Subject: Electrolux Site Summary Report - Jefferson, Iowa

You have received 1 secure file from jpeace@golder.com.
Use the secure link below to download.

Hi, Brian.

On behalf of Electrolux, I append the Site Summary Report for the former Electrolux facility in Jefferson, Iowa. Please let me know if you have any difficulties downloading the report (84 MB) and contact me or Doug Arnold with any questions regarding the report.

Cheers,

Jim

RE: SITE ASSESSMENT SUMMARY REPORT
FORMER ELECTROLUX HOME PRODUCTS, INC. FACILITY
JEFFERSON, IOWA

Dear Andrew:

Golder Associates Inc. (Golder) is pleased to present this Site Assessment Summary Report for the former Electrolux Home Products, Inc. site (Site) located in Jefferson, Iowa. This report summarizes past Golder assessment report submittals from 2011 to 2013, presents assessment activities and findings completed between April 2014 and July 2016, and provides the framework for future management of identified environmental conditions at the Site. Please contact the undersigned if you have any questions.

Sincerely,

GOLDER ASSOCIATES INC.

James S. Peace, PG
Senior Hydrogeologist

Alistair P. T. Macdonald, CPG, LSP
Senior Program Leader and Principal

1.0 INTRODUCTION

The former Electrolux Home Products, Inc. (Electrolux) manufacturing facility is located at 601 East Central Street in Jefferson, Greene County, Iowa (Site) (see Figure 1). The approximately 20.75 acre Site was previously improved by a 75,542 square-foot single-story former manufacturing/office/warehouse building constructed in 1960, with additions constructed in 1973, 1984, 1988, and 1992 (see Figure 3). The area of the Site formerly used for manufacturing operations encompasses approximately 7.5 acres of the 20.75-acre property owned by Electrolux (herein referred as the "facility" or ""former manufacturing area"). The remainder of the property, south and east of the facility, has historically been leased for agricultural use (see Figure 2). Electrolux terminated the agricultural leases for these areas.

The Site was developed in 1960 to manufacture dishwasher motor transmissions. Electrolux closed the facility in March 2011, decommissioned and removed the manufacturing equipment and other items from the facility buildings, and demolished the buildings. The concrete building slabs, parking areas, chain-link fence, and sidewalks are still in place.

In 2010, Electrolux commissioned Golder Associates Inc. (Golder) to review the Site history and develop an environmental assessment plan to evaluate subsurface conditions downgradient and exterior of the facility buildings as part of facility closure activities. Electrolux then voluntarily assessed Site subsurface conditions using a phased approach. Assessment activities completed between 2010 and 2013 were documented in the following reports and associated work plans:

- Golder Associates Inc., 2011, "Letter Report, Former Electrolux Manufacturing Facility, 601 East Central Street, Jefferson, Iowa" May 13, 2011.
- Golder Associates Inc., 2012, "Work Plan for Supplemental Soil and Groundwater Assessment, Former Electrolux Manufacturing Facility, 601 East Central Street, Jefferson, Iowa" January 2012.
- Golder Associates Inc., 2012a, "Supplemental Soil and Groundwater Assessment, Former Electrolux Manufacturing Facility, 601 East Central Street, Jefferson, Iowa" September 4, 2012.
- Golder Associates Inc., 2012b, "Work Plan Addendum for Supplemental Soil and Groundwater Assessment, Former Electrolux Manufacturing Facility, 601 East Central Street, Jefferson, Iowa" October 5, 2012.
- Golder Associates Inc., 2013, "Supplemental Soil and Groundwater Assessment Addendum Report, Former Electrolux Manufacturing Facility, 601 East Central Street, Jefferson, Iowa" May 15, 2013.
- Golder Associates Inc., 2014, "Soil and Groundwater Assessment Addendum No. 2, Former Electrolux Manufacturing Facility, 601 East Central Street, Jefferson, Iowa" January 7, 2014.

