USA F (312) 533-2070

Report Certification

I certify that to the best of my knowledge:

- Testing data and all corresponding information have been checked for accuracy and completeness.
- Sampling and analysis have been conducted in accordance with the approved protocol and applicable reference methods (as applicable).
- All deviations, method modifications, or sampling and analytical anomalies are summarized in the appropriate report narrative(s).

Mr. Paul Coleman
Project Manager

June 16, 2016
Date

TRC was operating in conformance with the requirements of ASTM D7036-04 during this test program.

Jeffrey W. Burdette
TRC Air Measurements Technical Director

EMISSIONS COMPLIANCE STUDY

1.0 INTRODUCTION

TRC Environmental Corporation (TRC) performed a particulate matter (PM), lead (Pb) and visible emissions (VE) compliance test program on the exhaust stacks associated with the Induction Melt Furnaces (EU29, EU30, and EU31) at the foundry of Elkhart Brass Manufacturing Company, Inc. (Elkhart Brass) in Elkhart, Indiana on May 11, 2016. The tests were authorized by and performed for Elkhart Brass.

The purpose of this test program was in response to a Request to Provide Information Pursuant to the Clean Air Act (Request) from the United States Environmental Protection Agency Region 5 (USEPA), dated September 17, 2015. The test program, conducted according to the TRC Test Protocol 253282 dated May 2, 2016, was performed in order to determine particulate, lead and visible emission rates during maximum operating conditions.

1.1 Project Contact Information

Participants		
Test Facility	Elkhart Brass Manufacturing Company, Inc. Elkhart Foundry 1302 West Beardsley Ave. Elkhart, Indiana 46514	Mr. Dennis Grenier 574-970-7666 (phone) 574-274-8950 (cell) dgrenier@elkhartbrass.com
Air Emissions Testing Body (AETB)	TRC Environmental Corporation 2025 Beltline Ave. SE Suite 402 Grand Rapids, MI 49546	Mr. Ben Lemley, PE Project Engineer 201-636-5885 (phone) 616-975-1098 (fax) blemley@trcsolutions.com
	TRC Environmental Corporation 7521 Brush Hill Road Burr Ridge, Illinois 60527	Mr. Paul Coleman Project Manager 312-533-2023 (phone) 312-533-2070 (fax) pcoleman@trcsolutions.com

The tests were conducted by Ben Cacao, Greg Rock, Ricardo Nunez, Johnathan Kell, Rome Rothgeb, Gavin Lewis, Ryan Novosal, Cameron Dillion, Bill Harris and Paul Coleman of TRC. Documentation of the on-site ASTM D7036-04 Qualified Individual(s) (QI) can be located in the appendix to this report.

1.2 Facility and Process Description

Elkhart Brass operates a brass and aluminum firefighting equipment manufacturing source located at 1302 West Beardsley Avenue, Elkhart, Indiana. The source operates under Significant Permit Revision No. M039-30851-00072 to Minor Source Operating Permit (MSOP) No. 039-22655-0072 issued by the Indiana Department of Environmental Management (IDEM) on January 4, 2012. This test program to determine lead, filterable particulate matter and opacity was performed simultaneously at the three (3) exhaust stacks associated with the three Induction Melt Furnaces (EU29, EU30, and EU31).

1.3 Process Data

Appendix B of the Request states that testing was to be conducted while operating the melt furnaces at maximum production rates identified as a minimum of 95% of the capacity of the unit. Per Section D.4(e) of the MSOP Elkhart is permitted to operate three induction melt furnaces (EU29, EU30, and EU31) with a capacity of 2.25 tons per hour each. However, Elkhart generally operates only two of the furnaces at any one time due to limited electrical availability. Further, the maximum operating capability of the furnaces as currently installed, accounting for use of the alloy with the worst case lead content, is estimated to be 1.5 tons per hour each. As planned, during this test program Elkhart operated the melt and mold lines so that the furnaces were not idle at any point and molds would be available to be poured at all times. The table below outlines the production data collected during the test. Scans of original data sheets from the test day are included in the appendix.

Test	Sample Time (min)	Production Rate (lb brass/test)	Production Rate (ton brass/hour)
1	120	7,300	1.83
2	120	9,697	2.42
3	120	10,343	2.59
Average	**120**	**9,113**	**2.28**

Note that all throughput during the test consisted of the proposed worst case alloy, C83600. The specifications for the alloy are included in the appendix.

2.0 SUMMARY OF RESULTS

The results of this test program are summarized in the table below. Detailed individual run results are presented in Section 6.0.

Unit ID	Pollutant Tested	Total Measured Emissions				Permitted Emission Limit[1]
		Run 1	Run 2	Run 3	Average	
Induction Melt Furnaces (EU29, EU30, and EU31)	Filterable PM lb/hour	0.93	1.11	1.12	1.05	14.12
	Filerable PM lb/ton	0.51	0.46	0.43	0.47	---
	Lead lb/hour	0.067	0.062	0.042	0.057	---
	Lead lb/ton	0.037	0.026	0.016	0.026	---

1. Permit limit of 7.06 lb/hr for each furnace listed in MSOP No. 039-22655-0072, accounting for two furnaces operating during testing.

Unit ID	Pollutant Tested	Visible Emission		
		Melt 1 Stack	Melt 2 Stack	Tap Hood Stack
Induction Melt Furnaces (EU29, EU30, and EU31)	Opacity Maximum 6-Minute Average (%)	0.0	0.0	0.0

The table below summarizes the test methods used, as well as the number and duration of each at each test location:

Unit ID/ Sample Location	Emission Point	Parameter Measured	Test Method	No. of Runs	Run Duration (min)
Induction Melt Furnaces (EU29, EU30, and EU31)	Melt 1 Stack, Melt 2 Stack, Tap Hood Stack (sampled simultaneously)	Filerable PM	USEPA 1, 2, 3, and 5, 40CFR60, Appendix A	3	120
		Lead (Pb)	USEPA 12, 40CFR60, Appendix A	3	120
		Visible Emissions	USEPA 9, 40CFR60, Appendix A	3	60

3.0 DISCUSSION OF RESULTS

No problems were encountered with the testing equipment during the test program. Source operation appeared normal during the entire test program. No changes or problems were encountered that required modification of any procedures presented in the test plan. No adverse test or environmental conditions were encountered during the conduct of this test program.

4.0 SAMPLING AND ANALYSIS PROCEDURES

All testing, sampling, analytical, and calibration procedures used for this test program were performed in accordance with the methods presented in the following sections. Where applicable, the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods, USEPA 600/R-94/038c, September 1994 was used to supplement procedures.

4.1 Determination of Sample Point Locations by USEPA Method 1

This method is applicable to gas streams flowing in ducts, stacks, and flues and is designed to aid in the representative measurement of pollutant emissions and/or total volumetric flow rates from stationary sources. In order to qualify as an acceptable sample location, it must be located at a position at least two stack or duct equivalent diameters downstream and a half equivalent diameter upstream from any flow disturbance.

The cross-section of the measurement site was divided into a number of equal areas, and the traverse points were then located in the center of these areas. The minimum number of points were determined from Figure 1-1 (particulate) of USEPA Method 1.

4.2 Volumetric Flow Rate Determination by USEPA Method 2

This method is applicable for the determination of the average velocity and the volumetric flow rate of a gas stream.

The gas velocity head (ΔP) and temperature were measured at traverse points defined by USEPA Method 1. The velocity head was measured with a Type S (Stausscheibe or reverse type) pitot tube and oil-filled manometer; and the gas temperature was measured with a Type K thermocouple. The average gas velocity in the flue was calculated based on: the gas density (as determined by USEPA Methods 3 and 4); the flue gas pressure; the average of the square roots of the velocity heads at each traverse point, and the average flue gas temperature.

4.3 CO_2 and O_2 Determination by USEPA Method 3

This method is applicable for the determination of CO_2 and O_2 concentrations and dry molecular weight of a sample from an effluent gas stream of a fossil-fuel combustion process or other process.

