TABLE 1: SELECTION OF EXPOSURE PATHWAYS
CORNELL-DUBILIER ELECTRONICS SUPERFUND SITE: OU4 BOUND BROOK

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Human Receptor Population	Receptor Age	Exposure Route	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current/Future	Surface Water [1]	Surface Water [1]	OU4 Bound Brook Study Area	Recreationist / Sportsman / Angler [4]	Adult	Incidental Ingestion	None	Surface water could be contacted while wading in water bodies, fishing, or otherwise recreating in the OU4 Bound Brook Study Area. Incidental ingestion of chemicals of potential concern (COPC) in surface water during such activites is not likely or negligible; however, dermal contact exposure may occur.
						Dermal contact	Quantitative	
					Adolescent (7-18 years)	Incidental Ingestion	None	
						Dermal contact	Quantitative	
				Outdoor Worker [5]	Adult	Incidental Ingestion	None	Surface water could be contacted while maintaining, repairing, and/or cleaning culverts, spillways, bridges, and other structures in the OU4 Bound Brook Study Area. Incidental ingestion of COPCs in surface water during such activities is not likely or negligible; however, dermal contact exposure may occur.
						Dermal contact	Quantitative	
		Outdoor Air	OU4 Bound Brook Study Area	Recreationist / Sportsman / Angler [4]	Adult	Inhalation	Qualitative	Volatile organic compounds (VOC) may be present in surface water samples from the OU4 Bound Brook Study Area; however, inhalation of VOCs that may volatilize from surface water to outdoor air is not likely. VOCs would mix with outdoor ambient air, and the resultant VOC concentrations in outdoor air would be negligible.
					Adolescent (7-18 years)	Inhalation	Qualitative	
				Outdoor Worker [5]	Adult	Inhalation	Qualitative	
	Sediment [2]	Surface Sediment	OU4 Bound Brook Study Area	Recreationist / Sportsman / Angler [4]	Adult	Incidental Ingestion	Quantitative	Sediment could be contacted while wading in water bodies, fishing, or otherwise recreating in the OU4 Bound Brook Study Area.
						Dermal contact	Quantitative	
					Adolescent (7-18 years)	Incidental Ingestion	Quantitative	
						Dermal contact	Quantitative	
		All Sediment		Outdoor Worker [5]	Adult	Incidental Ingestion	Quantitative	Sediment could be contacted while maintaining, repairing, and/or cleaning culverts, spillways, bridges, and other structures in the OU4 Bound Brook Study Area.
						Dermal contact	Quantitative	
	Floodplain Soil [3]	Surface Soil	OU4 Bound Brook Study Area	Recreationist / Sportsman / Angler [4]	Adult	Incidental Ingestion	Quantitative	Floodplain soil could be contacted while recreating or fishing in the OU4 Bound Brook Study Area.
						Dermal contact	Quantitative	
					Adolescent (7-18 years)	Incidental Ingestion	Quantitative	
						Dermal contact	Quantitative	
		All Soil		Outdoor Worker	Adult	Incidental Ingestion	Quantitative	Floodplain soil could be contacted while maintaining, repairing, and/or cleaning culverts, spillways, bridges, and other structures in the OU4 Bound Brook Study Area.
						Dermal contact	Quantitative	
				Resident	Adult	Incidental Ingestion	Quantitative	Floodplain soil could be contacted by residents, as residences are located within the 100-year floodplain of the OU4 Bound Brook Study Area. However, the potential for exposure to soil in residential yards near the former CDE facility is being addressed by USEPA risk assessors as part of the OU1 Remedial Investigation (RI). The residential scenario included herein is not an evaluation of current/future residential exposures per se, but instead represents the Reasonable Maximum Exposure (RME) that any receptor population accessing the OU4 floodplain areas may have (*i.e.,* it is unlikely anyone using the floodplain areas would have a greater exposure than that associated with residential use). The residential exposure scenario is a conservative assessment and is thereby protective of most other receptor populations as well.
						Dermal contact	Quantitative	
					Child (0-6 years old)	Incidental Ingestion	Quantitative	
						Dermal contact	Quantitative	
		Surface Soil		Commercial / Industrial Worker	Adult	Incidental Ingestion	Quantitative	Floodplain soil could be contacted by commercial/industrial workers who primarily work outdoors on commercial/industrial properties located within the 100-year floodplain of the OU4 Bound Brook Study Area. While floodplain soils from these properties were not sampled as part of the RI for OU4, an outdoor site worker exposure scenario was included, assuming the floodplain soil data available for this RI represent soil from the entire floodplain area.
						Dermal contact	Quantitative	
		All Soil		Construction / Utility Worker	Adult	Incidental Ingestion	Quantitative	Utilities may be present within the 100-year floodplain of the OU4 Bound Brook Study Area. Floodplain soil could be contacted by construction/utility workers who perform construction or maintenance work on underground utilities.
						Dermal contact	Quantitative	