Since completing these activities, Electrolux completed additional follow-on Site assessment activities. The purpose of this report is to provide a summary of the previously prepared Site assessment reports (i.e., 2010 through 2013), present the results of assessment activities completed since 2014, present the

updated Conceptual Site Model (CSM), and provide the framework for future management of identified environmental conditions at the Site. For reference, appendices to this report combine supporting information from each individual assessment phase (e.g., boring and well installation logs, groundwater analytical lab data, slug test data, etc.).

2.0 SUMMARY OF ASSESSMENT ACTIVITIES

Electrolux voluntarily assessed Site subsurface conditions using a phased approach. Following completion of each assessment phase, Golder revised the CSM and developed a strategy for additional assessment. Section 3.0 describes the methodologies used to advance soil borings, install monitoring wells, collect and analyze soil and groundwater samples, and other related assessment activities. The following summarizes activities and findings for each phase of assessment:

1. Groundwater Flow Direction Assessment: In November and December 2010, Golder advanced ten boreholes and installed nine monitoring wells (MW-01 to MW-09) screened in the oxidized brown till (see Section 4.1 for a description of lithologic units) to assess the shallow groundwater (i.e., water table) flow direction across the developed portion of the Site. The shallow groundwater flow direction was identified to be towards the south.

2. Soil and Groundwater Assessment: Golder assessed soil and groundwater conditions downgradient and exterior of the facility buildings in March and April 2011. Golder advanced 14 soil borings and installed 14 monitoring wells (MW-10 through MW-23) screened in the oxidized brown till. The findings of the assessment indicated the presence of petroleum and chlorinated volatile organic compounds (CVOCs) impacted soils and groundwater along the southern edge of the facility building. Golder identified trichloroethene (TCE) and petroleum compounds (diesel/motor oil) at their highest concentrations in soil and groundwater near monitoring wells MW-19 and MW-22 (see Figure 3), respectively. Impacts along the downgradient boundary of the former manufacturing area were not detected and it was Golder's opinion that impacted groundwater did not extend downgradient to the Site property boundary.

3. Supplemental Soil and Groundwater Assessment: Golder prepared a work plan (Golder, 2012) outlining the objectives and field procedures to identify the source(s) of petroleum and CVOC impacts detected in soil and groundwater along the southern edge of the building and to obtain soil, water quality, geologic, and hydrogeologic information to support an evaluation of remedial alternatives. The assessment activities completed in April and May 2012 included:

   - Advancement of 51 membrane interface probes (MIP) equipped with a halogen specific detector (XSD), a photo-ionization detector (PID), and a flame ionization detector (FID) to screen for the presence of VOCs and petroleum hydrocarbons in soil and groundwater in areas with the potential for impacts (e.g., former solvent aboveground storage tank (AST) area, trenches, and sumps). The MIP points were advanced into the oxidized brown till and unoxidized gray till (collectively referred to as the upper tills).
   - Advancement of 24 Ultra-Violet Optical Screening Tool (**UVOST™**) laser-induced fluorescent probes (LIF) into the oxidized and unoxidized tills to screen for the presence of petroleum-related non-aqueous phase liquids (NAPL).
   - Advancement of 17 soil probes at locations adjacent to MIP/LIF locations to obtain shallow geologic information and confirmation soil samples.
   - Collection of 44 primary soil samples and five duplicate soil samples for laboratory analysis from selected depths at the 17 soil boring locations to confirm the MIP/LIF findings.
   - Installation of 10 groundwater monitoring wells (MW-24 to MW-31).
   - Collection of 21 primary groundwater samples and two duplicate groundwater samples for analysis of VOCs and/or Total Extractable Hydrocarbons (TEH).
   - Performance of slug tests at seven monitoring well locations.

The Supplemental Soil and Groundwater Assessment activities delineated most of the CVOC and petroleum constituents in the upper tills (i.e., approximately the upper 30 feet of soil) and identified the presence of NAPL in some areas of the Site.