Gas samples were extracted from each stack by single-point, grab sampling and the gas samples analyzed for percent CO_2 and percent O_2 using a Fyrite.

4.4 Filterable PM Determination by USEPA Method 5

This method is applicable for the determination of PM emissions from stationary sources. USEPA Methods 2-4 were performed concurrently with, and as an integral part of, these determinations.

Flue gas was withdrawn isokinetically from the source at traverse points determined per USEPA Method 1, and PM was collected in the nozzle, probe liner, and on a glass fiber filter. The probe liner and filter were maintained at a temperature of 120 ± 14°C (248 ± 25°F) or such other temperature as specified by an applicable subpart of the standards or approved by the Administrator for a particular application. The PM mass, which included any material that condensed at or above the filtration temperature, was determined gravimetrically after the removal of uncombined water.

4.5 Visible Emissions Determination by USEPA Method 9

This method is applicable for the determination of the opacity of emissions from stationary sources pursuant to § 60.11(b) and for visually determining opacity of emissions.

Opacity observations were made by a qualified observer. Observations were made at the point of greatest opacity in the portion of the plume where condensed water vapor was not present. Observations were made at 15-second intervals for the duration of the test period.

4.6 Lead Determination by USEPA Method 12

This method is applicable for the determination of inorganic lead (Pb) emissions from stationary sources, only as specified in an applicable subpart of the regulations. USEPA Methods 2-4 were performed concurrently with, and as an integral part of these determinations.

Flue gas was withdrawn isokinetically from each source at traverse points determined per USEPA Method 1. Particle-bound and gaseous Pb were collected in the nozzle, probe liner, filter, and impingers containing a solution of dilute nitric acid. The probe liner and filter were maintained at a temperature of 120 ± 14°C (248 ± 25°F). The

collected samples were digested and analyzed via atomic absorption spectrophotometry using an air/acetylene flame.

5.0 QUALITY ASSURANCE PROCEDURES

TRC integrates our Quality Management System (QMS) into every aspect of our testing service. We follow the procedures specified in current published versions of the test Method(s) referenced in this report. Any modifications or deviations are specifically identified in the body of the report. We routinely participate in independent, third party audits of our activities, and maintain:

- Accreditation from the Louisiana Environmental Laboratory Accreditation Program (LELAP);
- Accreditation from the Stack Testing Accreditation Council (STAC) and the American Association for Laboratory Accreditation (A2LA) that our operations conform with the requirements of ASTM D 7036 as an Air Emission Testing Body (AETB).

These accreditations demonstrate that our systems for training, equipment maintenance and calibration, document control and project management will fully ensure that project objectives are achieved in a timely and efficient manner with a strict commitment to quality.

All calibrations are performed in accordance with the test Method(s) identified in this report. If a Method allows for more than one calibration approach, or if approved alternatives are available, the calibration documentation in the appendices specifies which approach was used. All measurement devices are calibrated or verified at set intervals against standards traceable to the National Institute of Standards and Technology (NIST). NIST traceability information is available upon request.

ASTM D7036-04 specifies that: *"AETBs shall have and shall apply procedures for estimating the uncertainty of measurement. Conformance with this section may be demonstrated by the use of approved test protocols for all tests. When such protocols are used, reference shall be made to published literature, when available, where estimates of uncertainty for test methods may be found."* TRC conforms with this section by using approved test protocols for all tests.

6.0 TEST RESULTS SUMMARY

Elkhart Brass Manufacturing Company, Inc.
Elkhart, Indiana
May 11, 2016

Particulate Test Results Summary

Run #		Run 1	Run 2	Run 3	Average
Time		7:20 - 10:30	11:30 - 13:40	14:40 - 16:55	
Location	Unit				
Melt 1 Stack	lb/hr	0.36	0.40	0.35	0.37

This is to Certify that:

Paul F. Coleman

Is a Qualified Individual as defined in Section 8.3 of ASTM D7036-04 for the following test methods:

EPA Methods 1, 1A, 2, 2A, 2C, 2D, 2F, 2G, 2H, 3, 3B, 4, 5, 5A, 5B, 5E, 5F, 5i, 17, 19, 201A, and 202.

The individual has met the minimum experience requirements defined in Section 8.3.4.2 of ASTM D7036-04 and has successfully passed an internal comprehensive examination for the test methods designated above.

This certification is effective until: **01-23-2018**

Edward J MacKinnon

Air Measurements Practice Quality Director

Date of Issue: 02-13-2013

Certificate Number: 00443

TRC

This is to Certify that:

Ben Cacao

Is a Qualified Individual as defined in Section 8.3 of ASTM D7036-04 for the following test methods:

EPA Methods 1, 1A, 2, 2A, 2C, 2D, 2F, 2G, 2H, 3, 3B, 4, 5, 5A, 5B, 5D, 5E, 5F, 5i, 17, 19, 201A, and 202.

The individual has met the minimum experience requirements defined in Section 8.3.4.2 of ASTM D7036-04 and has successfully passed a comprehensive examination for the test methods designated above.

This certification is effective until: **02-27-2020**

Edward J MacKinnon

Air Measurements Practice Quality Manager

Date of Issue: 03-09-2015

Certificate Number: 00761

Subject: RE: Elkhart Stack Testing Details

Hi Paul,

The throughput data collected during the test is summarized below. This represents the total throughput for two furnaces running a single lead bearing brass alloy. Please let me know if you need anything else.

	Brass Alloy Throughput	
Test	lb/test	ton/hr
Test 1	7300	1.83
Test 2	9697	2.42
Test 2	10343	2.59

* Assumes 2 hour tests

Thanks,

Ben

Laboratory Analysis Report

Case Narrative

General Information

TRC Client Office:	**Burr Ridge**
Company:	Elkhart Brass
Facility:	Elkhart Foundry
Project #:	253282
Analysis Date(s):	5/13-18/2016
Analyst:	Gayle Swanson

Analysis

Analytes:	Particulate Matter
Analytical Protocols:	EPA Method 5
TRC SOP:	AM-P60-5, AM-P60-5L

Analytical Notes:	No problems were encountered during the analyses.
QA/QC Review:	All of the data have been reviewed for quality assurance. All of the quality control and sample specific information in this package is complete and meets or exceeds the minimum requirements for acceptability.
Comments:	All samples arrived at the laboratory in a condition acceptable for analysis. If you have any questions or concerns regarding this analysis, please feel free to contact me.

Laboratory Certification Statements

I certify that to the best of my knowledge:

- Test data and all corresponding information have been checked for accuracy and completeness.
- Analyses have been conducted in accordance with approved protocol and reference methods (as applicable).
- All deviations, method modifications, or analytical anomalies are summarized in the appropriate report narrative(s).
- Analysis results only represent that of the samples as received into the
- This document contains a total of 4 pages.

This test report shall not be reproduced except in full, without the written approval of the laboratory.

