeon) with virtually no likelihood that it will be rediscovered.

G? Species has not yet been ranked.

GNR Species has not yet been ranked.

STATE ELEMENT RANKS

S1 Critically imperiled in New Jersey because of extreme rarity (5 or fewer occurrences or very few remaining individuals or acres). Elements so ranked are often restricted to very specialized conditions or habitats and/or restricted to an extremely small geographical area of the state. Also included are elements which were formerly more abundant, but because of habitat destruction or some other critical factor of its biology, they have been demonstrably reduced in abundance. In essence, these are elements for which, even with intensive searching, sizable additional occurrences are unlikely to be discovered.

S2 Imperiled in New Jersey because of rarity (6 to 20 occurrences). Historically many of these elements may have been more frequent but are now known from very few extant occurrences, primarily because of habitat destruction. Diligent searching may yield additional occurrences.

S3 Rare in state with 21 to 100 occurrences (plant species and ecological communities in this category have only 21 to 50 occurrences). Includes elements which are widely distributed in the state but with small populations/acreage or elements with restricted distribution, but locally abundant. Not yet imperiled in state but may soon be if current trends continue. Searching often yields additional occurrences.

S4 Apparently secure in state, with many occurrences.

S5 Demonstrably secure in state and essentially ineradicable under present conditions.

SA Accidental in state, including species (usually birds or butterflies) recorded once or twice or only at very great intervals, hundreds or even thousands of miles outside their usual range; a few of these species may even have bred on the one or two occasions they were recorded; examples include European strays or western birds on the East Coast and vice-versa.

SE Elements that are clearly exotic in New Jersey including those taxa not native to North America (introduced taxa) or taxa deliberately or accidentally introduced into the State from other parts of North America (adventive taxa). Taxa ranked SE are not a conservation priority (viable introduced occurrences of G1 or G2 elements may be exceptions).

SH Elements of historical occurrence in New Jersey. Despite some searching of historical occurrences and/or potential habitat, no extant occurrences are known. Since not all of the historical occurrences have been field surveyed, and unsearched potential habitat remains, historically ranked taxa are considered possibly extant, and remain a conservation priority for continued field work.

SP Element has potential to occur in New Jersey, but no occurrences have been reported.

SR Elements reported from New Jersey, but without persuasive documentation which would provide a basis for either accepting or rejecting the report. In some instances documentation may exist, but as of yet, its source or location has not been determined.

SRF Elements erroneously reported from New Jersey, but this error persists in the literature.

SU Elements believed to be in peril but the degree of rarity uncertain. Also included are rare taxa of uncertain taxonomical standing. More information is needed to resolve rank.

SX Elements that have been determined or are presumed to be extirpated from New Jersey. All historical occurrences have been searched and a reasonable search of potential habitat has been completed. Extirpated taxa are not a current conservation priority.

SXC Elements presumed extirpated from New Jersey, but native populations collected from the wild exist in cultivation.

SZ Not of practical conservation concern in New Jersey, because there are no definable occurrences, although the taxon is native and appears regularly in the state. An SZ rank will generally be used for long distance migrants whose occurrences during their migrations are too irregular (in terms of repeated visitation to the same locations), transitory, and dispersed to be reliably identified, mapped and protected. In other words, the migrant regularly passes through the state, but enduring, mappable element occurrences cannot be defined.

Typically, the SZ rank applies to a non-breeding population (N) in the state – for example, birds on migration. An SZ rank may in a few instances also apply to a breeding population (B), for example certain lepidoptera which regularly die out every year with no significant return migration.

Although the SZ rank typically applies to migrants, it should not be used indiscriminately. Just because a species is on migration does not mean it receives an SZ rank. SZ will only apply when the migrants occur in an irregular, transitory and dispersed manner.

B Refers to the breeding population of the element in the state.

N Refers to the non-breeding population of the element in the state.

T Element ranks containing a "T" indicate that the infraspecific taxon is being ranked differently than the full species. For example *Stachys palustris* var. *homotricha* is ranked "G5T? SH" meaning the full species is globally secure but the global rarity of the var. *homotricha* has not been determined; in New Jersey the variety is ranked historic.

Q Elements containing a "Q" in the global portion of its rank indicates that the taxon is of questionable, or uncertain taxonomical standing, e.g., some authors regard it as a full species, while others treat it at the subspecific level.

.1 Elements documented from a single location.

Note: To express uncertainty, the most likely rank is assigned and a question mark added (e.g., G2?). A range is indicated by combining two ranks (e.g., G1G2, S1S3).

IDENTIFICATION CODES

These codes refer to whether the identification of the species or community has been checked by a reliable individual and is indicative of significant habitat.

Y Identification has been verified and is indicative of significant habitat.

BLANK Identification has not been verified but there is no reason to believe it is not indicative of significant habitat.

? Either it has not been determined if the record is indicative of significant habitat or the identification of the species or community may be confusing or disputed.

Re: Freedom of Information Request, Threatened or Endangered Species
Site Located adjacent to Old Place Creek
South of Port Ivory, Richmond County, New York

Dear Ms. Pietrusiak:

The Chazen Companies are in the process of conducting a Phase II Remedial Investigation and Ecological Risk Assessment (ERA) of a 26-acre site in the City of Linden, Union County, New Jersey. As part of the remediation process, a reference stream within the vicinity of the site is being studied.

The reference stream is located along Old Place Creek, which is located south of Port Ivory, Richmond County, New York. Old Place Creek is located below the Goethals Bridge which connects New Jersey and Staten Island. Please find the enclosed USGS topographic maps (Arthur Kill and Elizabeth Quadrangle) illustrating the approximate location of the site and reference stream. The land use surrounding the site and reference stream is industrial. Brackish tidal marshes are located adjacent to the reference stream.

Please provide any information you have concerning known occurrences of endangered, threatened and/or special concern wildlife species as well as rare plant, animal, natural community occurrences, or other significant habitats either at the reference stream site or in the immediate surrounding area. Also, although the 26-acre site is located within New Jersey, we are requesting any information you may have for the portion of New York (i.e., Chelsea, New York) which is located east of the site.

If at all possible, please fax the requested information to me at (845) 567-1925. Please do not hesitate to contact me at (845) 567-1133 if you have any questions.

Thank you for your assistance.

Sincerely,

Jason Tourscher

Denise M. Sheehan
Commissioner

October 27, 2006

Jason Tourscher
Chazen Engineering
21 Fox Street
Poughkeepsie, NY 12601

Dear Mr. Tourscher:

In response to your recent request, we have reviewed the New York Natural Heritage Program database with respect to an Environmental Assessment for the proposed 26-acre Phase II Remedial Investigation and Ecological Risk Assessment, area along Old Place Creek below Goethals Bridge which connects New Jersey and Staten Island, area as indicated on the map you provided, located in Richmond County, New York State.

Enclosed is a report of rare or state-listed animals and plants, significant natural communities, and other significant habitats, which our databases indicate occur, or may occur, on your site or in the immediate vicinity of your site. The information contained in this report is considered sensitive and should not be released to the public without permission from the New York Natural Heritage Program.

The presence of rare species may result in this project requiring additional permits, permit conditions, or review. For further guidance, and for information regarding other permits that may be required under state law for regulated areas or activities (e.g., regulated wetlands), please contact the appropriate NYS DEC Regional Office, Division of Environmental Permits, at the enclosed address.

For most sites, comprehensive field surveys have not been conducted; the enclosed report only includes records from our databases. We cannot provide a definitive statement on presence or absence of all rare or state-listed species or significant natural communities. This information should not be substituted for on-site surveys that may be required for environmental impact assessment.

Our databases are continually growing as records are added and updated. If this proposed project is still under development one year from now, we recommend that you contact us again so that we may update this response with the most current information.

Sincerely,

Tara Seoane

COMPREHENSIVE LIST OF NEW JERSEY MUNICIPALITIES WITH EXTANT AND HISTORIC OCCURRENCES OF FEDERALLY LISTED THREATENED AND ENDANGERED SPECIES, AND CANDIDATE SPECIES, PURSUANT TO THE ENDANGERED SPECIES ACT OF 1973
(87 Stat. 884, as amended; 16 U.S.C. 1531 *et seq.*)

{Revised June 2004; Bald eagle data revised July 2005}

1. SPECIES OCCURRENCES BY COUNTY AND MUNICIPALITY

Index of symbols used in the tables:
- T – Federally listed as threatened.
- E – Federally listed as endangered.
- X – Known occurrence of extant federally listed or candidate species.
- H – Historic occurrence of federally listed or candidate species.
- W – Wintering foraging habitat for bald eagles.

2. FEDERALLY LISTED THREATENED AND ENDANGERED SPECIES AND CANDIDATE SPECIES IN NEW JERSEY UNDER U.S. FISH AND WILDLIFE SERVICE JURISDICTION (Species Narratives)

LISTED SPECIES - PLANTS
- Swamp pink (*Helonias bullata*)
- Knieskern's beaked-rush (*Rhynchospora knieskernii*)
- Sensitive joint-vetch (*Aeschynomene virginica*)
- American chaffseed (*Schwalbea americana*)
- Small whorled pogonia (*Isotria medeoloides*)
- Seabeach amaranth (*Amaranthus pumilus*)

LISTED SPECIES - INVERTEBRATES
- Dwarf wedgemussel (*Alasmidonta heterodon*)
- Northeastern beach tiger beetle (*Cicindela dorsalis dorsalis*)

LISTED SPECIES - REPTILES
- Bog turtle (*Clemmys muhlenbergii*)

LISTED SPECIES - BIRDS
- Bald eagle (*Haliaeetus leucocephalus*)
- Piping plover (*Charadrius melodus*)
- Roseate tern (*Sterna dougallii*)

LISTED SPECIES - MAMMALS
- Indiana bat (*Myotis sodalis*)

CANDIDATE SPECIES
- Bog asphodel (*Narthecium americanum*)
- Hirst's panic grass (*Dichanthelium hirstii*)

DELISTED SPECIES
- Peregrine falcon (*Falco peregrinus*)

UNION COUNTY

The species listed below are known to occur in at least one of the Union County municipalities listed below.

Species	
Bog Turtle	
Indiana Bat	(*)

Municipalities
Berkeley Heights Township
Mountainside Borough
Scotch Plains Township
Summit City

(*) Indiana bats may occur in any municipality within Union County

Appendix B:
Site Photographs

Photo #1
Northern view of the urban vacant lot ecological community located throughout the majority of the Site.

Photo #2
Southern view of abandoned buildings located within the central portion of the Site

Photo #3
Eastern view of South Branch Creek

Photo #4
View of fiddler crabs within South Branch Creek

Photo #5
View of the eastern shore of Pralls Island and the Arthur Kill

Photo #6
View of successional fields surrounding the Site. Bulk petroleum storage tanks are located in the distance.

Photo #7
View of the urban vacant lot community along the southern Site boundary

Photo #8
View of the eastern slope of the capped sludge lagoon

Photo #9
Northeastern view of Pile's Creek. The DuPont chemical plant is in the background

Photo #10
Southeastern view of Rahway Creek. Valero LP petroleum storage tanks are displayed in the background.

Appendix G: Representative Photographic Logs

Photograph #1 – Use of coring device for sediment sampling.

Photograph #2–Detachment of core during sediment sampling.

Photograph #3 – Use of Petite Ponar dredge for sediment sampling.

Photograph #4 – Grab sample during surface water sampling.

Photograph #5 – Surface water grab sample collection.

Photograph #6 – Low marsh soil sampling.

Photograph #7 – Homogenizing low marsh soil sample.

Photograph #8 – Collecting fiddler crabs.

Photograph #9 – Fiddler crab yield for two sample stations.

Photograph #10 – Weighing fiddler crabs.

Photograph #11 – Baited traps for mummichog.

Photograph #12 – Baited trap in water at transect.

Photograph #13 – Fish yield at transect.

Photograph #14 – Measuring fish samples.

Photograph #1 – Deep soil drilling with hollow-stem auger rig.

Photograph #2 – Deep soil sampling, split-tube samples.

Photograph #3 – Shallow soil using GeoProbe direct push sampler.

Photograph #4 – Shallow soil using GeoProbe direct push sampler.

Photograph #5 – Horizontal boring drill rods advanced into shallow trench before proceeding beneath Buildings 230 and 240.

Photograph #6 – Horizontal drilling rig. Drill rods being advanced into and through shallow trench.

Photograph #7 – Elemental mercury from sample HB-105A.

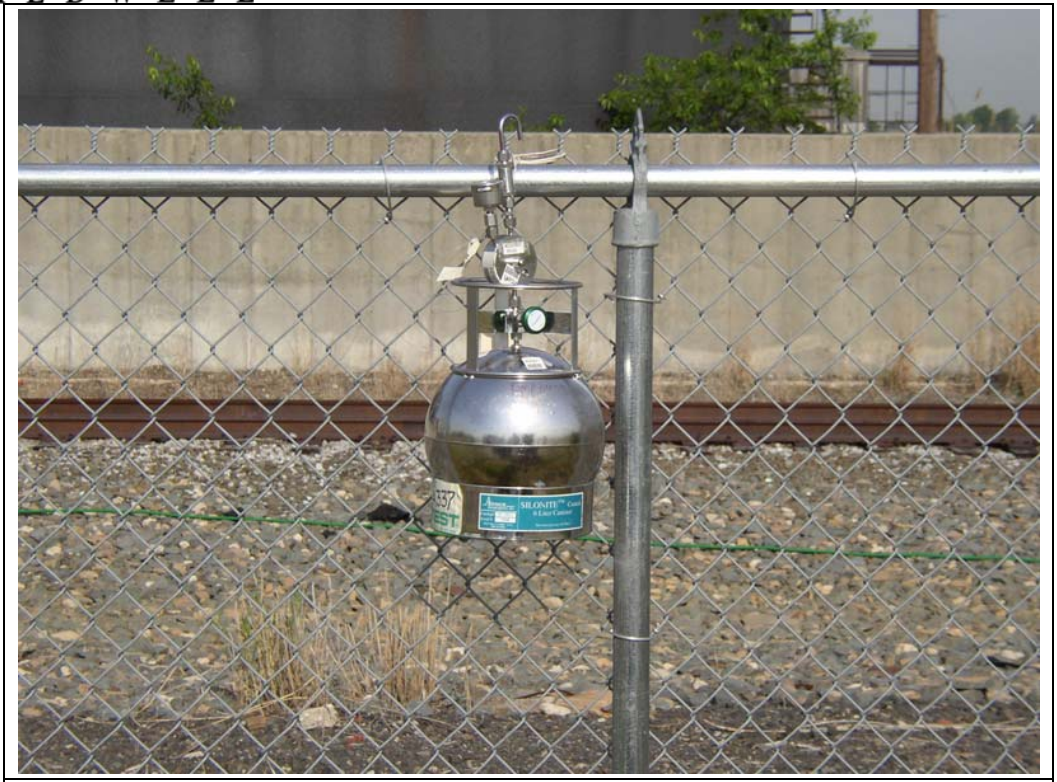
Photograph #8 – Elemental mercury beads on soil (in lower right-hand corner) discovered while digging shallow trench for HB-103. Trench was abandoned and area taped off.

Photograph #9 – Groundwater sample collection.

Photograph #10 – Groundwater sample collection.

Photograph #11 – Mercury soil vapor screening using a Jerome 431B mercury vapor analyzer.

Photograph #12 – Collection of mercury soil vapors via method IO-5. Gold-bead traps are placed inside heated-tube (bottom left of photo)to reduce moisture in sample.



Photograph #13 – Ambient air sample collected in six-liter summa canister.

Photograph #14 – Purging soil vapor probe and monitoring mercury vapors for health and safety purposes.

Photograph #15 – Collection of duplicate soil vapor samples in 1-liter summa canister.

R2-0004010

Introduction

No. of Samples/Matrix:	10 Soil samples
Sample Delivery Groups (SDG):	E95157
Sampling Date:	July 17, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: The Field blank reported methylene chloride contamination. This resulted in all detected methylene chloride results being qualified as non-detects at CRDL. The recovery for one surrogate exceeded acceptable QC limits for sample TLN-3-2-4. Acetone, chloroform and benzene are the affected compounds and were qualified with the "J" validation flag to indicate the results are estimated due to this anomaly. A trip blank was reported in the sample summary but neither raw data nor Form 1 was presented with this SDG.

Pesticide: All results are acceptable

PCB: All results are acceptable.

Metals: Vanadium and zinc results were qualified as estimated "J" due to serial dilution recoveries that were outside QC limits. Antimony and lead results were qualified estimated "UJ/J" due to low matrix spike recovery.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

The CCAL is acceptable.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

A trip blank was not included with this SDG.

4.2 Field Blank (FB)

The field blank reported methylene chloride contamination at 3.0ug/L. This resulted in all detected methylene chloride results being qualified as non-detects at CRDL.

4.3 Method Blank (MB)

VOA: Method blanks reported methylene chloride contamination. Affected samples were already qualified due to field blank contamination.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

VOA: Recovery for one surrogate exceeded acceptable QC limits for sample TLN-3-2-4. Acetone, chloroform and benzene are the affected compounds and were qualified with the "J" validation flag to indicate the results are estimated due to this anomaly.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Metals: Antimony and lead results were qualified as estimate "UJ/J" due to low matrix spike recovery.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

SVOA: Recoveries for 4-nitrophenol and bis(2-chloroethyl)ether exceeded the required QC limits. There were no detected results so no qualification was necessary.

6.0 Serial Dilution (SD)

Vanadium and zinc results were qualified as estimated "J" due to SD recoveries that were outside QC limits.

6.1 Internal Standards (IS)

All IS area counts are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs are acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

There were no field duplicates presented.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures (see Table 1.0). The data as presented are usable.

12.0 Data Qualification Summary Table

R2-0004017

Introduction

No. of Samples/Matrix:	14 Soil samples and 1 water sample
Sample Delivery Groups (SDG):	E95239
Sampling Date:	July 18, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: The Field blank and method blanks reported methylene chloride contamination. This resulted in all detected methylene chloride results being qualified as non-detects at CRDL. The field blank also reported acetone contamination which resulted in some detected acetone results being qualified as non-detects at CRDL.

SVOA: Internal standard area count for perylene-d12 was below the required QC limits for samples ADS-3-0-0.5 and ADS-4-0-0.5. The corresponding target compounds for this internal standard were all qualified "UJ/J" to indicate that the results are estimated due to this anomaly.

Pesticide: Several samples reported surrogate recoveries above QC limits. All affected detected sample results were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: All results are acceptable.

Metals: Lead and iron results were qualified as estimated "J" due to serial dilution recoveries that were outside QC limits. Antimony and beryllium results were qualified as estimated "UJ/J" due to low matrix spike recovery and all sodium results were rejected "R" due to matrix interference. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time
All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)
The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)
The CCAL is acceptable.

3.0 CRDL Standard
All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)
A trip blank was not analyzed with this SDG.

4.2 Field Blank (FB)
VOA: The field blank reported methylene chloride contamination at 1.6ug/L and acetone at 7.0ug/L. Affected methylene chloride sample results were already qualified due to method blank contamination. Affected acetone sample results were qualified as non-detects at CRDL.

4.3 Method Blank (MB)
VOA: Method blanks reported methylene chloride contamination. Affected samples were already qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery
Pesticide: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)
Metals: Antimony and beryllium results were qualified as estimated "UJ/J" due to low matrix spike recovery and all sodium results were rejected "R" due to matrix interference.

5.3 Laboratory Control Samples (LCS)/Blank Spikes
All is acceptable.

R2-0004020

6.0 Serial Dilution (SD)

Iron and lead results were qualified as estimated "J" due to SD recoveries that were outside QC limits.

6.1 Internal Standards (IS)

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples ADS-3-0-0.5 and ADS-4-0.5. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs are acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

RPDs are acceptable.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures (see Table 1.0). The data as presented are usable with the exception of sodium metal results which are not usable.

R2-0004021

R2-0004026

Introduction

No. of Samples/Matrix:	11 Soil samples and 1 Field blank
Sample Delivery Group (SDG):	E95302
Sampling Date:	July 18 and 19, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: The method blank reported methylene chloride contamination. This resulted in all detected methylene chloride results being qualified as non-detects at CRDL.

SVOA: Low internal standard recovery was exhibited by samples WWT-1-0-0.5 and ADS-5-0-0.5. All affected compounds in these samples were qualified "UJ" to indicate the results are estimated due to this anomaly.

Pesticide: Surrogate recoveries for sample SPR-2B-10-12 was below required the required QC limits. This resulted in all sample results for this sample being qualified "UJ" to indicate the results are estimated due to this anomaly.

PCB: Surrogate recoveries were above the QC limits for samples; ADS-6-0-.5-2, ADS-6-0-0.5 and ADS-5-0-0.5. Samples ADS-6-0-.5-2 and ADS-6-0-0.5 were qualified estimated "J" for aroclor 1260. Sample ADS-5-0-0.5 was qualified estimated "J" for aroclor 1254 due to this anomaly.

Metals: All antimony results were qualified as estimated "UJ" due to deficiency in matrix spike recovery. Aluminum, copper iron and potassium detected results were qualified as estimated "J" due to exceedance in matrix spike recovery. Arsenic and beryllium results were qualified as estimated "UJ/J" due to serial dilution recoveries that were outside QC limits.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

DATA QUALIFICATION SUMMARY TABLE 3

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

Technical Holding Time
All is acceptable.

Calibration

1.1 Initial Calibration (ICAL)
The ICAL is acceptable.

1.2 Continuing Calibration (CCAL)
The CCAL is acceptable.

CRDL Standard
All is acceptable.

Blanks Quality Control

1.3 Trip Blank (TB)
A trip blank was not included with this SDG.

1.4 Field Blank (FB)
The field blank reported no contamination.

1.5 Method Blank (MB)
VOA: One method blank reported methylene chloride contamination. Affected samples were qualified as non-detects at CRDL.

Accuracy and Precision Data

1.6 Surrogate Recovery
Pest: Recovery was below the QC limits for sample SPR-2B-10-12. All compounds in this sample were qualified "UJ" to indicate the results are estimated.

PCB: Recoveries were above the QC limits for samples; ADS-6-0-.5-2, ADS-6-0-0.5 and ADS-5-0-0.5. Samples ADS-6-0-.5-2 and ADS-6-0-0.5 were qualified estimated "J" for aroclor 1260. Sample ADS-5-0-0.5 was qualified estimated "J" for aroclor 1254 due to this anomaly.

1.7 Matrix Spike/Matrix Spike Duplicates (MS/MSD)
Metals: Antimony results were qualified estimated "UJ/J" due to low recovery. Aluminum, Iron, copper and potassium detected results were all qualified as estimated "J" due to high recoveries.

1.8 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

Serial Dilution (SD)

Beryllium and arsenic were qualified as estimated "UJ/J" due to SD recoveries that were outside QC limits.

1.9 Internal Standards (IS)

SVOA: Two IS area counts were below the required QC limits. Samples WWT-1-0-0.5 and ADS-5-0-0.5 are the affected samples. All associated affected compounds in these two samples were qualified "UJ" to indicate the results are estimated due to this anomaly.

Target Compound Identification

All target compound identification is acceptable.

Tentative Identification Compounds (TICs)

TICs are acceptable.

Compound Quantitation

All compound quantitation is acceptable.

Field Duplicates (FD)

There were no field duplicates presented.

Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures (see Table 1.0). The data as presented are usable.

R2-0004041

Introduction

No. of Samples/Matrix:	10 Soil samples
Sample Delivery Groups (SDG):	E97258
Sampling Date:	August 21, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Results are acceptable.

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples TLS-6-0-.5, LP-4 .5-2 and TLS-9 0-.5. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

Pesticide: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

Metals: Antimony and nickel results were qualified as estimated "UJ/J" due to low matrix spike recoveries. Calcium and zinc results were qualified as estimated "J" due to SD recoveries that were outside QC limits. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

The percent difference exceeded the 20% QC criteria for delta-BHC. All results in affected samples were qualified as estimated "UJ/J."

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

A trip blank was not analyzed with this SDG.

4.2 Field Blank (FB)

There was no field blank associated with this SDG.

4.3 Method Blank (MB)

Method blanks reported no contamination.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Pesticide: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Metals: Antimony and nickel results were qualified as estimated "UJ/J" due to low matrix spike recoveries.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

Calcium and zinc results were qualified as estimated "J" due to SD recoveries that were outside QC limits.

6.1 Internal Standards (IS)

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples TLS-6-0-.5, LP-4 .5-2 and TLS-9 0-.5. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs are acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

There are no field duplicates associated with this SDG.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures (see Table 1.0). The data as presented are usable.

Introduction

No. of Samples/Matrix:	11 Soil samples
Sample Delivery Groups (SDG):	E97259
Sampling Date:	August 21, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Method blank reported methylene chloride contamination at 5.9ug/L. All detected methylene chloride results were qualified as non-detects at CRDL.

SVOA: IS Perylene-d12 area counts were below the required QC limits for several samples. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

Pesticide: Results are acceptable.

PCB: Results are acceptable.

Metals: Antimony results were qualified as estimated "UJ/J" due to low matrix spike recoveries. All aluminum, copper, iron and some sodium results were qualified as estimated "J" due to high spike recoveries. All magnesium results were rejected "R" due to elevated spike recoveries. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

CCAL results for methoxychlor and 4,4'-DDT exceeded the required 15% QC limits. All sample results (except EQBL) for these compounds were qualified as estimated "UJ" due to this anomaly.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

A trip blank was not analyzed with this SDG.

4.2 Field Blank (FB)

The field blank reported methylene chloride contamination but there were no detected methylene chloride results thus, no validation action was necessary.

4.3 Method Blank (MB)

Method blank reported no contamination.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Recoveries are acceptable.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Recoveries are acceptable.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

Metals: Serial dilution result for sodium exceeded the required QC limits; all sodium results were qualified as estimated "J" due to this anomaly.

6.1 Internal Standards (IS)

All IS results are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs are acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

There were no field duplicates associated with this SDG.

11.0 Overall Assessment of Data

The data as presented are usable.

R2-0004064

Introduction

No. of Samples/Matrix:	12 Soil samples and 2 water samples
Sample Delivery Groups (SDG):	E97358
Sampling Date:	August 21 & 22, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Some methylene chloride results were qualified as non-detects at CRDL since their method blank reported methylene chloride contamination.

SVOA: Results are acceptable.

Pesticide: Results are acceptable.

PCB: Surrogate recoveries for sample 230 B6 0-0.5 were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly and all non-detected compounds were qualified "UJ" to indicate the results are estimated due to this anomaly.

Metals: Antimony and sodium results were qualified as estimated "UJ/J" due to low matrix spike recoveries. Aluminum results were qualified as estimated "J" due to exceedance in matrix spike recoveries. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

A trip blank was not analyzed with this SDG.

4.2 Field Blank (FB)

Field blanks reported no contamination.

4.3 Method Blank (MB)

VOA: Method blanks reported methylene chloride contamination at 10ug/L. All detected methylene chloride results were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Pesticide: Recoveries for one sample was above the required QC limits. There were no detected compounds so no qualification was necessary.

PCB: Recoveries for sample 230 B6 0-0.5 were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly and all non-detected compounds were qualified "UJ" to indicate the results are estimated due to this anomaly.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Metals: Antimony and sodium results were qualified as estimated "UJ/J" due to low matrix spike recoveries. Aluminum results were qualified as estimated "J" due to exceedance in matrix spike recoveries.

R2-0004067

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

SD is acceptable.

6.1 Internal Standards (IS)

IS area counts are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs are acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A blind field duplicate was presented in the SDG. RPDs are calculated when both original and Duplicate report detects. The following RPDs were calculated;
VOA: Acetone-67% and benzene-75%.

SVOA: Benzo (a) anthracene-38%, benzo (a) pyrene- 32%, benzo (b) fluoranthene-14%, benzo (k) fluoranthene-30%, chrysene-13%, fluoranthene-54%, phenanthrene-6%, pyrene-48% and 1,2,3-trichlorobenzene-25%.

Pesticide: 4,4'-DDD-1.2%, 4,4'-DDE-18% and 4,4'-DDT-30%

PCB: No RPDs were calculated.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures and some due to calibration range exceedance (see Table 1.0). The data as presented are usable.

Introduction

No. of Samples/Matrix:	4 Soil samples
Sample Delivery Groups (SDG):	E97359
Sampling Date:	August 22, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Some methylene chloride results were qualified as non-detects at CRDL since their method blank reported methylene chloride contamination.

SVOA: Results are acceptable.

Pesticide: Results are acceptable.

PCB: Surrogate recoveries for sample 230 B6 0-0.5 were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly and all non-detected compounds were qualified "UJ" to indicate the results are estimated due to this anomaly.

Metals: Antimony and sodium results were qualified as estimated "UJ/J" due to low matrix spike recoveries. Aluminum results were qualified as estimated "J" due to exceedance in matrix spike recoveries. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

R2-0004078

Introduction

No. of Samples/Matrix:	16 Sediment samples and 3 water samples
Sample Delivery Groups (SDG):	E97444
Sampling Date:	August 22, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB, Metals and TOC
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082, 6010B/ 7470A/7471/9012 and 160.1

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: The method blanks reported methylene chloride contamination. This resulted in some detected methylene chloride results being qualified as non-detects at CRDL.

SVOA: All compounds in some samples were qualified as estimated "J" since the reported solids were below the 50% minimum requirement.

Pesticide: All compounds in some samples were qualified as estimated "J" since their reported solids were below the 50% minimum requirement.

PCB: Recoveries for surrogate exceeded the QC limits in sample SC-2; this resulted in aroclor1260 being qualified as estimated "J." All compounds in some samples were qualified as estimated "J" since their reported solids were below the 50% minimum requirement.

Metals: Aluminum, barium, calcium, magnesium and zinc results were qualified as estimated "J" due to matrix spike recoveries that were outside QC limits. Antimony results were qualified as estimated "UJ/J" due to low matrix spike recovery. All compounds in some samples were qualified as estimated "J" since their reported solids were below the 50% minimum requirement.

Cyanide: All compounds in some samples were qualified as estimated "J" since their reported solids were below the 50% minimum requirement.

TOC: All compounds in some samples were qualified as estimated "J" since their reported

R2-0004079

solids were below the 50% minimum requirement.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

R2-0004088

Introduction

No. of Samples/Matrix:	6 Soil samples and 1 water sample
Sample Delivery Groups (SDG):	E97445
Sampling Date:	August 23, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Benzene and toluene exceeded the calibration range for sample WWT-2-12-14. Upon reanalysis at 250X dilution the holding time was exceeded. Thus, sample WWT-2-12-14 is being reported as a hybrid of the original and diluted analyses. Benzene and toluene results are qualified as estimated "J" due to this holding time anomaly.

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples WWT-2-0-0.5 and WWT-2-12-14. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

Pesticide: Several samples reported surrogate recoveries above QC limits. All affected detected sample results were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: Several samples reported surrogate recoveries above QC limits. All affected detected sample results were qualified "J" to indicate the results are estimated due to this anomaly.

Metals: Antimony and barium results were qualified as estimated "UJ/J" due to low matrix spike recoveries. All zinc results were qualified as estimated "J" due to matrix spike recovery exceedance. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

Benzene and toluene exceeded the calibration range for sample WWT-2-12-14. Upon reanalysis at 250X dilution, the holding time was exceeded. Thus, sample WWT-2-12-14 is being reported as a hybrid of the original and diluted analyses. Benzene and toluene results are qualified as estimated "J" due to this holding time anomaly.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

The percent difference exceeded the 20% QC criteria for 4,4'-DDT and methoxychlor. All samples were affected thus, all results for these compounds in all samples were qualified as estimated "UJ/J."

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

A trip blank was not analyzed with this SDG.

4.2 Field Blank (FB)

There was no field blank associated with this SDG.

4.3 Method Blank (MB)

Method blanks reported methylene chloride contamination at 2.76ug/L. Affected detected sample results were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Pesticide: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

R2-0004091

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Metals: Antimony and barium results were qualified as estimated "UJ/J" due to low matrix spike recoveries. All zinc results were qualified as estimated "J" due to matrix spike recovery exceedance.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

Results are acceptable.

6.1 Internal Standards (IS)

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples WWT-2-0-0.5 and WWT-2-12-14. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs are acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

No field duplicates were included with this SDG.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures, and some were diluted due to calibration range exceedance (see Table 1.0). The data as presented are usable.

Introduction

No. of Samples/Matrix:	6 Soil samples and 1 water sample
Sample Delivery Groups (SDG):	E95445
Sampling Date:	August 23, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Benzene and toluene exceeded the calibration range for sample WWT-2-12-14. Upon reanalysis at 250X dilution the holding time was exceeded. Thus, sample WWT-2-12-14 is being reported as a hybrid of the original and diluted analyses. Benzene and toluene results are qualified as estimated "J" due to this holding time anomaly.