4. Supplemental Soil and Groundwater Assessment Addendum: Golder prepared a Work Plan Addendum (Golder, 2012b) for additional assessment to complete the delineation of impacts within the upper tills, to assess groundwater quality in the underlying yellow-brown till, and to identify the type of NAPL present beneath the facility. Assessment activities completed during the November/December 2012 included:

   - Advancement of 25 MIP points (MIP-52 through MIP-77) to screen for the presence of CVOCs and petroleum hydrocarbons in soil and groundwater.
   - Advancement of 60 **UVOST**™ LIF probes (LIF-24 to LIF-84) to screen for the presence of petroleum-related NAPL.
   - Installation of 25 groundwater monitoring wells (MW-32 to MW-55).
   - Installation of one double-cased monitoring well (MW-45) screened in the unoxidized till and three double-cased monitoring wells (MW-43D, MW-46, and MW-47D) screened in the yellow-brown till.
   - Collection of 66 primary groundwater samples and seven duplicate groundwater samples for analysis of VOCs and/or TEH.
   - Collection of six soil samples from the yellow-brown till for laboratory analysis of CVOCs.
   - Collection of NAPL samples from monitoring wells MW-21 and MW-35 for laboratory fingerprint analysis.
   - Collection of four NAPL-impacted soil samples for laboratory petroleum fingerprint analysis.
   - Performance of slug tests at four monitoring well locations.

   Based on this work Golder concluded the following:

   - While the nature and extent of soil and groundwater impacts in the upper tills (i.e., upper 30 feet) was mostly complete, there were two areas, located southeast and south of the former manufacturing facility that required limited additional groundwater assessment.
   - CVOC impacts to yellow-brown till soil and groundwater were identified. Additionally, the yellow-brown till was found to be composed of sand and sandy silts more permeable than the overlying unoxidized gray till (silty clay) in some areas of the Site.

   To complete the delineation of the nature and extent of soil and groundwater impacts in the upper tills and to further assess the yellow-brown till, Golder completed additional assessment activities in February/March 2013, which included:

   - Installation of two, single-cased monitoring wells (MW-56S and MW-60) screened in the oxidized brown and unoxidized gray till units (see Figure 3).
   - Advancement of one soil boring (GA-13-SB-01) to a depth of approximately 65 ft bgs north of the former manufacturing building to better characterize the lithology below the upper tills. The driller collected continuous soil samples from the boring and Golder submitted eight soil samples to a certified laboratory for geotechnical analysis.
   - Installation of five double-cased monitoring wells (MW-56D, MW-57, MW-58, MW-59, and MW-61) screened in the yellow-brown till. Monitoring well MW-61 was installed at an

assumed upgradient location. The remaining four monitoring wells were installed near the downgradient extent of the facility.

- Collection of one round of water level measurements from the seven newly-installed and 62 existing monitoring wells.
- Collection of groundwater samples from the seven newly-installed monitoring wells and three existing deep monitoring wells (MW-43D, MW-46, and MW-47D).

Upon evaluation of the February/March 2013 assessment results, Golder concluded the following:

- A fine-grained, gray to black to dark gray very stiff to hard silty clay underlies the yellow-brown till. Golder designated the soils beneath the yellow-brown till as the "dark gray till."
- Assessment activities successfully delineated the nature and extent of impacts to soil and groundwater in most areas of the Site. The delineation of petroleum and CVOC impacts to soil and groundwater in the upper tills is complete.
- The vertical extent of VOC groundwater impacts below the yellow-brown till and horizontal extent of VOC-impacts in the yellow-brown till in the southeast corner of the manufacturing facility (southeast of MW-57) required further delineation.

5. Soil and Groundwater Assessment Addendum No. 2: Golder revised the Work Plan Addendum (Golder 2012b) outlining the objectives and field procedures to complete the vertical and horizontal delineation of VOC groundwater impacts in the yellow-brown till. Activities completed during the September/October 2013 field assessment included:

- Installation of three double-cased monitoring wells (MW-62 and MW-63 screened in the dark gray till and MW-64 screened in the yellow-brown till).
- Installation of one triple-cased monitoring well (MW-65) screened in the dark gray till in the suspected source area near MW-47D.
- Collection of 16 soil samples for geotechnical analysis.
- Collection of 18 primary groundwater samples and two duplicate groundwater samples for analysis of CVOCs, 1,4-dioxane, and monitored natural attenuation parameters.
- Performance of slug tests at six monitoring well locations.