TABLE 1: SELECTION OF EXPOSURE PATHWAYS
CORNELL-DUBILIER ELECTRONICS SUPERFUND SITE: OU4 BOUND BROOK

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Human Receptor Population	Receptor Age	Exposure Route	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway
Current/Future	Floodplain Soil [3]	Outdoor Air	OU4 Bound Brook Study Area	Recreationist / Sportsman / Angler [4]	Adult	Inhalation	Quantitative	VOCs, if present in floodplain soil, and/or particulates generated from floodplain soil may be inhaled while recreating or fishing in the OU4 Bound Brook Study Area.
					Adolescent (7-18 years)	Inhalation	Quantitative	
				Outdoor Worker	Adult	Inhalation	Quantitative	VOCs, if present in floodplain soil, and/or particulates generated from floodplain soil may be inhaled while maintaining, repairing, and/or cleaning culverts, spillways, bridges, and other structures in the OU4 Bound Brook Study Area.
				Resident	Adult	Inhalation	Quantitative	VOCs, if present in floodplain soil, and/or particulates generated from floodplain soil may be inhaled by residents in floodplain areas within the OU4 Bound Brook Study Area. As described for ingestion and dermal contact exposures of residents, the residential scenario included herein is not an evaluation of current/future residential exposures per se, but instead represents the RME that any receptor population accessing the OU4 floodplain areas may have. The residential exposure scenario is a conservative assessment and is thereby protective of most other receptor populations as well.
					Child (0-6 years old)	Inhalation	Quantitative	
				Commercial / Industrial Worker	Adult	Inhalation	Quantitative	VOCs, if present in floodplain soil, and/or particulates generated from floodplain soil may be inhaled while working outdoors on commercial/industrial properties within the OU4 Bound Brook Study Area.
				Construction / Utility Worker	Adult	Inhalation	Quantitative	VOCs, if present in floodplain soil, and/or particulates generated from floodplain soil may be inhaled while performing construction/utility work in floodplain areas within the OU4 Bound Brook Study Area.
	Biota	Fish Fillet	OU4 Bound Brook Study Area	Angler [4]	Adult	Ingestion	Quantitative	Locally-caught fish could be consumed.
					Adolescent (7-18 years)	Ingestion	Quantitative	
					Child (0-6 years old)	Ingestion	Quantitative	
		Other biota	OU4 Bound Brook Study Area	Angler [4]	Adult	Ingestion	Quantitative	Other locally-caught biota (e.g., Asiatic clams, crayfish) may also be consumed.
					Adolescent (7-18 years)	Ingestion	Quantitative	
					Child (0-6 years old)	Ingestion	Quantitative	

Notes

[1] While periodic flooding does occur and residents or commercial/industrial workers may be exposed to COPCs in surface water while wading through flood waters, residents and commercial/industrial workers were not identified as potential human receptors for surface water in this risk assessment. Potential exposure during flooding is not a long-term exposure scenario, and it is assumed that evaluation of potential recreationist, outdoor worker, and angler/sportsman exposures (which have greater exposure frequencies and exposure durations) are protective of short-term exposures of residents and commercial/industrial workers during periodic flooding.

[2] Sediment data were separated into two data sets: "surface sediment" (0-15 cm below the sediment-water interface) and "all sediment" (all sediment samples regardless of depth). The surface sediment data set was used to evaluate the potential for exposure and associated health risks under the current/future scenario for receptors engaged in non-intrusive activities (*i.e.* , recreationist, angler/sportsman). The all sediment data set was used to evaluate the potential for exposure and associated health risks under the current/future scenario for receptors potentially engaged in intrusive activities (*i.e.* , outdoor workers) and, depending on the results of the sediment transport modeling, under a hypothetical future scenario in which receptors engaged in non-intrusive activites (*i.e.* , recreationists, anglers/sportsmen) are exposed to subsurface sediments brought to the surface by channel scouring.