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples WWT-2-0-0.5 and WWT-2-12-14. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

Pesticide: Several samples reported surrogate recoveries above QC limits. All affected detected sample results were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: Several samples reported surrogate recoveries above QC limits. All affected detected sample results were qualified "J" to indicate the results are estimated due to this anomaly.

Metals: Antimony and barium results were qualified as estimated "UJ/J" due to low matrix spike recoveries. All zinc results were qualified as estimated "J" due to matrix spike recovery exceedance. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

Introduction

No. of Samples/Matrix:	12 Soil samples
Sample Delivery Groups (SDG):	E97631
Sampling Date:	August 27, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Some methylene chloride results were qualified as non-detects at CRDL since their method blank reported methylene chloride contamination.

SVOA: Results are acceptable.

Pesticide: 4,4-DDT in samples LP-5-0-0.5 and LP-11-0-0.5 was qualified "J" to indicate the results are estimated due to elevated surrogate recoveries.

PCB: Aroclor-1254 in sample LP-10-0-0.5 was qualified "J" to indicate the result is estimated due to elevated surrogate recoveries.

Metals: Antimony results were qualified as estimated "UJ" due to low matrix spike recoveries. Zinc results were rejected "R" due to matrix interference. Some potassium results were qualified as estimated "J" due to serial dilution results being out of control. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

R2-0004118

Introduction

No. of Samples/Matrix:	14 Soil samples and 1 water sample
Sample Delivery Groups (SDG):	E97685
Sampling Date:	August 27 & 28, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Method blanks reported methylene chloride contamination. Affected detected sample results were qualified as non-detects at CRDL. VOA TIC for naphthalene was rejected "R" in sample LP-2-0.5-2 since it is a SVOA target compound and thus cannot be reported as a VOA TIC.

SVOA: SVOA: IS Perylene-d12 area counts were below the required QC limits for samples LP-6-4-6, LP-2-0-0.5 and CF-7-4-6. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

Pesticide: The percent difference exceeded the 20% QC criteria for 4,4'-DDT, endosulfan II and methoxychlor. All results for these compounds in affected samples were qualified as estimated "UJ/J." Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

Metals: Antimony, aluminum, barium and iron results were qualified as estimated "UJ/J" due to low matrix spike recoveries. All detected potassium results were qualified as estimated "J" due to serial dilution exceedance. All cyanide results are acceptable.

R2-0004119

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

Pesticide: The percent difference exceeded the 20% QC criteria for 4,4'-DDT, endosulfan II and methoxychlor. All results for these compounds in affected samples were qualified as estimated "UJ/J."

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

There was no trip blank present in this SDG.

4.2 Field Blank (FB)

Field blank reported no contamination

4.3 Method Blank (MB)

Method blanks reported methylene chloride contamination. Affected detected sample results were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Pesticide: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Metals: Antimony, aluminum, barium and iron results were qualified as estimated "UJ/J" due to matrix spike recoveries that were outside QC limits.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

Detected potassium results were qualified as estimated "J" due to serial dilution exceedance.

6.1 Internal Standards (IS)

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples LP-6-4-6, LP-2-0-0.5 and CF-7-4-6. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

VOA TICs for naphthalene was rejected "R" in sample LP-2-0.5-2 since it is a SVOA target compound and thus cannot be reported as a VOA TIC.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A blind field duplicate was included with this SDG. All RPDs are acceptable.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures, and some were diluted due to calibration range exceedance (see Table 1.0). The data as presented are usable with the exception of the one naphthalene TIC result qualified with the "R" qualifier.

R2-0004127

Introduction

No. of Samples/Matrix:	9 Soil samples and 5 water samples
Sample Delivery Groups (SDG):	E97259X, E97444X, E97631X, E97685X & E99129X
Sampling Date:	September 20, 21, 27, 28 & September 20, 2001
Analyses:	Dioxin
Analytical Method:	EPA Method 1613A

Summary of Data Validation:

The adherence of laboratory analytical performance to the above method was evaluated during the data validation process. The USEPA Region II Data Validation SOP No. 25 for EPA Method 1613 was used as the guideline for data qualifications.

E97444X: The ongoing precision standard (OPR) recovery was outside QC limits for some compounds. Results for those compounds were qualified as estimated "J" due to this anomaly.

E97631X: 2,3,7,8-TCDF and OCDD in samples LP-16-0-0.5 and LP-10-0-0.5 were rejected since the compound exceeded the calibration range.

SDG E97685X: Sample temperature were 12.1°C which, is above the required 4 °C. Based on technical information and professional judgement all sample results were qualified as estimated "J" since the integrity of the samples may have been compromised.

SDG E97631: Sample temperature were 24.2°C which, is above the required 4 °C. Based on technical information and professional judgement all sample results were qualified as estimated "J" since the integrity of the samples may have been compromised

A data validation summary table of all qualified compounds is presented in Section 10.0 and a detailed description in the report.

R2-0004134

Introduction

No. of Samples/Matrix:	4 Soil samples and 1 water sample
Sample Delivery Groups (SDG):	E99805
Sampling Date:	October 1, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Method blanks reported methylene chloride contamination. Affected detected sample results were qualified as non-detects at CRDL. Field blank reported acetone contamination. All affected detected acetone results were qualified as non-detects at CRDL. Reported 1, 3-dichlorobenzene, 1, 4-dichlorobenzene, 1, 2-dichlorobenzene, 1, 2, 4-trichlorobenzene and naphthalene in sample 5K-B4-4-6 and naphthalene in sample 5K-B1-0-0.5 were rejected "R" since they are SVOA target compounds and therefore cannot be reported as VOA TICs.

SVOA: IS Perylene-d12 area counts were below the required QC limits for 5K-B4-0-0.5 Corresponding target compounds for this internal standard in this sample was qualified "UJ" to indicate the results are estimated due to this anomaly.

Pesticide: All results are acceptable.

PCB: Recoveries for several samples exceeded the required QC limits and thus all detected results in affected samples were qualified as estimated "J."

Metals and Cyanide: All results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

R2-0004141

Introduction

No. of Samples/Matrix:	6 Soil samples and 1 water sample
Sample Delivery Groups (SDG):	E99913
Sampling Date:	October 2, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Method blanks reported methylene chloride contamination. Affected detected sample results were qualified as non-detects at CRDL. Field blank reported acetone contamination. All affected detected acetone results were qualified as non-detects at CRDL.

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples BT-B5-0-.5. Corresponding target compounds for this internal standard in this sample was qualified "UJ/J" to indicate the results are estimated due to this anomaly.

Pesticide: Recoveries for several samples exceeded the required QC limits and thus all detected results in affected samples were qualified as estimated "J."

PCB: Recoveries for several samples exceeded the required QC limits and thus all detected results in affected samples were qualified as estimated "J."

Metals: Antimony results were qualified as estimated "UJ" due to low matrix spike recoveries. Aluminum, copper, lead and potassium results were qualified as estimated "J" due to matrix spike recovery exceedance. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

The CCAL is acceptable.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

Trip blank reported no contamination.

4.2 Field Blank (FB)

VOA: Field blank reported acetone contamination. All affected detected acetone results were qualified as non-detects at CRDL.

4.3 Method Blank (MB)

VOA: Method blanks reported methylene chloride contamination. Affected detected sample results were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Pesticide: Recoveries for several samples exceeded the required QC limits and thus all detected results in affected samples were qualified as estimated "J."

PCB: Recoveries for several samples exceeded the required QC limits and thus all detected results in affected samples were qualified as estimated "J."

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Metals: Antimony results were qualified as estimated "UJ" due to low matrix spike recoveries. Aluminum, copper, lead and potassium results were qualified as estimated "J" due to matrix spike recovery exceedance.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

All is acceptable.

6.1 Internal Standards (IS)

IS Perylene-d12 area counts were below the required QC limits for several samples. However, corresponding target compounds for this internal standard in sample BT-B5-0-.5 only was qualified "UJ/J" to indicate the results are estimated due to this anomaly.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

VOA: Reported 1,2-dichlorobenzene was rejected "R" in sample 230-B1-4-6 since it is a SVOA target compound and therefore cannot be reported as a VOA TIC.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A field duplicate was reported. All RPDs are acceptable.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures, and some were diluted due to calibration range exceedance (see Table 1.0). The data as presented are usable with the exception of the TIC with the "R" qualifier.

12.0 Data Qualification Summary Table

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A field duplicate was reported with this SDG. All RPDs are acceptable.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures, and some were diluted due to calibration range exceedance (see Table 1.0). The data as presented are usable with the exception of the results with the "R" qualifiers.

12.0 Data Qualification Summary Table

LCP Superfund Site

VOA

Sample Identification	Compound	Qualifier	Section Reference
RR-9-0-.5	Methylene chloride	16.5U	4.3
RR-11-0-.5	Methylene chloride	6.3U	4.3
RR-12-0-.5	Methylene chloride	7.2U	4.3

Pesticide

Sample Identification	Compound	Qualifier	Section Reference
RR-10-0-.5	4,4-DDE, 4,4'-DDT	J	5.1
	All other compounds	UJ	5.1
RR-11-0-.5	4,4-DDE, 4,4'-DDT, methoxychlor	J	5.1

Metals

Sample Identification	Compound	Qualifier	Section Reference
RR-9-0-.5, R-11-0-.5, RR-12-0-.5, DUP-01-121001	Antimony	UJ	5.1
	Aluminum, manganese	J	5.1
	Calcium, magnesium	R	5.1
RR-10-0-.5	Antimony, aluminum, manganese	J	5.1

R2-0004170

Introduction

No. of Samples/Matrix:	1 Soil sample and 1 water sample
Sample Delivery Groups (SDG):	N3142
Sampling Date:	November 19, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Field blank reported acetone contamination. The affected sample result was qualified as a non-detect at CRDL.

SVOA: All results are acceptable.

Pesticide: All results are acceptable

PCB: All results are acceptable.

Metals: Field blank reported calcium, manganese, mercury and zinc contamination which resulted in these sample results being rejected in the affected sample. Aluminum and potassium results were rejected "R" due to MS recoveries that exceeded the 200% QC criteria. Antimony results were qualified as estimated "J" due to MS recovery exceedance.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

The CCAL is acceptable.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

There was no trip blank present in this SDG.

4.2 Field Blank (FB)

VOA: Field blank reported acetone contamination. The affected sample result was qualified as a non-detect at CRDL.

SVOA: Field blank reported bis (2-ethyl hexyl phthalate) contamination. There was no affected sample result thus, no qualification was necessary.

Metals: Field blank reported calcium, manganese, mercury and zinc contamination which resulted in these sample results being rejected in the affected sample.

4.3 Method Blank (MB)

Method blanks reported no contamination.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Surrogate recoveries are acceptable.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Metals: Aluminum and potassium results were rejected "R" due to MS recoveries that exceeded the 200% QC criteria. Antimony results were qualified as estimated "J" due to MS recovery exceedance.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

All is acceptable.

6.1 Internal Standards (IS)

All IS area counts are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs identification is acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A field duplicate was not included with this SDG.

11.0 Overall Assessment of Data

The data as presented are usable with the exception of the results flagged with the "R" qualifier.

R2-0004197

Introduction

No. of Samples/Matrix:	10 water samples
Sample Delivery Groups (SDG):	N5011
Sampling Date:	December 18-19, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Field blank reported acetone and carbon disulfide contamination. All affected detected sample results for these compounds were qualified as non-detects at CRDL. TIC results for naphthalene, 1,2-dichlorobenzene, 1,3-dichlorobenzene in sample MW-12; naphthalene in samples MW-19 and MW-18 were rejected "R" since they are semi-volatile target compounds and therefore cannot be reported as TICs.

SVOA: All sample results are acceptable.

Pesticide: Endrin ketone percent relative standard deviation exceeded the required 20% QC limits. All endrin ketone results were qualified "UJ" to indicate the results are estimated. Heptachlor percent difference exceed the 15% QC limits which resulted in heptachlor results in samples MW-15 (N5011-1), MW-15 (N5011-2) and MW-14 being qualified "UJ" to indicate the results are estimated due to this anomaly. Surrogate recoveries for samples MW-12 and MW-19 were below the required QC limits. All non-detected sample results for these samples were qualified "UJ" to indicate the results are estimated due to this anomaly.

PCB: Surrogate recovery for sample MW-18 was below the required QC limits. All compounds for this sample were qualified as "UJ" to indicate the results are estimated due to this anomaly.

Metals & Cyanide: Field blank reported zinc contamination. This resulted in zinc result in samples MW-12 and MW-19 being rejected. The MS %R for cyanide was below the required QC limits and this resulted in cyanide results in all samples except MW-18 being

R2-0004198

qualified "UJ" to indicate the results are estimated

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

PEST: Endrin ketone percent relative standard deviation exceeded the required 20% QC limits. All endrin ketone results were qualified "UJ" to indicate the results are estimated.

2.2 Continuing Calibration (CCAL)

PEST: Heptachlor percent difference exceed the 15% QC limits which resulted in heptachlor results in samples MW-15 (N5011-1), MW-15 (N5011-2) and MW-14 being qualified "UJ" to indicate the results are estimated due to this anomaly.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

The trip blank reported no contamination.

4.2 Field Blank (FB)

VOA: Field blank reported acetone and carbon disulfide contamination at 228ug/L and 9.3ug/L respectively. All affected detected sample results for these compounds were qualified as non-detects.

Metals: Field blank reported zinc contamination. This resulted in zinc result in samples MW-12 and MW-19 being rejected.

4.3 Method Blank (MB)

Method blanks reported no contamination.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

PEST: Surrogate recoveries for samples MW-12 and MW-19 were below the required QC limits. All non-detected sample results for these samples were qualified "UJ" to indicate the results are estimated due to this anomaly.

PCB: Surrogate recovery for sample MW-18 was below the required QC limits. All compounds for this sample were qualified as "UJ" to indicate the results are estimated due to this anomaly.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Cyanide: The MS %R was below the required QC limits and this resulted in cyanide results in all samples except MW-18 being qualified "UJ" to indicate the results are estimated.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

All is acceptable.

6.1 Internal Standards (IS)

All IS area counts are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

VOA: TIC results for naphthalene, 1,2-dichlorobenzene, 1,3-dichlorobenzene in sample MW-12; naphthalene in samples MW-19 and MW-18 were rejected "R" since they are semi-volatile target compounds and therefore cannot be reported as TICs.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A field duplicate was not included with this SDG.

11.0 Overall Assessment of Data

The data as presented are usable with the exception of the zinc results qualified with the "R" flag, which are not usable.

12.0 Data Qualification Summary Table

Introduction

No. of Samples/Matrix:	2 water samples
Sample Delivery Groups (SDG):	N5077
Sampling Date:	December 19, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: The trip blank reported carbon disulfide contamination at 5.3ug/L. Detected carbon disulfide result in sample MW-16 was qualified as non-detected at CRDL due to this anomaly.

SVOA: All sample results are acceptable.

Pesticide: Surrogate recovery for sample MW-16 was below the required QC limits. All compounds for this sample were qualified as "UJ" to indicate the results are estimated due to this anomaly.

PCB: Surrogate recovery for sample MW-16 was below the required QC limits. All compounds for this sample were qualified as "UJ" to indicate the results are estimated due to this anomaly.

Metals & Cyanide: All results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

R2-0004213

Introduction

No. of Samples/Matrix:	8 soil samples
Sample Delivery Groups (SDG):	N11935
Sampling Date:	April 8, 2002
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

For VOA analyses, the field blank reported acetone and methylene chloride contamination. All affected detected sample results for these compounds were qualified as non-detects at CRDL. TIC results rejected "R" for; naphthalene and 1,2, 4-trichlorobenzene in sample IB-1-0-2; IB-2-4-6, naphthalene in samples IB-1-4-6 and IB-2-12-14, acenapthene and naphthalene in sample DUP-01-0804012 and IB-3-8-10, naphthalene, 1,2-dichlorobenzene, 1,3-dichlorobenzene and 1,2,4-trichlorobenzene in samples IB-3-4-6. These compounds are semi-volatile target compounds and therefore cannot be reported as TICs.

SVOA: All sample results are acceptable.

Pesticide: Gamma-BHC, delta-BHC, endosulfan sulfate and endrin ketone percent difference exceeded the 15% QC limits. This resulted in gamma-BHC, delta-BHC, endosulfan sulfate and endrin ketone results in samples IB-2-4-6 and DUP-08-04012 being qualified "UJ" to indicate the results are estimated due to this anomaly. Endrin aldehye percent difference exceeded the 15% QC limits. This resulted in endrin aldehyde result in samples IB-1-4-6 and IB-1-0-2 being qualified "UJ" to indicate the results are estimated due to this anomaly. Surrogate recovery for sample IB-3-8-10 was above the required QC limits. All detected sample results were qualified "J" to indicate the results are estimated due to this anomaly. The MS reported 0%R for dieldrin and 4,4'-DDT. This resulted in dieldrin and 4,4'-DDT in sample IB-3-4-6 (the original field sample) being qualified as estimated. "UJ/J."

PCB: All sample results are acceptable.

R2-0004214

Metals & Cyanide: MS %R for antimony, mercury and zinc were below the required QC limits and above QC limits for magnesium. This resulted in all associated antimony, mercury and zinc sample results being qualified as estimated "UJ/J" and all detected magnesium results being qualified as estimated "J." Nickel and vanadium results were qualified as estimated "J" due to serial dilution results that were above QC limits.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

All is acceptable.

2.2 Continuing Calibration (CCAL)

Pesticide: Gamma-BHC, delta-BHC, endosulfan sulfate and endrin ketone percent difference exceeded the 15% QC limits. This resulted in gamma-BHC, delta-BHC, endosulfan sulfate and endrin ketone results in samples IB-2-4-6 and DUP-08-04012 being qualified "UJ" to indicate the results are estimated due to this anomaly. Endrin aldehye percent difference exceeded the 15% QC limits. This resulted in endrin aldehyde results in samples IB-1-4-6 and IB-1-0-2 being qualified "UJ" to indicate the results are estimated due to this anomaly.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

A trip blank was not reported with this SDG.

4.2 Field Blank (FB)

Field blank reported no contamination.

4.3 Method Blank (MB)

VOA: Field blank reported acetone and methylene chloride contamination at 6.3ug/L and 3.0ug/L respectively. All affected detected sample results for these compounds were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Pesticide: Surrogate recovery for sample IB-3-8-10 was above the required QC limits. All detected sample results were qualified "J" to indicate the results are estimated due to this anomaly.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Pesticide: The MS reported 0%R for dieldrin and 4,4'-DDT; this resulted in dieldrin and 4, 4'-DDT in sample IB-3-4-6 (the original field sample) being qualified as estimated. "UJ/J."

Metals: MS %R for antimony, mercury and zinc were below the required QC limits and above QC limits for magnesium. This resulted in all associated antimony, mercury and zinc sample results being qualified as estimated "UJ/J" and all detected magnesium results being qualified as estimated "J."

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

Nickel and vanadium results were qualified as estimated "J" due to serial dilution results that were above QC limits.

6.1 Internal Standards (IS)

All IS area counts are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

VOA: TIC results rejected "R" for; naphthalene and 1,2, 4-trichlorobenzene in sample IB-1-0-2; IB-2-4-6, naphthalene in samples IB-1-4-6 and IB-2-12-14, acenapthene and naphthalene in sample DUP-01-0804012 and IB-3-8-10, naphthalene, 1,2-dichlorobenzene, 1,3-dichlorobenzene and 1,2,4-trichlorobenzene in samples IB-3-4-6. These compounds are semi-volatile target compounds and therefore cannot be reported as TICs.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A field duplicate was not included with this SDG.

11.0 Overall Assessment of Data

The data as presented are usable with the exception of the results qualified with the "R" flag. They are not usable.

1.0 Technical Holding Time
All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)
The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)
The CCAL is acceptable.

3.0 CRDL Standard
All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)
A trip blank was not included with this SDG.

4.2 Field Blank (FB)
VOA: Field blank reported acetone and carbon disulfide contamination. There were no affected sample results so no validation action was necessary.

4.3 Method Blank (MB)
Method blanks reported no contamination.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery
All recoveries are acceptable.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)
All recoveries are acceptable.

5.3 Laboratory Control Samples (LCS)/Blank Spikes
All is acceptable.

6.0 Serial Dilution (SD)
All is acceptable.

6.1 Internal Standards (IS)
All IS area counts are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

The laboratory correctly reported all TICs.

9.0 Compound Quantitation

All is acceptable.

10.0 Field Duplicates (FD)

A field duplicate was included with this SDG. Its original field sample is not included in this SDG thus, no assessment of the duplicate pair was done.

11.0 Overall Assessment of Data

The data as presented are usable.

12.0 Data Qualification Summary Table

Introduction

No. of Samples/Matrix:	4 soil samples
Sample Delivery Groups (SDG):	N12606
Sampling Date:	April 17-18, 2002
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Field blank reported acetone and methylene chloride contamination. The affected sample results were qualified as non-detects at CRDL.

SVOA: All results are acceptable.

Pesticide: All results are acceptable.

PCB: All results are acceptable.

Metals & Cyanide: All results are acceptable

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

Introduction

No. of Samples/Matrix:	4 soil samples
Sample Delivery Groups (SDG):	N12718
Sampling Date:	April 18 and 19, 2002
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Field blank reported acetone contamination. All affected detected sample results for these compounds were qualified. TIC results for naphthalene in sample HB-1A, naphthalene and 1, 2, 4-trichlorobenzene in sample HB-7A and naphthalene in sample HB-4A were rejected "R" since they are semi-volatile target compounds and therefore cannot be reported as TICs.

SVOA: All results are acceptable.

Pesticide: All results are acceptable.

PCB: All results are acceptable.

Metals & Cyanide: Serial dilution results for copper and potassium exceeded the QC limits and this resulted in detected copper and potassium results being qualified as estimated "J."

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

Sampling Date:	April 24, 2002
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Field blank reported acetone and methylene chloride contamination. All affected detected sample results for these compounds were qualified as non-detects. TIC results for naphthalene and 1, 3-dichlorobenzene in sample HB-9A were rejected "R" since they are semi-volatile target compounds and therefore cannot be reported as volatile TICs.

SVOA: All sample results are acceptable.

Pesticide: All sample results are acceptable.

PCB: All sample results are acceptable.

Metals & Cyanide: All sample results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

R2-0004270

Introduction

No. of Samples/Matrix:	10 Soil samples
Sample Delivery Groups (SDG):	E95157
Sampling Date:	July 17, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: The Field blank reported methylene chloride contamination. This resulted in all detected methylene chloride results being qualified as non-detects at CRDL. The recovery for one surrogate exceeded acceptable QC limits for sample TLN-3-2-4. Acetone, chloroform and benzene are the affected compounds and were qualified with the "J" validation flag to indicate the results are estimated due to this anomaly. A trip blank was reported in the sample summary but neither raw data nor Form 1 was presented with this SDG.

Pesticide: All results are acceptable

PCB: All results are acceptable.

Metals: Vanadium and zinc results were qualified as estimated "J" due to serial dilution recoveries that were outside QC limits. Antimony and lead results were qualified estimated "UJ/J" due to low matrix spike recovery.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

The CCAL is acceptable.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

A trip blank was not included with this SDG.

4.2 Field Blank (FB)

The field blank reported methylene chloride contamination at 3.0ug/L. This resulted in all detected methylene chloride results being qualified as non-detects at CRDL.

4.3 Method Blank (MB)

VOA: Method blanks reported methylene chloride contamination. Affected samples were already qualified due to field blank contamination.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

VOA: Recovery for one surrogate exceeded acceptable QC limits for sample TLN-3-2-4. Acetone, chloroform and benzene are the affected compounds and were qualified with the "J" validation flag to indicate the results are estimated due to this anomaly.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Metals: Antimony and lead results were qualified as estimate "UJ/J" due to low matrix spike recovery.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

SVOA: Recoveries for 4-nitrophenol and bis(2-chloroethyl)ether exceeded the required QC limits. There were no detected results so no qualification was necessary.

6.0 Serial Dilution (SD)

Vanadium and zinc results were qualified as estimated "J" due to SD recoveries that were outside QC limits.

6.1 Internal Standards (IS)

All IS area counts are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs are acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

There were no field duplicates presented.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures (see Table 1.0). The data as presented are usable.

R2-0004277

Introduction

No. of Samples/Matrix:	14 Soil samples and 1 water sample
Sample Delivery Groups (SDG):	E95239
Sampling Date:	July 18, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: The Field blank and method blanks reported methylene chloride contamination. This resulted in all detected methylene chloride results being qualified as non-detects at CRDL. The field blank also reported acetone contamination which resulted in some detected acetone results being qualified as non-detects at CRDL.

SVOA: Internal standard area count for perylene-d12 was below the required QC limits for samples ADS-3-0-0.5 and ADS-4-0-0.5. The corresponding target compounds for this internal standard were all qualified "UJ/J" to indicate that the results are estimated due to this anomaly.

Pesticide: Several samples reported surrogate recoveries above QC limits. All affected detected sample results were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: All results are acceptable.

Metals: Lead and iron results were qualified as estimated "J" due to serial dilution recoveries that were outside QC limits. Antimony and beryllium results were qualified as estimated "UJ/J" due to low matrix spike recovery and all sodium results were rejected "R" due to matrix interference. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

The CCAL is acceptable.

3.0 CRDL Standard
All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)
A trip blank was not analyzed with this SDG.

4.2 Field Blank (FB)
VOA: The field blank reported methylene chloride contamination at 1.6ug/L and acetone at 7.0ug/L. Affected methylene chloride sample results were already qualified due to method blank contamination. Affected acetone sample results were qualified as non-detects at CRDL.

4.3 Method Blank (MB)
VOA: Method blanks reported methylene chloride contamination. Affected samples were already qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery
Pesticide: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)
Metals: Antimony and beryllium results were qualified as estimated "UJ/J" due to low matrix spike recovery and all sodium results were rejected "R" due to matrix interference.

5.3 Laboratory Control Samples (LCS)/Blank Spikes
All is acceptable.

R2-0004280

6.0 Serial Dilution (SD)

Iron and lead results were qualified as estimated "J" due to SD recoveries that were outside QC limits.

6.1 Internal Standards (IS)

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples ADS-3-0-0.5 and ADS-4-0.5. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs are acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

RPDs are acceptable.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures (see Table 1.0). The data as presented are usable with the exception of sodium metal results which are not usable.

Sampling Date:	July 18 and 19, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: The method blank reported methylene chloride contamination. This resulted in all detected methylene chloride results being qualified as non-detects at CRDL.

SVOA: Low internal standard recovery was exhibited by samples WWT-1-0-0.5 and ADS-5-0-0.5. All affected compounds in these samples were qualified "UJ" to indicate the results are estimated due to this anomaly.

Pesticide: Surrogate recoveries for sample SPR-2B-10-12 was below required the required QC limits. This resulted in all sample results for this sample being qualified "UJ" to indicate the results are estimated due to this anomaly.

PCB: Surrogate recoveries were above the QC limits for samples; ADS-6-0-.5-2, ADS-6-0-0.5 and ADS-5-0-0.5. Samples ADS-6-0-.5-2 and ADS-6-0-0.5 were qualified estimated "J" for aroclor 1260. Sample ADS-5-0-0.5 was qualified estimated "J" for aroclor 1254 due to this anomaly.

Metals: All antimony results were qualified as estimated "UJ" due to deficiency in matrix spike recovery. Aluminum, copper iron and potassium detected results were qualified as estimated "J" due to exceedance in matrix spike recovery. Arsenic and beryllium results were qualified as estimated "UJ/J" due to serial dilution recoveries that were outside QC limits.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

Technical Holding Time
All is acceptable.

Calibration

1.1 Initial Calibration (ICAL)
The ICAL is acceptable.

1.2 Continuing Calibration (CCAL)
The CCAL is acceptable.

CRDL Standard
All is acceptable.

Blanks Quality Control

1.3 Trip Blank (TB)
A trip blank was not included with this SDG.

1.4 Field Blank (FB)
The field blank reported no contamination.

1.5 Method Blank (MB)
VOA: One method blank reported methylene chloride contamination. Affected samples were qualified as non-detects at CRDL.

Accuracy and Precision Data

1.6 Surrogate Recovery
Pest: Recovery was below the QC limits for sample SPR-2B-10-12. All compounds in this sample were qualified "UJ" to indicate the results are estimated.

PCB: Recoveries were above the QC limits for samples; ADS-6-0-.5-2, ADS-6-0-0.5 and ADS-5-0-0.5. Samples ADS-6-0-.5-2 and ADS-6-0-0.5 were qualified estimated "J" for aroclor 1260. Sample ADS-5-0-0.5 was qualified estimated "J" for aroclor 1254 due to this anomaly.

1.7 Matrix Spike/Matrix Spike Duplicates (MS/MSD)
Metals: Antimony results were qualified estimated "UJ/J" due to low recovery. Aluminum, Iron, copper and potassium detected results were all qualified as estimated "J" due to high recoveries.

1.8 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

Serial Dilution (SD)

Beryllium and arsenic were qualified as estimated "UJ/J" due to SD recoveries that were outside QC limits.

1.9 Internal Standards (IS)

SVOA: Two IS area counts were below the required QC limits. Samples WWT-1-0-0.5 and ADS-5-0-0.5 are the affected samples. All associated affected compounds in these two samples were qualified "UJ" to indicate the results are estimated due to this anomaly.

Target Compound Identification

All target compound identification is acceptable.

Tentative Identification Compounds (TICs)

TICs are acceptable.

Compound Quantitation

All compound quantitation is acceptable.

Field Duplicates (FD)

There were no field duplicates presented.

Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures (see Table 1.0). The data as presented are usable.

Introduction

No. of Samples/Matrix:	10 Soil samples
Sample Delivery Groups (SDG):	E97258
Sampling Date:	August 21, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Results are acceptable.

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples TLS-6-0-.5, LP-4 .5-2 and TLS-9 0-.5. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

Pesticide: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

Metals: Antimony and nickel results were qualified as estimated "UJ/J" due to low matrix spike recoveries. Calcium and zinc results were qualified as estimated "J" due to SD recoveries that were outside QC limits. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

R2-0004309

Introduction

No. of Samples/Matrix:	11 Soil samples
Sample Delivery Groups (SDG):	E97259
Sampling Date:	August 21, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Method blank reported methylene chloride contamination at 5.9ug/L. All detected methylene chloride results were qualified as non-detects at CRDL.

SVOA: IS Perylene-d12 area counts were below the required QC limits for several samples. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

Pesticide: Results are acceptable.

PCB: Results are acceptable.

Metals: Antimony results were qualified as estimated "UJ/J" due to low matrix spike recoveries. All aluminum, copper, iron and some sodium results were qualified as estimated "J" due to high spike recoveries. All magnesium results were rejected "R" due to elevated spike recoveries. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time
All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)
The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)
CCAL is acceptable.

3.0 CRDL Standard
All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)
A trip blank was not analyzed with this SDG.

4.2 Field Blank (FB)
There was no field blank associated with this SDG.

4.3 Method Blank (MB)
VOA: Method blank reported methylene chloride contamination at 5.9ug/L. All detected methylene chloride results were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery
Recoveries are acceptable.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)
Metals: Antimony results were qualified as estimated "UJ/J" due to low matrix spike recoveries. All aluminum, copper, iron and some sodium results were qualified as estimated "J" due to high spike recoveries. All magnesium results were rejected "R" due to elevated spike recoveries.

5.3 Laboratory Control Samples (LCS)/Blank Spikes
All is acceptable.

6.0 Serial Dilution (SD)
All is acceptable.

R2-0004312

6.1 Internal Standards (IS)

SVOA: IS Perylene-d12 area counts were below the required QC limits for several samples. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs are acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

There was a blind field duplicates associated with this SDG. All RPDs are acceptable.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures and some samples were diluted due to calibration range exceedance (see Table 1.0). The data as presented are usable except those results flagged with the "R" qualifier.

Introduction

No. of Samples/Matrix:	7 water samples
Sample Delivery Groups (SDG):	E97283
Sampling Date:	August 20, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Results are acceptable.

SVOA: Results are acceptable.

Pesticide: CCAL results for methoxychlor and 4,4'-DDT exceeded the required 15% QC limits. All sample results (except EQBL) for these compounds were qualified as estimated "UJ" due to this anomaly.

PCB: Results are acceptable.

Metals: Serial dilution result for sodium exceeded the required QC limits; all sodium results were qualified as estimated "J" due to this anomaly. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

CCAL results for methoxychlor and 4,4'-DDT exceeded the required 15% QC limits. All sample results (except EQBL) for these compounds were qualified as estimated "UJ" due to this anomaly.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

A trip blank was not analyzed with this SDG.

4.2 Field Blank (FB)

The field blank reported methylene chloride contamination but there were no detected methylene chloride results thus, no validation action was necessary.

4.3 Method Blank (MB)

Method blank reported no contamination.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Recoveries are acceptable.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Recoveries are acceptable.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

Metals: Serial dilution result for sodium exceeded the required QC limits; all sodium results were qualified as estimated "J" due to this anomaly.