Do all sample IDs on sample labels match those on the COC form?	Y
Are the sample containers intact?	Y
No signs of leakage?	Y
No visible damage to sample containers?	Y

Sample Temperature Upon Receipt 70 °F

Notes and/or Explanations for any "No" above:

Signed (Recipient): Gage Swan

Laboratory Report Summary

TRC Office: Burr Ridge
Company: Elkhart Brass
Facility: Elkhart Foundry
Project #: 253282
Analysis Date(s): 5/13-18/2016
Analyst: Gayle Swanson

Method 5 Data

PM Filter:

Client Sample ID	Net Mass (mg)
28232 Melt 1 Stack Run 1	31.5
28234 Melt 1 Stack Run 2	34.1
28236 Melt 1 Stack Run 3	26.5
28238 Melt 2 Stack Run 1	17.1
28240 Melt 2 Stack Run 2	27.6
28242 Melt 2 Stack Run 3	26.6
28244 Tap Hood Run 1	18.5
28246 Tap Hood Run 2	22.0
28248 Tap Hood Run 3	22.5

PM Front Half Wash:

Client Sample ID	Sample Volume (ml)	Net Mass (mg)
28233 Melt 1 Stack Run 1	54	3.6
28235 Melt 1 Stack Run 2	67	5.9
28237 Melt 1 Stack Run 3	51	8.6
28239 Melt 2 Stack Run 1	58	2.7
28241 Melt 2 Stack Run 2	50	3.3
28243 Melt 2 Stack Run 3	43	4.1
28245 Tap Hood Run 1	69	10.2
28247 Tap Hood Run 2	52	8.7
28249 Tap Hood Run 3	52	12.3
28250 Acetone Blank	195	0.0

Method 12 Sample Analysis Summary

Project#:	**253282**	Unit ID:	**Melt 1**
Company:	**Elkhart Brass**	Location:	**Stack**
Plant:	**Elkhart, IN**	Test Date(s):	**May 11, 2016**

Filter Diameter (mm): 115 (Anderson)

Gross front-half metals

	Run 1	Run 2	Run 3	Run 4	Reagent Blank
Pb (µg)	2940.00	2430.00	1360.00	-	< 15.20

"<" indicates that the mass of a metal in the sample was below the laboratory analytical detection limit

Blank-corrected front-half metals

	Run 1	Run 2	Run 3	Run 4
Pb (µg)	2924.80	2414.80	1344.80	-

* If "<" preceeds a "Gross" value, subsequent calculations were conducted using the detection limit

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B699259
Received: 2016/05/13, 18:30

Sample Matrix: Stack Sampling Train
Samples Received: 13

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Reference
Lead in Filter by ICPMS (M12mod) (1)	13	2016/05/25	2016/05/27	BRL SOP-00103	EPA 12 m

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) EPA Method 12 Modification - The analysis for the lead was completed using ICPMS instead of flame AA.

GENERAL COMMENTS

Sample CJG249-01 : Data for this sample is reported in ug/mL

ELEMENTS BY ICP/MS (STACK SAMPLING TRAIN)

Lead in Filter by ICPMS (M12mod): Extra 10x dilution was required for all samples except CJG161 and CJG248, due to the matrix and high levels. Post digestion duplicate and spike were done on sample CJG162.

Results relate only to the items tested.

4511698	N_R	RPD [CJG162-01]	Inorganic Lead (Pb)	2016/05/27	1.8		%	20
			Inorganic Lead (Pb)	2016/05/27	1.7		%	20
4511698	N_R	Spiked Blank	Inorganic Lead (Pb)	2016/05/27		107	%	85 - 115
4511698	N_R	RPD	Inorganic Lead (Pb)	2016/05/27	1.2		%	20
4511698	N_R	Method Blank	Inorganic Lead (Pb)	2016/05/27	<0.5		ug	

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ralph Siebert, Operations Manager - Inorganic Analyses

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

ERA
A Waters Company

May 31, 2016

Paul Coleman
TRC Environmental
7521 Brush Hill Road
Burr Ridge, IL 60527

Enclosed is your final report for ERA's Stationary Source Audit Sample (SSAS) Program. Your final report includes an evaluation of all results submitted by your laboratory to ERA.

Data Evaluation Protocols: All analytes in ERA's SSAS Program have been evaluated comparing the reported result to the acceptance limits generated using the criteria contained in the TNI SSAS Table.

For any "Not Acceptable" results, please contact your state regulator for any corrective action requirements.

Thank you for your participation in ERA's SSAS Program. If you have any questions, please contact our Proficiency Testing Department at 1-800-372-0122.

Sincerely,

Pat Larson

Patrick Larson
Quality Officer

X-Factor Isokinetic Sampling Coefficient (based on pre-test data)

$$\textbf{X-Factor} = 846.72 \times (D_n)^4 \times \Delta H_{@I} \times C_p^2 \times (1-B_{ws})^2 \times \frac{(M_d \times T_m \times P_s)}{(M_s \times T_s \times (P_{bar} + (\Delta H_{@I}/13.6)))} \times Ts/Tm$$

Where:

T_s = Temperature of effluent gas (°R)
T_m = Average dry test meter temperature (°R)
D_n = Nozzle Diameter (in.)
$\Delta H_{@I}$ = Orifice pressure drop corresponding to 0.75 cfm meter flow rate (in. H_20)
C_p = Pitot Tube Coefficient (dimensionless)
B_{ws} = Effluent gas fractional moisture content (dimensionless)
M_d = Dry molecular weight of exhaust (lb/lb-mole)
M_s = Molecular weight of exhaust, wet basis (lb/lb-mole)
P_s = Absolute flue gas pressure ("Hg)
P_{bar} = Ambient barometric pressure at sample elevation ("Hg)

D_n =	0.296	in.	P_s =	29.19	in. Hg abs.
$\Delta H_{@I}$ =	1.86	in. H_20	M_s =	28.64	lb/lb-mole
C_p =	0.84	(dimensionless)	T_s =	535	°R
M_d =	28.84	lb/lb-mole	P_{bar} =	29.20	in. Hg
T_m =	535	°R	B_{ws} =	0.018	(dimensionless)

X-Factor = 8.249

Dry Molecular Weight

$$M_d = 0.44 \times (\%CO_2) + 0.32 \times (\%O_2) + 0.28 \times \%N_2$$

Where:

M_d = Effluent gas molecular weight (lb/lb-mole, dry basis)
$\%CO_2$ = Effluent gas Carbon Dioxide Content (% volume, dry basis)
$\%O_2$ = Effluent gas Oxygen Content (% volume, dry basis)
$\%N_2$ = Effluent gas Nitrogen Dioxide Content (% volume, dry basis)

$\%CO_2$ =	0.0	%vol dry	$\%N_2$ =	79.1	%vol dry
$\%O_2$ =	20.9	%vol dry			

M_d = 28.84 lb/lb-mole

Plant:	Elkhart, IN	**Test Date:**	5/11/2016
Unit:	Melt 1		
Test Location:	Stack		

Wet Molecular Weight

$$M_s = M_d \times (1 - B_{ws}) + (18.0 \times B_{ws})$$

Where:

M_s = Effluent gas molecular weight (lb/lb-mole, wet basis)

B_{ws} = Effluent gas fractional moisture content (dimensionless)

M_d = 28.84 lb/lb-mole *Bws* = 0.015

M_s = 28.68 lb/lb-mole

Effluent Gas Pressure

$$P_s = P_{bar} + (P_f/13.6)$$

Where:

P_s = flue gas pressure ("Hg)

P_{bar} = Ambient barometric pressure at sample elevation ("Hg)

P_g = Flue gas gauge pressure ("H_2O)

P_{bar} = 29.17 "Hg P_g = -0.18 "H_2O

P_s = 29.16 "Hg

Average Meter Temperature

$$T_m = \frac{\sum_{I=1}^{n} (T_{mini} + T_{mouti})/2}{n}$$

Where:

T_m = Average dry test meter temperature (°R)

T_{min} = Temperature of gas entering dry test meter (°R)

T_{mout} = Temperature of gas leaving dry test meter (°R)

Avg T_{min} = 532.3 °R Avg T_{mout} = 527.3 °R

T_m = 529.8 °R

ΔH at Sample Point - Example Point 2

$$\Delta H_i = \text{X-Factor} \times \Delta Pi \times Tmi/Tsi$$

Where:

ΔH = Pressure drop across calibrated orifice ("H_2O)

ΔP = Pressure drop across pitot ("H_2O)

Ts = Temperature of effluent gas (°R)

X-Factor = 8.249 ΔPi = 0.17 "H_2O

Tmi = 521.5 °R Tsi = 529.0 °R

ΔH_i = 1.38 "H_2O

Sample Volume at Standard Conditions

$$V_{m(std)} = (T_{std}/29.92) \times Y \times V_m \times (P_{bar} + \Delta H/13.6)/T_m$$

Where:

$V_{m(std)}$ = Sample volume collected corrected to 29.92 in. Hg and 528(°R) (ft3, dry basis)