[3] Floodplain soil data were separated into two data sets: "surface soil" (0-30 cm below ground surface) and "all soil" (all soil samples, regardless of depth). The surface soil data set was used to evaluate the potential for exposure and associated health risks under the current/future scenario for receptors engaged in non-intrusive activities (*i.e.* , recreationist, angler/sportsman, commercial/industrial worker). The all soil data set was used to evaluate the potential for exposure and associated health risks under the current/future scenario for receptors potentially engaged in intrusive activities (*i.e.* , outdoor worker, resident, construction/utility worker).

[4] For the purposes of this risk assessment, a distinction was made between an angler and sportsman. Anglers might consume their catch, while sportsmen fish for sport and release their catch.

[5] Outdoor workers may also be construction/utility workers who perform construction or maintenance work on underground utilities crossing the brook. The potential for this exposure scenario will be considered on an exposure unit by exposure unit basis and will be quantitatively evaluated, as applicable.

TABLE 2.1: SELECTION OF CHEMICALS OF POTENTIAL CONCERN (COPC) IN SURFACE WATER

Notes

Surface water data are from unfiltered samples.

[1] Detection limits are equivalent to sample reporting limits.

[2] Background concentrations are surface water data from CDEOU4-20110921-SWW-BB-RM8.3 and, for Total PCB Congeners, from porewater sampling location SW-01 at RM8.29.

[3] Unless otherwise noted, screening toxicity values are the USEPA Regional Screening Levels (RSL) for tapwater from May 2012 (USEPA, 2012c), which are based on either a cancer risk (c) of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for free cyanide (CN-)

b = Screening toxicity value is the drinking water action level (al) of 15 µg/L.

N/A = Not Applicable

Qualifier codes:
J = Estimated concentration.
D = Sample dilution was performed.

Rationale Codes:
1 = Maximum detected concentration exceeds screening toxicity value.
2 = Maximum detected concentration is less than screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value is available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in sediment samples from Ambrose Brook, which was selected as the reference area for stream channel sediment within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based

a = Screening toxicity value is for Chromium III.

b = Screening toxicity value is for mercuric chloride.

c = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
D = Sample dilution was performed.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in sediment samples from Ambrose Brook, which was selected as the reference area for stream channel sediment within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chromium III.
b = Screening toxicity value is for free cyanide (CN-)
c = Screening toxicity value is for mercuric chloride.
d = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
D = Sample dilution was performed.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] The analytical results from the Phase II (June 1997) and Phase III (August 1997) sampling events conducted as part of the USEPA's 1997 Ecological Evaluation were manually entered into the project database from data tables for each sampling event that present only detected chemicals. In so doing, data for chemicals not detected in one sampling event but detected in the other sampling event were omitted from the database. As a result, the frequency of detection for some chemicals is less than otherwise indicated and the EPCs for those chemicals selected as COPCs for further evaluation may be overstated.

[2] Detection limits are equivalent to sample reporting limits.

[3] Background values are concentrations detected in sediment samples from Ambrose Brook, which was selected as the reference area for stream channel sediment within the Study Area (see Appendix B).

[4] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for p-Cresol.
b = Screening toxicity value is for Chlordane.
c = Screening toxicity value is for Endosulfan.
d = Screening toxicity value is for Chromium III.
e = Screening toxicity value is for free cyanide (CN-)
f = Screening toxicity value is for mercuric chloride.
g = Screening toxicity value is for nickel, soluble salts.

[5] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.
P = Observed >25% difference between the two GC columns.
W = Sample was weathered; value is estimated.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] The analytical results from the Phase II (June 1997) and Phase III (August 1997) sampling events conducted as part of the USEPA's 1997 Ecological Evaluation were manually entered into the project database from data tables for each sampling event that present only detected chemicals. In so doing, data for chemicals not detected in one sampling event but detected in the other sampling event were omitted from the database. As a result, the frequency of detection for some chemicals is less than otherwise indicated and the EPCs for those chemicals selected as COPCs for further evaluation may be overstated.