6.1 Internal Standards (IS)

All IS results are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs are acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

There were no field duplicates associated with this SDG.

11.0 Overall Assessment of Data

The data as presented are usable.

R2-0004324

Introduction

No. of Samples/Matrix:	12 Soil samples and 2 water samples
Sample Delivery Groups (SDG):	E97358
Sampling Date:	August 21 & 22, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Some methylene chloride results were qualified as non-detects at CRDL since their method blank reported methylene chloride contamination.

SVOA: Results are acceptable.

Pesticide: Results are acceptable.

PCB: Surrogate recoveries for sample 230 B6 0-0.5 were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly and all non-detected compounds were qualified "UJ" to indicate the results are estimated due to this anomaly.

Metals: Antimony and sodium results were qualified as estimated "UJ/J" due to low matrix spike recoveries. Aluminum results were qualified as estimated "J" due to exceedance in matrix spike recoveries. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

Introduction

No. of Samples/Matrix:	16 Sediment samples and 3 water samples
Sample Delivery Groups (SDG):	E97444
Sampling Date:	August 22, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB, Metals and TOC
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082, 6010B/ 7470A/7471/9012 and 160.1

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: The method blanks reported methylene chloride contamination. This resulted in some detected methylene chloride results being qualified as non-detects at CRDL.

SVOA: All compounds in some samples were qualified as estimated "J" since the reported solids were below the 50% minimum requirement.

Pesticide: All compounds in some samples were qualified as estimated "J" since their reported solids were below the 50% minimum requirement.

PCB: Recoveries for surrogate exceeded the QC limits in sample SC-2; this resulted in aroclor1260 being qualified as estimated "J." All compounds in some samples were qualified as estimated "J" since their reported solids were below the 50% minimum requirement.

Metals: Aluminum, barium, calcium, magnesium and zinc results were qualified as estimated "J" due to matrix spike recoveries that were outside QC limits. Antimony results were qualified as estimated "UJ/J" due to low matrix spike recovery. All compounds in some samples were qualified as estimated "J" since their reported solids were below the 50% minimum requirement.

Cyanide: All compounds in some samples were qualified as estimated "J" since their reported solids were below the 50% minimum requirement.

TOC: All compounds in some samples were qualified as estimated "J" since their reported

R2-0004339

solids were below the 50% minimum requirement.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time
All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)
The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)
The CCAL is acceptable.

3.0 CRDL Standard
All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)
Trip blank reported no contamination.

4.2 Field Blank (FB)
Field blank reported no contamination.

4.3 Method Blank (MB)
VOA: Method blanks reported methylene chloride contamination. Affected samples were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery
PCB: Recoveries for surrogate exceeded the QC limits in sample SC-2; this resulted in arochlor1260 being qualified as estimated "J."

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)
Metals: Aluminum and zinc detected results were qualified as estimated "J" due to exceedance in matrix spike recovery. Antimony, beryllium, calcium, iron and magnesium results were qualified as estimated "UJ/J" due to low matrix spike recovery.

5.3 Laboratory Control Samples (LCS)/Blank Spikes
All is acceptable.

6.0 Serial Dilution (SD)
Results are acceptable.

R2-0004342

6.1 Internal Standards (IS)

Results are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs are acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

No field duplicates were presented.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures (see Table 1.0). The data as presented are usable. Several sample results were qualified as estimated "J" since their percent solids were less the 50% minimum requirement.

Introduction

No. of Samples/Matrix:	6 Soil samples and 1 water sample
Sample Delivery Groups (SDG):	E97445
Sampling Date:	August 23, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Benzene and toluene exceeded the calibration range for sample WWT-2-12-14. Upon reanalysis at 250X dilution the holding time was exceeded. Thus, sample WWT-2-12-14 is being reported as a hybrid of the original and diluted analyses. Benzene and toluene results are qualified as estimated "J" due to this holding time anomaly.

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples WWT-2-0-0.5 and WWT-2-12-14. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

Pesticide: Several samples reported surrogate recoveries above QC limits. All affected detected sample results were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: Several samples reported surrogate recoveries above QC limits. All affected detected sample results were qualified "J" to indicate the results are estimated due to this anomaly.

Metals: Antimony and barium results were qualified as estimated "UJ/J" due to low matrix spike recoveries. All zinc results were qualified as estimated "J" due to matrix spike recovery exceedance. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

Benzene and toluene exceeded the calibration range for sample WWT-2-12-14. Upon reanalysis at 250X dilution, the holding time was exceeded. Thus, sample WWT-2-12-14 is being reported as a hybrid of the original and diluted analyses. Benzene and toluene results are qualified as estimated "J" due to this holding time anomaly.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

The percent difference exceeded the 20% QC criteria for 4,4'-DDT and methoxychlor. All samples were affected thus, all results for these compounds in all samples were qualified as estimated "UJ/J."

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

A trip blank was not analyzed with this SDG.

4.2 Field Blank (FB)

There was no field blank associated with this SDG.

4.3 Method Blank (MB)

Method blanks reported methylene chloride contamination at 2.76ug/L. Affected detected sample results were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Pesticide: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

R2-0004351

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Metals: Antimony and barium results were qualified as estimated "UJ/J" due to low matrix spike recoveries. All zinc results were qualified as estimated "J" due to matrix spike recovery exceedance.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

Results are acceptable.

6.1 Internal Standards (IS)

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples WWT-2-0-0.5 and WWT-2-12-14. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs are acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

No field duplicates were included with this SDG.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures, and some were diluted due to calibration range exceedance (see Table 1.0). The data as presented are usable.

B Case Narrative and Chain of Custody

1.0 Technical Holding Time

Benzene and toluene exceeded the calibration range for sample WWT-2-12-14. Upon reanalysis at 250X dilution, the holding time was exceeded. Thus, sample WWT-2-12-14 is being reported as a hybrid of the original and diluted analyses. Benzene and toluene results are qualified as estimated "J" due to this holding time anomaly.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

The percent difference exceeded the 20% QC criteria for 4,4'-DDT and methoxychlor. All samples were affected thus, all results for these compounds in all samples were qualified as estimated "UJ/J."

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

A trip blank was not analyzed with this SDG.

4.2 Field Blank (FB)

There was no field blank associated with this SDG.

4.3 Method Blank (MB)

Method blanks reported methylene chloride contamination at 2.76ug/L. Affected detected sample results were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Pesticide: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

R2-0004359

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Metals: Antimony and barium results were qualified as estimated "UJ/J" due to low matrix spike recoveries. All zinc results were qualified as estimated "J" due to matrix spike recovery exceedance.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

Results are acceptable.

6.1 Internal Standards (IS)

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples WWT-2-0-0.5 and WWT-2-12-14. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs are acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

No field duplicates were included with this SDG.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures, and some were diluted due to calibration range exceedance (see Table 1.0). The data as presented are usable.

R2-0004371

Introduction

No. of Samples/Matrix:	12 Soil samples
Sample Delivery Groups (SDG):	E97631
Sampling Date:	August 27, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Some methylene chloride results were qualified as non-detects at CRDL since their method blank reported methylene chloride contamination.

SVOA: Results are acceptable.

Pesticide: 4,4-DDT in samples LP-5-0-0.5 and LP-11-0-0.5 was qualified "J" to indicate the results are estimated due to elevated surrogate recoveries.

PCB: Aroclor-1254 in sample LP-10-0-0.5 was qualified "J" to indicate the result is estimated due to elevated surrogate recoveries.

Metals: Antimony results were qualified as estimated "UJ" due to low matrix spike recoveries. Zinc results were rejected "R" due to matrix interference. Some potassium results were qualified as estimated "J" due to serial dilution results being out of control. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

Pesticide: The percent difference exceeded the 20% QC criteria for 4,4'-DDT, endosulfan II and methoxychlor. All results for these compounds in affected samples were qualified as estimated "UJ/J."

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

There was no trip blank present in this SDG.

4.2 Field Blank (FB)

Field blank reported no contamination

4.3 Method Blank (MB)

Method blanks reported methylene chloride contamination. Affected detected sample results were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Pesticide: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

PCB: Recoveries for several samples were above the required QC limits. All detected compounds for these samples were qualified "J" to indicate the results are estimated due to this anomaly.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Metals: Antimony, aluminum, barium and iron results were qualified as estimated "UJ/J" due to matrix spike recoveries that were outside QC limits.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

Detected potassium results were qualified as estimated "J" due to serial dilution exceedance.

6.1 Internal Standards (IS)

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples LP-6-4-6, LP-2-0-0.5 and CF-7-4-6. Corresponding target compounds for this internal standard in these samples were qualified "UJ/J" to indicate the results are estimated due to this anomaly.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

VOA TICs for naphthalene was rejected "R" in sample LP-2-0.5-2 since it is a SVOA target compound and thus cannot be reported as a VOA TIC.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A blind field duplicate was included with this SDG. All RPDs are acceptable.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures, and some were diluted due to calibration range exceedance (see Table 1.0). The data as presented are usable with the exception of the one naphthalene TIC result qualified with the "R" qualifier.

12.0 Data Qualification Summary Table

R2-0004387

Introduction

No. of Samples/Matrix:	9 Soil samples and 5 water samples
Sample Delivery Groups (SDG):	E97259X, E97444X, E97631X, E97685X & E99129X
Sampling Date:	September 20, 21, 27, 28 & September 20, 2001
Analyses:	Dioxin
Analytical Method:	EPA Method 1613A

Summary of Data Validation:

The adherence of laboratory analytical performance to the above method was evaluated during the data validation process. The USEPA Region II Data Validation SOP No. 25 for EPA Method 1613 was used as the guideline for data qualifications.

E97444X: The ongoing precision standard (OPR) recovery was outside QC limits for some compounds. Results for those compounds were qualified as estimated "J" due to this anomaly.

E97631X: 2,3,7,8-TCDF and OCDD in samples LP-16-0-0.5 and LP-10-0-0.5 were rejected since the compound exceeded the calibration range.

SDG E97685X: Sample temperature were 12.1°C which, is above the required 4 °C. Based on technical information and professional judgement all sample results were qualified as estimated "J" since the integrity of the samples may have been compromised.

SDG E97631: Sample temperature were 24.2°C which, is above the required 4 °C. Based on technical information and professional judgement all sample results were qualified as estimated "J" since the integrity of the samples may have been compromised

A data validation summary table of all qualified compounds is presented in Section 10.0 and a detailed description in the report.

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time
All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)
The ICAL is acceptable.

2.2 Calibration Verification
All is acceptable.

3.0 Blanks Quality Control

3.1 Field Blank (FB)
Field blank results are acceptable.

3.2 Method Blank (MB)
Method blank results are acceptable.

4.0 Accuracy and Precision Data

4.1 Precision Recovery Standard
E97444X: The ongoing precision standard (OPR) recovery was outside QC limits for some compounds. Results for those compounds were qualified as estimated "J" due to this anomaly.

4.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)
None was performed.

4.3 Blank Spikes
All is acceptable.

5.0 Internal Standard (IS)
Results are acceptable.

6.0 Target Compound Identification
All target compound identification is acceptable.

7.0 Compound Quantitation
E97631X: 2,3,7,8-TCDF and OCDD in samples LP-16-0-0.5 and LP-10-0-0.5 respectively were rejected since the compound exceeded the calibration range.

8.0 Field Duplicates (FD)

Field duplicates were not submitted.

9.0 Overall Assessment of Data

The data as presented are usable with the exception of the results qualified with the "R" qualifier.

SDG E97685: Sample temperature were 12.1°C which, is above the required 4 °C. Based on technical information and professional judgement all sample results were qualified as estimated "J" since the integrity of the samples may have been compromised.

SDG E97631: Sample temperature were 24.2°C which, is above the required 4 °C. Based on technical information and professional judgement all sample results were qualified as estimated "J" since the integrity of the samples may have been compromised.

R2-0004394

Introduction

No. of Samples/Matrix:	4 Soil samples and 1 water sample
Sample Delivery Groups (SDG):	E99805
Sampling Date:	October 1, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Method blanks reported methylene chloride contamination. Affected detected sample results were qualified as non-detects at CRDL. Field blank reported acetone contamination. All affected detected acetone results were qualified as non-detects at CRDL. Reported 1, 3-dichlorobenzene, 1, 4-dichlorobenzene, 1, 2-dichlorobenzene, 1, 2, 4-trichlorobenzene and naphthalene in sample 5K-B4-4-6 and naphthalene in sample 5K-B1-0-0.5 were rejected "R" since they are SVOA target compounds and therefore cannot be reported as VOA TICs.

SVOA: IS Perylene-d12 area counts were below the required QC limits for 5K-B4-0-0.5 Corresponding target compounds for this internal standard in this sample was qualified "UJ" to indicate the results are estimated due to this anomaly.

Pesticide: All results are acceptable.

PCB: Recoveries for several samples exceeded the required QC limits and thus all detected results in affected samples were qualified as estimated "J."

Metals and Cyanide: All results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

The CCAL is acceptable.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

No trip blank was reported.

4.2 Field Blank (FB)

VOA: Field blank reported acetone contamination. All affected detected acetone results were qualified as non-detects at CRDL.

4.3 Method Blank (MB)

VOA: Method blanks reported methylene chloride contamination. Affected detected sample results were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

PCB: Recoveries for several samples exceeded the required QC limits and thus all detected results in affected samples were qualified as estimated "J."

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All is acceptable.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

All is acceptable.

6.1 Internal Standards (IS)

SVOA: IS Perylene-d12 area counts were below the required QC limits for 5K-B4-0-0.5 Corresponding target compounds for this internal standard in this sample was qualified "UJ" to indicate the results are estimated due to this anomaly.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

VOA: Reported 1, 3-dichlorobenzene, 1,4-dichlorobenzene, 1, 2-dichlorobenzene, 1, 2, 4-trichlorobenzene and naphthalene in sample 5K-B4-4-6 and naphthalene in sample 5K-B1-0-0.5 were rejected "R" since they are SVOA target compounds and therefore cannot be reported as VOA TICs.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A field duplicate was not reported with this SDG.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures, and some were diluted due to calibration range exceedance (see Table 1.0). The data as presented are usable with the exception of the TICs with the "R" qualifiers.

R2-0004401

Introduction

No. of Samples/Matrix:	6 Soil samples and 1 water sample
Sample Delivery Groups (SDG):	E99913
Sampling Date:	October 2, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Method blanks reported methylene chloride contamination. Affected detected sample results were qualified as non-detects at CRDL. Field blank reported acetone contamination. All affected detected acetone results were qualified as non-detects at CRDL.

SVOA: IS Perylene-d12 area counts were below the required QC limits for samples BT-B5-0-.5. Corresponding target compounds for this internal standard in this sample was qualified "UJ/J" to indicate the results are estimated due to this anomaly.

Pesticide: Recoveries for several samples exceeded the required QC limits and thus all detected results in affected samples were qualified as estimated "J."

PCB: Recoveries for several samples exceeded the required QC limits and thus all detected results in affected samples were qualified as estimated "J."

Metals: Antimony results were qualified as estimated "UJ" due to low matrix spike recoveries. Aluminum, copper, lead and potassium results were qualified as estimated "J" due to matrix spike recovery exceedance. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

The CCAL is acceptable.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

Trip blank reported no contamination.

4.2 Field Blank (FB)

VOA: Field blank reported acetone contamination. All affected detected acetone results were qualified as non-detects at CRDL.

4.3 Method Blank (MB)

VOA: Method blanks reported methylene chloride contamination. Affected detected sample results were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Pesticide: Recoveries for several samples exceeded the required QC limits and thus all detected results in affected samples were qualified as estimated "J."

PCB: Recoveries for several samples exceeded the required QC limits and thus all detected results in affected samples were qualified as estimated "J."

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Metals: Antimony results were qualified as estimated "UJ" due to low matrix spike recoveries. Aluminum, copper, lead and potassium results were qualified as estimated "J" due to matrix spike recovery exceedance.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

All is acceptable.

6.1 Internal Standards (IS)

IS Perylene-d12 area counts were below the required QC limits for several samples. However, corresponding target compounds for this internal standard in sample BT-B5-0-.5 only was qualified "UJ/J" to indicate the results are estimated due to this anomaly.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

VOA: Reported 1,2-dichlorobenzene was rejected "R" in sample 230-B1-4-6 since it is a SVOA target compound and therefore cannot be reported as a VOA TIC.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A field duplicate was reported. All RPDs are acceptable.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures, and some were diluted due to calibration range exceedance (see Table 1.0). The data as presented are usable with the exception of the TIC with the "R" qualifier.

12.0 Data Qualification Summary Table

R2-0004409

Introduction

No. of Samples/Matrix:	3 Soil samples and 1 water sample
Sample Delivery Groups (SDG):	E99979
Sampling Date:	October 03, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Method blanks reported methylene chloride contamination. Affected detected sample results were qualified as non-detects at CRDL. Naphthalene was rejected "R" in sample DC-B12-0-0.5 since it is a SVOA target compound and thus cannot be reported as VOA TIC

SVOA: All results are acceptable.

Pesticide: All results are acceptable.

PCB: All results are acceptable.

Metals: Metals: Antimony, copper, lead and potassium results were qualified as estimated "UJ/J" due to matrix spike recoveries that were outside QC limits. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

The CCAL is acceptable.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

There was no trip blank present in this SDG.

4.2 Field Blank (FB)

Field blank reported no contamination.

4.3 Method Blank (MB)

Method blanks reported methylene chloride contamination. Affected detected sample results were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Surrogate recoveries are acceptable.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Metals: Antimony, copper, lead and potassium results were qualified as estimated "UJ/J" due to matrix spike recoveries that were outside QC limits.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

All is acceptable.

R2-0004412

6.1 Internal Standards (IS)

All IS area counts are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

VOA: Naphthalene was rejected "R" in sample DC-B12-0-0.5 since it is a SVOA target compound and thus cannot be reported as VOA TIC.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A field duplicate was not included with this SDG.

11.0 Overall Assessment of Data

Some samples were reanalyzed due to surrogate failures and some were diluted due to calibration range exceedance (see Table 1.0). The data as presented are usable with the exception of the one naphthalene TIC result qualified with the "R" qualifier.

Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Benzene and toluene in sample 231-B1-0-0.5 were reported as non-detects by the laboratory. The validator found these to be detected compounds and thus they are corrected on the Form 1.

SVOA: All results are acceptable.

Pesticide: All results are acceptable.

PCB: Recovery was outside the required QC limits. This resulted in aroclor-1254 in sample 231-B1-0-0.5 being qualified "J" to indicate the result is estimated due to this anomaly.

Metals: All results are acceptable. All cyanide results are acceptable.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time
All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)
The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)
The CCAL is acceptable.

3.0 CRDL Standard
All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)
There was no trip blank present in this SDG.

4.2 Field Blank (FB)
Field blank reported no contamination.

4.3 Method Blank (MB)
Method blanks reported methylene chloride contamination but samples were already qualified as estimated due to percent solids that were below the required 50% criteria.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery
Surrogate recoveries are acceptable.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)
Recoveries are acceptable.

5.3 Laboratory Control Samples (LCS)/Blank Spikes
All is acceptable.

6.0 Serial Dilution (SD)
All is acceptable.

6.1 Internal Standards (IS)
All IS area counts are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

TICs identification is acceptable.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A field duplicate was not included with this SDG.

11.0 Overall Assessment of Data

The data as presented are usable. All soil sample results for all samples were qualified as estimated "J" due to percent solids that were below the required 50% criteria.

Introduction

No. of Samples/Matrix:	4 water samples
Sample Delivery Groups (SDG):	N4844
Sampling Date:	December 17, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: All results are acceptable.

SVOA: All results are acceptable.

Pesticide: CCAL results for heptachlor exceeded the required 15% QC limits, this resulted in all heptachlor results being qualified as estimated "J."

PCB: All results are acceptable.

Metals & Cyanide: All results are acceptable

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

R2-0004457

Introduction

No. of Samples/Matrix:	10 water samples
Sample Delivery Groups (SDG):	N5011
Sampling Date:	December 18-19, 2001
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Field blank reported acetone and carbon disulfide contamination. All affected detected sample results for these compounds were qualified as non-detects at CRDL. TIC results for naphthalene, 1,2-dichlorobenzene, 1,3-dichlorobenzene in sample MW-12; naphthalene in samples MW-19 and MW-18 were rejected "R" since they are semi-volatile target compounds and therefore cannot be reported as TICs.

SVOA: All sample results are acceptable.

Pesticide: Endrin ketone percent relative standard deviation exceeded the required 20% QC limits. All endrin ketone results were qualified "UJ" to indicate the results are estimated. Heptachlor percent difference exceed the 15% QC limits which resulted in heptachlor results in samples MW-15 (N5011-1), MW-15 (N5011-2) and MW-14 being qualified "UJ" to indicate the results are estimated due to this anomaly. Surrogate recoveries for samples MW-12 and MW-19 were below the required QC limits. All non-detected sample results for these samples were qualified "UJ" to indicate the results are estimated due to this anomaly.

PCB: Surrogate recovery for sample MW-18 was below the required QC limits. All compounds for this sample were qualified as "UJ" to indicate the results are estimated due to this anomaly.

Metals & Cyanide: Field blank reported zinc contamination. This resulted in zinc result in samples MW-12 and MW-19 being rejected. The MS %R for cyanide was below the required QC limits and this resulted in cyanide results in all samples except MW-18 being

R2-0004458

qualified "UJ" to indicate the results are estimated

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

PEST: Endrin ketone percent relative standard deviation exceeded the required 20% QC limits. All endrin ketone results were qualified "UJ" to indicate the results are estimated.

2.2 Continuing Calibration (CCAL)

PEST: Heptachlor percent difference exceed the 15% QC limits which resulted in heptachlor results in samples MW-15 (N5011-1), MW-15 (N5011-2) and MW-14 being qualified "UJ" to indicate the results are estimated due to this anomaly.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

The trip blank reported no contamination.

4.2 Field Blank (FB)

VOA: Field blank reported acetone and carbon disulfide contamination at 228ug/L and 9.3ug/L respectively. All affected detected sample results for these compounds were qualified as non-detects.

Metals: Field blank reported zinc contamination. This resulted in zinc result in samples MW-12 and MW-19 being rejected.

4.3 Method Blank (MB)

Method blanks reported no contamination.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

PEST: Surrogate recoveries for samples MW-12 and MW-19 were below the required QC limits. All non-detected sample results for these samples were qualified "UJ" to indicate the results are estimated due to this anomaly.

PCB: Surrogate recovery for sample MW-18 was below the required QC limits. All compounds for this sample were qualified as "UJ" to indicate the results are estimated due to this anomaly.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Cyanide: The MS %R was below the required QC limits and this resulted in cyanide results in all samples except MW-18 being qualified "UJ" to indicate the results are estimated.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

All is acceptable.

6.1 Internal Standards (IS)

All IS area counts are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

VOA: TIC results for naphthalene, 1,2-dichlorobenzene, 1,3-dichlorobenzene in sample MW-12; naphthalene in samples MW-19 and MW-18 were rejected "R" since they are semi-volatile target compounds and therefore cannot be reported as TICs.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A field duplicate was not included with this SDG.

11.0 Overall Assessment of Data

The data as presented are usable with the exception of the zinc results qualified with the "R" flag, which are not usable.

Introduction

No. of Samples/Matrix:	8 soil samples
Sample Delivery Groups (SDG):	N11935
Sampling Date:	April 8, 2002
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

For VOA analyses, the field blank reported acetone and methylene chloride contamination. All affected detected sample results for these compounds were qualified as non-detects at CRDL. TIC results rejected "R" for; naphthalene and 1,2, 4-trichlorobenzene in sample IB-1-0-2; IB-2-4-6, naphthalene in samples IB-1-4-6 and IB-2-12-14, acenapthene and naphthalene in sample DUP-01-0804012 and IB-3-8-10, naphthalene, 1,2-dichlorobenzene, 1,3-dichlorobenzene and 1,2,4-trichlorobenzene in samples IB-3-4-6. These compounds are semi-volatile target compounds and therefore cannot be reported as TICs.

SVOA: All sample results are acceptable.

Pesticide: Gamma-BHC, delta-BHC, endosulfan sulfate and endrin ketone percent difference exceeded the 15% QC limits. This resulted in gamma-BHC, delta-BHC, endosulfan sulfate and endrin ketone results in samples IB-2-4-6 and DUP-08-04012 being qualified "UJ" to indicate the results are estimated due to this anomaly. Endrin aldehye percent difference exceeded the 15% QC limits. This resulted in endrin aldehyde result in samples IB-1-4-6 and IB-1-0-2 being qualified "UJ" to indicate the results are estimated due to this anomaly. Surrogate recovery for sample IB-3-8-10 was above the required QC limits. All detected sample results were qualified "J" to indicate the results are estimated due to this anomaly. The MS reported 0%R for dieldrin and 4,4'-DDT. This resulted in dieldrin and 4,4'-DDT in sample IB-3-4-6 (the original field sample) being qualified as estimated. "UJ/J."

PCB: All sample results are acceptable.

R2-0004474

Metals & Cyanide: MS %R for antimony, mercury and zinc were below the required QC limits and above QC limits for magnesium. This resulted in all associated antimony, mercury and zinc sample results being qualified as estimated "UJ/J" and all detected magnesium results being qualified as estimated "J." Nickel and vanadium results were qualified as estimated "J" due to serial dilution results that were above QC limits.

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

List of Attachments

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

All is acceptable.

2.2 Continuing Calibration (CCAL)

Pesticide: Gamma-BHC, delta-BHC, endosulfan sulfate and endrin ketone percent difference exceeded the 15% QC limits. This resulted in gamma-BHC, delta-BHC, endosulfan sulfate and endrin ketone results in samples IB-2-4-6 and DUP-08-04012 being qualified "UJ" to indicate the results are estimated due to this anomaly. Endrin aldehye percent difference exceeded the 15% QC limits. This resulted in endrin aldehyde results in samples IB-1-4-6 and IB-1-0-2 being qualified "UJ" to indicate the results are estimated due to this anomaly.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

A trip blank was not reported with this SDG.

4.2 Field Blank (FB)

Field blank reported no contamination.

4.3 Method Blank (MB)

VOA: Field blank reported acetone and methylene chloride contamination at 6.3ug/L and 3.0ug/L respectively. All affected detected sample results for these compounds were qualified as non-detects at CRDL.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

Pesticide: Surrogate recovery for sample IB-3-8-10 was above the required QC limits. All detected sample results were qualified "J" to indicate the results are estimated due to this anomaly.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Pesticide: The MS reported 0%R for dieldrin and 4,4'-DDT; this resulted in dieldrin and 4, 4'-DDT in sample IB-3-4-6 (the original field sample) being qualified as estimated. "UJ/J."

Metals: MS %R for antimony, mercury and zinc were below the required QC limits and above QC limits for magnesium. This resulted in all associated antimony, mercury and zinc sample results being qualified as estimated "UJ/J" and all detected magnesium results being qualified as estimated "J."

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

Nickel and vanadium results were qualified as estimated "J" due to serial dilution results that were above QC limits.

6.1 Internal Standards (IS)

All IS area counts are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

VOA: TIC results rejected "R" for; naphthalene and 1,2, 4-trichlorobenzene in sample IB-1-0-2; IB-2-4-6, naphthalene in samples IB-1-4-6 and IB-2-12-14, acenapthene and naphthalene in sample DUP-01-0804012 and IB-3-8-10, naphthalene, 1,2-dichlorobenzene, 1,3-dichlorobenzene and 1,2,4-trichlorobenzene in samples IB-3-4-6. These compounds are semi-volatile target compounds and therefore cannot be reported as TICs.

9.0 Compound Quantitation

All compound quantitation is acceptable.

10.0 Field Duplicates (FD)

A field duplicate was not included with this SDG.

11.0 Overall Assessment of Data

The data as presented are usable with the exception of the results qualified with the "R" flag. They are not usable.

12.0 Data Qualification Summary Table

Introduction

No. of Samples/Matrix:	9 Soil samples
Sample Delivery Groups (SDG):	N2718X, N12849X, N124510X, N12606X
Sampling Date:	April 17, 18 & 19, 2002
Analyses:	Dioxin
Analytical Method:	EPA Method 1613A

Summary of Data Validation:

The adherence of laboratory analytical performance to the above method was evaluated during the data validation process. The USEPA Region II Data Validation SOP No. 25 for EPA Method 1613 was used as the guideline for data qualifications.

N12510X: The results are acceptable.

N12606X: The results are acceptable

N12718X: OCDD in sample HB-4A was rejected since the compound exceeded the calibration range.

N12849X: OCDD in sample HB-8A was rejected since the compound exceeded the calibration range.

A data validation summary table of all qualified compounds is presented in Section 10.0 and a detailed description in the report.

HB-4A	SOIL	N12718-4	X	X	X	X	X

R2-0004502

Introduction

No. of Samples/Matrix:	4 soil samples
Sample Delivery Groups (SDG):	N12718
Sampling Date:	April 18 and 19, 2002
Analyses:	Volatile, Semi-volatile, Pesticide, PCB and Metals
Analytical Method:	SW 846 8260B, 8270C, 8081A, 8082 and 6010B/ 7470A/7471/9012

Summary of Data Validation:

The adherence of laboratory analytical performance to the above methods was evaluated during the data validation process. The National Functional Guidelines for Organic Data Review (October 1999), the National Functional Guidelines for Inorganic Data Review (February 1994) and Region II Data Validation Checklists were used as guidelines for data qualifications.

VOA: Field blank reported acetone contamination. All affected detected sample results for these compounds were qualified. TIC results for naphthalene in sample HB-1A, naphthalene and 1, 2, 4-trichlorobenzene in sample HB-7A and naphthalene in sample HB-4A were rejected "R" since they are semi-volatile target compounds and therefore cannot be reported as TICs.

SVOA: All results are acceptable.

Pesticide: All results are acceptable.

PCB: All results are acceptable.

Metals & Cyanide: Serial dilution results for copper and potassium exceeded the QC limits and this resulted in detected copper and potassium results being qualified as estimated "J."

A data validation summary table of all qualified compounds is presented in Section 12.0 and a detailed description in the report.

A Validated and Qualified Data Sheets (Forms 1s)
B Case Narrative and Chain of Custody

1.0 Technical Holding Time

All is acceptable.

2.0 Calibration

2.1 Initial Calibration (ICAL)

The ICAL is acceptable.

2.2 Continuing Calibration (CCAL)

The CCAL is acceptable.

3.0 CRDL Standard

All is acceptable.

4.0 Blanks Quality Control

4.1 Trip Blank (TB)

A trip blank was not included with this SDG.

4.2 Field Blank (FB)

VOA: Field blank reported acetone contamination. All affected detected sample results for these compounds were qualified as non-detects at CRDL.

4.3 Method Blank (MB)

Method blanks reported no contamination.

5.0 Accuracy and Precision Data

5.1 Surrogate Recovery

All recoveries are acceptable.

5.2 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All recoveries are acceptable.

5.3 Laboratory Control Samples (LCS)/Blank Spikes

All is acceptable.

6.0 Serial Dilution (SD)

Serial dilution results for copper and potassium exceeded the QC limits and this resulted in detected copper and potassium results being qualified as estimated "J."

6.1 Internal Standards (IS)

All IS area counts are acceptable.

7.0 Target Compound Identification

All target compound identification is acceptable.

8.0 Tentative Identification Compounds (TICs)

VOA: TIC results for naphthalene in sample HB-1A, naphthalene and 1, 2, 4-trichlorobenzene in sample HB-7A and naphthalene in sample HB-4A were rejected "R" since they are semi-volatile target compounds and therefore cannot be reported as TICs.

9.0 Compound Quantitation

All is acceptable.

10.0 Field Duplicates (FD)

A field duplicate was not included with this SDG.

11.0 Overall Assessment of Data

The data as presented are usable with the exception of those results qualified with the "R" flag, which are not usable.

12.0 Data Qualification Summary Table

LCP Superfund Site

VOA

Sample Identification	Compound	Qualifier	Section Reference
HB-1A	Naphthalene	R	8.0
HB-7A	Acetone	36.5U	4.2

RE: Data Validation for the LCP Superfund site, Linden, NJ
South Branch and Reference Stream Locations
Accutest SDG Nos. J41738, J41741, J42011, J42360, J42535, J42762, J42838, J42866, J43022, J43207, J43284, J43443, J43008, J41738X, J41741X, J42011X, J42360X, J42535X, J42762X, J42838X, J42866X, J43022X, J43207X, J43284X, J43443A, J43443X, and J43008X

Dear Mr. Cavas:

Review has been completed for the data packages generated by Accutest Laboratories that pertain to samples collected 9/21/06 through 10/10/06 at the South Branch and Reference Stream sites of the LCP Superfund, Linden, NJ project. Eighty soil samples and eleven aqueous samples were processed for TCL Volatiles, TCL Semivolatiles, TCL Pesticides, TCL PCBs, TAL metals, hexavalent chromium, total cyanide, and methyl mercury. Twenty-two of the soil and four of the aqueous samples were also processed for Dioxin/Furans (PCDD/PCDF). The aqueous samples were also analyzed for low level total mercury, TOC, cyanide, TSS, DOC, and total hardness. The soils were also analyzed for Particle Size (Sieve) and Redox Potential. Thirty-seven of the soils were also processed for acid volatile sulfide metals (AVS/SEM). Aqueous samples also underwent Selective Ion Monitoring (SIM) for selected semivolatile analytes in order to obtain better sensitivity and lower reporting limits. Blind field duplicates, sample matrix spikes, field blanks, and trip blanks were processed with the project samples. The specific sample location identifications covered in this report are noted in the attached laboratory summary listings.