Y = Dry test meter calibration coefficient (dimensionless)

V_m = V_m = Sample volume collected at actual conditions (ft^3, dry basis)

T_{std} = Standard Temperature 528(°R)

Y = 0.992 V_m = 79.940 cf

P_{bar} = 29.17 "Hg ΔH = 1.54 "H_2O

T_m = 529.8 °R T_{std} = 528 °R

$V_{m(std)}$ = 77.348 dscf

Volume of Water Vapor Condensed

$$V_{wc(std)} = 0.04715 \times (T_{std} / 528) \times M_{H2O}$$

Where:

$V_{wc(std)}$ = Volume of water vapor collected at 29.92"Hg and 528°R (ft^3)

M_{H2O} = Net weight gain of impingers (grams)

M_{H2O} = 24.7 grams

$V_{w(std)}$ = 1.165 wscf

Plant:	Elkhart, IN	**Test Date:**	5/11/2016
Unit:	Melt 1		
Test Location:	Stack		

Moisture Content

$$B_{ws} = \frac{V_{wc(std)}}{V_{wc(std)} + V_{m(std)}}$$

$V_{wc(std)}$ = 1.165 dscf $V_{m(std)}$ = 77.348 wscf

B_{ws} = **0.015**

Average Duct Velocity

$$V_s = 85.49 \times C_p \times \text{Sqrt } \Delta P \text{ (avg)} \times (T_s/(P_s \times M_s))^{1/2}$$

Where:

V_s = Average velocity of effluent gas (ft/sec)

C_p = Pitot calibration coefficient (dimensionless)

Sqrt ΔP (avg) = Average of the square roots of DP's at all traverse points

C_p = 0.840 Sqrt ΔP (avg) = 0.430

T_s = 534.0 °R P_s = 29.16 "Hg

M_s = 28.68 lb/lb-mole

V_s = 24.70 ft/sec

Method 2 Volumetric Flow Rate (Actual Basis)

$$Q = V_s \times A \times 60$$

Where:

Q = Effluent gas volumetric flow rate at actual conditions (ft^3/min)

A = Cross-sectional area of duct at sample location (ft^2)

V_s = 24.70 ft/sec A = 4.238 ft^2

Q = 6,281 cfm

Method 2 Volumetric Flow Rate (Standard Basis)

$$Q_{std} = \frac{T_{std} \times Q \times P_s}{T_s \times 29.92}$$

Where:

Q_{std} = Effluent gas volumetric flow rate corrected to 29.92 in. Hg and 528°R (ft3/min)

Q = 6281 cfm P_s = 29.16 "Hg

T_s = 534.0 °R

Q_{std} = 6,052 scfm

© 2016 TRC Environmental Corp.

Company:	Elkhart Brass	**Run:**	1
Plant:	Elkhart, IN	**Test Date:**	5/11/2016
Unit:	Melt 1		
Test Location:	Stack		

Method 2 Volumetric Flow Rate (Standard Dry Basis)

$$Q_{std(dry)} = Q_{std} \times (1 - B_{ws})$$

Where:

$Q_{std(dry)}$ = Effluent gas volumetric flow rate corrected to 29.92 in. Hg and 528°R (ft3/min, dry basis)

Q_{std} = 6052 scfm *Bws* = 0.015

$Q_{std(dry)}$ = 5,963 dscfm

Isokinetic Variation:

$$I = \frac{0.0945 \times T_s \times V_{m(std)} \times 528}{V_s \times \theta \times A_n \times P_s \times (1-Bws) \times T_{std}}$$

Where:

I = Percent of isokinetic sampling (dimensionless)

θ = Total sample collection time (min)

A_n = Cross-sectional area of nozzle (ft^2)

T_s =	534.0	°R	$V_{m(std)}$ =	77.348	dscf
V_s =	24.703	ft/sec	θ =	120.0	min
P_s =	29.16	"Hg	A_n =	0.000478	ft^2

B_{ws} = 0.015

I = 95.9 %

PM Concentration - example for filterable only:

$$C_s = \frac{m_n \times 0.01543}{V_{m(std)}}$$

Where:

C_s = Particulate matter concentration (grains/dry standard ft^3)

m_n = Net mass of particulate matter collected (mg)

m_n = 35.1 mg $V_{m(std)}$ = 77.348 dscf

C_s = 0.00700 gr/dscf

Solutions for a Changing Environment

Certification of Visible Opacity Reading

Ricardo Nunez

qualified to conduct EPA Method 9 Tests for visible opacity in accordance with the methods established for such qualification in 40 CFR Part 60 Appendix A.

Certification Date: March 22, 2016

Expiration Date: September 22, 2016

Wayne Redden

AeroMet Instructor: Wayne Redden

Equipment Configuration for Meter Box Calibration

Pre Test Thermocouple Calibration Checks

Analyst:	G. Rock
Date:	5/10/16
Project Number:	253282
Client:	Elkhart Brass
Test Location:	Rooftop

(See SOP AM-CAL-005 for instructions)

Console/Meter Box ID #	E21
Probe ID#	776
Test Location/Measurement Point Info:	Rooftop
NIST Thermometer ID #	FK007-TH00201

Procedure 1: Calibrate thermocouple against a reference thermometer.

After each test run series, check the accuracy (and, hence, the calibration) of each thermocouple system at ambient temperature, or any other temperature, within the range specified by the manufacturer, using a reference thermometer.

Procedure 2: Check the response of the thermocouple to a change in temperature.

Check the "continuity" of the thermocouple by subjecting it to a change in temperature (e.g., removing it from the stack or touching an ice cube). This step will also check for loose connections and reversed connections.

Measurement	T/C Temp, °F	NIST Thermometer Temp, °F	Difference, °F (± 2)	Continuity Check	Overall Status

PITOT TUBE ASSEMBLY INSPECTION

Analyst:	G. Rock
Date:	5/10/16
Project Number:	253282
Test Location:	Rooftop
EPA Probe Configuration:	Method 5

(See SOP AM-CAL-006 for Instructions)

A B

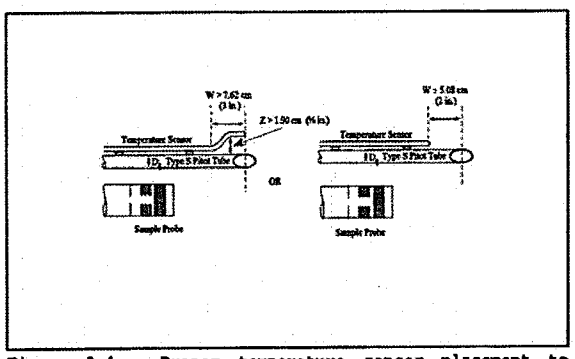

Figure 2-4. Proper temperature sensor placement to prevent interference; D_t between 0.48 and 0.95 cm (3/16 and 3/8 in).

Configuration (A, B or NA): NA

Tube diameter (D_t), Inch: 0.25

Distance "W", Inch: 6.54

Distance "Z" Inch: 1.6

Correct configuration? NA

NA - Temperature sensor not mounted on pitot tube
Configuration A - W >3 inches, Z> 0.75 inches
Configuration B - W at least 2 inches

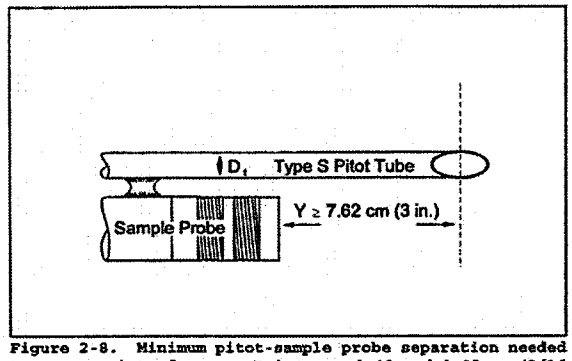

Figure 2-8. Minimum pitot-sample probe separation needed to prevent interference; D_t between 0.48 and 0.95 cm (3/16 and 3/8 in).