[2] Detection limits are equivalent to sample reporting limits.

[3] Background values are concentrations detected in sediment samples from Ambrose Brook, which was selected as the reference area for stream channel sediment within the Study Area (see Appendix B).

[4] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for p-Cresol.
b = Screening toxicity value is for Chlordane.
c = Screening toxicity value is for Endosulfan.
d = Screening toxicity value is for Chromium III.
e = Screening toxicity value is for free cyanide (CN-)
f = Screening toxicity value is for mercuric chloride.
g = Screening toxicity value is for nickel, soluble salts.

[5] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
D = Sample dilution was performed.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.
P = Observed >25% difference between the two GC columns.
W = Sample was weathered; value is estimated.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in sediment samples from Ambrose Brook, which was selected as the reference area for stream channel sediment within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for p-Cresol.
b = Screening toxicity value is for Chlordane.
c = Screening toxicity value is for Endosulfan.
d = Screening toxicity value is for Chromium III.
e = Screening toxicity value is for free cyanide (CN-)
f = Screening toxicity value is for mercuric chloride.
g = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
D = Sample dilution was performed.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in sediment samples from Ambrose Brook, which was selected as the reference area for stream channel sediment within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for p-Cresol.
b = Screening toxicity value is for Chlordane.
c = Screening toxicity value is for Endosulfan.
d = Screening toxicity value is for Chromium III.
e = Screening toxicity value is for free cyanide (CN-)
f = Screening toxicity value is for mercuric chloride.
g = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
D = Sample dilution was performed.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in sediment samples from Ambrose Brook, which was selected as the reference area for stream channel sediment within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for p-Cresol.
b = Screening toxicity value is for Chlordane.
c = Screening toxicity value is for Endosulfan.
d = Screening toxicity value is for Chromium III.
e = Screening toxicity value is for free cyanide (CN-)
f = Screening toxicity value is for mercuric chloride.
g = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
C = Identification confirmed by GC/MS.
D = Sample dilution was performed.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.
P = Observed >25% difference between the two GC columns.
X =

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in sediment samples from Ambrose Brook, which was selected as the reference area for stream channel sediment within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chlordane.
b = Screening toxicity value is for Endosulfan.
c = Screening toxicity value is for Chromium III.
d = Screening toxicity value is for free cyanide (CN-)
e = Screening toxicity value is for mercuric chloride.
f = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
D = Sample dilution was performed.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Chemical was tentatively identified.
P = Observed >25% difference between the two GC columns.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in sediment samples from Ambrose Brook, which was selected as the reference area for stream channel sediment within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chlordane.
b = Screening toxicity value is for Endosulfan.
c = Screening toxicity value is for Chromium III.
d = Screening toxicity value is for free cyanide (CN-)
e = Screening toxicity value is for mercuric chloride.
f = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
D = Sample dilution was performed.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Chemical was tentatively identified.
P = Observed >25% difference between the two GC columns.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in sediment samples from Ambrose Brook, which was selected as the reference area for stream channel sediment within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for p-Cresol.
b = Screening toxicity value is for Chlordane.
c = Screening toxicity value is for Endosulfan.
d = Screening toxicity value is for Chromium III.
e = Screening toxicity value is for free cyanide (CN-)
f = Screening toxicity value is for mercuric chloride.
g = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
D = Sample dilution was performed.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Chemical was tentatively identified.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in sediment samples from Ambrose Brook, which was selected as the reference area for stream channel sediment within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for p-Cresol.
b = Screening toxicity value is for Chlordane.
c = Screening toxicity value is for Endosulfan.
d = Screening toxicity value is for Chromium III.
e = Screening toxicity value is for free cyanide (CN-)
f = Screening toxicity value is for mercuric chloride.
g = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
D = Sample dilution was performed.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in sediment samples from Ambrose Brook, which was selected as the reference area for stream channel sediment within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for p-Cresol.
b = Screening toxicity value is for Chlordane.
c = Screening toxicity value is for Endosulfan.
d = Screening toxicity value is for Chromium III.
e = Screening toxicity value is for free cyanide (CN-)
f = Screening toxicity value is for mercuric chloride.
g = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
D = Sample dilution was performed.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
N = Chemical was tentatively identified.
J = Estimated concentration.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

The Spring Lake sediment data set consists of twenty-one surface sediment samples and one additional subsurface sediment sample that was analyzed for TCL pesticides/PCB Aroclors only (see Table 2-3). As there was only one subsurface sediment sample collected, all Spring Lake sediment data were combined into a single data set, presented in this summary table.