The analytical methodologies utilized are those of the USEPA SW846 3rd edition and USEPA Standard Methods. The dioxin/furan analyses were subcontracted to SGS/Paradigm, the methyl mercury and low level aqueous mercury analyses were subcontracted to Columbia Analytical Services (CAS)-Kelso and Battelle Marine Sciences, and AVS/SEM were subcontracted to Accutest-Houston.

Validation review of the data packages has been performed utilizing the guidance in the USEPA National Functional Guidelines for Data Review, the USEPA Region II validation SOPs, the project QAPP (including laboratory SOPs), the specific methodology requirements, and professional judgment.

The following items were reviewed:

* Laboratory Narrative Discussion
* Custody Documentation
* Holding Times
* Surrogate Recoveries and Internal Standard Responses
* Matrix Spike Recoveries/Duplicate Correlations
* Field Duplicate Correlations
* Preparation/Calibration Blanks
* Control Spike/Laboratory Control Samples
* Instrumental Tunes
* Calibration/CRI/CRA Standards
* ICP Serial Dilution
* ICP Interference Check Samples
* Dioxin/Furan Recovery and Clean-Up Standards
* Instrument IDLs and Performance
* Method Compliance
* Sample Result Verification

Those items listed above which show deficiencies are discussed within the text of this narrative. All of the other items were determined to be acceptable according to the validation guidelines noted above.

In summary, most of the sample analyte values/reporting limits are usable as reported, or usable with minor qualification as estimated ("J" qualifier) due to typical processing or matrix effects. The following exceptions were noted:

- Due to matrix effect, the results for hexavalent chromium in the soil samples are not usable, as evidenced by the lack of recovery of that analyte in the spiked sample controls.
- Results for hexachlorocyclopentadiene in most of the soil samples are not usable due to lack of recovery in the project matrix spikes.
- Results for several select volatile or semivolatile compounds are not usable in a limited number of samples due to apparent matrix effect
- POC processing was requested, but was not performed on the samples due to laboratory oversight. There are no POC data for the project.
- Many of the reported pesticide detections have been qualified to reflect the potential for false positives due to matrix interferences.
- Some of the low level detections are considered external contamination, as evidenced by presence in associated blank
- A large proportion of the soil samples covered in this report exhibit low solids (high moisture) content. Therefore, all results for those samples have been qualified as being estimated in quantitative value.

Laboratory processing was generally compliant with analytical protocol requirements, and the project data completeness requirement of 90% has been met.

Copies of the laboratory sample identification summary forms that list the sample covered in this report are attached to this text, and should be reviewed in conjunction with this report. Included with this submission are electronic client data tables that have been qualified in red to reflect the edits and qualifications recommended within this report. These tables have been submitted under separate cover.

The following text discusses quality issues of concern.

General

The strong majority of the samples have solids content below 50%. With low solids (high moisture) content, there exists the possibility of a non-homogeneous aliquot taken during sample collection in the field or during sample processing in the laboratory. Additionally, the aqueous matrix (i.e. which is approached with samples having very low solids content) involves significantly different processing procedures than the solid matrix for semivolatiles (including BNA, pesticides, PCBs, and herbicides) and certain of the wet chemistry analytes. Additionally, the aqueous matrix requires preservation for volatiles, metals, and certain of the wet chemistry parameters not required of the soil samples.

Therefore, results (both detected values and the reporting limits of non-detected analytes) for the samples with solids below 50% have been qualified as estimated, with a possible bias of an unknown direction

TCL Volatiles by USEPA SW846 8260B

Results for LM-E-3, LM-E-4, and LM-F-3 are qualified as estimated due to outlying holding times (analyzed at 15 days from collection). These samples are also qualified due to low solids content.

Matrix spikes (MS and MSD) for SW-D, SW-W, SED-Z-1, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-F-1-0-0.5, SED-F-3-0-0.5, SED-E-2-1.0-1.5, SED-C-3-0-0.5, SED-B-1-0-0.5, SED-A-1-0-0.5 (all at low level), and SED-9 (at medium level) show accuracy and precision within QAPP/validation guidelines, with the following exceptions:

- Recoveries of five compounds are below recommended limit in the matrix spike SW-D, but are acceptable in the MSD. Similarly, a total of 14 compounds show elevated duplicate correla-tions with the MSD>MS. The MS also shows a low internal standard response not exhibited by the parent sample or MSD. The MS outliers are a processing anomaly, and no qualifications were made to the parent sample on that basis.
- Bromoform and 1,2,4-trichlorobenzene did not recover in the spikes of SED-C-3-0-0.5. Results for these two compounds in the parent sample are therefore not usable, and are rejected.
- Bromoform and dibromochloromethane did not recover in the spikes of SED-A-1-0-0.5. Results for these two compounds in the parent sample are therefore not usable, and are rejected. 1,2,4-trichlorobenzene also did not recover in those spikes; the detected value in the parent sample is qualified as estimated. Twenty-seven other volatile analytes recovered below the recommended limit in both spikes. All results for the parent sample are already qualified as estimated due to low solids content.

Field duplicate correlations for SW-B, SW-Y, SED-W-1-0-0.5, SED-F-3-0-0.5, SED-Y-3, and LM-C-2 are acceptable, with the exception of that for methyl acetate in LM-C-2 (114%RPD).

Calibrations standards showed acceptable responses, with the following exceptions, results for which are qualified as estimated in the indicated samples:

- acetone and 2-butanone (low RRF) in the three soils reported in SDG J41741, and in LM-B-3 and LM-B-4
- trichlorofluoromethane (28%D) detections in the aqueous samples in SDG J42011
- 2-hexanone (30%D) in samples in SDG J42360
- methyl acetate in eight sample reported in SDG J43443
- acetone (low RRF) in low level soils in SDGs J42535, J42762, J42838, J42866, J43022, J43207
- 2-butanone (low RRF and/or 24%D) in field blanks of 9/29/06, 10/02/06, 10/03/06, and 10/05/06

Results of the field blank of 9/29/06 are qualified as estimated, and may have a low bias, due to elevated temperature at sample receipt (14.5°C).

Tentatively Identified Compounds (TICs) that are flagged as "B" or identified as "system artifacts" are considered external contamination, as shown by presence in the associated blanks.

TCL Semivolatile Analyses by USEPA SW846 8270C

Due to apparent matrix effects, samples SED-F-1-0-0.5, SED-F-2-0-0.5, and SED-F-3-0-0.5 show very low response (<25%) for internal standard d12-perylene. Therefore, the result for the undetected associated analyte, di-n-octylphthalate, is not usable in those three samples. Two of those samples, as well as the field duplicate of the latter, also show low response for internal standard d12-chrysene. Results for all other associated compounds in those samples are qualified as estimated.

The results for the seven compounds associated with d12-perylene are qualified as estimated in SED-E-2-0-0.5, SED-C-3-0-0.5, and SED-B-1-0-0.5 due to low responses of that internal standard in those samples and their matrix spikes.

Matrix spikes (MS and MSD) for SW-D, SW-W, SED-X-3, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-F-1-0-0.5, SED-C-3-0-0.5, SED-C-3-0-0.5, SED-B-1-0-0.5, LM-C-2, and SED-9 show accuracy and precision within validation guidelines, with the following exceptions:

- 3,3'-dichorobenzidine, 3-nitroaniline, and 4-nitroaniline failed to recover in SW-D and SW-W. Results for those three compounds in those two parent samples are therefore rejected, and not usable
- hexachlorocyclopentadiene failed to recover in the matrix spikes of SED-X-3, SED-E-1-0-0.5 SED-F-1-0-0.5, SED-E-2-1.0-1.5, SED-C-3-0-0.5, and SED-9. Due to The persistence of failure in the project soil matrix spikes (in all soils except SED-W-3-0-0.5) the results for this compound in all soil samples covered in this report except those in SDG J42535 are therefore rejected, and not usable.
- bis(2-ethylhexyl)phthalate in SED-F-1-0-0.5 shows elevated recoveries; results in the parent sample are qualified as estimated

- fluoranthene and phenanthrene showed inconsistent results (and very low recoveries) in the spikes of SED-B-1-0-0.5 and SED-9. Results for those two compounds in the two parent samples are qualified as estimated.

Detected values of anthracene and fluoranthene in soils reported in SDG J43022 are qualified as estimated, with a possible high bias, due to elevated recoveries (111% and 118%) in the associated spiked blank control.

Field duplicate correlations for SW-B, SW-Y, and SED-W-1-0-0.5 are acceptable.

The field duplicate evaluation of SED-F-3-0-0.5 shows outlying correlations for acenapthylene, anthracene, benzo(k)fluoranthene, 1,1-biphenyl, dibenz(a,h)anthracene, bis(2-ethylhexyl)phthalate, 2-methylnaphthalene, pyrene (59%RPD to 126%RPD). Results for these analytes in the parent sample and the duplicate are qualified as estimated.

The field duplicate evaluation of SED-Y-3 shows outlying correlations for fluoranthene, phenanthrene, and pyrene (78%RPD to 126%RPD). Results for these analytes in the parent sample and the duplicate are qualified as estimated.

The field duplicate evaluation of LM-D-4 shows outlying correlations for bis(2-ethylhexyl)phthalate and fluoranthene (67%RPD and 101%RPD). Results for these analytes in the parent sample and the duplicate are qualified as estimated.

The results for the field blank of 10/05/06 are qualified as estimated, with a possible low bias, due to outlying holding time to extraction.

Results of the field blank of 9/29/06 are qualified as estimated, and may have a low bias, due to elevated temperature at sample receipt (14.5°C).

Calibrations standards showed acceptable responses with laboratory requirements and validation guidelines, with the following exceptions, results for which are qualified as indicated in the noted samples:

- benzo(k)fluoranthene (28%D) in SIM aqueous samples in SDG J42011
- 2,4-dinitrophenol (33%D) and 4,6-dinitro-2-methylphenol (28%D) in the field blank and all soils reported in SDG J42762
- dibenz(a,h)anthracene (26%D) detections in samples reported in J42866
- hexachlorocyclopentadiene (28%D) in FB 100506
- 2,4-dinitrophenol (28%D) in SED-C-1-0-0.5, SED-C-2-0-0.5, SED-C-2-0.5-1.0, and SED-C-2-1.0-1.5

Due to presence in the associated method or field blank, detected results for bis(2-ethylhexyl)-phthalate in SW-D, and in samples reported in SDGs J42762 and J42838 are considered external contamination, and edited to reflect non-detection ("U").

Tentatively Identified Compounds (TICs) that are flagged as "B" and/or "A", or identified as "system artifacts" are considered external contamination, as shown by presence in the associated blanks.

TCL PCB/Pesticides Analyses by USEPA SW846 8081A and 8082

Some of the pesticide reported detections may reflect responses from the sample matrix or PCB components. Those detections show elevated dual column correlations, with resulting qualifications as either estimated in value ("J"), tentative in identification and estimated in value ("NJ"), or edited to nondetection ("U", sometimes at elevated reporting limits). The correlations reported on summary forms by the laboratory were calculated as %RPD. Per validation protocols, this review evaluation utilized %D. The appropriate qualifica-tions have been made on the attached sample result forms.

Due to elevated surrogate DCB standard recoveries, results for detected pesticides (4,4'-DDD, 4,4'-DDE, and 4,4'-DDT) in the field duplicate of SED-W-1-0-0.5 are qualified as estimated ("J"), and may have a high bias. Results for the parent sample are not affected.

Due to elevated surrogate TCX and/or DCB standard recoveries, results for detected pesticides in SED-F-1-0-0.5, SED-F-2-0-0.5, SED-F-3-0-0.5, SEF-A-2-0-0.5, and the field duplicate of SED-F-3-0-0.5 are qualified as estimated ("J"), and may have a high bias.

Results for SED-7 are qualified as estimated due to outlying holding time for re-extraction (the initial extraction produced outlying low surrogate standard recoveries).

Calibration standards meet protocol and validation requirements.

Matrix spikes of pesticides and Aroclors 1016 and 1260 in SW-D, SW-W, SED-Y-1, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-C-3-0-0.5, SED-B-1-0-0.5, SED-A-1-0-0.5, and SED-9 show acceptable accuracy and precision, with the following exceptions, results for which are qualified as estimated in the indicated parent sample:

- aldrin, a-chlordane, endosulfan I, endosulfan II, heptachlor (outliers 44% to 49%), and 4,4'-DDT (0% and 1000%) in SED-Y-1
- endrin aldehyde, aldrin, and g-chlordane (17% to 44%, 57%RPD to 87%RPD) in SED-E-1-0-0.5
- Aroclor 1260 (225% and 1275%) in SED-B-1-0-0.5

Some of the Aroclor 1016 recoveries in the matrix spikes are elevated due to response contributions from the Aroclor 1254 that is present in the parent sample.

Field duplicate correlations for SW-B and SW-Y are acceptable.

Those for SED-W-1-0-0.5 show an outlying variance for 4,4'-DDT. The results for that analyte in the parent sample and field duplicate are considered additionally estimated (results are also qualified due to low solids content).

The field duplicates of LM-C-2 and LM-D-4 show large variance for 4,4'-DDT, where it was not detected in the parents, but detected at 19 ug/kg or 18 ug/kg in the duplicate. The detected result in the duplicate of LM-C-2 has been qualified as tentative in identification due to dual column variance. The non-detected results of 4,4'-DDT in the parent samples, and the detected result in the duplicate of LM-D-4 are qualified as estimated due to the field duplicate variance.

The field duplicate of SED-F-3-0-0.5 shows significant variances for 4,4'-DDD, 4,4'-DDT, heptachlor epoxide, and methoxychlor (up to more than an order of magnitude). Results are qualified as estimated in the parent sample and duplicate.

The field duplicate evaluation of SED-Y-3 shows outlying correlations for 4,4'-DDD, 4,4'-DDE, an 4,4'-DDT. Results for these analytes in the parent sample and the duplicate are qualified as estimated.

Results of the field blank of 9/29/06 are qualified as estimated, and may have a low bias, due to elevated temperature at sample receipt (14.5°C).

TCL Dioxin/Furan Analyses by USEPA SW846 8290

Results of the field blank of 9/29/06 are qualified as estimated, with a possible low bias, due to elevated temperature at original laboratory sample receipt (14.5°C).

Detected results for samples that were reported with the laboratory "A" qualifier reflect quantitative values below the established linear range of the instrument, and have therefore been qualified as estimated in value.

The method and field blanks contain low levels (below CRDL) of many of the PCDD and PCDF isomers. Field samples containing detected levels of those compounds that are below fivefold of the associated blank concentrations (at the instrument level) are considered potential external contamination. Those detections have been noted as being Estimated Maximum Potential Concentrations (EMPCs). It can be said that these analytes are not present at levels above those originally reported concentrations.

Results for furans that may include quantitative contribution from the corresponding chlorinated biphenyl ethers (BPE) have been noted as being EMPC. They may reflect false positives or a high bias.

Sample responses showing outlying ion ratios do not meet the requirements for identification and have been noted as being EMPC.

Detected results reported with the "Q" laboratory qualifier have been qualified as estimated due to quantitative interferences.

Sample SED-D-3-0-0.5 exhibited an elevated recovery (146%) for recovery standard $^{13}C_{12}$-OCDD. Therefore, the results for associated analyte OCDD are considered additionally estimated in value (all results for that sample are qualified due to low solids content).

The ion ratio of the surrogate standard $^{13}C_{12}$-1,2,3,4,6,7,8-HpCDD in LM-E-3 shows an ion ratio out of acceptable range. The results for this sample are qualified as estimated due to low solids content.

LM-F-2 was re-extracted within holding time. Although the data package only submitted the re-extraction results, the electronic table shows two analysis results. The initial results were deleted from the electronic table.

Matrix spikes were performed on LM-A-3, SW-W, SED-W-3-0-0.5 and show acceptable recoveries and duplicate correlations, with the following exceptions:

- LM-A-3 –two analytes show outlying recoveries in only one spike; three show outlying duplicate correlations. Results for the parent are qualified as estimated due to low solids content
- SED-W-3-0-0.5---OCDD shows elevated recoveries; results for the parent are qualified as estimated due to low solids content
- SED-C-3-0-0.5---these spikes produced nine and ten outlying recoveries and nine outlying duplicate correlations. This is attributed to the matrix. It is also noted that the solids content of the parent sample is 25%, and that for the spikes are 33% and 35%. Sample non-homogeneity is suspected. All results are qualified due to solids content.

Field duplicates of SW-Y, SED-Y-3, SED-W-1-0-0.5, and LMC-2 show acceptable correlations (below 50%RPD or <±CRDL), with the following exceptions, results for which are qualified in the parent sample and its corresponding duplicate:

- Numerous PCDD and PCDF isomers show poor correlations (66%RPD to 200%RPD) in SED-Y-3. All results for that pair are qualified as estimated due to low solids content.
- Six PCDD and PCDF isomers show variances fourfold to fivefold in SED-W-1-0-0.5. All results for that pair are also qualified as estimated due to low solids content.

The date on the method blank summary form for samples in SDG J43207 should have stated the date of 10/18/06, not 10/17/06. The raw data for that blank are correct.

Due to the matrix, sample SED-C-2-0.5-1.0 would not evaporate down to the protocol required volume. This results in elevated reporting limits for undetected compounds.

Detections of 2,3,7,8-TCDF were confirmed by alternate column analyses.

TAL and AVS/SEM Metals by USEPA SW846 6010B, 7470/7471

Results for the AVS/SEM in the field blank of 10/05/06 have been qualified as estimated due to the fact it was not received at the laboratory with adequate preservation.

Holding times were met. Blanks associated with sample analyses show no contamination above the reporting limit.

Matrix spike recovery and laboratory duplicate correlation evaluations were performed for TAL elements on SW-D, SW-W, SED-Z-1, SED-Z-2-0-0.5, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-E-2-1.0-1.5, SED-C-3-0-0.5, SED-B-1-0-0.5, and SED-9, for AVS/SEM processing on SED-Z-2-0-0.5, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-C-3-0-0.5, and SED-9, and for low level total mercury on .

Mercury failed to recover from the SEM digestions for SED-Z-1, SED-E-1-0-0.5, SED-C-3-0-0.5, and SED-9. Results for that element in the SEM fraction of the samples reported in SDGs J42535, J42838, J43022, J43207, J43284, and J43443 that report no detection of mercury are not usable. Detected SEM mercury results in those SDGs are qualified as estimated.

Other recoveries or correlations for the matrix spikes/duplicates that are outside validation guidelines (75% to 125% recovery, 50%RPD) are noted below, with qualification of results as estimated in the indicated samples:

Parent Sample	Analyte	Recoveries	Associated Samples
SED-Z-1	antimony	34% and 34%	Soils in J42535
SED-Z-1	SEM copper	65% and 63%	AVS/SEM in J42535
SED-Z-2-0-0.5	aluminum	126% and 128%	Soils in J42535
	antimony	55% and 55%	"
	copper	136% and 133%	"
SED-W-3-0-0.5	iron	118% and 586% (69%RPD)	Soils in J42762
	aluminum	139% and 105%	"
	antimony	47% and 44%	"
	calcium	70% and 66%	"
	magnesium	131% and 89%	"
	potassium	128% and 84%	"
	manganese	103% and 149%	"
	zinc	104% and 132%	"
	mercury	83% and 54%	"
SED-W-3-0-0.5	SEM cadmium	75% and 70%	AVS/SEM in J42762, J42866, J43022
	SEM lead	198% and 170%	" detections
	SEM zinc	249% and 191%	" detections
SED-E-1-0-0.5	antimony	65% and 65%	Soils in J42838
	barium	10% and 45%	"
	copper	42% and 50%	"
	iron	169% and 70%	"
	magnesium	277% and 208%	"
	manganese	200% and 92%; 62%RPD	"
	potassium	132% and 84%	"
	selenium	70% and 73%	"
	sodium	23% and 90%	"
	calcium	97%RPD	"
SED-E-1-0-0.5	SEM copper	65% and 63%	AVS/SEM in J42838
SED-F-2-0-0.5	antimony	36% and 36%	Soils in J42866
	cadmium	64% and 77%	"
SED-E-2-1.0-1.5	antimony	34% and 33%	Soils in J43022
	silver	275%; 100%RPD	"
	calcium	141%RPD	"
	zinc	71%RPD	"

Parent Sample	Analyte	Recoveries	Associated Samples
SED-C-3-0-0.5	antimony	25% and 29%	Soils in J43207 & J43284
	barium	212% and 250%	"
	cadmium	163% and 78	"
	copper	126% and 494%	"
	chromium	95% and 154%	"
	lead	203% and 108%	"

	antimony	22% and 20%	"
	arsenic	66% and 65%	"
	beryllium	51% and 42%	"
	chromium	27% and 30%	"
	cobalt	70% and 68%	"
	manganese	52% and 56%	"
	nickel	68% and 68%	"
	selenium	68% and 67%	"
SED-C-3-0-0.5	SEM copper	-59% & -55%;74%RPD	AVS/SEM J43207+J43284
	SEM lead	-4% and –20%	"
SED-9	antimony	47% and 50%	Soils in J43443
	magnesium	174% and 108%	"
SED-9	SEM copper	-70% and -61%	AVS/SEM in J43443

Elevated recoveries for elements not detected in the samples do not require qualification of associated data.

The three soil samples reported in SDG J41738 were associated with non-project batch QC that showed seven analytes having low recoveries and ten analytes having outlying duplicate correlations. All results for the samples in that SDG are already qualified as estimated due to low solids content.

Results for all AVS/SEM results in SED-C-3-0-0.5 are qualified as estimated due to low recoveries (60% to 58%) in the volatile sulfide procedure.

Field duplicate evaluations were performed for on SW-B, SW-Y, SED-W-1-0-0.5, SED-F-3-0-0.5, LM-C-2, and LM-D-4, for SEM metals on SED-W-1-0-0.5 and SED-Y-3, and for low level total mercury on SW-B and SW-C. The following outliers were observed, with resultant qualification of that element as estimated in the specific parent sample and associated duplicate:

- mercury in SB-B (66%RPD)
- the field duplicate of SED-W-1-0-0.5 (logged into the laboratory with the suffix "B" to the lab ID number ten days after receipt) shows no detection of any of the analytes; this is atypical of the project soil SEM results. The parent sample shows normal constituency. The reason for the duplicate sample variance is not evident.
- lead and mercury in SED-F-3-0-0.5
- AVS/SEM cadmium in SED-F-3-0-0.5
- aluminum, chromium, and zinc (52%RPD to 74%RPD) in LM-C-2
- barium (55%RPD) in SED-Y-3

The ICP serial dilutions of SEM metals on SED-W-3-0-0.5 and SED-C-3-0-0.5, and of total metals on SED-E-1-0-0.5 and SED-E-2-1.0-1.5 show acceptable correlations.

The following ICP serial dilution evaluations show outlying correlations, with detected results in associated samples qualified as estimated ("J"):

Parent Sample	Analyte	%RPD	Associated SDGs
SW-D	potassium	12	J42011
SW-W	potassium	16	J42360
SED-Z-1	potassium and sodium	12 and 16	J42535
SED-Z-2-0-0.5	lead, magnesium, potassium, and sodium	12 to 16	J42535
SED-Z-1	SEM lead	17	AVS/SEM J42535
SED-E-1-0-0.5	SEM lead	17	AVS/SEM J42838
SED-W-3-0-0.5	cobalt, lead, nickel, sodium, and zinc	11 to 15	J42762
SED-F-2-0-0.5	sodium and zinc	10 to 12	J42866
SED-9	sodium and zinc	10 to 12	J43443
SED-C-3-0-0.5	barium, cobalt, vanadium, and zinc	11 to 28	J43207
SED-B-1-0-0.5	arsenic, cadmium, calcium, chromium, cobalt, copper, lead, magnesium, manganese, nickel, potassium, sodium, and zinc	11 to 22	J43207
SED-9	SEM cadmium and lead	11 and 12	AVS/SEM J43443

The result for sodium in the field blank of 9/21/06 is qualified as estimated ("J"), with a low bias, due to low recovery for the associated low-level CRI standard.

The result for arsenic in the samples reporting detection in SDG J42011 are qualified as estimated ("J"), with a high bias, due to elevated recovery for the associated low-level CRI standard.

The results for mercury in the field blank of 09/29/06 and in the SEM fractions of the soils in J42762, J42866, and J43284 are qualified as estimated ("J"), with a low bias, due to low recoveries for the associated low-level CRI standards.

The result for antimony in the field blank of 10/02/06 is qualified as estimated ("J"), with a low bias, due to low recovery for the associated low-level CRI standard.

The results for arsenic in SED-Z-2-0-0.5, and in all soil reported in J42866 except SED-F-2-0-0.5, are qualified as estimated ("J"), with a high bias, due to elevated recoveries in the associated low-level CRI standards.

Wet Chemistry- Methyl Mercury, Cyanide, Hexavalent Chromium, TOC, Seive, Redox Potential (ORP), TSS, DOC, Hardness, pH

Review was conducted for method compliance, transcription, calculations, standard and blank acceptability, accuracy and precision, etc., as applicable to each procedure.

Hexavalent chromium failed to recover in the matrix spikes of LM-A-1, SED-Z-1, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-F-1-0-0.5, SED-E-2-0-0.5, SED-C-3-0-0.5, SED-B-1-0-0.5, SED-A-1-0-0.5, SW-C, and SED-9. Therefore, all non-detected results for that analyte in soils are rejected, and provide no usable information as to the presence or absence of that analyte. Detected values are qualified as estimated, and may have a significant low bias. Although those data are rejected, it can be said that the total chromium of the samples would represent a maximum potential value for hexavalent chromium.

The following matrix spike recovery/laboratory duplicate evaluations were performed:

- TOC in LM-A-2 and LM-F-3
- hexavalent chromium in LM-A-1, SW-A, SED-Z-1, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-F-1-0-0.5, SED-E-2-0-0.5, SED-C-3-0-0.5, SED-B-1-0-0.5, SED-A-1-0-0.5, and SED-9
- Redox Potential on LM-A-1 and SED-Z-1
- cyanide, TOC, DOC, TSS, and Hardness on SW-D and SW-W
- cyanide on SED-Z-2-1-1.5, SED-W-1-0-0.5, SED-D-2-2.0-2.5, LM-F-1, SED-9, and SED-A-2-0-0.5
- Sieve duplicates on SED-X-3, SED-W-3-0-0.5, SED-F-1-0-0.5, SED-E-2-0.5-1.0, SED-C-3-0-0.5, SED-B-1-0-0.5, SED-9, and SED-A-1-0-0.5
- cyanide, hexavalent chromium, Redox Potential, solids, and ph on SED-W-1-0-0.5
- cyanide and TOC on SED-E-1-0-0.5 and SED-C-3-0-0.5
- methyl mercury on LM-A-2, SW-D, SED-Z-1, SED-W-3-0-0.5, SED-E-2-0-0.5, FB100506, SED-C-3-0-0.5, SED-B-1-0-0.5, and SED-9

The result for cyanide in SED-9 is rejected and not usable due to very low recovery (7%) in the matrix spike of that sample.

Outlying matrix spike recoveries or duplicate correlations (in addition to the hexavalent chromium and cyanide outliers noted above) are listed below, with qualification of results as estimated in the indicated samples:

Parent Sample	Analyte	Associated Samples
SED-Z-2-1-1.5	Cyanide	soils in SDG J42535
SED-F-1-0-0.5	Gravel	parent sample
SED-E-2-0.5-1.0	Gravel	parent sample
SED-C-3-0-0.5	Gravel	parent sample
SED-B-1-0-0.5	Gravel	parent sample
SED-C-3-0-0.5	Cyanide and TOC	soils in SDG J43207
SED-A-1-0-0.5	Gravel	parent sample
SED-9	Gravel and methyl mercury	parent sample

The accuracy and precision evaluation for methyl mercury in LM-A-2 was repeated due to initial spiking error.
Some of the analyte recovery evaluations are not applicable due to high parent sample concentrations.

Field duplicate evaluations were performed for the following sample analytes.

- methyl mercury and total mercury in SW-B and SW-C
- methyl mercury on LMC-2, SED-Y-3, SED-W-1-0-0.5, SED-F-3-0-0.5, and LM-D-4
- TSS, hexavalent chromium, TOC, DOC, Hardness on SW-B and SW-Y
- Redox Potential, TOC, hexavalent chromium, sieve, and cyanide on SED-F-3-0-0.5, SED-Y-3, LM-D-4, and LM-C-2

Outliers were observed for the following analytes, with resultant qualification as estimated in the specific parent sample and associated duplicate:

- TSS (78%RPD) in SB-B
- Redox Potential and solids in SED-F-3-0-0.5
- % solids on LM-C-2
- No. 200 Sieve, %Silt, and Redox Potential on LM-D-4

The samples submitted in J42011 and the field blank of 9/21/06 (J41741) showed inadequate preservation at laboratory receipt. Results for these samples are therefore qualified as estimated, with a potential low bias.

The result for methyl mercury in the field blank of 9/29/06 is qualified as estimated due to elevated temperature at sample receipt (14.5°C).

Results for TOC in LM-D-3, LM-D-4, SED-7, and SED-8 are qualified as estimated, with unknown bias, due to variance in the result of the replicate injections.

Some of the field blanks show low levels of methyl mercury. Associated aqueous sample detected values are of high enough concentration to be disregarded as external contamination. Several of the soil samples reported in J42535, SED-E-2-1.5-2.0, SED-C-2-1.0-1.5 show levels within the action range for consideration as contamination, and have been edited to reflect non-detection at elevated reporting limits.

Samples SED-Y-1, SED-X-1, and SED-X-3 were received in broken containers that were closed into baggies. These samples are qualified for low solids content, but may also have a low bias due to potential losses.

Data Package Completeness/Chains-of-Custody

The chains-of-custody associated with the subcontracts do not include times of collection. They were present on the original field custodies and bottle labels. Some of the custodies do not include specific entries of release time and/or receipt date and time. The down-arrow for collection date was not present on the custody for J42762.

Some of the custodies for the subcontracting transfer to Battelle do not include release date, release times, and/or receipt signatures. The custody entry for SED-D-1-0-0.5 incorrectly denotes it as being HCl preserved.

The matrix of one of the field blanks on a custody submitted to Paradigm was incorrectly denoted as being soil.

The calibration standard sections of the Paradigm data packages are not paginated

Discrepancies in custody entries were resolved at sample receipt. Edits to custodies should have been dated and initialed.

SW-Y was reported as SW-4 in some of the hardcopy data. Similarly, some of the laboratory report forms show SED-4-3 rather than SED-Y-3. The field blank FB100506 is noted as being FB100S06 on some of the forms. Proper identifications were made on the electronic deliverables.

Please do not hesitate to contact me if you have comments or questions regarding this report.

Very truly yours,

Judy Harry

VALIDATION QUALIFIER DEFINITIONS

DATA QUALIFIER DEFINITIONS

The following definitions provide brief explanations of the national qualifiers assigned to results in the data review process. If the Regions choose to use additional qualifiers, a complete explanation of those qualifiers should accompany the data review.

U	-	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
J	-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
N	-	The analysis indicates the present of an analyte for which there is presumptive evidence to make a "tentative identification".
NJ	-	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
UJ	-	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	-	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

RE: Data Validation for the LCP Superfund site, Linden, NJ
Accutest SDG Nos. J44803, J44938, J45239, J45527, J46783, J45854, J46057, J46213, J46443, J46565, J46700, J46853, J47004, J47128, J47366, J48098, J48211, J48325, J49293, J49409, J49451, J49611, J51040, J51158, J51393, J51494, J51580, J51673, J51889, J52021, J52027, J52130, J52219, J52588, J52669, J52751, J52878, J52971, J53104, J53258, J53388, J53483, J53484, J53630, J53740, J53817, J54238, J54435, J54580, J54581, J54589, J54782, J55249, J55249X, J55951, J55951X, J56074, and J57403

Dear Mr. Cavas:

Review has been completed for the data packages generated by Accutest Laboratories that pertain to samples collected 10/26/07 through 3/30/07 at the LCP Superfund, Linden, NJ project site. One hundred and six soil samples and twenty-eight aqueous samples were processed for TCL Volatiles, TCL Semivolatiles, TCL Pesticides, TCL PCBs, TAL metals, hexavalent chromium, and total cyanide. The soil samples were also processed for TOC and Redox Potential, and the aqueous samples were also processed for filtered metals. Twelve of the soil samples were also processed for Dioxin/Furans (PCDD/PCDF). Twenty-four of the samples were also processed for methyl mercury. A total of thirty samples were processed only for mercury (total or filtered). Four aqueous and one soil sample were analyzed only for metals. Aqueous samples also underwent Selective Ion Monitoring (SIM) for selected semivolatile analytes in order to obtain better sensitivity and lower reporting limits. Blind field duplicates, sample matrix spikes, field blanks, and trip blanks were processed with the project samples. The specific sample location identifications covered in this report are noted in the attached laboratory summary listings.