Distance "Y": 4.45 (inch)

Correct configuration? Yes

Y must be at least 3 inches

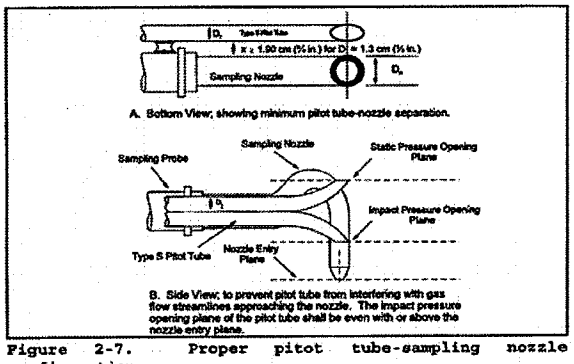

Figure 2-7. Proper pitot tube-sampling nozzle configuration.

Distance "X": 1.32 (inch)
Must be ≥ 0.75 inches

Correct configuration? Yes

Pre Test Thermocouple Calibration Checks

Analyst:	Ben Cacao
Date:	5/10/16
Project Number:	253282
Client:	Elkhart Brass
Test Location:	Melt 2 Stack

(See SOP AM-CAL-005 for instructions)

Console/Meter Box ID #	E53
Probe ID#	347
Test Location/Measurement Point Info:	On roof besides stack platform
NIST Thermometer ID #	FK002/TH002

Procedure 1: Calibrate thermocouple against a reference thermometer.

After each test run series, check the accuracy (and, hence, the calibration) of each thermocouple system at ambient temperature, or any other temperature, within the range specified by the manufacturer, using a reference thermometer.

Procedure 2: Check the response of the thermocouple to a change in temperature.

Check the "continuity" of the thermocouple by subjecting it to a change in temperature (e.g., removing it from the stack or touching an ice cube). This step will also check for loose connections and reversed connections.

Measurement	T/C Temp, °F	NIST Thermometer Temp, °F	Difference, °F (± 2)	Continuity Check	Overall Status

After each test run series, check the accuracy (and, hence, the calibration) of each thermocouple system at ambient temperature, or any other temperature, within the range specified by the manufacturer, using a reference thermometer.

Procedure 2: Check the response of the thermocouple to a change in temperature.

Check the "continuity" of the thermocouple by subjecting it to a change in temperature (e.g., removing it from the stack or touching an ice cube). This step will also check for loose connections and reversed connections.

PITOT TUBE ASSEMBLY INSPECTION

Analyst:	Gavin Lewis
Date:	5/10/16
Project Number:	253282
Test Location:	Tap Hood
EPA Probe Configuration:	Method 5

(See SOP AM-CAL-006 for Instructions)

A **B**

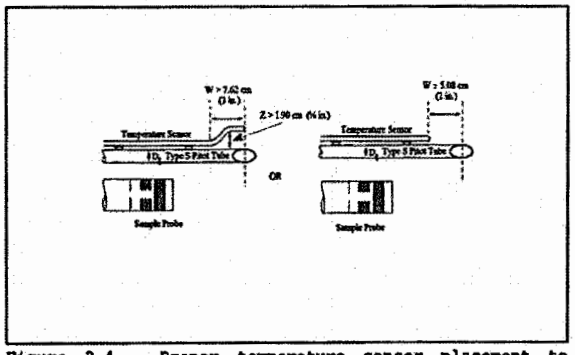

Figure 2-4. Proper temperature sensor placement to prevent interference; D_t between 0.48 and 0.95 cm (3/16 and 3/8 in).

Configuration (A, B or NA): NA

Tube diameter (D_t), Inch: 0.25

Distance "W", Inch:

Distance "Z" Inch:

Correct configuration? NA

NA - Temperature sensor not mounted on pitot tube
Configuration A - W >3 inches, Z> 0.75 inches
Configuration B - W at least 2 inches

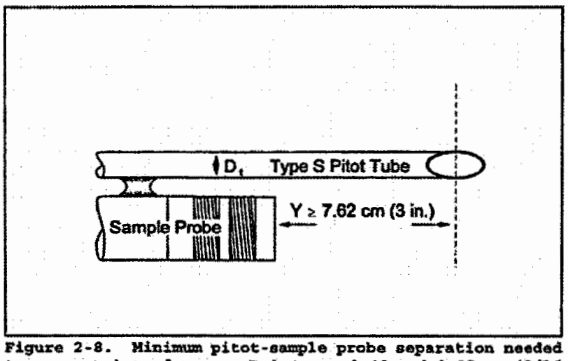

Figure 2-8. Minimum pitot-sample probe separation needed to prevent interference; D_t between 0.48 and 0.95 cm (3/16 and 3/8 in).

Distance "Y": 3 (inch)

Correct configuration? Yes

Y must be at least 3 inches

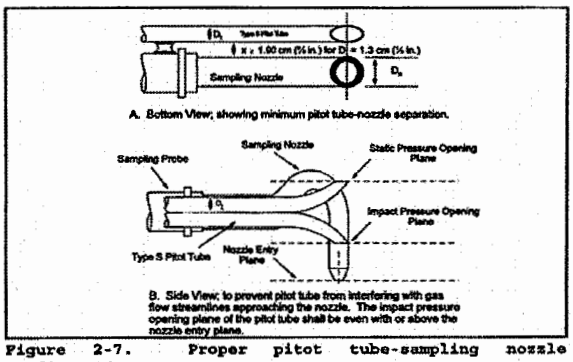

Figure 2-7. Proper pitot tube-sampling nozzle configuration.

Distance "X": 0.75 (inch)

Must be ≥ 0.75 inches

Correct configuration? Yes

TRC Protocol Compliance template revised 02/03/15

1.0 INTRODUCTION

On September 17, 2015 Elkhart Brass Manufacturing Company, Inc. (Elkhart Brass) received a Request to Provide Information Pursuant to the Clean Air Act (Request) from the United States Environmental Protection Agency Region 5 (USEPA). In response to Appendix B of that request, TRC Environmental Corporation (TRC) will perform for Elkhart Brass an emission compliance test program to determine filterable Particulate Matter (PM), Lead (Pb) and Visible Emissions (VE) on the exhaust stacks associated with the Induction Melt Furnaces (EU29, EU30, and EU31). Testing will occur at the Elkhart Brass foundry in Elkhart, Indiana. This program will be completed in accordance with the methods and at the source sampling locations listed below. All required analyses, including any quality assurance samples, will be completed.

1.1 Project Contact Information

Location	Address	Contact
Test Facility	Elkhart Brass Manufacturing Company, Inc. Elkhart Foundry 1302 West Beardsley Ave. Elkhart, Indiana 46514	Mr. Dennis Grenier Foundry Manager 574-970-7666 (phone) 574-274-8950 (cell) dgrenier@elkhartbrass.com
Company Representatives	TRC Environmental Corporation 2025 Beltline Ave. SE Suite 402 Grand Rapids, MI 49546	Mr. Ben Lemley, PE Project Engineer 201-636-5885 (phone) 616-975-1098 (fax) blemley@trcsolutions.com
	TRC Environmental Corporation 7521 Brush Hill Road Burr Ridge, IL 60527	Mr. Paul Coleman Project Manager 312-533-2023 (phone) 312-533-2070 (fax) pcoleman@trcsolutions.com

2.0 FACILITY AND PROCESS DESCRIPTION

Elkhart Brass operates a brass and aluminum firefighting equipment manufacturing source located at 1302 West Beardsley Avenue, Elkhart, Indiana. The source operates under Significant Permit Revision No. M039-30851-00072 to Minor Source Operating Permit (MSOP) No. 039-22655-0072 issued by the Indiana Department of Environmental Management (IDEM) on January 4, 2012. Elkhart plans to conduct lead, filterable particulate matter and opacity testing simultaneously on the three (3) exhaust stacks associated with the three Induction Melt Furnaces (EU29, EU30, and EU31).