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in sediment samples from Lake Nelson, which was selected as the reference area for Spring Lake (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chlordane.
b = Screening toxicity value is for Chromium III.
c = Screening toxicity value is for free cyanide (CN-)
d = Screening toxicity value is for mercuric chloride.
e = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
D = Sample dilution was performed.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Chemical was tentatively identified.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in soil samples from the Ambrose Brook floodplain, which was selected as the reference area for floodplain soil within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chromium III.
b = Screening toxicity value is for free cyanide (CN-).
c = Screening toxicity value is for mercuric chloride.
d = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
D = Sample dilution was performed.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in soil samples from the Ambrose Brook floodplain, which was selected as the reference area for floodplain soil within the Study Area (see Appendix B)

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chromium III.
b = Screening toxicity value is for free cyanide (CN-).
c = Screening toxicity value is for mercuric chloride.
d = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
D = Sample dilution was performed.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in soil samples from the Ambrose Brook floodplain, which was selected as the reference area for floodplain soil within the Study Area (see Appendix B)

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chlordane.
b = Screening toxicity value is for Endosulfan.
c = Screening toxicity value is for Chromium III.
d = Screening toxicity value is for free cyanide (CN-).
e = Screening toxicity value is for mercuric chloride.
f = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in soil samples from the Ambrose Brook floodplain, which was selected as the reference area for floodplain soil within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chromium III.
b = Screening toxicity value is for free cyanide (CN-).
c = Screening toxicity value is for mercuric chloride.
d = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in soil samples from the Ambrose Brook floodplain, which was selected as the reference area for floodplain soil within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chromium III.
b = Screening toxicity value is for free cyanide (CN-).
c = Screening toxicity value is for mercuric chloride.
d = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in soil samples from the Ambrose Brook floodplain, which was selected as the reference area for floodplain soil within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chlordane.
b = Screening toxicity value is for Endosulfan.
c = Screening toxicity value is for Chromium III.
d = Screening toxicity value is for free cyanide (CN-).
e = Screening toxicity value is for mercuric chloride.
f = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
D = Sample dilution was performed.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in soil samples from the Ambrose Brook floodplain, which was selected as the reference area for floodplain soil within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^6 cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chlordane.
b = Screening toxicity value is for Endosulfan.
c = Screening toxicity value is for Chromium III.
d = Screening toxicity value is for free cyanide (CN-).
e = Screening toxicity value is for mercuric chloride.
f = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
D = Sample dilution was performed.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in soil samples from the Ambrose Brook floodplain, which was selected as the reference area for floodplain soil within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chlordane.
b = Screening toxicity value is for Endosulfan.
c = Screening toxicity value is for Chromium III.
d = Screening toxicity value is for free cyanide (CN-).
e = Screening toxicity value is for mercuric chloride.
f = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
D = Sample dilution was performed.
E = Concentration exceeds calibration range of GC/MS intrument.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in soil samples from the Ambrose Brook floodplain, which was selected as the reference area for floodplain soil within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chlordane.
b = Screening toxicity value is for Endosulfan.
c = Screening toxicity value is for Chromium III.
d = Screening toxicity value is for free cyanide (CN-).
e = Screening toxicity value is for mercuric chloride.
f = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
D = Sample dilution was performed.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in soil samples from the Ambrose Brook floodplain, which was selected as the reference area for floodplain soil within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chlordane.
b = Screening toxicity value is for Endosulfan.
c = Screening toxicity value is for Chromium III.
d = Screening toxicity value is for free cyanide (CN-).
e = Screening toxicity value is for mercuric chloride.
f = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
D = Sample dilution was performed.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in soil samples from the Ambrose Brook floodplain, which was selected as the reference area for floodplain soil within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chlordane.
b = Screening toxicity value is for Endosulfan.
c = Screening toxicity value is for Chromium III.
d = Screening toxicity value is for free cyanide (CN-).
e = Screening toxicity value is for mercuric chloride.
f = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
D = Sample dilution was performed.
E = For organics, concentration exceeds calibration range of GC/MS intrument.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Background values are concentrations detected in soil samples from the Ambrose Brook floodplain, which was selected as the reference area for floodplain soil within the Study Area (see Appendix B).