The analytical methodologies utilized are those of the USEPA SW846 3rd edition and USEPA Standard Methods. The dioxin/furan analyses were subcontracted to SGS/Paradigm, the methyl mercury to Battelle Marine Sciences.

Validation review of the data packages has been performed utilizing the guidance in the USEPA National Functional Guidelines for Data Review, the USEPA Region II validation SOPs, the project QAPP (including laboratory SOPs), the specific methodology requirements, and professional judgment.

The following items were reviewed:

* Laboratory Narrative Discussion
* Custody Documentation
* Holding Times
* Surrogate Recoveries and Internal Standard Responses
* Matrix Spike Recoveries/Duplicate Correlations
* Field Duplicate Correlations
* Preparation/Calibration Blanks
* Control Spike/Laboratory Control Samples
* Instrumental Tunes
* Calibration/CRI/CRA Standards
* ICP Serial Dilution
* ICP Interference Check Samples
* Dioxin/Furan Recovery and Clean-Up Standards
* Instrument IDLs and Performance
* Method Compliance
* Sample Result Verification

Those items listed above which show deficiencies are discussed within the text of this narrative. All of the other items were determined to be acceptable according to the validation guidelines noted above.

In summary, most of the sample analyte values/reporting limits are usable as reported, or usable with minor qualification as estimated ("J" qualifier) due to matrix effects. The following exceptions were noted:

- Due to matrix effect, the results for hexavalent chromium in numerous samples are not usable, as evidenced by the lack of recovery of that analyte in the sample spikes.
- Results for several select volatile or semivolatile compounds are not usable in a limited number of samples due to matrix effects
- Numerous metals results of soil and aqueous samples were qualified as estimated due to matrix effects
- Reporting limits for metals in many of the aqueous samples are elevated, typically tenfold, due to interferences, primarily from sodium constituency
- Some of the low level detections are considered external contamination, as evidenced by presence in associated blank

Laboratory processing was generally compliant with analytical protocol requirements, the samples do not show significant matrix effects on organic target analyte recoveries, and the project data completeness requirement of 90% has been met.

Copies of the laboratory sample identification summary forms that list the sample covered in this report are attached to this text. Included with this submission are electronic client data tables that have been qualified in red to reflect the edits and qualifications referenced and recommended within this report. These tables have been submitted under separate cover.

The following text discusses quality issues of concern.

General

Due to low solids content (20.8%), results (both detected values and the reporting limits of non-detected analytes) for LHP-126-10.5-12 have been qualified as estimated, with a possible bias of an unknown direction. This is due to the potential for non-homogeneity during sample collection/processing, as well as to the variances in analytical methodologies betweennn aqueous and soil matrices.

Field and trip blanks submitted with the samples covered in this report show minimal contamination, with most having no contamination above reporting limits. The rare exceptions where sample results are affected are noted in the following text.

Sample LHP-105-1-3 was reported by the laboratory in the data package as "LHP-105-13-1". The electronic tables are correct.

TCL Volatiles by USEPA SW846 8260B

Results for toluene in MW-13S and MW-18S are considered external contamination due to presence I the associated field blank, and are edited to non-detection.

Matrix spikes (MS and MSD) for MW-6D-12-14, MW-16D-17-19, LHP-111-0-1, LHP-105-1-3, ADS-102-7-8, MW-11D-12-14, MW-23D, MW-9S, MW-24S, H-B-105D, and MW-22S show accuracy and precision within QAPP/validation guidelines, with the following exceptions:

- bromomethane in MW-11D-12-14—that result in the parent sample is qualified as estimated
- numerous analytes show elevated duplicate correlations in MW-23D. The sample reports no detections, and reported results are unaffected.
- carbon disulfide, 1,1-dichloroethene, and trans-1,2-dichloroethene in MW-24S show low recoveries

Field duplicate correlations for WW-101-15-17, MW-16D-17-19, MW-25D-10-12, LHP-105-0-1, LHP-128-0-1, MW-7S, and MW-19S are acceptable, with the exception of that for methylene chloride (>±CRDL) in WW-101-1115-17. Results for that analyte in the parent sample and duplicate are qualified as estimated.

Calibrations standards show acceptable responses, with the following exceptions, results for which are qualified as estimated in the indicated samples:

- acetone and/or 2-butanone (low RRF) in the majority of the sample covered in this report
- bromomethane in MW-11D-12-14
- chloromethane in MW-18S
- carbon disulfide and bromoform in HB-102B and HB-102C

No qualification is made for analytes that show elevated responses in calibration standards but were not detected in the samples.

The results for the trip blank reported in SDG J46700 are qualified as estimated due to analysis beyond the QAPP holding time requirement.

The results for TB020207 are qualified as estimated due to bubbles present in the vials, and the potential of loss through headspace.

No volatile field or trip blank analysis was associated with HB-102A. The sample reports no detection of volatile compounds, and results are therefore not affected.

Tentatively Identified Compounds (TICs) that are flagged as "B" or identified as "system artifacts" are considered external contamination, as shown by presence in the associated blanks.

TCL Semivolatile Analyses by USEPA SW846 8270C

The three soils reported in SDG J44803 and six soils in J48098 show outlying low responses for one or more internal standards. The results for specific target analyte compounds associated with the outlying standards have been qualified as estimated in those samples.

Four soil samples reported in J48325 show sufficiently low responses for internal standard d12-perylene that results for non-detected analytes associated with that internal standard have been rejected, and are not usable. For those samples, detected results associated with d12-perylene, as well as all results associated with d12-chrysene, have been qualified as estimated.

Six detected results in TES-4-0-1 have been qualified as estimated due to elevated response of the associated internal standard.

Results for benzaldehyde in WW-101-15-17, its field duplicate, MW-23D-15-17, and MW-14D-17-19 are not usable due to lack of recovery of this compound in the associated spiked blank controls.

The results for 2-methylphenol MW-23D-15-17 and MW-14D-17-19 are qualified as estimated due to low recovery in the associated spiked blank control.

MW-17D and MW-17S were re-extracted beyond allowable holding time, due to low recoveries for seven analytes in the associated spiked blank control. The initial results are used, with results for those compounds qualified as estimated. Additionally, the result for 2-chlorophenol in MW-17D and the detected values in MW-17S (they are derived from the re-extractions) are qualified as estimated due to the outlying holding time.

MW-16S was re-extracted due to a single low surrogate recovery. The initial result can be used without qualification.

The results for 2-chlorophenol in the soil samples reported in SDG J47004, and for 2,4,6-trichlorophenol in the soils reported in J48098 are qualified as estimated due to slightly low recovery in the associated spiked blank control.

Field duplicate correlations for WW-101-15-17, MW-16D-17-19, MW-25D-10-12, LHP-105-0-1, LHP-128-0-1, MW-7S, and MW-19S are acceptable, with the exception of that for bis(2-ethylhexyl)phthalate in LHP-105-0-1, which shows variance exceeding ±2XCRDL. The results for that analyte in the parent sample and duplicate have been qualified as estimated.

Matrix spikes (MS and MSD) for LHP-124-2-4, LHP-124-10-12, MW-6D-12-14, MW-25D-10-12, LHP-111-0-1, LHP-105-1-3, LB-103-0-1, MW-11D-12-14, MW-11D-16-18, MW-17D, MW-16D, MW-21D, MW-6D, MW-7S, MW-8S, MW-12S, MW-9S, MW-22S, and H-B-104B show accuracy and precision within validation guidelines, with the following exceptions:

- benzaldehyde and hexachlorocyclopentadiene failed to recover in LHP-124-2-4 and hexachlorocyclopentadiene failed to recover in LHP-109-7-9. Results for those specific compounds in the noted parent samples are therefore rejected, and not usable
- benzaldehyde, hexachlorocyclopentadiene, atrazine, 3,3-dichorobenzidine, and caprolactum failed to recover in LHP-109-7-9. Results for those specific compounds in the parent sample are therefore rejected, and not usable. The result for 4-chloroaniline in this parent sample is qualified as estimated due to outlying spike recoveries.
- benzaldehyde failed to recover in DUP02070, and the results for that compound in the field duplicate and parent sample are rejected. The result for phenol is qualified as estimated in that parent and duplicate because the matrix spike responses were not resolved from those of aniline the spikes.
- bis(2-ethylhexyl)phthalate in LHP-124-2-4 shows elevated recoveries; results in the parent sample are qualified as estimated
- five analytes did not recover in the spikes of LHP-111-0-1, but they were analyzed at tenfold dilution. Accuracy and precision for the other analytes were acceptable; no qualification is indicated
- 4,6-nitro-2-methylphenol in LHP-109-0-1 is qualified as estimated due to low recovery
- some of the SIMs matrix spikes show slightly outlying recoveries, but were inadvertently spiked at concentrations exceeding instrument linear range; no qualification is made
- MW-23D shows elevated duplicate correlations for more than thirty analytes; the recoveries are acceptable, and the parent sample shows no detections; no qualification is made
- matrix spikes of MW-12S exhibited elevated duplicate correlations for all but one analyte. This variance was also noted in the surrogate recoveries of the spikes, and is likely an extract-specific anomaly—no qualification is made
- benzo(k)fluoranthene in MW-12S
- five analytes show low recovery in the matrix spikes of MW-22S, and have been qualified as estimated in the parent sample

The results for the field blank of 12/05/06 are qualified as estimated, with a possible low bias, due to outlying holding time to extraction.

Due to presence in the associated field blank, the detected results for bis(2-ethylhexyl)phthalate in H-B-103A and H-B-104A, and for 2-methylnaphthalene inn HB-102B, are considered external contamination, and edited to reflect non-detection ("U").

Calibrations standards showed acceptable responses with laboratory requirements and validation guidelines, with the following exceptions, results for which are qualified as indicated in the noted samples:

- hexachlorocyclopentadiene in MW-17D-15-17, MW-17D-17-19, FB102706, FB110807, LHP-113-0-1, LHP-106-0-1, LHP-119-0-1, TES-4-0-1, TES-1-0-1, FB121406, FB121806, MW-15S, MW-24S, FB022007, and HB-102C
- bis(2-ethylhexyl)phthalate detections in soils in J44803
- 2,4-dinitrophenol and 4-nitrophenol in FB103106
- hexachlorocyclopentadiene, 2,4-dinitrophenol, and 4-nitrophenol in MW-20D-32-34 and MW-20D-36-38
- hexachlorocyclopentadiene and 4,6-dinitro-2-methylphenol in FB111006
- hexachlorocyclopentadiene, benzaldehyde, and 2-methylphenol in FB111306
- 2-methylphenol in FB111506
- 2-chlorophenol, 2,4,6-trichlorophenol, and 1,1-biphenyl in soils reported in J46853
- hexachlorocyclopentadiene, hexachlorobutadiene, and 1,1-biphenyl in FB111606
- hexachlorocyclopentadiene and 2,4-dinitrophenol in four samples in J48325,
- pentachlorophenol in MW-17D, MW-17S, MW-18D, MW-16S, MW-14S, and the associated field blanks
- 4-nitrophenol in MW-18D and its field blank

Tentatively Identified Compounds (TICs) that are flagged as "B" and/or "A", or identified as "system artifacts" are considered external contamination, as shown by presence in the associated blanks.

TCL PCB/Pesticides Analyses by USEPA SW846 8081A and 8082

Samples MW-8S and MW-12S show very high concentrations of elemental sulfur (also noted in the BNA analysis TIC results). Although the extracts went through copper cleanup, there is still sufficient copper as to produced significant interferences in the pesticide and PCB analyses of those samples. These would have completely masked response for heptachlor on both analytical columns used in these analyses, and results for that compound are therefore rejected, and not usable in those samples. Results for the other pesticides and PCB analytes (they report no detection) are qualified as estimated in value, and should be considered as being borderline usability.

Some of the pesticide reported detections may reflect responses from the sample matrix or PCB components. Those detections show elevated dual column correlations, with resulting qualifications as either estimated in value ("J"), tentative in identification and estimated in value ("NJ"), or edited to nondetection ("U", sometimes at elevated reporting limits). The correlations reported on summary forms by the laboratory were calculated as %RPD. Per validation protocols, this review evaluation utilized %D. The appropriate qualifications have been made on the client results tables.

MW-16D-13-15 and LHP-122-0-1 produced low recoveries for all surrogates in the initial extractions. The re-extractions were beyond allowable holding time. The pesticide and PCB results are qualified as estimated, and likely have a low bias.

The results for the field blank of 12/18/06 are qualified as estimated, with a possible low bias, due to outlying holding time to extraction.

The field blanks FB112006 and FB020207 were re-extracted (beyond holding time) due to low surrogate recovery on one column. The initial alternate column responses were acceptable, and are used without qualification.

Calibration standards meet protocol and validation requirements.

Matrix spikes of pesticides and Aroclors 1016 and 1260 were performed on LHP-124-10-12, MW-6D-12-14, MW-25D-10-12, LHP-105-1-3, MW-11D-16-18, MW-16S, MW-23D, H-B-105C, and MW-22S. Matrix spikes of pesticides were performed on LHP-101-0-1 and LHP-109-7-9, and matrix spikes of Aroclors 1016 and 1260 on LHP-105-5-8 and LHP-121-0-1. They show acceptable accuracy and precision, with the following exceptions:

- several recoveries were elevated in LHP-105-1-3 due to high concentrations of Aroclor 1254 in the parent sample.
- seven pesticides show low recoveries in MW-16S spikes, and results for those compounds in the parent sample are qualified as estimated in value
- recoveries were elevated in some cases for analytes not detected in the samples due to interferences; no qualifications are made as a result

Due to slightly low recoveries in the associated spiked blank controls, the results for d-BHC in the soils reported in J49409, and in the aqueous samples in J51494, J51580, J51673, J51889, J52021, and J52219 are qualified as estimated, with a possible low bias.

Field duplicate correlations for WW-101-15-17, MW-16D-17-19, LHP-128-0-1, MW-7S, and MW-19S are acceptable.

The field duplicate correlations for Aroclors 1254 and 1260 in LHP-105-0-1 show variance where there were detections in the parent at levels above CRDL (up to 629 ug/kg), but no detections above the CRDL of 35 ug/kg in the duplicate. Those results have been qualified as estimated in the parent and its duplicate.

TES-3-0-1 shows elevated surrogate recoveries in the pesticide and PCB analyses due to interferences from the PCBs in the sample. No qualification is made.

TCL Dioxin/Furan Analyses by USEPA SW846 8290

Detected results for samples that were reported with the laboratory "A" qualifier reflect quantitative values below the established linear range of the instrument, and have therefore been qualified as estimated in value.

Results for furans that may include quantitative contribution from the corresponding chlorinated biphenyl ethers (BPE) have been noted as being EMPC. They may reflect false positives or a high bias.

The method and field blanks contain low levels (below CRDL) of many of the PCDD and PCDF isomers. Field samples containing detected levels of those compounds that are below fivefold of the associated blank concentrations (at the instrument level) are considered potential external contamination. Those detections have been noted as being Estimated Maximum Potential Concentrations (EMPCs). It can be said that these analytes are not present at levels above those originally reported concentrations.

Sample responses showing outlying ion ratios do not meet the requirements for identification and have been noted as being EMPC.

Detected results reported with the "Q" laboratory qualifier have been qualified as estimated due to quantitative interferences.

TAL Metals by USEPA SW846 6010B, 7470/7471

As noted earlier, reporting limits for many aqueous sample analytes are elevated due to matrix interference. Although this results in limits that are higher than those proposed, this occurs only in samples showing extremely high concentrations of sodium and other elements.

Sample LCP-231-SS112706 was reported on a wet weight basis. A minimal quantity of sample was submitted; no solids determination was performed. The "as-received" basis should be considered in the evaluation of those data.

Analytes showing matrix spikes recoveries that are outside validation guidelines are noted below, with qualification of results as estimated in the samples in the indicated samples:

Parent Sample	Analyte	Associated Samples
LHP-126-2-4	aluminum, barium, beryllium, cobalt, potassium, and sodium	J44803
LHP-125-.5-2	antimony, copper, lead, magnesium, manganese, and zinc	J44938
LHP-125	antimony, barium, manganese	J45239
LP-101-11-13	antimony	J45527
WWT-101-21-23	antimony	J45783
MW-6D-12-14	aluminum, antimony, barium, cadmium, chromium, copper, iron, lead, magnesium, manganese, nickel, potassium, and vanadium	J45854
MW-20D-12-14	antimony, manganese, iron, potassium, and mercury	J46057
MW-20D-36-38	antimony, arsenic, calcium, chromium, manganese, potassium, selenium, zinc	J46213
MW-14D-13-15	antimony, barium, iron, manganese	J46443
MW-23D-15-17	antimony, manganese, iron, magnesium	J46565
MW-23D-37-39	antimony and selenium	J46700, J46853, and J47004
MW-6D-30-32	antimony, aluminum, barium, potassium	J47128 and J47366
LHP-111-0-1	antimony, barium, calcium, magnesium, manganese, zinc	J48098

cont'd

Parent Sample	Analyte	Associated Samples
LHP-105-1-3	antimony and mercury	J48211
LHP-127-3-5	antimony, arsenic, beryllium, chromium, potassium, and mercury (detections)	J48325
MW-11D-16-18	antimony, iron, manganese, selenium	J49293, J49409, and J49611
MW-110-14-16	antimony, iron, manganese, sodium	J49293, J49409, and J49611
TPS-1	sodium	J49451
MW-17D	cadmium and iron	J51040 and J51153
MW-18D	iron, mercury, thallium	J51393, J51494, J51580, and J51673
WC-SOIL-011907B	mercury	J52027
MW-6S	potassium	J52130, J52219, and J52588
MW-23D	potassium	J52669 and J52751
MW-6D	potassium	J52878, J52971, J53104, and J53258,
H-B-105C	mercury	J53484
H-B-103A	antimony and magnesium	J53484 and J54238
SW-SB-2-22-07-1400	mercury	J54435 and J54581
H-B-104B	antimony	J54580 and J54782
HB-101A	antimony	J55249 and J55951
HB-102C	antimony, potassium, thallium	J56074

Laboratory duplicate correlations are acceptable. Matrix spikes for TAL metals on MW-16S, and for mercury on LHP-124-10-12, MW-7S, MW-22S, HB-102B, and DUP110606 show recoveries within recommended limits. Elevated matrix spike recoveries for elements not detected in the samples do not require qualification of associated data.

Field duplicate evaluations were performed for on WW-101-15-17, MW-16D-17-19, MW-25D-10-12, LHP-105-0-1, LHP-128-0-1, MW-7S, and MW-19S, and for filtered mercury in SW-VB-02-23-07-0900. The following outliers were observed, with resultant qualification of that element as estimated in the specific parent sample and associated duplicate:

- barium and manganese inn WW-101-15-17
- zinc in MW-16D-17-19
- mercury in MW-25D-10-12
- iron in filtered fraction of MW-19S

Due to low level detection in the associated field blank, the results for manganese in MW-22S and its filtrate are edited to reflect non-detection at the originally reported concentrations.

The following ICP serial dilution evaluations show outlying correlations, with detected results (greater than 10 X IDL) in associated samples qualified as estimated ("J"):

Parent Sample	Analytes	Associated SDGs
LHP-126-2-4	calcium, cobalt, magnesium, nickel	J44803
LHP-125-.5-2	zinc	J44938
LHP-125	aluminum, barium, beryllium, calcium, potassium and zinc	J45239
LP-101-11-13	calcium, chromium, cobalt, copper, nickel, zinc	J45527
WWT-101-21-23	calcium, chromium, cobalt, iron, manganese, sodium, vanadium, and zinc	J45783
MW-6D-12-14	barium, cadmium, cobalt, iron, nickel, potassium, sodium	J45854
MW-20D-12-14	copper	J46057
MW-20D-36-38	aluminum, barium, calcium, chromium, cobalt, iron, magnesium, manganese, nickel, potassium, sodium, vanadium, zinc	J46213
MW-14D-13-15	aluminum and beryllium	J46443
MW-23D-37-39	beryllium, chromium, manganese, nickel, potassium sodium, vanadium, zinc	J46700, J46853 and J47004
MW-6D-30-32	nickel and sodium	J47128 and J47366
LHP-105-1-3	arsenic, barium, beryllium, calcium, chromium magnesium, and nickel	J48211
LHP-127-3-5	arsenic, beryllium, calcium, chromium, magnesium, nickel, silver, sodium	J48325
MW-11D-16-18	aluminum, barium, calcium, chromium, cobalt, magnesium, manganese, nickel, potassium, sodium, and zinc	J49293, J49409, and J49611
MW-110-14-16	potassium and sodium	J49293 andJ49409
MW-17D	potassium	J51040 and J51153
MW-18D	copper, potassium, sodium	J51153, J51494, J51580, and J51673
MW-16S	manganese and potassium	J51889 and J52021
MW-6S	potassium	J52130, J52219, and J52588
MW-23D	iron and potassium	J52669 and J52751
MW-23D-Filt	potassium	J52669 and J52751
MW-6D	potassium and sodium	J52878, J52971, J53104, and J53258
MW-22S-Filt	barium in filtered	J53388, J53483, J53630, J53740, and J53817
H-B-104B	calcium and zinc	J54580 and J54782
HB-101A	cobalt, potassium, and sodium	J55249and J55951

cont'd

Parent Sample	Analytes	Associated SDGs
HB-102C	aluminum, barium, calcium, chromium, cobalt, iron, magnesium, manganese, nickel, potassium, vanadium, and zinc	J56074

The ICP serial dilutions of MW-23D-15-17, LHP-111-0-1, WC-SOIL-011907B, and MW-22S-Total show acceptable correlations.

The following analytes show concentrations higher in the filtered fractions by more than 10%D, and results for those elements have been qualified in both the total and filtered fractions of the indicated samples:

Sample ID	Analytes
MW-17D	cobalt, iron, lead, magnesium, manganese, and sodium
MW-18D	manganese and sodium
MW-16D	calcium, lead, manganese, potassium, sodium
MW-20D	calcium and lead
MW-14D	calcium
MW-14S	sodium
MW-21D	calcium, iron, potassium, sodium
MW-21S	lead and iron
MW-11S	antimony, calcium, iron, lead, magnesium, selenium, and sodium
MW-6D	calcium
MW-7S	potassium
MW-8S	manganese
MW-10S	arsenic
MW-12S	arsenic and manganese
MW-24S	magnesium
MW-15S	barium, nickel, potassium
MW-22S	arsenic

The result for mercury in LHP-125-0.5-2, MW-13S and MW-18S are qualified as estimated, with a low bias, due to low recoveries for the associated low-level CRI standards.

The results for antimony in soils reported in SDG J48211, MW-21S, MW-21D, MW-23S, MW-23D-Filt, and in the field blanks of 11/02/06 and 11/07/06 are qualified as estimated, with a low bias, due to low recoveries for the associated low-level CRI standards.

The result for arsenic in FB111606 is qualified as estimated, with a low bias, due to low recovery in the associated low-level CRI standard.

The results for lead in MW-9S, MW019S, DUP020707, and FB121506 are qualified as estimated, with a low bias, due to low recovery in the associated low-level CRI standards.

The result for thallium in the filtrate of MW-17D is qualified as estimated, with a low bias, due to low recovery in the associated low-level CRI standard.

The results for arsenic and beryllium in MW-24S and MW-15S are qualified as estimated, with a low bias, due to low recovery in the associated low-level CRI standard.

The results for arsenic and antimony in MW-22S and MW-15S (Filt only) are qualified as estimated, with a low bias, due to low recovery in the associated low-level CRI standard.

Detected results for lead in MW-25D, for cadmium in samples reported in J47366, and selenium in MW-11S and MW-11D are qualified as estimated, with a high bias, due to elevated recoveries for the associated low-level CRI standards.

MW-18S was received by the laboratory with incomplete preservation. The sample was preserved at the laboratory. Results are qualified as estimated, and may have a low bias.

Wet Chemistry- Cyanide, Hexavalent Chromium, TOC, Methyl Mercury, Redox Potential (ORP), TSS, pH

Review was conducted for method compliance, transcription, calculations, standard and blank acceptability, accuracy and precision, etc., as applicable to each procedure.

Cyanide recovered below 10% in the matrix spikes of LHP-126-2-4 and LHP-127-3-5. Therefore, the non-detected result for that analyte in the parent samples are rejected, and provide no usable information as to the presence or absence of that analyte. Results for all associated samples (J44803, J44938, J48325, and J48293) are qualified as estimated, and may have a significant low bias.

Hexavalent chromium recovered below 10% in the matrix spikes of MW-6D-12-14, LHP-127-3-5, LHP-105-1-3, MW-20S, MW-14D-Filt, MW-21D-Filt, MW-6D-Filt, MW-10S-Filt, MW-12S-Filt, MW-9S-Filt, and HB-102C. Therefore, the non-detected results for that analyte in the samples in J45854 J48211, J48325, J49409, J51580, J51673, J52021, J52878, J53104, J53258, J53388 and J56074 are rejected, and provide no usable information as to the presence or absence of that analyte. Detected values in those samples are qualified as estimated.

The hexavalent chromium reported result for MW-10S is detection at 10 ug/L. The total chromium result for that sample shows no detection at that level. Because the total chromium analysis is more definitive, it is assumed that the hexachrome detection reflects interferences, and it has therefore been edited to non-detection. Following that edit, the result is rejected due to lack of recovery of the matrix spike of that sample.

Although the hexavalent chromium data are rejected, it can be said that the total chromium values in the samples would represent a maximum potential value for hexavalent chromium.

Field duplicate evaluations were performed on WW-101-15-17, MW-16D-17-19, MW-25D-10-12, LHP-105-0-1, LHP-128-0-1, MW-7S, and MW-19S. Outliers were observed for the following analytes, with resultant qualification as estimated in the specific parent sample and associated duplicate:

- cyanide in WW-101-15-17
- TOC in LHP-105-0-1
- TOC in LHP-128-0-1

The cyanide fraction of MW-18S was received by the laboratory with incomplete preservation. The sample was preserved at the laboratory. The result is qualified as estimated, and may have a low bias.

The following matrix spike/laboratory duplicate evaluations were performed:

- TOC on MW-265-8-10, MW-20D-12-14, MW-23D-15-17, MW-21D-15-17, MW-16D-17-19, LHP-111-0-1, LHP-105-1-3, LHP-127-3-5, MW-11D-16-18, H-B-105C, H-B-104B, H-B-104D, H-B-101A, and HB-102B
- Cyanide on LHP-126-2-4, LHP-125-10-12, WW-101-21-23, MW-6D-12-14, MW-20D-12-14, MW-20D-36-38, MW-14D-13-15, MW-23D-15-17, MW-21D-13-15, MW-16D-17-19, LHP-101-0-1, LHP-105-1-3, LHP-127-3-5, LB-101-0-1, MW-11D-16-18, MW-25D-33-35, MW-17D. MW-17S, MW-18D, MW-20S, MW-14D, MW-14S-Filt, MW-25D, MW-23S, MW-23D, MW-11S, MW-6D, H-B-105C, MW-22S, MW-13S, H-B-103A, H-B-104B, H-B-104D, H-B-101A, HB-102A, and HB-102B
- Hexavalent chromium on MW-6D-12-14, LHP-125-0.5-2, DUP110606, LHP-111-0-1, LHP-127-3-5, LHP-105-1-3, MW-17D-Filt, MW-17S-Filt, MW-18D-Filt, MW-16D, MW-14D-Filt, MW-14S-Filt, MW-21D-Filt, MW-6-Filt, MW-25D, MW-23D, MW-11S, MW-6D-Filt, DUP020107-Filt, MW-10S-Filt, MW-12S-Filt, MW-9S-Filt, MW-22S, MW-13S-Filt, H-B-104B, H-B-104D
- Redox Potential on LHP-125-10-12, LP-101-11-13, MW-14D-13-15, LHP-105-1-3, LHP-127-3-5, MW-11D-16-18, and MW-25D-33-35
- Petroleum hydrocarbon on WC-SOIL-011907B
- Specific Gravity on MW-6D and MW-11D
- TSS on SW-SB-2-22-07-1400
- Methyl mercury on HB-101A

Outlying matrix spike recoveries or duplicate correlations (in addition to the hexavalent chromium and cyanide outliers noted above) are listed below, with qualification of results as estimated in the indicated parent samples:

Parent Sample	Analyte	Associated Samples
MW-265-8-10 TOC		J44803
DUP110606	hexavalent chromium	J45783
MW-6D-12-14	cyanide	J45854
MW-20D-12-14	TOC	J46057
LHP-127-3-5	TOC	J48325
MW-16D	hexavalent chromium	J51494
MW-14S-Filt	hexavalent chromium	J51889
MW-16S-Filt	hexavalent chromium	J52130
MW-25D-Filt	hexavalent chromium	J52219
MW-11S	hexavalent chromium	J52751
DUP020107-Filt	hexavalent chromium	J52971
H-B-105C	TOC	J53484
MW-13S-Filt	hexavalent chromium	J53740
HB-102B	TOC	J56074

Results for TOC in MW-6D-0-2, MW-17D-17-19, MW-16D-13-15, LHP-101-5-8, LHP-120-0-1, H-B-104B, H-B-104C, and nine samples reported in SDG J48325 are qualified as estimated, with unknown bias, due to variance in the result of the replicate determinations.

Data Package Completeness/Chains-of-Custody

Two samples reported in J45239 were submitted and reported with the same client ID (LHP-125). The electronic deliverables distinquishes the two different depths.

Two samples submitted for SDG J45239 were not entered onto the custody form until sample receipt.

The calibration standard sections of the Paradigm data packages are not paginated

Discrepancies in custody entries were resolved at sample receipt. Edits to custodies should have been dated and initialed.

Please do not hesitate to contact me if you have comments or questions regarding this report.

Very truly yours,

Judy Harry

VALIDATION QUALIFIER DEFINITIONS

DATA QUALIFIER DEFINITIONS

The following definitions provide brief explanations of the national qualifiers assigned to results in the data review process. If the Regions choose to use additional qualifiers, a complete explanation of those qualifiers should accompany the data review.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

N - The analysis indicates the present of an analyte for which there is presumptive evidence to make a "tentative identification".

NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

QUALITATIVE
DATA USABILITY REPORT
Soil Vapor Sampling
LCP Superfund Site

SDG No.: J63094 and J63222

Laboratory: Accutest Laboratories, Dayton, New Jersey

Site: LCP Superfund Site, Linden, New Jersey

Date: July 25, 2007

Data Reviewed by: Gregory Cole, Brown and Caldwell

A Qualitative Data Usability Review was performed on all analytical data from SDGs J63094, and J63222. The following table outlines the samples and analytical methods reviewed;

Sample	Analysis	Method
SV-8	Volatile Organic Compounds (VOC)	TO-15
SV-9	Volatile Organic Compounds (VOC)	TO-15
SV-10	Volatile Organic Compounds (VOC)	TO-15
SV-12	Volatile Organic Compounds (VOC)	TO-15
SV-13	Volatile Organic Compounds (VOC)	TO-15
DUP060707	Volatile Organic Compounds (VOC)	TO-15
TB060707	Volatile Organic Compounds (VOC)	TO-15
SV-1	Volatile Organic Compounds (VOC)	TO-15
SV-2	Volatile Organic Compounds (VOC)	TO-15
SV-3	Volatile Organic Compounds (VOC)	TO-15
SV-4	Volatile Organic Compounds (VOC)	TO-15
SV-5	Volatile Organic Compounds (VOC)	TO-15
AA2-060707	Volatile Organic Compounds (VOC)	TO-15
AA1-060707	Volatile Organic Compounds (VOC)	TO-15

This review was performed based on the requirements provided in the project Quality Assurance Project Plan, the USEPA Region II validation SOPs, and on guidance provided in the Contract Laboratory Program National Functional Guidelines for Organic and Inorganic Data Review, 2004.

The review included the parameters listed below.

- Sample Documentation
- Sample Holding Times
- Laboratory and Field Blank Review
- Surrogate Recovery Review
- MS/MSD Recovery and Precision
- Field/Laboratory Duplicate Review
- Laboratory Control Sample (LCS) Review
- Sample Quantitation

DESCRIPTION OF QUALITATIVE REVIEW

Summary Evaluation of Data and Potential Usability Issues

Overall, the data is acceptable for the intended purposes. No results were rejected. Data quality issues with respect to field duplicate precision and results exceeding the calibration range were identified requiring qualification of some data.