2.1 PROCESS DATA

Appendix B of the Request states that testing should be conducted while operating the melt furnaces at maximum production rates identified as a minimum of 95% of the capacity of the unit. Per Section D.4(e) of the MSOP Elkhart is permitted to operate three induction melt furnaces (EU29, EU30, and EU31) with a capacity of 2.25 tons per hour each. However, Elkhart generally operates only two of the furnaces at any one time due to limited electrical availability. Further, the maximum operating capability of the furnaces as currently installed, accounting for use of the alloy with the worst case lead

content, is estimated to be 1.5 tons per hour. During the test Elkhart plans to operate the melt and mold lines such that the furnaces will not be idle at any point and molds will be available to be poured at all times. Elkhart has not attempted to operate the process in this fashion before but are doing so to provide a worst case operating scenario. Therefore, during the testing period Elkhart plans to operate two furnaces at or near this 1.5 tons per hour maximum rate and leave the third furnace idle. This configuration and melt composition will result in the maximum combined production rate for the melt operation of near 3.0 tons per hour.

Note that the maximum of 1.5 tons per hour per furnace is specific to melting operations including the maximum lead alloy usage. Elkhart may be capable of operating at a greater metal throughput while utilizing an alloy with different properties than the proposed alloy. However, as discussed below Elkhart has selected the proposed alloy to demonstrate a worst case lead emissions condition for the test.

Elkhart plans to use alloy C83600 during the testing. In the last 12 months this ingot was used to produce the highest lead emission rates due to both the number of castings produced and the lead content of the alloy. The specifications of C83600 are included in the Appendix.

The following process operation data will be collected:

- process time and mass of brass and aluminum charged
- brass lead content

3.0 TEST REQUIREMENTS

The table below presents the test methods, as well as the number and duration of each at each test location:

Unit ID/ Sample Location	Emission Point	Parameter Measured	Test Method	No. of Runs	Run Duration (min)
Induction Melt Furnaces (EU29, EU30, and EU31)	Melt 1 Stack, Melt 2 Stack, Tap Hood Stack (sampled simultaneously)	Filerable PM	USEPA 1, 2, 3, and 5, 40CFR60, Appendix A	3	120
		Lead (Pb)	USEPA 12, 40CFR60, Appendix A	3	120
		Visible Emissions	USEPA 9, 40CFR60, Appendix A	3	60

4.0 SPECIFIC TEST PROCEDURES

Detailed test procedures are described in Section 8 of this protocol. Three complete test runs will be performed for each constituent in accordance with the following USEPA methods.

1. Volumetric flow will be determined utilizing USEPA Methods 1 and 2, 40CFR60 in conjunction with each emission test run. The location of the ports in relation to upstream and downstream disturbances will be measured and recorded.

2. A check for the presence or absence of cyclonic flow will be performed in accordance with Section 11.4 of Method 1 and recorded on the data sheet appended.

3. O_2 and CO_2 content of the stack gas will be determined by USEPA Method 3, 40CFR60 during each test run.

4. Filterable particulate emission test runs will be completed in accordance with USEPA 5, 40CFR60. Each test run will be a minimum of 120 minutes in length, during which the volume sampled will be a minimum of 60 DSCF. A glass or stainless steel-lined probe will be utilized.

5. Opacity tests will be completed in accordance with USEPA Method 9 during each particulate test run.

6. Lead concentrations will be determined in accordance with the USEPA Method 12, 40CFR60. Each test run will be a minimum of 120 minutes in length, during which a minimum of 60 DSCF will be sampled. A glass-lined probe will be utilized. A lead audit sample will also be procured and analyzed.

5.0 TEST PROGRAM SCHEDULE

Date	Task	On-Site Hours
May 9, 2016	Crew travels to Elkhart.	---
May 10, 2016	Crew sets up all three (3) sampling locations to perform both PM and Pb sampling simultaneously at each of the stacks.	8
May 11, 2016	Perform PM, VE and Pb sampling on all three (3) sources simultaneously. Pack equipment if time allows.	11
May 12, 2016	Pack equipment, if necessary. Return travel to TRC office	4

All test days are considered consecutive 8-hour weekdays, generally scheduled between the hours of 8:00 a.m. and 4:30 p.m., unless otherwise stated.

6.0 PROJECT PERSONNEL AND RESPONSIBILITIES

1 Field Team Leader:
Coordinates all test activities. Maintains communications between all test participants and plant personnel.

9 Technical Support:
Prepares and operates the test train. Ensures all field calculations are completed. Records data. Assists in sample recovery as required.

7.0 PLANT REQUIREMENTS

TRC must be supplied with the following items in order to complete this test program:

1. Safe access to test positions.
2. Electrical power 110 V, 30 A, 60 cycle service at the test locations.
3. Six-inch test ports cleaned and loose prior to arrival of test crew.
4. Any scaffolding or aerial man-lifts required to reach the test locations. Scaffolding shall be erected by a qualified person and must meet minimum OSHA standards as listed in 29 CFR 1926.451.
5. Sufficient lighting at the test site.
6. Elevators safety checked and certified in good operation.
7. Hoist equipment, if required.
8. Plant or pollution control equipment operating data, in the format required by the applicable regulatory agency, for inclusion in the report.
9. Washroom facilities for use by members of the test crew.
10. A shelter at the test location, if weather conditions warrant.
11. Stable operations and the required load or production rate during the test period.
12. Communication between the test location and the control room.
13. Parking location to place TRC mobile trailer within 200 feet of sampling locations with access to multiple 110 V, 20 A, 60 cycle and one (1) 480 V, 50 A, 60 cycle circuit.
14. Proper disposal of any hazardous waste resulting from test methods being performed on-site.

8.0 TEST PROCEDURES

All testing, sampling, analytical, and calibration procedures used for this test program will be performed in accordance with the methods presented in the following sections. Where applicable, the Quality Assurance Handbook for Air Pollution Measurement Systems, Volume III, Stationary Source Specific Methods, USEPA 600/R-94/038c, September 1994 is used to supplement procedures.

8.1 Determination of Sample Point Locations by USEPA Method 1

This method is applicable to gas streams flowing in ducts, stacks, and flues. It is designed to aid in the representative measurement of pollutant emissions and/or total volumetric flow rates from stationary sources. In order to qualify as an acceptable sample location, it must be located at a position at least two stack or duct equivalent diameters downstream and a half equivalent diameter upstream from any flow disturbance. The location of the ports in relation to upstream and downstream disturbances will be measured and recorded

The cross-section of the measurement site is divided into a number of equal areas, and the traverse points are then located in the center of these areas. The minimum number of points are determined from Figure 1-1 (particulate) of USEPA Method 1.

Prior to performing volumetric flow traverses, a check for the presence or absence of cyclonic flow will be performed in accordance with Section 11.4 of Method 1 and recorded on the data sheet enclosed.

8.2 Volumetric Flow Rate Determination by USEPA Method 2

This method is applicable for the determination of the average velocity and the volumetric flow rate of a gas stream.

The gas velocity head (ΔP) and temperature is measured at traverse points defined by USEPA Method 1. The velocity head is measured with a Type S (Stausscheibe or reverse type) pitot tube and oil-filled manometer; the gas temperature is measured with a Type K thermocouple. The average gas velocity in the flue is calculated based on: the gas density (as determined by USEPA Methods 3 and 4), the flue gas pressure, the average of the square roots of the velocity heads at each traverse point, and the average flue gas temperature.

8.3 CO_2 and O_2 Determination by USEPA Method 3

This method is applicable for the determination of CO_2 and O_2 concentrations and dry molecular weight of a sample from an effluent gas stream of a fossil-fuel combustion process or other process.

A gas sample is extracted from each stack by single-point grab sampling, and analyzed for percent CO_2 and percent O_2 using a Fyrite gas analyzer.