[3] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for Resident Soil from April 2012 (USEPA, 2012c) and are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chlordane.
b = Screening toxicity value is for Endosulfan.
c = Screening toxicity value is for Chromium III.
d = Screening toxicity value is for free cyanide (CN-).
e = Screening toxicity value is for mercuric chloride.
f = Screening toxicity value is for nickel, soluble salts.

[4] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable
L = USEPA screening level for lead in residential soil

Qualifier Codes:
B = For organics, chemical found in associated blank.
E = For inorganics, Serial dilution results not within 10%. Applicable only if analyte concentration is at least 50X the IDL in original sample.
J = Estimated concentration.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for fish ingestion from April 2012 (USEPA, 2012c), which are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for Chromium III.

b = Screening toxicity value is for methylmercury.

[3] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available

N/A = Not Applicable

Qualifier Codes:

B = For oganics, chemical found in associated blank.

J = Estimated concentration.

MI = Matrix interference.

N = Indicates presumptive evidence of a compound.

W = Sample was weathered; value is estimated.

Rationale Codes:

1 = Maximum concentration exceeds screening toxicity value.

2 = Maximum concentration does not exceed screening toxicity value.

3 = Chemical is an essential nutrient.

4 = Frequency of detection is less than 5%.

5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] The relevant screening toxicity values are the USEPA Regional Screening Levels (RSL) for fish ingestion from April 2012 (USEPA, 2012c), which are based on either a cancer (c) risk of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

a = Screening toxicity value is for chlordane.
b = Screening toxicity value is for Chromium III.
c = Screening toxicity value is for methylmercury.

[3] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

NA = Not Available
N/A = Not Applicable

Qualifier Codes:
J = Estimated concentration.
MI = Matrix interference.
N = Indicates presumptive evidence of a compound.

Rationale Codes:
1 = Maximum concentration exceeds screening toxicity value.
2 = Maximum concentration does not exceed screening toxicity value.
3 = Chemical is an essential nutrient.
4 = Frequency of detection is less than 5%.
5 = No screening toxicity value available.

Notes

[1] Detection limits are equivalent to sample reporting limits.

[2] Screening toxicity values are the USEPA Regional Screening Levels (RSL) for fish from May 2012 (USEPA, 2012c), adjusted to reflect a shellfish consumption rate equivalent to 8.2% of the default fish consumption rate of 54 g/day (4.4 g/day) (USEPA, 2011). The RSLs are based on either a cancer risk (c) of one in a million (i.e., 10^{-6} cancer risk level) or a non-cancer (n) hazard quotient (HQ) of 1. Consistent with USEPA, Region 2 guidance, RSLs based on non-cancer effects were reduced by a factor of 10 to represent a target HQ of 0.1. Where a cancer risk-based RSL was greater than the resultant non-cancer 0.1 HQ-based RSL, the applicable screening toxicity value is the non-cancer based level.

[3] Selection of PCB Aroclors as a COPC was based on data for "Total PCB Aroclors," which is the sum of detected Aroclor 1242, Aroclor 1254, and Aroclor 1260 concentrations within a given sample.

Notes
(1) Information regarding modeled intake development can be found in Section 4.2, Exposure Assessmen
(2) Professional judgment.
* Non-cancer hazard quotients for adult anglers are computed based on an ED of 30 years as an adult. Cancer risks for adult anglers are computed based on an ED of 30 years, assuming 6 years at the child's rate of exposure and 24 years at the adult's rate of exposure.
The adolescent ingestion rate is equivalent to 2/3 the ingestion rate of the adult. The child ingestion rate is equivalent to 1/3 the ingestion rate of the adu

Notes

Gastrointestinal absorption efficiencies are from Exhibit 4-1 in USEPA, 2004b. See Section 4, "Toxicity Assessment," of the Human Health Risk Assessment text.

