RE: Protocol 1613-002 - A Neurobehavioral Developmental Study of Ammonium Perchlorate Administered Orally in Drinking Water to Rats
Sponsor's Study Number: 7757A210-1096-25F

Dear Ms. Jarabek:

We have addressed most of your questions in our previous fax. Below is an update on the status of the remaining outstanding items for the above referenced study.

1. All of the motor activity count data was reanalyzed by Dr. Simon Mats, our statistician at our sister laboratory in Worcester, MA. He can be reach at (508) 890-0908 for further clarification. Counts for each time block for each treatment group for each male and each female on each testing days were combined. When the first MANOVA was performed (APPENDIX 1) there was a significant effect for DAY (of testing) and BLOCK (5 minute intervals) but not for GROUP (dosage) or SEX (gender). Dr. Mats then performed additional MANOVA and Univariate tests to probe for interactions (APPENDIX 2). These analysis indicated there was only a significant block by sex interaction on testing Day 22. If you look at the MANOVA and Univariate analyses for testing DAY 14, there is only a significant effect for BLOCK, and not for BLOCK x GROUP, BLOCK x SEX, nor BLOCK x GROUP x SEX.

   I spoke to Dr. Mats regarding Dr. Crofton's concern that the total counts for Group V were 95% higher than Group I total counts on DAY 14, but the increase was not significant. He indicated that the variation in the data sets probably was

the cause but this would be inappropriate analysis anyway because the data had already been analyzed by each time block and should not be collapsed.

2. Historical control data for motor activity will be provided this week because we have two recently completed studies that need to be added to the historical control data (APPENDIX 3).

3. The F1 generation body weight data has been separated into pre-weaning and post-weaning graphs and error bars included (APPENDIX 4).

Sincerely,

for Raymond G. York, Ph.D., DABT
Associate Director of Research
and Study Director