8.4 Filterable PM Determination by USEPA Method 5

This method is applicable for the determination of particulate matter (PM) emissions from stationary sources. USEPA Methods 2-4 are performed concurrently with, and as an integral part, of these determinations.

Flue gas is withdrawn isokinetically from the source at traverse points determined per USEPA Method 1, and PM is collected in the nozzle, probe liner, and on a glass fiber filter. The probe liner and filter are maintained at a temperature of 120 ± 14°C (248 ± 25°F) or such other temperature as specified by an applicable subpart of the standards, or as approved by the Administrator for a particular application. The PM mass, which includes any material that condenses at or above the filtration temperature, is determined gravimetrically after the removal of uncombined water.

8.5 Visible Emissions Determination by USEPA Method 9

This method is applicable for the determination of the opacity of emissions from stationary sources pursuant to § 60.11(b) and for visually determining opacity of emissions.

Opacity observations are made by a qualified observer. Observations are made at the point of greatest opacity in the portion of the plume where condensed water vapor is not present. Observations are made at 15-second intervals for the duration of the test period.

8.6 Lead Determination by USEPA Method 12

This method is applicable for the determination of inorganic lead (Pb) emissions from stationary sources, only as specified in an applicable subpart of the regulations. USEPA Methods 2-4 are performed concurrently with, and as an integral part of, these determinations.

Flue gas is withdrawn isokinetically from the source at traverse points determined per USEPA Method 1. Particle-bound and gaseous Pb are collected in the nozzle, probe liner, filter, and impingers containing a solution of dilute nitric acid. The probe liner and filter are maintained at a temperature of 120 ± 14°C (248 ± 25°F), or such other temperature as specified by an applicable subpart of the standards or approved by the Administrator for a particular application. The collected samples are digested and analyzed via atomic absorption spectrophotometry using an air/acetylene flame.

9.0 QUALITY ASSURANCE PROCEDURES

TRC integrates our Quality Management System (QMS) into every aspect of our testing service. We follow the procedures specified in current published versions of the test Method(s) referenced in this report. Any modifications or deviations are specifically identified in the body of the report. We routinely participate in independent, third party audits of our activities and maintain:

- Louisiana Environmental Lab Accreditation Program (LELAP) accreditation;
- Accreditation from the Stack Testing Accreditation Council (STAC) and the American Association for Laboratory Accreditation (A2LA) that our operations conform with the requirements of ASTM D 7036 as an Air Emission Testing Body (AETB).

These accreditations demonstrate that our systems for training, equipment maintenance and calibration, document control and project management will fully ensure that project objectives are achieved in a timely and efficient manner with a strict commitment to quality.

All calibrations are performed in accordance with the test Method(s) identified in this protocol. If a method allows for more than one calibration approach, or if approved alternatives are available, the calibration documentation in the appendices specifies which approach is used. All measurement devices are calibrated or verified at set intervals against standards traceable to the National Institute of Standards and Technology (NIST). NIST traceability information is available upon request.

Raw data is kept on file at the TRC office performing the sampling. All samples from the test program are retained for 60 days after the submittal of the report, after which they are discarded unless TRC is advised otherwise.

Calculations are performed on the computer. An explanation of the nomenclature and calculations along with the complete test results are appended. Also to be appended are calibration data and copies of the raw field data sheets.

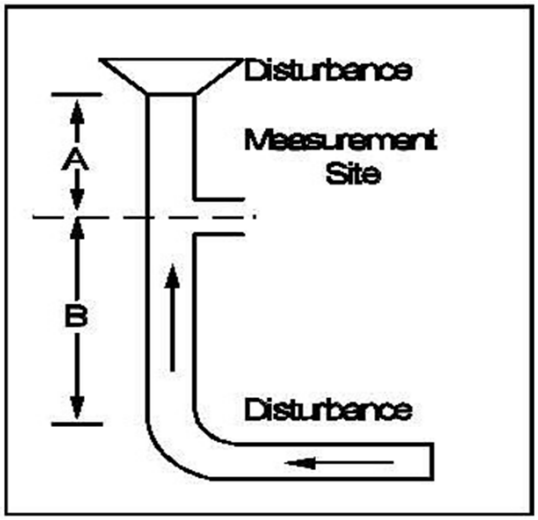
Sample Location Information for Isokinetic Sampling - Round Ducts

Project #: 253282
Company: Elkhart Brass
Plant: Elkhart, IN
Unit ID: EU29, EU30, EU31
Sample Location: Melt 1 Stack

Distance A: 2.33 Feet, 1.00 Duct diameters
Distance B: 4.67 Feet, 2.00 Duct diameters
Meets Method 1 criteria

Duct Diameter: 28 inches 2.33 feet
# of Ports Used: 2
# of Points/Diameter: 12
Sample Plane: Horizontal
Port Type: Nipple
Port Length: 3.0 inches
Port Inside Diameter: 6.0 inches



Traverse Point Locations

T_m =	460	^oR	B_{ws} =	_____	(dimensionless)

X = _____

Dry Molecular Weight

$$Md = 0.44 \times (\%CO_2) + 0.32 \times (\%O_2) + 0.28 \times \%N_2$$

Where:

Md = Effluent gas molecular weight (lb/lb-mole, dry basis)
$\%CO_2$ = Effluent gas Carbon Dioxide Content (% volume, dry basis)
$\%O_2$ = Effluent gas Oxygen Content (% volume, dry basis)
$\%N_2$ = Effluent gas Nitrogen Dioxide Content (% volume, dry basis)

$\%CO_2$ =	_____	%vol dry	$\%N_2$ =	_____	%vol dry
$\%O_2$ =	_____	%vol dry			

Md = _____ **lb/lb-mole**

© 2013 TRC Environmental Corp.

Company: **Run:**
Plant: **Test Date:**
Unit:
Test Location:

Wet Molecular Weight

$$Ms = Md \times (1-Bws) + (18.0 \times Bws)$$

Where:

Ms = Effluent gas molecular weight (lb/lb-mole, wet basis)

Bws = Effluent gas fractional moisture content (dimensionless)

Md = _____ lb/lb-mole *Bws* = _____

Ms = _____ lb/lb-mole

Effluent Gas Pressure

$$P_s = P_{bar} + (P_f/13.6)$$

Where:

P_s = flue gas pressure ("Hg)

P_{bar} = Ambient barometric pressure at sample elevation ("Hg)

P_g = Flue gas gauge pressure ("H_2O)

P_{bar} = _____ "Hg P_g = _____ "H_2O

Ps = 0.00 "Hg

Average Meter Temperature

$$T_m = \frac{\sum_{I=1}^{n} (T_{mini} + T_{mouti})/2}{n}$$

Where:

T_m = Average dry test meter temperature (^oR)

T_{min} = Temperature of gas entering dry test meter (^oR)

T_{mout} = Temperature of gas leaving dry test meter (^oR)

Avg T_{min} = _____ ^oR Avg T_{mout} = _____ ^oR

T_m = _____ ^oR

DH at Sample Point - Example Point 0

$$DHi = X \times DPi \times (T_{mi}/T_{si})$$

Where:

DH = Pressure drop across calibrated orifice ("H_2O)

DP = Pressure drop across pitot ("H_2O)

T_s = Temperature of effluent gas (^oR)

X = _____ DPi = _____ "H_2O

T_{mi} = _____ ^oR T_{si} = 460.0 ^oR

DHi = _____ "H_2O

Sample Volume at Standard Conditions

$$V_{m(std)} = (T_{std}/29.92) \times Y \times V_m \times (P_{bar} + DH/13.6)/T_m$$

Where:

$V_{m(std)}$ = Sample volume collected corrected to 29.92 in. Hg and (°R) (ft3, dry basis)

Y = Dry test meter calibration coefficient (dimensionless)

V_m = V_m = Sample volume collected at actual conditions (ft^3, dry basis)

T_{std} = Standard Temperature (°R)