NA = Not Available

NOAEL = No observable adverse effect level

[1] = The subchronic RfD is from a different source than the chronic RfD. The subchronic value is lower than the chronic value and will therefore not be used in the noncancer hazard calculations.

[2] = RfD is specific to vanadium pentoxide and was corrected for vanadium per the USEPA Regional Screening Levels User's Guide, Section 5.4 (USEPA, 2012c)

Hierarchy of Sources:

IRIS = Integrated Risk Information System (USEPA, 2012a).

NCEA = National Center for Environmental Assessment, Provisional Peer-Reviewed Toxicity Value (http://hhpprtv.ornl.gov/).

CalEPA = California Environmental Protection Agency, Office of Environmental Health Hazard Assessment (http://oehha.ca.gov/tcdb/index.asp).

ATSDR = Agency for Toxic Substances and Disease Registry, Minimal Risk Level (ATSDR, 2012).

HEAST = Health Effects Assessment Summary Tables (USEPA, 1997b).

Notes

Gastrointestinal absorption efficiencies are from Exhibit 4-1 in USEPA, 2004b.

NA = Not Available

Hierarchy of Sources:

IRIS = Integrated Risk Information System (USEPA, 2012a).

NCEA = National Center for Environmental Assessment, Provisional Peer-Reviewed Toxicity Value (http://hhpprtv.ornl.gov/).

CalEPA = California Environmental Protection Agency, Office of Environmental Health Hazard Assessment (http://oehha.ca.gov/tcdb/index.asp).

ATSDR = Agency for Toxic Substances and Disease Registry, Minimal Risk Level (ATSDR, 2012).

HEAST = Health Effects Assessment Summary Tables (USEPA, 1997b).

Other Sources:

ECAO = Environmental Criteria and Assessment Office (USEPA, 2012).

NJDEP = New Jersey Department of Environmental Protection (Stern, 2009).

USEPA (1986) Weight of Evidence Classifications:

A - Human carcinogen.

B1 - Probable human carcinogen - indicates that limited human data are available.

B2 - Probable human carcinogen - indicates sufficient evidence in animals and inadequate or no evidence in humans.

C - Possible human carcinogen.

D - Not classifiable as a human carcinogen.

E - Evidence of noncarcinogenicity.

USEPA (2005d) Cancer Guidelines Descriptions:

Carcinogenic to humans.

Likely to be carcinogenic to humans.

Suggestive evidence of carcinogenic potential.

Inadequate information to assess carcinogenic potential.

Not likely to be carcinogenic to humans.

Receptor Total - Angler Adult, Abiotic Media + Bottom-Feeding Fish Fillet							1E-03				Receptor HI Total	8E+01

Notes

N/A = Not Applicable

NA = Not Available

Blood HI Across All Media =	3E+01
Kidney HI Across All Media =	4E-03
Liver HI Across All Media =	3E+01
Developmental HI Across All Media =	1E-02
Neurological HI Across All Media =	2E-01
Respiratory, Lung HI Across All Media =	3E+01
Musculoskeletal HI Across All Media =	3E-03
Eye HI Across All Media =	5E+01
Immunological HI Across All Media =	6E+01
Hair, Skin, Nails HI Across All Media =	6E+01
Cardiovascular HI Across All Media =	1E-02
Endocrine HI Across All Media =	3E+01
GI tract HI Across All Media =	5E-02
Whole body HI Across All Media =	3E-02

TABLE 9.3.CTE: SUMMARY OF RECEPTOR RISKS AND HAZARDS FOR COPCs
CORNELL-DUBILIER ELECTRONICS SUPERFUND SITE: OU4 BOUND BROOK

Scenario Timeframe:	Current/Future
Exposure Unit (EU):	Bound Brook 3 (BB3)
Receptor Population:	Angler
Receptor Age:	Adult

Medium	Exposure Medium	Exposure Point	Chemical of Potential Concern	Carcinogenic Risk				Non-Carcinogenic Hazard Quotient				
				Ingestion	Inhalation	Dermal	Exposure Routes Total	Primary Target Organ(s)	Ingestion	Inhalation	Dermal	Exposure Routes Total
Biota	Asiatic Clams	EU BB3	Total PCB Aroclors	1E-05	N/A	N/A	1E-05	Eye; Nails; Immunological	2E+00	N/A	N/A	2E+00