Sample Documentation

Provided laboratory reports included all the necessary information to perform the described data review except the following:

- Detection limits were not provided in the hardcopy lab report. The lab report provides the reporting limit only. However, results detected at concentrations between the detection limit and the reporting limit are reported as estimated values The detection limits were provided as part of the electronic deliverable and have been loaded into the project database. Results reported as not detected can be considered to be less than the detection limit

Sample Holding Times

Each sample was prepared and analyzed within the specified holding time for each analysis

Laboratory and Field Blank Review

All compounds were reported as not detected in the laboratory and field blanks

Surrogate Recovery Data

Each of the surrogate recoveries were within the guidance limits.

MS/MSD Review

Matrix spikes were not performed on any Site samples.

Field/Laboratory Duplicate Review

One field duplicates was collected and analyzed for the same parameters as the associated parent samples. DUP060707 is a field duplicate for SV-10. In general, duplicate precision was poor. This is likely due to the inherent difficulties in collecting high volumes of soil vapor. Soil vapor becomes diluted as the sample volume collected increases. Therefore, reported results may be biased low. The field duplicate had much lower concentrations than the parent sample indicating that it was collected after the parent sample. The following analytes have been qualified as estimated due to field duplicate imprecision.

Constituent	Parent amt. (ppbv)	Duplicate amt. (ppbv)	RPD	RPD Limit	Action
Ethylbenzene	13.9	4.7	99	50	J
1,3,5-Trimethylbenzene	4.0	1.3	102	50	J
Toluene	91.8	35.2	89	50	J
Hexane	23.3	12.9	57	50	J

Constituent	Parent amt. (ppbv)	Duplicate amt. (ppbv)	RPD	RPD Limit	Action
Mixed Xylenes	74.1	24.3	101	50	J
Heptane	11.1	5.1	74	50	J
2,2,4-Trimethylpentane	5.5	3.1	56	50	J
1,3-Dichlorobenzene	6.3	1.5	123	50	J
4-Ethyltoluene	3.9	1.2	105	50	J
Ethanol	2360	956	85	50	J
Isopropanol	290	111	90	50	J
Chloroform	6.4	2.5	88	50	J
Benzene	16.6	7.7	80	50	J
Chloromethane	11.8	3.9	101	50	J
Tert-Butyl alcohol	7.0	2.5	95	50	J
Trichlorofluoromethane	2.1	1.2	54	50	J
2-Butanone	7.4	2.7	85	50	J
O-Xylene	16.6	5.3	103	50	J
1,2,4-Trimethylbenzene	13.9	4.3	105	50	J
M,P-Xylene	57.5	19.1	100	50	J

Laboratory Control Sample (LCS) Review

Each of the criteria is within guidance limits.

Sample Quantitation

Results for Ethanol in two samples (SV-10 and DUP060707) exceeded the calibration limit and are qualified as estimated.

The following table provides the affected samples and associated qualifications:

Sample	Constituent	amt. (ppbv)	Action
SV-10	Ethanol	2360	J
DUP060707	Ethanol	956	J

Validation Qualifiers

The following validation qualifiers may have been applied to the data, as appropriate.

- J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.
- U = The analyte was tested, but was not detected above the sample reporting limit.
- R = The sample result is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

- Sample Quantitation

DESCRIPTION OF QUALITATIVE REVIEW

Summary Evaluation of Data and Potential Usability Issues

Overall, the data is acceptable for the intended purposes. No results were rejected. Data quality issues with respect to field duplicate precision were identified requiring qualification of some data.

Sample Documentation

Provided laboratory reports included all the necessary information to perform the described data review.

Sample Holding Times

Each sample was prepared and analyzed within the specified holding time for each analysis

Laboratory and Field Blank Review

All compounds were reported as not detected in the laboratory and field blanks

MS/MSD Review

Matrix spikes and matrix spike duplicates were performed on three Site samples. All recoveries were within limits.

Field/Laboratory Duplicate Review

Two field duplicates were collected and analyzed for the same parameters as the associated parent samples. MC-A-DUP is a field duplicate for MC-A and FC-W-2-DUP is a field duplicate for FC-W-2. In addition, the laboratory performed laboratory replicate analyses on

three samples. In general, duplicate precision was good. However, the RPDs for several duplicate pairs exceeded the limit and have been qualified. The following results have been qualified as estimated due to duplicate imprecision.

Sample	Constituent	Parent amt. (ug/g)	Duplicate amt. (ug/g)	RPD	RPD Limit	Action
MC-A	As+3 as As	0.088	0.037	82	50	J
MC-A	As+5 as As	0.184	0.104	56	50	J
FC-F-2	DMA as As	0.013	0.005	89	50	J

Laboratory Control Sample (LCS) Review

Each of the criteria is within guidance limits.

Sample Quantitation

Each of the criteria is within guidance limits.

Validation Qualifiers

The following validation qualifiers may have been applied to the data, as appropriate.

- J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.
- U = The analyte was tested, but was not detected above the sample reporting limit.
- R = The sample result is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

This review was performed based on the requirements provided in the project Quality Assurance Project Plan, the USEPA Region II validation SOPs, and on guidance provided in the Contract Laboratory Program National Functional Guidelines for Organic and Inorganic Data Review, 2004.

The review included the parameters listed below.

- Sample Documentation
- Sample Holding Times
- Laboratory and Field Blank Review
- Labeled Standards Recovery Review
- MS/MSD Recovery and Precision
- Field/Laboratory Duplicate Review
- Laboratory Control Sample (LCS) Review
- Sample Quantitation

DESCRIPTION OF QUALITATIVE REVIEW

Summary Evaluation of Data and Potential Usability Issues

Overall, the data is acceptable for the intended purposes. Three PCB congener results in one sample (FC-E-2) were rejected due to extremely low labeled standard recoveries. Data quality issues with respect to labeled standard recoveries outside of limits, field duplicate precision and results exceeding the calibration range were identified requiring qualification of some data.

Sample Documentation

Provided laboratory reports included all the necessary information to perform the described data review.

Sample Holding Times

Each sample was prepared and analyzed within the specified holding time for each analysis

Laboratory and Field Blank Review

PCB congeners were detected in the laboratory and field blanks. Associated sample results were qualified as not detected with an estimated detection limit (UJ). Low levels of manganese were also detected in method blanks. However, associated sample concentrations were greater than five times the blank concentration and results were not qualified. The following analytes have been qualified due to blank contamination:

Sample ID	Analyte	Sample amt. (ng/Kg)	Blank amt. (ng/Kg)	Action
FC-A-1	3,3'-Dichlorobiphenyl	469.72	105	UJ
	3-Chlorobiphenyl	5.89	1.8	UJ
	4-Chlorobiphenyl	21.51	5.5	UJ
FC-A-2	3,3'-Dichlorobiphenyl	351.2	105	UJ

Sample ID	Analyte	Sample amt. (ng/Kg)	Blank amt. (ng/Kg)	Action
	3-Chlorobiphenyl	4.51	1.8	UJ
	4-Chlorobiphenyl	19.03	5.5	UJ
FC-B-2	2,2'-Dichlorobiphenyl	35.67	9.41	UJ
	3,3'-Dichlorobiphenyl	355.43	100.2	UJ
	2-Chlorobiphenyl	9.85	3.88	UJ
	4-Chlorobiphenyl	10.22	5.43	UJ
FC-C-2	3,3'-Dichlorobiphenyl	373.03	100.2	UJ
	2-Chlorobiphenyl	9.45	3.88	UJ
	4-Chlorobiphenyl	10.12	5.43	UJ
FC-B-1	3,3'-Dichlorobiphenyl	370.72	100.2	UJ
	2-Chlorobiphenyl	12.41	3.88	UJ
	4-Chlorobiphenyl	11.37	5.43	UJ
MC-A	3,3'-Dichlorobiphenyl	156.78	100.2	UJ

FC-Z-2	2-Chlorobiphenyl	6.64	1.42	UJ
MC-Y	4-Chlorobiphenyl	5.91	1.55	UJ
MC-Z	4-Chlorobiphenyl	5.79	1.55	UJ

Labeled Standards Recovery Data

Labeled Standards were added to the samples for PCB congener analysis. Recovery limits for labeled standards are 15-150 percent recovery. Results associated with recoveries outside limits were qualified as shown below.

Sample ID	Analyte	Spike recovery. (%)	Sample amt. (ng/Kg)	Action
FC-A-1	Decachlorobiphenyl	199	1241	J
	2,2'3,3',5,5',6,6'-Octachlorobiphenyl	341	440.22	J
	2,3',4,4',5-Pentachlorobiphenyl	156	11834.16	J

MS/MSD Review

Matrix spikes and matrix spike duplicates were performed on three Site samples (FC-C-1, MC-B, and MC-X). Many recoveries were outside of acceptance limits. This is likely due to the

matrix interferences inherent in tissue samples. Results associated with recoveries outside limits were qualified as shown below.

Sample ID	Analyte	Spike recovery. (%)	Sample amt. (ng/Kg)	Action
FC-C-1	2,2'-Dichlorobiphenyl	-51	369.05	J
	3,3',4,4'-Tetrachlorobiphenyl	-58	671.61	J
	3,4,4'-Trichlorobiphenyl	22	550.22	J
	2,3,3',4,4',5,5'-Heptachlorobiphenyl	21	211.38	J
	2,2'3,3',4,5,5',6,6'-Nonachlorobiphenyl	-171	784.43	J
	3,3',4,4',5-Pentachlorobiphenyl	26	212.45	J
	2,3,3',4,4',5,5'6-Octachlorobiphenyl	42	263.32	J
	2,3,3',4,4',5,5'6-Octachlorobiphenyl	27	0	UJ
	Zinc	140	145	J
MC-B	Zinc	134	175	J
MC-X	2,2'-Dichlorobiphenyl	153	213.38	J
	Decachlorobiphenyl	161	685.8	J
	2,2',3,3',5,5',6,6'-Octachlorobiphenyl	176	831.8	J
	2,2'3,3',4,5,5',6,6'-Nonachlorobiphenyl	151	475.05	J

Field/Laboratory Duplicate Review

Two field duplicates were collected and analyzed for the same parameters as the associated parent samples. MC-A-DUP is a field duplicate for MC-A. FC-W-2-DUP is a field duplicate for FC-W-2. Laboratory replicates were also performed. In general, duplicate precision was fair. The following analytes have been qualified as estimated due to field duplicate imprecision.

Sample	Constituent	Parent amt. (ppbv)	Duplicate amt. (ppbv)	RPD	RPD Limit	Action
MC-A	2,3,3',4',6-Pentachlorobiphenyl	17155.71	9370.8	59	50	J

Laboratory Control Sample (LCS) Review

Each of the criteria is within guidance limits.

Sample Quantitation

Results for four PCB congeners in two samples (MC-X and MC-W) exceeded the calibration limit and are qualified as estimated.

The following table provides the affected samples and associated qualifications:

Sample	Constituent	amt. (ng/Kg)	Action
MC-X	2,3',4,4',5-Pentachlorobiphenyl	10431.63	J
	2,2',3,5',6-Pentachlorobiphenyl	8181.67	J
MC-W	Decachlorobiphenyl	21130.6	J
	2,3',4,4',5-Pentachlorobiphenyl	9516.31	J

Validation Qualifiers

The following validation qualifiers may have been applied to the data, as appropriate.

- J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.
- U = The analyte was tested, but was not detected above the sample reporting limit.
- R = The sample result is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

QUALITATIVE
DATA USABILITY REPORT
Gaseous Mercury Sampling
LCP Superfund Site

SDG No.: 0607133

Laboratory: Frontier Geosciences, Inc., Seattle, Washington

Site: LCP Superfund Site, Linden, New Jersey

Date: September 11, 2007

Data Reviewed by: Gregory Cole, Brown and Caldwell

A Qualitative Data Usability Review was performed on all analytical data from SDG 0607133. The following table outlines the samples and analytical methods reviewed;

Sample	Analysis	Method
IO5-1	Total Gaseous Mercury (TGM)	IO-5
IO5-2	Total Gaseous Mercury (TGM)	IO-5
IO5-3	Total Gaseous Mercury (TGM)	IO-5
IO5-5	Total Gaseous Mercury (TGM)	IO-5
IO5-6	Total Gaseous Mercury (TGM)	IO-5

This review was performed based on the requirements provided in the project Quality Assurance Project Plan, the USEPA Region II validation SOPs, and on guidance provided in the Contract Laboratory Program National Functional Guidelines for Organic and Inorganic Data Review, 2004.

The review included the parameters listed below.

- Sample Documentation
- Sample Holding Times
- Laboratory and Field Blank Review
- Field/Laboratory Duplicate Review

- Laboratory Control Sample (LCS) Review
- Sample Quantitation

DESCRIPTION OF QUALITATIVE REVIEW

Summary Evaluation of Data and Potential Usability Issues

No results were rejected. Data quality issues with respect to exceeding holding times and high mercury breakthrough were identified requiring qualification of all results. The data user should determine if the data is acceptable for the intended purposes.

Sample Documentation

Provided laboratory reports included all the necessary information to perform the described data review.

Sample Holding Times

All samples were prepared past the recommended seven day holding time. Results have been qualified as estimated (J/UJ).

Laboratory and Field Blank Review

Mercury was reported as not detected in the laboratory and field blanks

Field/Laboratory Duplicate Review

No field duplicates were submitted for analysis. Laboratory replicates are not applicable to the method.

Laboratory Control Sample (LCS) Review

Each of the criteria is within guidance limits.

Sample Quantitation

Sample breakthrough in the second trap was observed for sample IO5-3. The mercury result was qualified as estimated (J) with a possible low bias.

The following table provides the affected samples and associated qualifications:

Sample	Constituent	amt. (ppbv)	Action
IO5-3	Mercury	1.04	J

Validation Qualifiers

The following validation qualifiers may have been applied to the data, as appropriate.

- J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.
- U = The analyte was tested, but was not detected above the sample reporting limit.
- R = The sample result is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

RE: Data Validation for the LCP Superfund site, Linden, NJ
South Branch and Reference Stream Locations
Accutest SDG Nos. J41738, J41741, J42011, J42360, J42535, J42762, J42838, J42866, J43022, J43207, J43284, J43443, J43008, J41738X, J41741X, J42011X, J42360X, J42535X, J42762X, J42838X, J42866X, J43022X, J43207X, J43284X, J43443A, J43443X, and J43008X

Dear Mr. Cavas:

Review has been completed for the data packages generated by Accutest Laboratories that pertain to samples collected 9/21/06 through 10/10/06 at the South Branch and Reference Stream sites of the LCP Superfund, Linden, NJ project. Eighty soil samples and eleven aqueous samples were processed for TCL Volatiles, TCL Semivolatiles, TCL Pesticides, TCL PCBs, TAL metals, hexavalent chromium, total cyanide, and methyl mercury. Twenty-two of the soil and four of the aqueous samples were also processed for Dioxin/Furans (PCDD/PCDF). The aqueous samples were also analyzed for low level total mercury, TOC, cyanide, TSS, DOC, and total hardness. The soils were also analyzed for Particle Size (Sieve) and Redox Potential. Thirty-seven of the soils were also processed for acid volatile sulfide metals (AVS/SEM). Aqueous samples also underwent Selective Ion Monitoring (SIM) for selected semivolatile analytes in order to obtain better sensitivity and lower reporting limits. Blind field duplicates, sample matrix spikes, field blanks, and trip blanks were processed with the project samples. The specific sample location identifications covered in this report are noted in the attached laboratory summary listings.

The analytical methodologies utilized are those of the USEPA SW846 3rd edition and USEPA Standard Methods. The dioxin/furan analyses were subcontracted to SGS/Paradigm, the methyl mercury and low level aqueous mercury analyses were subcontracted to Columbia Analytical Services (CAS)-Kelso and Battelle Marine Sciences, and AVS/SEM were subcontracted to Accutest-Houston.

Validation review of the data packages has been performed utilizing the guidance in the USEPA National Functional Guidelines for Data Review, the USEPA Region II validation SOPs, the project QAPP (including laboratory SOPs), the specific methodology requirements, and professional judgment.

The following items were reviewed:

* Laboratory Narrative Discussion
* Custody Documentation
* Holding Times
* Surrogate Recoveries and Internal Standard Responses
* Matrix Spike Recoveries/Duplicate Correlations
* Field Duplicate Correlations
* Preparation/Calibration Blanks
* Control Spike/Laboratory Control Samples
* Instrumental Tunes
* Calibration/CRI/CRA Standards
* ICP Serial Dilution
* ICP Interference Check Samples
* Dioxin/Furan Recovery and Clean-Up Standards
* Instrument IDLs and Performance
* Method Compliance
* Sample Result Verification

Those items listed above which show deficiencies are discussed within the text of this narrative. All of the other items were determined to be acceptable according to the validation guidelines noted above.

In summary, most of the sample analyte values/reporting limits are usable as reported, or usable with minor qualification as estimated ("J" qualifier) due to typical processing or matrix effects. The following exceptions were noted:

- Due to matrix effect, the results for hexavalent chromium in the soil samples are not usable, as evidenced by the lack of recovery of that analyte in the spiked sample controls.
- Results for hexachlorocyclopentadiene in most of the soil samples are not usable due to lack of recovery in the project matrix spikes.
- Results for several select volatile or semivolatile compounds are not usable in a limited number of samples due to apparent matrix effect
- POC processing was requested, but was not performed on the samples due to laboratory oversight. There are no POC data for the project.
- Many of the reported pesticide detections have been qualified to reflect the potential for false positives due to matrix interferences.
- Some of the low level detections are considered external contamination, as evidenced by presence in associated blank
- A large proportion of the soil samples covered in this report exhibit low solids (high moisture) content. Therefore, all results for those samples have been qualified as being estimated in quantitative value.

Laboratory processing was generally compliant with analytical protocol requirements, and the project data completeness requirement of 90% has been met.

Copies of the laboratory sample identification summary forms that list the sample covered in this report are attached to this text, and should be reviewed in conjunction with this report. Included with this submission are electronic client data tables that have been qualified in red to reflect the edits and qualifications recommended within this report. These tables have been submitted under separate cover.

The following text discusses quality issues of concern.

General

The strong majority of the samples have solids content below 50%. With low solids (high moisture) content, there exists the possibility of a non-homogeneous aliquot taken during sample collection in the field or during sample processing in the laboratory. Additionally, the aqueous matrix (i.e. which is approached with samples having very low solids content) involves significantly different processing procedures than the solid matrix for semivolatiles (including BNA, pesticides, PCBs, and herbicides) and certain of the wet chemistry analytes. Additionally, the aqueous matrix requires preservation for volatiles, metals, and certain of the wet chemistry parameters not required of the soil samples.

Therefore, results (both detected values and the reporting limits of non-detected analytes) for the samples with solids below 50% have been qualified as estimated, with a possible bias of an unknown direction

TCL Volatiles by USEPA SW846 8260B

Results for LM-E-3, LM-E-4, and LM-F-3 are qualified as estimated due to outlying holding times (analyzed at 15 days from collection). These samples are also qualified due to low solids content.

Matrix spikes (MS and MSD) for SW-D, SW-W, SED-Z-1, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-F-1-0-0.5, SED-F-3-0-0.5, SED-E-2-1.0-1.5, SED-C-3-0-0.5, SED-B-1-0-0.5, SED-A-1-0-0.5 (all at low level), and SED-9 (at medium level) show accuracy and precision within QAPP/validation guidelines, with the following exceptions:

- Recoveries of five compounds are below recommended limit in the matrix spike SW-D, but are acceptable in the MSD. Similarly, a total of 14 compounds show elevated duplicate correla-tions with the MSD>MS. The MS also shows a low internal standard response not exhibited by the parent sample or MSD. The MS outliers are a processing anomaly, and no qualifications were made to the parent sample on that basis.
- Bromoform and 1,2,4-trichlorobenzene did not recover in the spikes of SED-C-3-0-0.5. Results for these two compounds in the parent sample are therefore not usable, and are rejected.
- Bromoform and dibromochloromethane did not recover in the spikes of SED-A-1-0-0.5. Results for these two compounds in the parent sample are therefore not usable, and are rejected. 1,2,4-trichlorobenzene also did not recover in those spikes; the detected value in the parent sample is qualified as estimated. Twenty-seven other volatile analytes recovered below the recommended limit in both spikes. All results for the parent sample are already qualified as estimated due to low solids content.

Field duplicate correlations for SW-B, SW-Y, SED-W-1-0-0.5, SED-F-3-0-0.5, SED-Y-3, and LM-C-2 are acceptable, with the exception of that for methyl acetate in LM-C-2 (114%RPD).

Calibrations standards showed acceptable responses, with the following exceptions, results for which are qualified as estimated in the indicated samples:

- acetone and 2-butanone (low RRF) in the three soils reported in SDG J41741, and in LM-B-3 and LM-B-4
- trichlorofluoromethane (28%D) detections in the aqueous samples in SDG J42011
- 2-hexanone (30%D) in samples in SDG J42360
- methyl acetate in eight sample reported in SDG J43443
- acetone (low RRF) in low level soils in SDGs J42535, J42762, J42838, J42866, J43022, J43207
- 2-butanone (low RRF and/or 24%D) in field blanks of 9/29/06, 10/02/06, 10/03/06, and 10/05/06

Results of the field blank of 9/29/06 are qualified as estimated, and may have a low bias, due to elevated temperature at sample receipt (14.5°C).

Tentatively Identified Compounds (TICs) that are flagged as "B" or identified as "system artifacts" are considered external contamination, as shown by presence in the associated blanks.

TCL Semivolatile Analyses by USEPA SW846 8270C

Due to apparent matrix effects, samples SED-F-1-0-0.5, SED-F-2-0-0.5, and SED-F-3-0-0.5 show very low response (<25%) for internal standard d12-perylene. Therefore, the result for the undetected associated analyte, di-n-octylphthalate, is not usable in those three samples. Two of those samples, as well as the field duplicate of the latter, also show low response for internal standard d12-chrysene. Results for all other associated compounds in those samples are qualified as estimated.

The results for the seven compounds associated with d12-perylene are qualified as estimated in SED-E-2-0-0.5, SED-C-3-0-0.5, and SED-B-1-0-0.5 due to low responses of that internal standard in those samples and their matrix spikes.

Matrix spikes (MS and MSD) for SW-D, SW-W, SED-X-3, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-F-1-0-0.5, SED-C-3-0-0.5, SED-C-3-0-0.5, SED-B-1-0-0.5, LM-C-2, and SED-9 show accuracy and precision within validation guidelines, with the following exceptions:

- 3,3'-dichorobenzidine, 3-nitroaniline, and 4-nitroaniline failed to recover in SW-D and SW-W. Results for those three compounds in those two parent samples are therefore rejected, and not usable
- hexachlorocyclopentadiene failed to recover in the matrix spikes of SED-X-3, SED-E-1-0-0.5 SED-F-1-0-0.5, SED-E-2-1.0-1.5, SED-C-3-0-0.5, and SED-9. Due to The persistence of failure in the project soil matrix spikes (in all soils except SED-W-3-0-0.5) the results for this compound in all soil samples covered in this report except those in SDG J42535 are therefore rejected, and not usable.
- bis(2-ethylhexyl)phthalate in SED-F-1-0-0.5 shows elevated recoveries; results in the parent sample are qualified as estimated

- fluoranthene and phenanthrene showed inconsistent results (and very low recoveries) in the spikes of SED-B-1-0-0.5 and SED-9. Results for those two compounds in the two parent samples are qualified as estimated.

Detected values of anthracene and fluoranthene in soils reported in SDG J43022 are qualified as estimated, with a possible high bias, due to elevated recoveries (111% and 118%) in the associated spiked blank control.

Field duplicate correlations for SW-B, SW-Y, and SED-W-1-0-0.5 are acceptable.

The field duplicate evaluation of SED-F-3-0-0.5 shows outlying correlations for acenapthylene, anthracene, benzo(k)fluoranthene, 1,1-biphenyl, dibenz(a,h)anthracene, bis(2-ethylhexyl)phthalate, 2-methylnaphthalene, pyrene (59%RPD to 126%RPD). Results for these analytes in the parent sample and the duplicate are qualified as estimated.

The field duplicate evaluation of SED-Y-3 shows outlying correlations for fluoranthene, phenanthrene, and pyrene (78%RPD to 126%RPD). Results for these analytes in the parent sample and the duplicate are qualified as estimated.

The field duplicate evaluation of LM-D-4 shows outlying correlations for bis(2-ethylhexyl)phthalate and fluoranthene (67%RPD and 101%RPD). Results for these analytes in the parent sample and the duplicate are qualified as estimated.

The results for the field blank of 10/05/06 are qualified as estimated, with a possible low bias, due to outlying holding time to extraction.

Results of the field blank of 9/29/06 are qualified as estimated, and may have a low bias, due to elevated temperature at sample receipt (14.5°C).

Calibrations standards showed acceptable responses with laboratory requirements and validation guidelines, with the following exceptions, results for which are qualified as indicated in the noted samples:

- benzo(k)fluoranthene (28%D) in SIM aqueous samples in SDG J42011
- 2,4-dinitrophenol (33%D) and 4,6-dinitro-2-methylphenol (28%D) in the field blank and all soils reported in SDG J42762
- dibenz(a,h)anthracene (26%D) detections in samples reported in J42866
- hexachlorocyclopentadiene (28%D) in FB 100506
- 2,4-dinitrophenol (28%D) in SED-C-1-0-0.5, SED-C-2-0-0.5, SED-C-2-0.5-1.0, and SED-C-2-1.0-1.5

Due to presence in the associated method or field blank, detected results for bis(2-ethylhexyl)-phthalate in SW-D, and in samples reported in SDGs J42762 and J42838 are considered external contamination, and edited to reflect non-detection ("U").

Tentatively Identified Compounds (TICs) that are flagged as "B" and/or "A", or identified as "system artifacts" are considered external contamination, as shown by presence in the associated blanks.

TCL PCB/Pesticides Analyses by USEPA SW846 8081A and 8082

Some of the pesticide reported detections may reflect responses from the sample matrix or PCB components. Those detections show elevated dual column correlations, with resulting qualifications as either estimated in value ("J"), tentative in identification and estimated in value ("NJ"), or edited to nondetection ("U", sometimes at elevated reporting limits). The correlations reported on summary forms by the laboratory were calculated as %RPD. Per validation protocols, this review evaluation utilized %D. The appropriate qualifica-tions have been made on the attached sample result forms.

Due to elevated surrogate DCB standard recoveries, results for detected pesticides (4,4'-DDD, 4,4'-DDE, and 4,4'-DDT) in the field duplicate of SED-W-1-0-0.5 are qualified as estimated ("J"), and may have a high bias. Results for the parent sample are not affected.

Due to elevated surrogate TCX and/or DCB standard recoveries, results for detected pesticides in SED-F-1-0-0.5, SED-F-2-0-0.5, SED-F-3-0-0.5, SEF-A-2-0-0.5, and the field duplicate of SED-F-3-0-0.5 are qualified as estimated ("J"), and may have a high bias.

Results for SED-7 are qualified as estimated due to outlying holding time for re-extraction (the initial extraction produced outlying low surrogate standard recoveries).

Calibration standards meet protocol and validation requirements.

Matrix spikes of pesticides and Aroclors 1016 and 1260 in SW-D, SW-W, SED-Y-1, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-C-3-0-0.5, SED-B-1-0-0.5, SED-A-1-0-0.5, and SED-9 show acceptable accuracy and precision, with the following exceptions, results for which are qualified as estimated in the indicated parent sample:

- aldrin, a-chlordane, endosulfan I, endosulfan II, heptachlor (outliers 44% to 49%), and 4,4'-DDT (0% and 1000%) in SED-Y-1
- endrin aldehyde, aldrin, and g-chlordane (17% to 44%, 57%RPD to 87%RPD) in SED-E-1-0-0.5
- Aroclor 1260 (225% and 1275%) in SED-B-1-0-0.5

Some of the Aroclor 1016 recoveries in the matrix spikes are elevated due to response contributions from the Aroclor 1254 that is present in the parent sample.

Field duplicate correlations for SW-B and SW-Y are acceptable.

Those for SED-W-1-0-0.5 show an outlying variance for 4,4'-DDT. The results for that analyte in the parent sample and field duplicate are considered additionally estimated (results are also qualified due to low solids content).

The field duplicates of LM-C-2 and LM-D-4 show large variance for 4,4'-DDT, where it was not detected in the parents, but detected at 19 ug/kg or 18 ug/kg in the duplicate. The detected result in the duplicate of LM-C-2 has been qualified as tentative in identification due to dual column variance. The non-detected results of 4,4'-DDT in the parent samples, and the detected result in the duplicate of LM-D-4 are qualified as estimated due to the field duplicate variance.

The field duplicate of SED-F-3-0-0.5 shows significant variances for 4,4'-DDD, 4,4'-DDT, heptachlor epoxide, and methoxychlor (up to more than an order of magnitude). Results are qualified as estimated in the parent sample and duplicate.

The field duplicate evaluation of SED-Y-3 shows outlying correlations for 4,4'-DDD, 4,4'-DDE, an 4,4'-DDT. Results for these analytes in the parent sample and the duplicate are qualified as estimated.

Results of the field blank of 9/29/06 are qualified as estimated, and may have a low bias, due to elevated temperature at sample receipt (14.5°C).

TCL Dioxin/Furan Analyses by USEPA SW846 8290

Results of the field blank of 9/29/06 are qualified as estimated, with a possible low bias, due to elevated temperature at original laboratory sample receipt (14.5°C).

Detected results for samples that were reported with the laboratory "A" qualifier reflect quantitative values below the established linear range of the instrument, and have therefore been qualified as estimated in value.

The method and field blanks contain low levels (below CRDL) of many of the PCDD and PCDF isomers. Field samples containing detected levels of those compounds that are below fivefold of the associated blank concentrations (at the instrument level) are considered potential external contamination. Those detections have been noted as being Estimated Maximum Potential Concentrations (EMPCs). It can be said that these analytes are not present at levels above those originally reported concentrations.

Results for furans that may include quantitative contribution from the corresponding chlorinated biphenyl ethers (BPE) have been noted as being EMPC. They may reflect false positives or a high bias.

Sample responses showing outlying ion ratios do not meet the requirements for identification and have been noted as being EMPC.

Detected results reported with the "Q" laboratory qualifier have been qualified as estimated due to quantitative interferences.

Sample SED-D-3-0-0.5 exhibited an elevated recovery (146%) for recovery standard $^{13}C_{12}$-OCDD. Therefore, the results for associated analyte OCDD are considered additionally estimated in value (all results for that sample are qualified due to low solids content).

The ion ratio of the surrogate standard $^{13}C_{12}$-1,2,3,4,6,7,8-HpCDD in LM-E-3 shows an ion ratio out of acceptable range. The results for this sample are qualified as estimated due to low solids content.

LM-F-2 was re-extracted within holding time. Although the data package only submitted the re-extraction results, the electronic table shows two analysis results. The initial results were deleted from the electronic table.

Matrix spikes were performed on LM-A-3, SW-W, SED-W-3-0-0.5 and show acceptable recoveries and duplicate correlations, with the following exceptions:

- LM-A-3 –two analytes show outlying recoveries in only one spike; three show outlying duplicate correlations. Results for the parent are qualified as estimated due to low solids content
- SED-W-3-0-0.5---OCDD shows elevated recoveries; results for the parent are qualified as estimated due to low solids content
- SED-C-3-0-0.5---these spikes produced nine and ten outlying recoveries and nine outlying duplicate correlations. This is attributed to the matrix. It is also noted that the solids content of the parent sample is 25%, and that for the spikes are 33% and 35%. Sample non-homogeneity is suspected. All results are qualified due to solids content.

Field duplicates of SW-Y, SED-Y-3, SED-W-1-0-0.5, and LMC-2 show acceptable correlations (below 50%RPD or <±CRDL), with the following exceptions, results for which are qualified in the parent sample and its corresponding duplicate:

- Numerous PCDD and PCDF isomers show poor correlations (66%RPD to 200%RPD) in SED-Y-3. All results for that pair are qualified as estimated due to low solids content.
- Six PCDD and PCDF isomers show variances fourfold to fivefold in SED-W-1-0-0.5. All results for that pair are also qualified as estimated due to low solids content.

The date on the method blank summary form for samples in SDG J43207 should have stated the date of 10/18/06, not 10/17/06. The raw data for that blank are correct.

Due to the matrix, sample SED-C-2-0.5-1.0 would not evaporate down to the protocol required volume. This results in elevated reporting limits for undetected compounds.

Detections of 2,3,7,8-TCDF were confirmed by alternate column analyses.

TAL and AVS/SEM Metals by USEPA SW846 6010B, 7470/7471

Results for the AVS/SEM in the field blank of 10/05/06 have been qualified as estimated due to the fact it was not received at the laboratory with adequate preservation.

Holding times were met. Blanks associated with sample analyses show no contamination above the reporting limit.