Y = _____ V_m = _____ cf

P_{bar} = _____ "Hg DH = _____ "H_2O

T_m = _____ °R T_{std} = _____ °R

$V_{m(std)}$ = _____ dscf

Volume of Water Vapor Condensed

$$V_{wc(std)} = 0.04715 \times M_{H2O}$$

Where:

$V_{wc(std)}$ = Volume of water vapor collected at 29.92"Hg and 528^oR (ft^3)

M_{H2O} = Net weight gain of impingers (grams)

M_{H2O} = _____ grams

$V_{w(std)}$ = _____ wscf

Moisture Content

$$Bws = \frac{V_{wc(std)}}{V_{wc(std)} + V_{m(std)}}$$

$V_{wc(std)}$ = _____ dscf $V_{m(std)}$ = _____ wscf

***Bws* = _____**

Plant: **Test Date:**
Unit:
Test Location:

Average Duct Velocity

$$V_s = 85.49 \times Cp \times \text{Sqrt DP (avg)} \times (Ts/(Ps \times Ms))^{1/2}$$

Where:

V_s = Average velocity of effluent gas (ft/sec)

C_p = Pitot calibration coefficient (dimensionless)

Sqrt DP (avg) = Average of the square roots of DP's at all traverse points

C_p = _____ Sqrt DP (avg) = _____

T_s = _____ ^oR Ps = _____ "Hg

Ms = _____ lb/lb-mole

Vs = _____ ft/sec

Method 2 Volumetric Flow Rate (Actual Basis)

$$Q = V_s \times A \times 60$$

Where:

Q = Effluent gas volumetric flow rate at actual conditions (ft^3/min)

A = Cross-sectional area of duct at sample location (ft^2)

Vs = _____ ft/sec A = _____ ft^2

Q = _____ cfm

Method 2 Volumetric Flow Rate (Standard Basis)

$$Q_{std} = \frac{528 \times Q \times P_s}{T_s \times 29.92}$$

Where:

Q_{std} = Effluent gas volumetric flow rate corrected to 29.92"Hg and 528^oR (ft^3/min)

Q = _____ cfm Ps = _____ "Hg

Ts = _____ ^oR

Qstd = _____ scfm

Company: **Run:**
Plant: **Test Date:**
Unit:
Test Location:

Method 2 Volumetric Flow Rate (Standard Dry Basis)

$$Q_{std(dry)} = Q_{std} \times (1-Bws)$$

Where:

$Q_{std(dry)}$ = Effluent gas volumetric flow rate corrected to 29.92"Hg and 528°R (ft^3/min, dry basis)

Qstd = _____ scfm *Bws* = 0.000

Qstd(dry) = _____ dscfm

Volumetric Flow Rate Calculated Based on Fuel Consumption (Standard Dry Basis)

$$Q_{cfc} = \frac{F_d \times GHV \times FCR \times 20.9}{1000000 \times (20.9 - \%O_2)}$$

Where:

Q_{cfc} =Calculated effluent gas volumetric flow corrected to 29.92"Hg and 528°R (ft^3/min, dry basis)

F_d = Dry basis, oxygen-based fuel factor (dry standard ft^3/MMBtu)

GHV = Gross Heating Value of fuel (Btu/unit mass or volume)

FCR = Fuel consumption rate (mass or volume/hr)

Fd = 0 dscf/MMBtu GHV = 0 Btu/
FCR = 0 /min %O2 = 0 %vol dry

Q_{cfc} = - dscf/hr

Isokinetic Variation:

$$I = \frac{0.0945 \times T_s \times V_{m(std)}}{V_s \times \theta \times A_n \times P_s \times (1-Bws)}$$

Where:

I = Percent of isokinetic sampling (dimensionless)

θ = Total sample collection time (min)

A_n = Cross-sectional area of nozzle (ft^2)

Ts = _____ °R Vm(std) = _____ dscf
Vs = _____ ft/sec θ = _____ min
Ps = _____ "Hg An = _____ ft^2 Bws = 0.000

I = _____ %

(See SOP AM-CAL-005 for instructions)

Console/Meter Box ID #	-
Probe ID#	-
Test Location/Measurement Point Info:	-
NIST Thermometer ID #	-

Procedure 1: Calibrate thermocouple against a reference thermometer.

After each test run series, check the accuracy (and, hence, the calibration) of each thermocouple system at ambient temperature, or any other temperature, within the range specified by the manufacture, using a reference thermometer (either NIST reference)

Procedure 2: Check the response of the thermocouple to a change in temperature.

Check the "continuity" of the thermocouple by subjecting it to a change in temperature (e.g., removing it from the stack or touching an ice cube). This step will also check for loose connections and reversed connections.

Measurement	T/C Temp, ^{o}F	NIST Thermometer Temp, ^{o}F	Difference, ^{o}F (± 2)	Continuity Check	Overall Status

Test Location:	-
EPA Probe Configuration:	

(See SOP AM-CAL-006 for Instructions)

A **B**

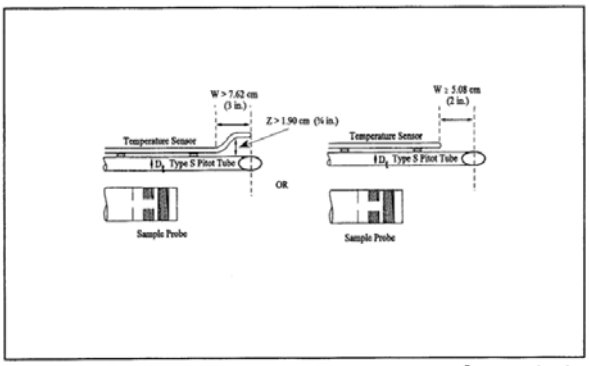

Figure 2-4. Proper temperature sensor placement to prevent interference; D_t between 0.48 and 0.95 cm (3/16 and 3/8 in).

Configuration (A, B or NA): NA

Tube diameter (D_t), Inch: _____

Distance "W", Inch: _____

Distance "Z" Inch: _____

Correct configuration? NA

NA - Temperature sensor not mounted on pitot tube
Configuration A - W >3 inches, Z> 0.75 inches
Configuration B - W at least 2 inches

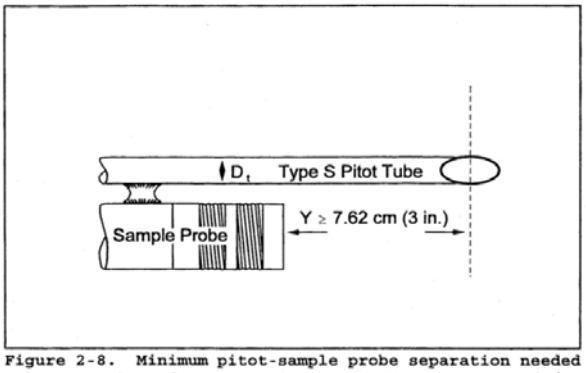

Figure 2-8. Minimum pitot-sample probe separation needed to prevent interference; D_t between 0.48 and 0.95 cm (3/16 and 3/8 in).

Distance "Y" : _____ (inch)

Correct configuration? NA

Y must be at least 3 inches

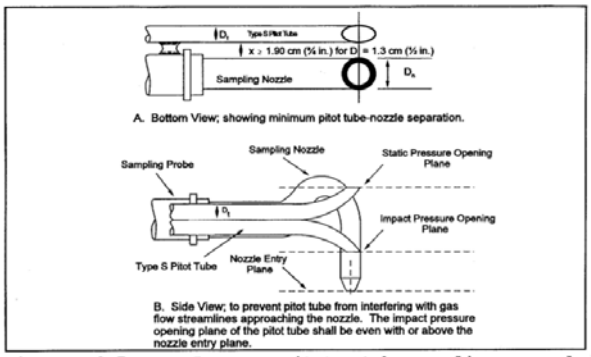

Figure 2-7. Proper pitot tube-sampling nozzle configuration.

Distance "X" : 0.1 (inch)

Must be ≥ 0.75 inches

Correct configuration? NA