Matrix spike recovery and laboratory duplicate correlation evaluations were performed for TAL elements on SW-D, SW-W, SED-Z-1, SED-Z-2-0-0.5, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-E-2-1.0-1.5, SED-C-3-0-0.5, SED-B-1-0-0.5, and SED-9, for AVS/SEM processing on SED-Z-2-0-0.5, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-C-3-0-0.5, and SED-9, and for low level total mercury on .

Mercury failed to recover from the SEM digestions for SED-Z-1, SED-E-1-0-0.5, SED-C-3-0-0.5, and SED-9. Results for that element in the SEM fraction of the samples reported in SDGs J42535, J42838, J43022, J43207, J43284, and J43443 that report no detection of mercury are not usable. Detected SEM mercury results in those SDGs are qualified as estimated.

Other recoveries or correlations for the matrix spikes/duplicates that are outside validation guidelines (75% to 125% recovery, 50%RPD) are noted below, with qualification of results as estimated in the indicated samples:

Parent Sample	Analyte	Recoveries	Associated Samples
SED-Z-1	antimony	34% and 34%	Soils in J42535
SED-Z-1	SEM copper	65% and 63%	AVS/SEM in J42535
SED-Z-2-0-0.5	aluminum	126% and 128%	Soils in J42535
	antimony	55% and 55%	"
	copper	136% and 133%	"
SED-W-3-0-0.5	iron	118% and 586% (69%RPD)	Soils in J42762
	aluminum	139% and 105%	"
	antimony	47% and 44%	"
	calcium	70% and 66%	"
	magnesium	131% and 89%	"
	potassium	128% and 84%	"
	manganese	103% and 149%	"
	zinc	104% and 132%	"
	mercury	83% and 54%	"
SED-W-3-0-0.5	SEM cadmium	75% and 70%	AVS/SEM in J42762, J42866, J43022
	SEM lead	198% and 170%	" detections
	SEM zinc	249% and 191%	" detections

	manganese	52% and 56%	"
	nickel	68% and 68%	"
	selenium	68% and 67%	"
SED-C-3-0-0.5	SEM copper	-59% & -55%;74%RPD	AVS/SEM J43207+J43284
	SEM lead	-4% and –20%	"
SED-9	antimony	47% and 50%	Soils in J43443
	magnesium	174% and 108%	"
SED-9	SEM copper	-70% and -61%	AVS/SEM in J43443

Elevated recoveries for elements not detected in the samples do not require qualification of associated data.

The three soil samples reported in SDG J41738 were associated with non-project batch QC that showed seven analytes having low recoveries and ten analytes having outlying duplicate correlations. All results for the samples in that SDG are already qualified as estimated due to low solids content.

Results for all AVS/SEM results in SED-C-3-0-0.5 are qualified as estimated due to low recoveries (60% to 58%) in the volatile sulfide procedure.

Field duplicate evaluations were performed for on SW-B, SW-Y, SED-W-1-0-0.5, SED-F-3-0-0.5, LM-C-2, and LM-D-4, for SEM metals on SED-W-1-0-0.5 and SED-Y-3, and for low level total mercury on SW-B and SW-C. The following outliers were observed, with resultant qualification of that element as estimated in the specific parent sample and associated duplicate:

- mercury in SB-B (66%RPD)
- the field duplicate of SED-W-1-0-0.5 (logged into the laboratory with the suffix "B" to the lab ID number ten days after receipt) shows no detection of any of the analytes; this is atypical of the project soil SEM results. The parent sample shows normal constituency. The reason for the duplicate sample variance is not evident.
- lead and mercury in SED-F-3-0-0.5
- AVS/SEM cadmium in SED-F-3-0-0.5
- aluminum, chromium, and zinc (52%RPD to 74%RPD) in LM-C-2
- barium (55%RPD) in SED-Y-3

The ICP serial dilutions of SEM metals on SED-W-3-0-0.5 and SED-C-3-0-0.5, and of total metals on SED-E-1-0-0.5 and SED-E-2-1.0-1.5 show acceptable correlations.

The following ICP serial dilution evaluations show outlying correlations, with detected results in associated samples qualified as estimated ("J"):

Parent Sample	Analyte	%RPD	Associated SDGs
SW-D	potassium	12	J42011
SW-W	potassium	16	J42360
SED-Z-1	potassium and sodium	12 and 16	J42535
SED-Z-2-0-0.5	lead, magnesium, potassium, and sodium	12 to 16	J42535
SED-Z-1	SEM lead	17	AVS/SEM J42535
SED-E-1-0-0.5	SEM lead	17	AVS/SEM J42838
SED-W-3-0-0.5	cobalt, lead, nickel, sodium, and zinc	11 to 15	J42762
SED-F-2-0-0.5	sodium and zinc	10 to 12	J42866
SED-9	sodium and zinc	10 to 12	J43443
SED-C-3-0-0.5	barium, cobalt, vanadium, and zinc	11 to 28	J43207
SED-B-1-0-0.5	arsenic, cadmium, calcium, chromium, cobalt, copper, lead, magnesium, manganese, nickel, potassium, sodium, and zinc	11 to 22	J43207
SED-9	SEM cadmium and lead	11 and 12	AVS/SEM J43443

The result for sodium in the field blank of 9/21/06 is qualified as estimated ("J"), with a low bias, due to low recovery for the associated low-level CRI standard.

The result for arsenic in the samples reporting detection in SDG J42011 are qualified as estimated ("J"), with a high bias, due to elevated recovery for the associated low-level CRI standard.

The results for mercury in the field blank of 09/29/06 and in the SEM fractions of the soils in J42762, J42866, and J43284 are qualified as estimated ("J"), with a low bias, due to low recoveries for the associated low-level CRI standards.

The result for antimony in the field blank of 10/02/06 is qualified as estimated ("J"), with a low bias, due to low recovery for the associated low-level CRI standard.

The results for arsenic in SED-Z-2-0-0.5, and in all soil reported in J42866 except SED-F-2-0-0.5, are qualified as estimated ("J"), with a high bias, due to elevated recoveries in the associated low-level CRI standards.

Wet Chemistry- Methyl Mercury, Cyanide, Hexavalent Chromium, TOC, Seive, Redox Potential (ORP), TSS, DOC, Hardness, pH

Review was conducted for method compliance, transcription, calculations, standard and blank acceptability, accuracy and precision, etc., as applicable to each procedure.

Hexavalent chromium failed to recover in the matrix spikes of LM-A-1, SED-Z-1, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-F-1-0-0.5, SED-E-2-0-0.5, SED-C-3-0-0.5, SED-B-1-0-0.5, SED-A-1-0-0.5, SW-C, and SED-9. Therefore, all non-detected results for that analyte in soils are rejected, and provide no usable information as to the presence or absence of that analyte. Detected values are qualified as estimated, and may have a significant low bias. Although those data are rejected, it can be said that the total chromium of the samples would represent a maximum potential value for hexavalent chromium.

The following matrix spike recovery/laboratory duplicate evaluations were performed:

- TOC in LM-A-2 and LM-F-3
- hexavalent chromium in LM-A-1, SW-A, SED-Z-1, SED-W-3-0-0.5, SED-E-1-0-0.5, SED-F-1-0-0.5, SED-E-2-0-0.5, SED-C-3-0-0.5, SED-B-1-0-0.5, SED-A-1-0-0.5, and SED-9
- Redox Potential on LM-A-1 and SED-Z-1
- cyanide, TOC, DOC, TSS, and Hardness on SW-D and SW-W
- cyanide on SED-Z-2-1-1.5, SED-W-1-0-0.5, SED-D-2-2.0-2.5, LM-F-1, SED-9, and SED-A-2-0-0.5
- Sieve duplicates on SED-X-3, SED-W-3-0-0.5, SED-F-1-0-0.5, SED-E-2-0.5-1.0, SED-C-3-0-0.5, SED-B-1-0-0.5, SED-9, and SED-A-1-0-0.5
- cyanide, hexavalent chromium, Redox Potential, solids, and ph on SED-W-1-0-0.5
- cyanide and TOC on SED-E-1-0-0.5 and SED-C-3-0-0.5
- methyl mercury on LM-A-2, SW-D, SED-Z-1, SED-W-3-0-0.5, SED-E-2-0-0.5, FB100506, SED-C-3-0-0.5, SED-B-1-0-0.5, and SED-9

The result for cyanide in SED-9 is rejected and not usable due to very low recovery (7%) in the matrix spike of that sample.

Outlying matrix spike recoveries or duplicate correlations (in addition to the hexavalent chromium and cyanide outliers noted above) are listed below, with qualification of results as estimated in the indicated samples:

Parent Sample	Analyte	Associated Samples
SED-Z-2-1-1.5	Cyanide	soils in SDG J42535
SED-F-1-0-0.5	Gravel	parent sample
SED-E-2-0.5-1.0	Gravel	parent sample
SED-C-3-0-0.5	Gravel	parent sample
SED-B-1-0-0.5	Gravel	parent sample
SED-C-3-0-0.5	Cyanide and TOC	soils in SDG J43207
SED-A-1-0-0.5	Gravel	parent sample
SED-9	Gravel and methyl mercury	parent sample

The accuracy and precision evaluation for methyl mercury in LM-A-2 was repeated due to initial spiking error.
Some of the analyte recovery evaluations are not applicable due to high parent sample concentrations.

Field duplicate evaluations were performed for the following sample analytes.

- methyl mercury and total mercury in SW-B and SW-C
- methyl mercury on LMC-2, SED-Y-3, SED-W-1-0-0.5, SED-F-3-0-0.5, and LM-D-4
- TSS, hexavalent chromium, TOC, DOC, Hardness on SW-B and SW-Y
- Redox Potential, TOC, hexavalent chromium, sieve, and cyanide on SED-F-3-0-0.5, SED-Y-3, LM-D-4, and LM-C-2

Outliers were observed for the following analytes, with resultant qualification as estimated in the specific parent sample and associated duplicate:

- TSS (78%RPD) in SB-B
- Redox Potential and solids in SED-F-3-0-0.5
- % solids on LM-C-2
- No. 200 Sieve, %Silt, and Redox Potential on LM-D-4

The samples submitted in J42011 and the field blank of 9/21/06 (J41741) showed inadequate preservation at laboratory receipt. Results for these samples are therefore qualified as estimated, with a potential low bias.

The result for methyl mercury in the field blank of 9/29/06 is qualified as estimated due to elevated temperature at sample receipt (14.5°C).

Results for TOC in LM-D-3, LM-D-4, SED-7, and SED-8 are qualified as estimated, with unknown bias, due to variance in the result of the replicate injections.

Some of the field blanks show low levels of methyl mercury. Associated aqueous sample detected values are of high enough concentration to be disregarded as external contamination. Several of the soil samples reported in J42535, SED-E-2-1.5-2.0, SED-C-2-1.0-1.5 show levels within the action range for consideration as contamination, and have been edited to reflect non-detection at elevated reporting limits.

Samples SED-Y-1, SED-X-1, and SED-X-3 were received in broken containers that were closed into baggies. These samples are qualified for low solids content, but may also have a low bias due to potential losses.

Data Package Completeness/Chains-of-Custody

The chains-of-custody associated with the subcontracts do not include times of collection. They were present on the original field custodies and bottle labels. Some of the custodies do not include specific entries of release time and/or receipt date and time. The down-arrow for collection date was not present on the custody for J42762.

Some of the custodies for the subcontracting transfer to Battelle do not include release date, release times, and/or receipt signatures. The custody entry for SED-D-1-0-0.5 incorrectly denotes it as being HCl preserved.

The matrix of one of the field blanks on a custody submitted to Paradigm was incorrectly denoted as being soil.

The calibration standard sections of the Paradigm data packages are not paginated

Discrepancies in custody entries were resolved at sample receipt. Edits to custodies should have been dated and initialed.

SW-Y was reported as SW-4 in some of the hardcopy data. Similarly, some of the laboratory report forms show SED-4-3 rather than SED-Y-3. The field blank FB100506 is noted as being FB100S06 on some of the forms. Proper identifications were made on the electronic deliverables.

Please do not hesitate to contact me if you have comments or questions regarding this report.

Very truly yours,

Judy Harry

Att: Validation qualifier definitions

VALIDATION QUALIFIER DEFINITIONS

DATA QUALIFIER DEFINITIONS

The following definitions provide brief explanations of the national qualifiers assigned to results in the data review process. If the Regions choose to use additional qualifiers, a complete explanation of those qualifiers should accompany the data review.

U	-	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
J	-	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
N	-	The analysis indicates the present of an analyte for which there is presumptive evidence to make a "tentative identification".
NJ	-	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
UJ	-	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	-	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

RE: Data Validation for the LCP Superfund site, Linden, NJ
Accutest SDG Nos. J44803, J44938, J45239, J45527, J46783, J45854, J46057, J46213, J46443, J46565, J46700, J46853, J47004, J47128, J47366, J48098, J48211, J48325, J49293, J49409, J49451, J49611, J51040, J51158, J51393, J51494, J51580, J51673, J51889, J52021, J52027, J52130, J52219, J52588, J52669, J52751, J52878, J52971, J53104, J53258, J53388, J53483, J53484, J53630, J53740, J53817, J54238, J54435, J54580, J54581, J54589, J54782, J55249, J55249X, J55951, J55951X, J56074, and J57403

Dear Mr. Cavas:

Review has been completed for the data packages generated by Accutest Laboratories that pertain to samples collected 10/26/07 through 3/30/07 at the LCP Superfund, Linden, NJ project site. One hundred and six soil samples and twenty-eight aqueous samples were processed for TCL Volatiles, TCL Semivolatiles, TCL Pesticides, TCL PCBs, TAL metals, hexavalent chromium, and total cyanide. The soil samples were also processed for TOC and Redox Potential, and the aqueous samples were also processed for filtered metals. Twelve of the soil samples were also processed for Dioxin/Furans (PCDD/PCDF). Twenty-four of the samples were also processed for methyl mercury. A total of thirty samples were processed only for mercury (total or filtered). Four aqueous and one soil sample were analyzed only for metals. Aqueous samples also underwent Selective Ion Monitoring (SIM) for selected semivolatile analytes in order to obtain better sensitivity and lower reporting limits. Blind field duplicates, sample matrix spikes, field blanks, and trip blanks were processed with the project samples. The specific sample location identifications covered in this report are noted in the attached laboratory summary listings.

The analytical methodologies utilized are those of the USEPA SW846 3rd edition and USEPA Standard Methods. The dioxin/furan analyses were subcontracted to SGS/Paradigm, the methyl mercury to Battelle Marine Sciences.

Validation review of the data packages has been performed utilizing the guidance in the USEPA National Functional Guidelines for Data Review, the USEPA Region II validation SOPs, the project QAPP (including laboratory SOPs), the specific methodology requirements, and professional judgment.

The following items were reviewed:

* Laboratory Narrative Discussion
* Custody Documentation
* Holding Times
* Surrogate Recoveries and Internal Standard Responses
* Matrix Spike Recoveries/Duplicate Correlations
* Field Duplicate Correlations
* Preparation/Calibration Blanks
* Control Spike/Laboratory Control Samples
* Instrumental Tunes
* Calibration/CRI/CRA Standards
* ICP Serial Dilution
* ICP Interference Check Samples
* Dioxin/Furan Recovery and Clean-Up Standards
* Instrument IDLs and Performance
* Method Compliance
* Sample Result Verification

Those items listed above which show deficiencies are discussed within the text of this narrative. All of the other items were determined to be acceptable according to the validation guidelines noted above.

In summary, most of the sample analyte values/reporting limits are usable as reported, or usable with minor qualification as estimated ("J" qualifier) due to matrix effects. The following exceptions were noted:

- Due to matrix effect, the results for hexavalent chromium in numerous samples are not usable, as evidenced by the lack of recovery of that analyte in the sample spikes.
- Results for several select volatile or semivolatile compounds are not usable in a limited number of samples due to matrix effects
- Numerous metals results of soil and aqueous samples were qualified as estimated due to matrix effects
- Reporting limits for metals in many of the aqueous samples are elevated, typically tenfold, due to interferences, primarily from sodium constituency
- Some of the low level detections are considered external contamination, as evidenced by presence in associated blank

Laboratory processing was generally compliant with analytical protocol requirements, the samples do not show significant matrix effects on organic target analyte recoveries, and the project data completeness requirement of 90% has been met.

Copies of the laboratory sample identification summary forms that list the sample covered in this report are attached to this text. Included with this submission are electronic client data tables that have been qualified in red to reflect the edits and qualifications referenced and recommended within this report. These tables have been submitted under separate cover.

The following text discusses quality issues of concern.

General

Due to low solids content (20.8%), results (both detected values and the reporting limits of non-detected analytes) for LHP-126-10.5-12 have been qualified as estimated, with a possible bias of an unknown direction. This is due to the potential for non-homogeneity during sample collection/processing, as well as to the variances in analytical methodologies betweennn aqueous and soil matrices.

Field and trip blanks submitted with the samples covered in this report show minimal contamination, with most having no contamination above reporting limits. The rare exceptions where sample results are affected are noted in the following text.

Sample LHP-105-1-3 was reported by the laboratory in the data package as "LHP-105-13-1". The electronic tables are correct.

TCL Volatiles by USEPA SW846 8260B

Results for toluene in MW-13S and MW-18S are considered external contamination due to presence I the associated field blank, and are edited to non-detection.

Matrix spikes (MS and MSD) for MW-6D-12-14, MW-16D-17-19, LHP-111-0-1, LHP-105-1-3, ADS-102-7-8, MW-11D-12-14, MW-23D, MW-9S, MW-24S, H-B-105D, and MW-22S show accuracy and precision within QAPP/validation guidelines, with the following exceptions:

- bromomethane in MW-11D-12-14—that result in the parent sample is qualified as estimated
- numerous analytes show elevated duplicate correlations in MW-23D. The sample reports no detections, and reported results are unaffected.
- carbon disulfide, 1,1-dichloroethene, and trans-1,2-dichloroethene in MW-24S show low recoveries

Field duplicate correlations for WW-101-15-17, MW-16D-17-19, MW-25D-10-12, LHP-105-0-1, LHP-128-0-1, MW-7S, and MW-19S are acceptable, with the exception of that for methylene chloride (>±CRDL) in WW-101-1115-17. Results for that analyte in the parent sample and duplicate are qualified as estimated.

Calibrations standards show acceptable responses, with the following exceptions, results for which are qualified as estimated in the indicated samples:

- acetone and/or 2-butanone (low RRF) in the majority of the sample covered in this report
- bromomethane in MW-11D-12-14
- chloromethane in MW-18S
- carbon disulfide and bromoform in HB-102B and HB-102C

No qualification is made for analytes that show elevated responses in calibration standards but were not detected in the samples.

The results for the trip blank reported in SDG J46700 are qualified as estimated due to analysis beyond the QAPP holding time requirement.

The results for TB020207 are qualified as estimated due to bubbles present in the vials, and the potential of loss through headspace.

No volatile field or trip blank analysis was associated with HB-102A. The sample reports no detection of volatile compounds, and results are therefore not affected.

Tentatively Identified Compounds (TICs) that are flagged as "B" or identified as "system artifacts" are considered external contamination, as shown by presence in the associated blanks.

TCL Semivolatile Analyses by USEPA SW846 8270C

The three soils reported in SDG J44803 and six soils in J48098 show outlying low responses for one or more internal standards. The results for specific target analyte compounds associated with the outlying standards have been qualified as estimated in those samples.

Four soil samples reported in J48325 show sufficiently low responses for internal standard d12-perylene that results for non-detected analytes associated with that internal standard have been rejected, and are not usable. For those samples, detected results associated with d12-perylene, as well as all results associated with d12-chrysene, have been qualified as estimated.

Six detected results in TES-4-0-1 have been qualified as estimated due to elevated response of the associated internal standard.

Results for benzaldehyde in WW-101-15-17, its field duplicate, MW-23D-15-17, and MW-14D-17-19 are not usable due to lack of recovery of this compound in the associated spiked blank controls.

The results for 2-methylphenol MW-23D-15-17 and MW-14D-17-19 are qualified as estimated due to low recovery in the associated spiked blank control.

MW-17D and MW-17S were re-extracted beyond allowable holding time, due to low recoveries for seven analytes in the associated spiked blank control. The initial results are used, with results for those compounds qualified as estimated. Additionally, the result for 2-chlorophenol in MW-17D and the detected values in MW-17S (they are derived from the re-extractions) are qualified as estimated due to the outlying holding time.

MW-16S was re-extracted due to a single low surrogate recovery. The initial result can be used without qualification.

The results for 2-chlorophenol in the soil samples reported in SDG J47004, and for 2,4,6-trichlorophenol in the soils reported in J48098 are qualified as estimated due to slightly low recovery in the associated spiked blank control.

Field duplicate correlations for WW-101-15-17, MW-16D-17-19, MW-25D-10-12, LHP-105-0-1, LHP-128-0-1, MW-7S, and MW-19S are acceptable, with the exception of that for bis(2-ethylhexyl)phthalate in LHP-105-0-1, which shows variance exceeding ±2XCRDL. The results for that analyte in the parent sample and duplicate have been qualified as estimated.

Matrix spikes (MS and MSD) for LHP-124-2-4, LHP-124-10-12, MW-6D-12-14, MW-25D-10-12, LHP-111-0-1, LHP-105-1-3, LB-103-0-1, MW-11D-12-14, MW-11D-16-18, MW-17D, MW-16D, MW-21D, MW-6D, MW-7S, MW-8S, MW-12S, MW-9S, MW-22S, and H-B-104B show accuracy and precision within validation guidelines, with the following exceptions:

- benzaldehyde and hexachlorocyclopentadiene failed to recover in LHP-124-2-4 and hexachlorocyclopentadiene failed to recover in LHP-109-7-9. Results for those specific compounds in the noted parent samples are therefore rejected, and not usable
- benzaldehyde, hexachlorocyclopentadiene, atrazine, 3,3-dichorobenzidine, and caprolactum failed to recover in LHP-109-7-9. Results for those specific compounds in the parent sample are therefore rejected, and not usable. The result for 4-chloroaniline in this parent sample is qualified as estimated due to outlying spike recoveries.
- benzaldehyde failed to recover in DUP02070, and the results for that compound in the field duplicate and parent sample are rejected. The result for phenol is qualified as estimated in that parent and duplicate because the matrix spike responses were not resolved from those of aniline the spikes.
- bis(2-ethylhexyl)phthalate in LHP-124-2-4 shows elevated recoveries; results in the parent sample are qualified as estimated
- five analytes did not recover in the spikes of LHP-111-0-1, but they were analyzed at tenfold dilution. Accuracy and precision for the other analytes were acceptable; no qualification is indicated
- 4,6-nitro-2-methylphenol in LHP-109-0-1 is qualified as estimated due to low recovery
- some of the SIMs matrix spikes show slightly outlying recoveries, but were inadvertently spiked at concentrations exceeding instrument linear range; no qualification is made
- MW-23D shows elevated duplicate correlations for more than thirty analytes; the recoveries are acceptable, and the parent sample shows no detections; no qualification is made
- matrix spikes of MW-12S exhibited elevated duplicate correlations for all but one analyte. This variance was also noted in the surrogate recoveries of the spikes, and is likely an extract-specific anomaly—no qualification is made
- benzo(k)fluoranthene in MW-12S
- five analytes show low recovery in the matrix spikes of MW-22S, and have been qualified as estimated in the parent sample

The results for the field blank of 12/05/06 are qualified as estimated, with a possible low bias, due to outlying holding time to extraction.

Due to presence in the associated field blank, the detected results for bis(2-ethylhexyl)phthalate in H-B-103A and H-B-104A, and for 2-methylnaphthalene inn HB-102B, are considered external contamination, and edited to reflect non-detection ("U").

Calibrations standards showed acceptable responses with laboratory requirements and validation guidelines, with the following exceptions, results for which are qualified as indicated in the noted samples:

- hexachlorocyclopentadiene in MW-17D-15-17, MW-17D-17-19, FB102706, FB110807, LHP-113-0-1, LHP-106-0-1, LHP-119-0-1, TES-4-0-1, TES-1-0-1, FB121406, FB121806, MW-15S, MW-24S, FB022007, and HB-102C
- bis(2-ethylhexyl)phthalate detections in soils in J44803
- 2,4-dinitrophenol and 4-nitrophenol in FB103106
- hexachlorocyclopentadiene, 2,4-dinitrophenol, and 4-nitrophenol in MW-20D-32-34 and MW-20D-36-38
- hexachlorocyclopentadiene and 4,6-dinitro-2-methylphenol in FB111006
- hexachlorocyclopentadiene, benzaldehyde, and 2-methylphenol in FB111306
- 2-methylphenol in FB111506
- 2-chlorophenol, 2,4,6-trichlorophenol, and 1,1-biphenyl in soils reported in J46853
- hexachlorocyclopentadiene, hexachlorobutadiene, and 1,1-biphenyl in FB111606
- hexachlorocyclopentadiene and 2,4-dinitrophenol in four samples in J48325,
- pentachlorophenol in MW-17D, MW-17S, MW-18D, MW-16S, MW-14S, and the associated field blanks
- 4-nitrophenol in MW-18D and its field blank

Tentatively Identified Compounds (TICs) that are flagged as "B" and/or "A", or identified as "system artifacts" are considered external contamination, as shown by presence in the associated blanks.

TCL PCB/Pesticides Analyses by USEPA SW846 8081A and 8082

Samples MW-8S and MW-12S show very high concentrations of elemental sulfur (also noted in the BNA analysis TIC results). Although the extracts went through copper cleanup, there is still sufficient copper as to produced significant interferences in the pesticide and PCB analyses of those samples. These would have completely masked response for heptachlor on both analytical columns used in these analyses, and results for that compound are therefore rejected, and not usable in those samples. Results for the other pesticides and PCB analytes (they report no detection) are qualified as estimated in value, and should be considered as being borderline usability.

Some of the pesticide reported detections may reflect responses from the sample matrix or PCB components. Those detections show elevated dual column correlations, with resulting qualifications as either estimated in value ("J"), tentative in identification and estimated in value ("NJ"), or edited to nondetection ("U", sometimes at elevated reporting limits). The correlations reported on summary forms by the laboratory were calculated as %RPD. Per validation protocols, this review evaluation utilized %D. The appropriate qualifications have been made on the client results tables.

MW-16D-13-15 and LHP-122-0-1 produced low recoveries for all surrogates in the initial extractions. The re-extractions were beyond allowable holding time. The pesticide and PCB results are qualified as estimated, and likely have a low bias.

The results for the field blank of 12/18/06 are qualified as estimated, with a possible low bias, due to outlying holding time to extraction.

The field blanks FB112006 and FB020207 were re-extracted (beyond holding time) due to low surrogate recovery on one column. The initial alternate column responses were acceptable, and are used without qualification.

Calibration standards meet protocol and validation requirements.

Matrix spikes of pesticides and Aroclors 1016 and 1260 were performed on LHP-124-10-12, MW-6D-12-14, MW-25D-10-12, LHP-105-1-3, MW-11D-16-18, MW-16S, MW-23D, H-B-105C, and MW-22S. Matrix spikes of pesticides were performed on LHP-101-0-1 and LHP-109-7-9, and matrix spikes of Aroclors 1016 and 1260 on LHP-105-5-8 and LHP-121-0-1. They show acceptable accuracy and precision, with the following exceptions:

- several recoveries were elevated in LHP-105-1-3 due to high concentrations of Aroclor 1254 in the parent sample.
- seven pesticides show low recoveries in MW-16S spikes, and results for those compounds in the parent sample are qualified as estimated in value
- recoveries were elevated in some cases for analytes not detected in the samples due to interferences; no qualifications are made as a result

Due to slightly low recoveries in the associated spiked blank controls, the results for d-BHC in the soils reported in J49409, and in the aqueous samples in J51494, J51580, J51673, J51889, J52021, and J52219 are qualified as estimated, with a possible low bias.

Field duplicate correlations for WW-101-15-17, MW-16D-17-19, LHP-128-0-1, MW-7S, and MW-19S are acceptable.

The field duplicate correlations for Aroclors 1254 and 1260 in LHP-105-0-1 show variance where there were detections in the parent at levels above CRDL (up to 629 ug/kg), but no detections above the CRDL of 35 ug/kg in the duplicate. Those results have been qualified as estimated in the parent and its duplicate.

TES-3-0-1 shows elevated surrogate recoveries in the pesticide and PCB analyses due to interferences from the PCBs in the sample. No qualification is made.

TCL Dioxin/Furan Analyses by USEPA SW846 8290

Detected results for samples that were reported with the laboratory "A" qualifier reflect quantitative values below the established linear range of the instrument, and have therefore been qualified as estimated in value.

Results for furans that may include quantitative contribution from the corresponding chlorinated biphenyl ethers (BPE) have been noted as being EMPC. They may reflect false positives or a high bias.

The method and field blanks contain low levels (below CRDL) of many of the PCDD and PCDF isomers. Field samples containing detected levels of those compounds that are below fivefold of the associated blank concentrations (at the instrument level) are considered potential external contamination. Those detections have been noted as being Estimated Maximum Potential Concentrations (EMPCs). It can be said that these analytes are not present at levels above those originally reported concentrations.

Sample responses showing outlying ion ratios do not meet the requirements for identification and have been noted as being EMPC.

Detected results reported with the "Q" laboratory qualifier have been qualified as estimated due to quantitative interferences.

TAL Metals by USEPA SW846 6010B, 7470/7471

As noted earlier, reporting limits for many aqueous sample analytes are elevated due to matrix interference. Although this results in limits that are higher than those proposed, this occurs only in samples showing extremely high concentrations of sodium and other elements.

Sample LCP-231-SS112706 was reported on a wet weight basis. A minimal quantity of sample was submitted; no solids determination was performed. The "as-received" basis should be considered in the evaluation of those data.

Analytes showing matrix spikes recoveries that are outside validation guidelines are noted below, with qualification of results as estimated in the samples in the indicated samples:

Parent Sample	Analyte	Associated Samples
LHP-126-2-4	aluminum, barium, beryllium, cobalt, potassium, and sodium	J44803
LHP-125-.5-2	antimony, copper, lead, magnesium, manganese, and zinc	J44938
LHP-125	antimony, barium, manganese	J45239
LP-101-11-13	antimony	J45527
WWT-101-21-23	antimony	J45783
MW-6D-12-14	aluminum, antimony, barium, cadmium, chromium, copper, iron, lead, magnesium, manganese, nickel, potassium, and vanadium	J45854
MW-20D-12-14	antimony, manganese, iron, potassium, and mercury	J46057
MW-20D-36-38	antimony, arsenic, calcium, chromium, manganese, potassium, selenium, zinc	J46213
MW-14D-13-15	antimony, barium, iron, manganese	J46443
MW-23D-15-17	antimony, manganese, iron, magnesium	J46565
MW-23D-37-39	antimony and selenium	J46700, J46853, and J47004
MW-6D-30-32	antimony, aluminum, barium, potassium	J47128 and J47366
LHP-111-0-1	antimony, barium, calcium, magnesium, manganese, zinc	J48098

cont'd

Parent Sample	Analyte	Associated Samples
LHP-105-1-3	antimony and mercury	J48211
LHP-127-3-5	antimony, arsenic, beryllium, chromium, potassium, and mercury (detections)	J48325
MW-11D-16-18	antimony, iron, manganese, selenium	J49293, J49409, and J49611
MW-110-14-16	antimony, iron, manganese, sodium	J49293, J49409, and J49611
TPS-1	sodium	J49451
MW-17D	cadmium and iron	J51040 and J51153
MW-18D	iron, mercury, thallium	J51393, J51494, J51580, and J51673
WC-SOIL-011907B	mercury	J52027
MW-6S	potassium	J52130, J52219, and J52588
MW-23D	potassium	J52669 and J52751
MW-6D	potassium	J52878, J52971, J53104, and J53258,
H-B-105C	mercury	J53484
H-B-103A	antimony and magnesium	J53484 and J54238
SW-SB-2-22-07-1400	mercury	J54435 and J54581
H-B-104B	antimony	J54580 and J54782
HB-101A	antimony	J55249 and J55951
HB-102C	antimony, potassium, thallium	J56074

Laboratory duplicate correlations are acceptable. Matrix spikes for TAL metals on MW-16S, and for mercury on LHP-124-10-12, MW-7S, MW-22S, HB-102B, and DUP110606 show recoveries within recommended limits. Elevated matrix spike recoveries for elements not detected in the samples do not require qualification of associated data.

Field duplicate evaluations were performed for on WW-101-15-17, MW-16D-17-19, MW-25D-10-12, LHP-105-0-1, LHP-128-0-1, MW-7S, and MW-19S, and for filtered mercury in SW-VB-02-23-07-0900. The following outliers were observed, with resultant qualification of that element as estimated in the specific parent sample and associated duplicate:

- barium and manganese inn WW-101-15-17
- zinc in MW-16D-17-19
- mercury in MW-25D-10-12
- iron in filtered fraction of MW-19S

Due to low level detection in the associated field blank, the results for manganese in MW-22S and its filtrate are edited to reflect non-detection at the originally reported concentrations.

The following ICP serial dilution evaluations show outlying correlations, with detected results (greater than 10 X IDL) in associated samples qualified as estimated ("J"):

Parent Sample	Analytes	Associated SDGs
LHP-126-2-4	calcium, cobalt, magnesium, nickel	J44803
LHP-125-.5-2	zinc	J44938
LHP-125	aluminum, barium, beryllium, calcium, potassium and zinc	J45239
LP-101-11-13	calcium, chromium, cobalt, copper, nickel, zinc	J45527
WWT-101-21-23	calcium, chromium, cobalt, iron, manganese, sodium, vanadium, and zinc	J45783
MW-6D-12-14	barium, cadmium, cobalt, iron, nickel, potassium, sodium	J45854
MW-20D-12-14	copper	J46057
MW-20D-36-38	aluminum, barium, calcium, chromium, cobalt, iron, magnesium, manganese, nickel, potassium, sodium, vanadium, zinc	J46213
MW-14D-13-15	aluminum and beryllium	J46443
MW-23D-37-39	beryllium, chromium, manganese, nickel, potassium sodium, vanadium, zinc	J46700, J46853 and J47004
MW-6D-30-32	nickel and sodium	J47128 and J47366
LHP-105-1-3	arsenic, barium, beryllium, calcium, chromium magnesium, and nickel	J48211
LHP-127-3-5	arsenic, beryllium, calcium, chromium, magnesium, nickel, silver, sodium	J48325
MW-11D-16-18	aluminum, barium, calcium, chromium, cobalt, magnesium, manganese, nickel, potassium, sodium, and zinc	J49293, J49409, and J49611
MW-110-14-16	potassium and sodium	J49293 andJ49409
MW-17D	potassium	J51040 and J51153
MW-18D	copper, potassium, sodium	J51153, J51494, J51580, and J51673
MW-16S	manganese and potassium	J51889 and J52021
MW-6S	potassium	J52130, J52219, and J52588
MW-23D	iron and potassium	J52669 and J52751
MW-23D-Filt	potassium	J52669 and J52751
MW-6D	potassium and sodium	J52878, J52971, J53104, and J53258
MW-22S-Filt	barium in filtered	J53388, J53483, J53630, J53740, and J53817
H-B-104B	calcium and zinc	J54580 and J54782
HB-101A	cobalt, potassium, and sodium	J55249and J55951

cont'd

Parent Sample	Analytes	Associated SDGs
HB-102C	aluminum, barium, calcium, chromium, cobalt, iron, magnesium, manganese, nickel, potassium, vanadium, and zinc	J56074

The ICP serial dilutions of MW-23D-15-17, LHP-111-0-1, WC-SOIL-011907B, and MW-22S-Total show acceptable correlations.

The following analytes show concentrations higher in the filtered fractions by more than 10%D, and results for those elements have been qualified in both the total and filtered fractions of the indicated samples:

Sample ID	Analytes
MW-17D	cobalt, iron, lead, magnesium, manganese, and sodium
MW-18D	manganese and sodium
MW-16D	calcium, lead, manganese, potassium, sodium
MW-20D	calcium and lead
MW-14D	calcium
MW-14S	sodium
MW-21D	calcium, iron, potassium, sodium
MW-21S	lead and iron
MW-11S	antimony, calcium, iron, lead, magnesium, selenium, and sodium
MW-6D	calcium
MW-7S	potassium
MW-8S	manganese
MW-10S	arsenic
MW-12S	arsenic and manganese
MW-24S	magnesium
MW-15S	barium, nickel, potassium
MW-22S	arsenic

The result for mercury in LHP-125-0.5-2, MW-13S and MW-18S are qualified as estimated, with a low bias, due to low recoveries for the associated low-level CRI standards.

The results for antimony in soils reported in SDG J48211, MW-21S, MW-21D, MW-23S, MW-23D-Filt, and in the field blanks of 11/02/06 and 11/07/06 are qualified as estimated, with a low bias, due to low recoveries for the associated low-level CRI standards.

The result for arsenic in FB111606 is qualified as estimated, with a low bias, due to low recovery in the associated low-level CRI standard.

The results for lead in MW-9S, MW019S, DUP020707, and FB121506 are qualified as estimated, with a low bias, due to low recovery in the associated low-level CRI standards.

The result for thallium in the filtrate of MW-17D is qualified as estimated, with a low bias, due to low recovery in the associated low-level CRI standard.

The results for arsenic and beryllium in MW-24S and MW-15S are qualified as estimated, with a low bias, due to low recovery in the associated low-level CRI standard.

The results for arsenic and antimony in MW-22S and MW-15S (Filt only) are qualified as estimated, with a low bias, due to low recovery in the associated low-level CRI standard.

Detected results for lead in MW-25D, for cadmium in samples reported in J47366, and selenium in MW-11S and MW-11D are qualified as estimated, with a high bias, due to elevated recoveries for the associated low-level CRI standards.

MW-18S was received by the laboratory with incomplete preservation. The sample was preserved at the laboratory. Results are qualified as estimated, and may have a low bias.

Wet Chemistry- Cyanide, Hexavalent Chromium, TOC, Methyl Mercury, Redox Potential (ORP), TSS, pH

Review was conducted for method compliance, transcription, calculations, standard and blank acceptability, accuracy and precision, etc., as applicable to each procedure.

Cyanide recovered below 10% in the matrix spikes of LHP-126-2-4 and LHP-127-3-5. Therefore, the non-detected result for that analyte in the parent samples are rejected, and provide no usable information as to the presence or absence of that analyte. Results for all associated samples (J44803, J44938, J48325, and J48293) are qualified as estimated, and may have a significant low bias.

Hexavalent chromium recovered below 10% in the matrix spikes of MW-6D-12-14, LHP-127-3-5, LHP-105-1-3, MW-20S, MW-14D-Filt, MW-21D-Filt, MW-6D-Filt, MW-10S-Filt, MW-12S-Filt, MW-9S-Filt, and HB-102C. Therefore, the non-detected results for that analyte in the samples in J45854 J48211, J48325, J49409, J51580, J51673, J52021, J52878, J53104, J53258, J53388 and J56074 are rejected, and provide no usable information as to the presence or absence of that analyte. Detected values in those samples are qualified as estimated.

The hexavalent chromium reported result for MW-10S is detection at 10 ug/L. The total chromium result for that sample shows no detection at that level. Because the total chromium analysis is more definitive, it is assumed that the hexachrome detection reflects interferences, and it has therefore been edited to non-detection. Following that edit, the result is rejected due to lack of recovery of the matrix spike of that sample.

Although the hexavalent chromium data are rejected, it can be said that the total chromium values in the samples would represent a maximum potential value for hexavalent chromium.

Field duplicate evaluations were performed on WW-101-15-17, MW-16D-17-19, MW-25D-10-12, LHP-105-0-1, LHP-128-0-1, MW-7S, and MW-19S. Outliers were observed for the following analytes, with resultant qualification as estimated in the specific parent sample and associated duplicate:

- cyanide in WW-101-15-17
- TOC in LHP-105-0-1
- TOC in LHP-128-0-1

The cyanide fraction of MW-18S was received by the laboratory with incomplete preservation. The sample was preserved at the laboratory. The result is qualified as estimated, and may have a low bias.

The following matrix spike/laboratory duplicate evaluations were performed:

- TOC on MW-265-8-10, MW-20D-12-14, MW-23D-15-17, MW-21D-15-17, MW-16D-17-19, LHP-111-0-1, LHP-105-1-3, LHP-127-3-5, MW-11D-16-18, H-B-105C, H-B-104B, H-B-104D, H-B-101A, and HB-102B
- Cyanide on LHP-126-2-4, LHP-125-10-12, WW-101-21-23, MW-6D-12-14, MW-20D-12-14, MW-20D-36-38, MW-14D-13-15, MW-23D-15-17, MW-21D-13-15, MW-16D-17-19, LHP-101-0-1, LHP-105-1-3, LHP-127-3-5, LB-101-0-1, MW-11D-16-18, MW-25D-33-35, MW-17D. MW-17S, MW-18D, MW-20S, MW-14D, MW-14S-Filt, MW-25D, MW-23S, MW-23D, MW-11S, MW-6D, H-B-105C, MW-22S, MW-13S, H-B-103A, H-B-104B, H-B-104D, H-B-101A, HB-102A, and HB-102B
- Hexavalent chromium on MW-6D-12-14, LHP-125-0.5-2, DUP110606, LHP-111-0-1, LHP-127-3-5, LHP-105-1-3, MW-17D-Filt, MW-17S-Filt, MW-18D-Filt, MW-16D, MW-14D-Filt, MW-14S-Filt, MW-21D-Filt, MW-6-Filt, MW-25D, MW-23D, MW-11S, MW-6D-Filt, DUP020107-Filt, MW-10S-Filt, MW-12S-Filt, MW-9S-Filt, MW-22S, MW-13S-Filt, H-B-104B, H-B-104D
- Redox Potential on LHP-125-10-12, LP-101-11-13, MW-14D-13-15, LHP-105-1-3, LHP-127-3-5, MW-11D-16-18, and MW-25D-33-35
- Petroleum hydrocarbon on WC-SOIL-011907B
- Specific Gravity on MW-6D and MW-11D
- TSS on SW-SB-2-22-07-1400
- Methyl mercury on HB-101A

Outlying matrix spike recoveries or duplicate correlations (in addition to the hexavalent chromium and cyanide outliers noted above) are listed below, with qualification of results as estimated in the indicated parent samples:

Parent Sample	Analyte	Associated Samples
MW-265-8-10 TOC		J44803
DUP110606	hexavalent chromium	J45783
MW-6D-12-14	cyanide	J45854
MW-20D-12-14	TOC	J46057
LHP-127-3-5	TOC	J48325
MW-16D	hexavalent chromium	J51494
MW-14S-Filt	hexavalent chromium	J51889
MW-16S-Filt	hexavalent chromium	J52130
MW-25D-Filt	hexavalent chromium	J52219
MW-11S	hexavalent chromium	J52751
DUP020107-Filt	hexavalent chromium	J52971
H-B-105C	TOC	J53484
MW-13S-Filt	hexavalent chromium	J53740
HB-102B	TOC	J56074

Results for TOC in MW-6D-0-2, MW-17D-17-19, MW-16D-13-15, LHP-101-5-8, LHP-120-0-1, H-B-104B, H-B-104C, and nine samples reported in SDG J48325 are qualified as estimated, with unknown bias, due to variance in the result of the replicate determinations.

Data Package Completeness/Chains-of-Custody

Two samples reported in J45239 were submitted and reported with the same client ID (LHP-125). The electronic deliverables distinquishes the two different depths.

Two samples submitted for SDG J45239 were not entered onto the custody form until sample receipt.

The calibration standard sections of the Paradigm data packages are not paginated

Discrepancies in custody entries were resolved at sample receipt. Edits to custodies should have been dated and initialed.

Please do not hesitate to contact me if you have comments or questions regarding this report.

Very truly yours,

Judy Harry

VALIDATION QUALIFIER DEFINITIONS

DATA QUALIFIER DEFINITIONS

The following definitions provide brief explanations of the national qualifiers assigned to results in the data review process. If the Regions choose to use additional qualifiers, a complete explanation of those qualifiers should accompany the data review.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

J - The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

N - The analysis indicates the present of an analyte for which there is presumptive evidence to make a "tentative identification".

NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

UJ - The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R - The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

QUALITATIVE
DATA USABILITY REPORT
Soil Vapor Sampling
LCP Superfund Site

SDG No.: J63094 and J63222

Laboratory: Accutest Laboratories, Dayton, New Jersey

Site: LCP Superfund Site, Linden, New Jersey

Date: July 25, 2007

Data Reviewed by: Gregory Cole, Brown and Caldwell

A Qualitative Data Usability Review was performed on all analytical data from SDGs J63094, and J63222. The following table outlines the samples and analytical methods reviewed;

Sample	Analysis	Method
SV-8	Volatile Organic Compounds (VOC)	TO-15
SV-9	Volatile Organic Compounds (VOC)	TO-15
SV-10	Volatile Organic Compounds (VOC)	TO-15
SV-12	Volatile Organic Compounds (VOC)	TO-15
SV-13	Volatile Organic Compounds (VOC)	TO-15
DUP060707	Volatile Organic Compounds (VOC)	TO-15
TB060707	Volatile Organic Compounds (VOC)	TO-15
SV-1	Volatile Organic Compounds (VOC)	TO-15
SV-2	Volatile Organic Compounds (VOC)	TO-15
SV-3	Volatile Organic Compounds (VOC)	TO-15
SV-4	Volatile Organic Compounds (VOC)	TO-15
SV-5	Volatile Organic Compounds (VOC)	TO-15
AA2-060707	Volatile Organic Compounds (VOC)	TO-15
AA1-060707	Volatile Organic Compounds (VOC)	TO-15

This review was performed based on the requirements provided in the project Quality Assurance Project Plan, the USEPA Region II validation SOPs, and on guidance provided in the Contract Laboratory Program National Functional Guidelines for Organic and Inorganic Data Review, 2004.

The review included the parameters listed below.

- Sample Documentation
- Sample Holding Times
- Laboratory and Field Blank Review
- Surrogate Recovery Review
- MS/MSD Recovery and Precision
- Field/Laboratory Duplicate Review
- Laboratory Control Sample (LCS) Review
- Sample Quantitation

DESCRIPTION OF QUALITATIVE REVIEW

Summary Evaluation of Data and Potential Usability Issues

Overall, the data is acceptable for the intended purposes. No results were rejected. Data quality issues with respect to field duplicate precision and results exceeding the calibration range were identified requiring qualification of some data.

Sample Documentation

Provided laboratory reports included all the necessary information to perform the described data review except the following:

- Detection limits were not provided in the hardcopy lab report. The lab report provides the reporting limit only. However, results detected at concentrations between the detection limit and the reporting limit are reported as estimated values The detection limits were provided as part of the electronic deliverable and have been loaded into the project database. Results reported as not detected can be considered to be less than the detection limit

Sample Holding Times

Each sample was prepared and analyzed within the specified holding time for each analysis

Laboratory and Field Blank Review

All compounds were reported as not detected in the laboratory and field blanks

Surrogate Recovery Data

Each of the surrogate recoveries were within the guidance limits.

MS/MSD Review

Matrix spikes were not performed on any Site samples.

Field/Laboratory Duplicate Review

One field duplicates was collected and analyzed for the same parameters as the associated parent samples. DUP060707 is a field duplicate for SV-10. In general, duplicate precision was poor. This is likely due to the inherent difficulties in collecting high volumes of soil vapor. Soil vapor becomes diluted as the sample volume collected increases. Therefore, reported results may be biased low. The field duplicate had much lower concentrations than the parent sample indicating that it was collected after the parent sample. The following analytes have been qualified as estimated due to field duplicate imprecision.

Constituent	Parent amt. (ppbv)	Duplicate amt. (ppbv)	RPD	RPD Limit	Action
Ethylbenzene	13.9	4.7	99	50	J
1,3,5-Trimethylbenzene	4.0	1.3	102	50	J
Toluene	91.8	35.2	89	50	J
Hexane	23.3	12.9	57	50	J

Constituent	Parent amt. (ppbv)	Duplicate amt. (ppbv)	RPD	RPD Limit	Action
Mixed Xylenes	74.1	24.3	101	50	J
Heptane	11.1	5.1	74	50	J
2,2,4-Trimethylpentane	5.5	3.1	56	50	J
1,3-Dichlorobenzene	6.3	1.5	123	50	J
4-Ethyltoluene	3.9	1.2	105	50	J
Ethanol	2360	956	85	50	J
Isopropanol	290	111	90	50	J
Chloroform	6.4	2.5	88	50	J
Benzene	16.6	7.7	80	50	J
Chloromethane	11.8	3.9	101	50	J
Tert-Butyl alcohol	7.0	2.5	95	50	J
Trichlorofluoromethane	2.1	1.2	54	50	J
2-Butanone	7.4	2.7	85	50	J
O-Xylene	16.6	5.3	103	50	J
1,2,4-Trimethylbenzene	13.9	4.3	105	50	J
M,P-Xylene	57.5	19.1	100	50	J

Laboratory Control Sample (LCS) Review

Each of the criteria is within guidance limits.

Sample Quantitation

Results for Ethanol in two samples (SV-10 and DUP060707) exceeded the calibration limit and are qualified as estimated.

The following table provides the affected samples and associated qualifications:

Sample	Constituent	amt. (ppbv)	Action
SV-10	Ethanol	2360	J
DUP060707	Ethanol	956	J

Validation Qualifiers

The following validation qualifiers may have been applied to the data, as appropriate.

- J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.
- U = The analyte was tested, but was not detected above the sample reporting limit.
- R = The sample result is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

This review was performed based on the requirements provided in the project Quality Assurance Project Plan, the USEPA Region II validation SOPs, and on guidance provided in the Contract Laboratory Program National Functional Guidelines for Organic and Inorganic Data Review, 2004.

The review included the parameters listed below.

- Sample Documentation
- Sample Holding Times
- Laboratory and Field Blank Review
- MS/MSD Recovery and Precision
- Field/Laboratory Duplicate Review
- Laboratory Control Sample (LCS) Review
- Sample Quantitation

DESCRIPTION OF QUALITATIVE REVIEW

Summary Evaluation of Data and Potential Usability Issues

Overall, the data is acceptable for the intended purposes. No results were rejected. Data quality issues with respect to field duplicate precision were identified requiring qualification of some data.

Sample Documentation

Provided laboratory reports included all the necessary information to perform the described data review.

Sample Holding Times

Each sample was prepared and analyzed within the specified holding time for each analysis

Laboratory and Field Blank Review

All compounds were reported as not detected in the laboratory and field blanks

MS/MSD Review

Matrix spikes and matrix spike duplicates were performed on three Site samples. All recoveries were within limits.

Field/Laboratory Duplicate Review

Two field duplicates were collected and analyzed for the same parameters as the associated parent samples. MC-A-DUP is a field duplicate for MC-A and FC-W-2-DUP is a field duplicate for FC-W-2. In addition, the laboratory performed laboratory replicate analyses on

three samples. In general, duplicate precision was good. However, the RPDs for several duplicate pairs exceeded the limit and have been qualified. The following results have been qualified as estimated due to duplicate imprecision.

Sample	Constituent	Parent amt. (ug/g)	Duplicate amt. (ug/g)	RPD	RPD Limit	Action
MC-A	As+3 as As	0.088	0.037	82	50	J
MC-A	As+5 as As	0.184	0.104	56	50	J
FC-F-2	DMA as As	0.013	0.005	89	50	J

Laboratory Control Sample (LCS) Review

Each of the criteria is within guidance limits.

Sample Quantitation

Each of the criteria is within guidance limits.

Validation Qualifiers

The following validation qualifiers may have been applied to the data, as appropriate.

- J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.
- U = The analyte was tested, but was not detected above the sample reporting limit.
- R = The sample result is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

This review was performed based on the requirements provided in the project Quality Assurance Project Plan, the USEPA Region II validation SOPs, and on guidance provided in the Contract Laboratory Program National Functional Guidelines for Organic and Inorganic Data Review, 2004.

The review included the parameters listed below.

- Sample Documentation
- Sample Holding Times
- Laboratory and Field Blank Review
- Labeled Standards Recovery Review
- MS/MSD Recovery and Precision
- Field/Laboratory Duplicate Review
- Laboratory Control Sample (LCS) Review
- Sample Quantitation

DESCRIPTION OF QUALITATIVE REVIEW

Summary Evaluation of Data and Potential Usability Issues

Overall, the data is acceptable for the intended purposes. Three PCB congener results in one sample (FC-E-2) were rejected due to extremely low labeled standard recoveries. Data quality issues with respect to labeled standard recoveries outside of limits, field duplicate precision and results exceeding the calibration range were identified requiring qualification of some data.

Sample Documentation

Provided laboratory reports included all the necessary information to perform the described data review.

Sample Holding Times

Each sample was prepared and analyzed within the specified holding time for each analysis

Laboratory and Field Blank Review

PCB congeners were detected in the laboratory and field blanks. Associated sample results were qualified as not detected with an estimated detection limit (UJ). Low levels of manganese were also detected in method blanks. However, associated sample concentrations were greater than five times the blank concentration and results were not qualified. The following analytes have been qualified due to blank contamination:

Sample ID	Analyte	Sample amt. (ng/Kg)	Blank amt. (ng/Kg)	Action
FC-A-1	3,3'-Dichlorobiphenyl	469.72	105	UJ
	3-Chlorobiphenyl	5.89	1.8	UJ
	4-Chlorobiphenyl	21.51	5.5	UJ
FC-A-2	3,3'-Dichlorobiphenyl	351.2	105	UJ

Sample ID	Analyte	Sample amt. (ng/Kg)	Blank amt. (ng/Kg)	Action
	3-Chlorobiphenyl	4.51	1.8	UJ
	4-Chlorobiphenyl	19.03	5.5	UJ
FC-B-2	2,2'-Dichlorobiphenyl	35.67	9.41	UJ
	3,3'-Dichlorobiphenyl	355.43	100.2	UJ
	2-Chlorobiphenyl	9.85	3.88	UJ
	4-Chlorobiphenyl	10.22	5.43	UJ
FC-C-2	3,3'-Dichlorobiphenyl	373.03	100.2	UJ

MC-Z	4-Chlorobiphenyl	5.79	1.55	UJ

Labeled Standards Recovery Data

Labeled Standards were added to the samples for PCB congener analysis. Recovery limits for labeled standards are 15-150 percent recovery. Results associated with recoveries outside limits were qualified as shown below.

Sample ID	Analyte	Spike recovery. (%)	Sample amt. (ng/Kg)	Action
FC-A-1	Decachlorobiphenyl	199	1241	J
	2,2'3,3',5,5',6,6'-Octachlorobiphenyl	341	440.22	J

MS/MSD Review

Matrix spikes and matrix spike duplicates were performed on three Site samples (FC-C-1, MC-B, and MC-X). Many recoveries were outside of acceptance limits. This is likely due to the

matrix interferences inherent in tissue samples. Results associated with recoveries outside limits were qualified as shown below.

Sample ID	Analyte	Spike recovery. (%)	Sample amt. (ng/Kg)	Action
FC-C-1	2,2'-Dichlorobiphenyl	-51	369.05	J
	3,3',4,4'-Tetrachlorobiphenyl	-58	671.61	J
	3,4,4'-Trichlorobiphenyl	22	550.22	J

Field/Laboratory Duplicate Review

Two field duplicates were collected and analyzed for the same parameters as the associated parent samples. MC-A-DUP is a field duplicate for MC-A. FC-W-2-DUP is a field duplicate for FC-W-2. Laboratory replicates were also performed. In general, duplicate precision was fair. The following analytes have been qualified as estimated due to field duplicate imprecision.

Sample	Constituent	Parent amt. (ppbv)	Duplicate amt. (ppbv)	RPD	RPD Limit	Action
MC-A	2,3,3',4',6-Pentachlorobiphenyl	17155.71	9370.8	59	50	J

Laboratory Control Sample (LCS) Review

Each of the criteria is within guidance limits.

Sample Quantitation

Results for four PCB congeners in two samples (MC-X and MC-W) exceeded the calibration limit and are qualified as estimated.

The following table provides the affected samples and associated qualifications:

Sample	Constituent	amt. (ng/Kg)	Action
MC-X	2,3',4,4',5-Pentachlorobiphenyl	10431.63	J
	2,2',3,5',6-Pentachlorobiphenyl	8181.67	J
MC-W	Decachlorobiphenyl	21130.6	J
	2,3',4,4',5-Pentachlorobiphenyl	9516.31	J

Validation Qualifiers

The following validation qualifiers may have been applied to the data, as appropriate.

- J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.
- U = The analyte was tested, but was not detected above the sample reporting limit.
- R = The sample result is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

QUALITATIVE
DATA USABILITY REPORT
Gaseous Mercury Sampling
LCP Superfund Site

SDG No.: 0607133

Laboratory: Frontier Geosciences, Inc., Seattle, Washington

Site: LCP Superfund Site, Linden, New Jersey

Date: September 11, 2007

Data Reviewed by: Gregory Cole, Brown and Caldwell

A Qualitative Data Usability Review was performed on all analytical data from SDG 0607133. The following table outlines the samples and analytical methods reviewed;

Sample	Analysis	Method
IO5-1	Total Gaseous Mercury (TGM)	IO-5
IO5-2	Total Gaseous Mercury (TGM)	IO-5
IO5-3	Total Gaseous Mercury (TGM)	IO-5
IO5-5	Total Gaseous Mercury (TGM)	IO-5
IO5-6	Total Gaseous Mercury (TGM)	IO-5

This review was performed based on the requirements provided in the project Quality Assurance Project Plan, the USEPA Region II validation SOPs, and on guidance provided in the Contract Laboratory Program National Functional Guidelines for Organic and Inorganic Data Review, 2004.

The review included the parameters listed below.

- Sample Documentation
- Sample Holding Times
- Laboratory and Field Blank Review
- Field/Laboratory Duplicate Review

- Laboratory Control Sample (LCS) Review
- Sample Quantitation

DESCRIPTION OF QUALITATIVE REVIEW

Summary Evaluation of Data and Potential Usability Issues

No results were rejected. Data quality issues with respect to exceeding holding times and high mercury breakthrough were identified requiring qualification of all results. The data user should determine if the data is acceptable for the intended purposes.

Sample Documentation

Provided laboratory reports included all the necessary information to perform the described data review.

Sample Holding Times

All samples were prepared past the recommended seven day holding time. Results have been qualified as estimated (J/UJ).

Laboratory and Field Blank Review

Mercury was reported as not detected in the laboratory and field blanks

Field/Laboratory Duplicate Review

No field duplicates were submitted for analysis. Laboratory replicates are not applicable to the method.

Laboratory Control Sample (LCS) Review

Each of the criteria is within guidance limits.

Sample Quantitation

Sample breakthrough in the second trap was observed for sample IO5-3. The mercury result was qualified as estimated (J) with a possible low bias.

The following table provides the affected samples and associated qualifications:

Sample	Constituent	amt. (ppbv)	Action
IO5-3	Mercury	1.04	J

Validation Qualifiers

The following validation qualifiers may have been applied to the data, as appropriate.

- J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.
- U = The analyte was tested, but was not detected above the sample reporting limit.
- R = The sample result is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

This review was performed based on the requirements provided in the project Quality Assurance Project Plan, the USEPA Region II validation SOPs, and on guidance provided in the Contract Laboratory Program National Functional Guidelines for Organic and Inorganic Data Review, 2004.

The review included the parameters listed below.

- Sample Documentation
- Sample Holding Times
- Laboratory and Field Blank Review
- Surrogate Recovery Review
- MS/MSD Recovery and Precision
- Field/Laboratory Duplicate Review
- Laboratory Control Sample (LCS) Review

- Sample Quantitation

The items listed above were technically and contractually in compliance with the method and QAPP requirements, with the exceptions discussed in the following text.

Summary Evaluation of Data and Potential Usability Issues

Overall, the non-rejected data is acceptable for the intended purposes. The compound 3,3'-dichlorobenzidine was rejected in sample SW-SD-C due to extremely low matrix spike recoveries. This result is considered unusable for any purpose. Many of the sediment samples had moisture content above 50 percent. This increases the probability of sample non-homogeneity. In addition, aqueous matrix samples are processed differently and require sample preservation. Due to the analytical processing difficulties with high moisture soil samples, all results for samples having moisture content above 50 percent have been qualified as estimated. Data quality issues with respect to field duplicate precision, blank contamination and spike recoveries were identified requiring qualification of some data.

TCL Volatiles by Method SW846 8260B

The MS/MSD RPD for cyclohexane, dichlorodifluoromethane, Freon 113, methylcyclohexane, and trichlorofluoromethane were above control limits for sample SW-SD-C. These compounds were not detected in the parent sample and data qualification was not warranted.

The recovery for surrogate 4-Bromofluorobenzene was above control limits due to obvious matrix interference. No data qualification was warranted.

TCL Semivolatiles by SW846 Methods 8270D and 8270C (SIM)

Samples SW-SD-C and the associated water Field blank each had a slightly high surrogate recovery. As the other 5 surrogates were in control, no data qualification was warranted.

The LCS associated with samples SW-ND-C, SW-SD-A and SW-ND-A had recoveries of 2,3,4,6-tetrachlorophenol and 2,4,6-trichlorophenol that were below control limits. These compounds have been qualified as estimated in the associated samples.

The matrix spike of sample SW-SD-C had low recoveries of 3-nitroaniline, 4-nitroaniline, and an extremely low recovery for 3,3'-dichlorobenzidine. 3-Nitroaniline and 4-nitroaniline have

been qualified as estimated and 3,3'-dichlorobenzidine has been rejected (R) in the parent sample.

The laboratory blank had a detectable concentration of bis(2-ethylhexyl)phthalate. Samples with detected concentrations less than 10 times the blank concentration have been qualified as not detected with an estimated detection limit (UJ).

The field duplicate precision for acenapthylene between sample SW-SD-C and DUP072511 exceeded the control limit of 50 % RPD. This compound has been qualified as estimated (J/UJ) in samples SW-SD-C and DUP072511.

The field duplicate precision for acetophenone between sample SW-SD-C and DUP072511 exceeded the control limit of 50 % RPD. This compound has been qualified as estimated (J/UJ) in samples SW-SD-C and DUP072511.

Pesticides by SW846 Method 8081B

Samples SED-SD-C2-0-0.5, SED-SD-B1-0.5-1.5, SED-ND-C2-0-0.5, and SED-ND-C1-0-0.5 had a greater than 40 percent RPD between the two GC columns for 4,4'-DDE. The 4,4'-DDE results have been qualified as estimated (J). Sample SED-SD-B1-0.5-1.5 also had a greater than 40 percent RPD between the two GC columns for 4,4'-DDT and methoxychlor. These results have been qualified as estimated (J).

Sample SED-ND-C2-0-0.5 had a high surrogate recovery. Detected concentrations of 4,4'-DDD and 4,4'-DDE have been qualified as estimated (J).

Sample SED-ND-A1-0-0.5 was initially extracted within holding times. However, due to poor surrogate recovery, the sample was reextracted outside of the holding time and reanalyzed. All results for this sample are qualified as estimated (J/UJ).

The field duplicate precision for 4,4'-DDT between sample SED-SD-C2-0-0.5 and DUP072611 exceeded the control limit of 50 % RPD. This compound has been qualified as estimated (J) in samples SED-SD-C2-0-0.5 and DUP072611.

Metals by SW846 Methods 6010C, 7470A, 7471A, and EPA 1631

Matrix spike recoveries for SW-SD-C were outside of control limits for sodium, magnesium, potassium, and calcium due to high amount of these compounds in the parent sample. No qualification was warranted.

Several samples required dilutions due to matrix interferences. The sample detection limits are elevated due to this interference.

Matrix spike recoveries for antimony, copper, iron, magnesium, sodium, and zinc were all below the control limits for sample SED-SD-C2-0-0.5. These results have been qualified as estimated (J/UJ) in the parent sample.

The matrix spike for mercury was above the control limits for sample SED-SD-C2-0-0.5.The mercury result has been qualified as estimated in the parent sample.

The matrix spike recoveries for total and dissolved mercuryfor sample SW-SD-C were below control limits. Total and dissolved mercury for sample SW-SD-C have been qualified as estimated (J).

The field duplicate precision for silver exceeded control limits of 50% RPD for sample SED-SD-C2-0-0.5 and DUP072611. The silver results in these samples have been qualified as estimated.

Cyanide by USEPA Method 335.4/LACHAT

The matrix spike recovery for cyanide in sample SW-SD-C was below control limits. The cyanide result in the parent sample has been qualified as estimated (J).

The cyanide analysis for Field Blank 072611 was performed outside of holding times. The cyanide result for sample Field Blank 072611 hasd been qualified as estimated (UJ)

Particle Size by SM D422

The 0.030 mm results for samples SED-ND-C2-0-0.5, SED-ND-A1-0-0.5, SED-ND-B2-0-0.5and SED-SD-A1-0-0.5 were extrapolated from higher and lower data points. These results have been qualified as estimated (J).

Total Organic Carbon by Lloyd Kahn

High variability between mutiple injections indicates possible sample non-homogeneity for samples SED-ND-B1-0.5-2, SED-SD-B2-0-0.5, SED-ND-C2-0-0.5, and SED-ND-C1-0-0.5. TOC results fro these samples have been qualified as estimated (J).

Sample Documentation

Provided laboratory reports included all the necessary information to perform the described data review

Validation Qualifiers

The following validation qualifiers may have been applied to the data, as appropriate.

- J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ = The analyte was not detected above the sample reporting limit; and the reporting limit is approximate.
- U = The analyte was tested, but was not detected above the sample reporting limit.
- R = The sample result is rejected due to serious deficiencies. The presence or absence of the analyte cannot be verified.

Appendix J: Tabular Summary of Analytical Data