Golder evaluated the September/October 2013 assessment results and concluded the following:

- Impacts can be broadly separated into two categories: petroleum/NAPL impacts, and CVOC impacts, including 1,4-dioxane, which was detected in several shallow (i.e., oxidized/unoxidized till) groundwater samples.
- The petroleum/NAPL impacts are primarily confined to the oxidized brown and unoxidized gray tills. TEH impacts to groundwater are present in areas where NAPL is present, but attenuate rapidly vertically. The risk posed by the petroleum-impacted soil and groundwater is concluded to be low as analysis of the samples indicated the absence of typical risk-driving VOCs (e.g., benzene, ethylbenzene, toluene, xylene, etc.) and SVOCs (e.g., benzo-a-pyrene, benzo-a-anthracene, anthracene). Fingerprint analysis of NAPL-impacted soils indicates that the oils have undergone significant weathering and degradation.
- CVOC impacts, primarily TCE and its breakdown products, including cis-1,2-dichlorethene (cis-1,2-DCE) and vinyl chloride, are present in the upper tills, and to a lesser extent in the yellow-brown till. MIP profiling indicates that the highest CVOC concentrations occur at the interface between the oxidized brown and unoxidized gray till, which is coincident with,

and consistent with, a contrast in hydraulic conductivity between these two units. The unoxidized gray till is characterized by a very low hydraulic conductivity. Migration of CVOCs into the unoxidized gray till and in some areas into the yellow-brown till likely occurs through diffusion, rather than advection (groundwater) flow.

- Site data indicate that significant anaerobic biological reductive dechlorination is occurring in soils and groundwater which, along with the generally low transmissivity of the till materials, limits the horizontal and vertical extent and potential migration of CVOC impacts.
- Because facility-related impacts do not extend off Electrolux-owned property and that Electrolux intends to maintain control of the property, Golder recommended groundwater monitoring to evaluate the groundwater data in the context of a potential monitored natural attenuation (MNA) remedy.

6. 2014 Groundwater Monitoring: To obtain temporal groundwater quality information and to evaluate the degree of natural attenuation of groundwater impacts, Golder completed three rounds of groundwater monitoring in April, July, and October 2014. The groundwater monitoring program included:

- Collection of water level measurements and groundwater samples from 21 Site monitoring wells.
- Measurement of field water quality parameters (specific conductivity, pH, dissolved oxygen, and temperature) prior to sample collection.
- Laboratory analysis of collected samples for VOCs and MNA parameters including methane, ethane, ethene, sulfate, nitrate, nitrite, iron, manganese, and total organic carbon (TOC).

The analytical results indicated that the CVOC-impacted groundwater in the yellow-brown till had been adequately delineated (i.e., decreasing CVOC concentrations in the downgradient monitoring well - MW-64).

Groundwater samples collected from monitoring well MW-65 (screened in the dark gray till) indicated an increasing TCE concentration trend over time. To further assess groundwater quality near MW-65, Golder collected groundwater samples from MW-47D (screened in yellow-brown till above MW-65) and MW-65 in December 2014 and March 2015. The CVOC concentrations detected in the groundwater samples collected from MW-65 continued to increase. Golder compared the groundwater geochemistry data (e.g., sulfate, chloride, and VOC constituents) between MW-47D and MW-65 and concluded that the chemical properties of the groundwater in each well are different indicating that groundwater from MW-47D was not migrating vertically to MW-65.

Golder also assessed potential groundwater receptors near the Site by conducting a literature review of the Jefferson Groundwater Investigation, Greene County, Iowa, - Iowa Geological and Water Survey Technical Information Series 56, prepared by the Iowa Department of Natural Resources (IDNR), dated December 2013. This document provides a summary of the Pleistocene Sand and Gravel Unit, local geology, thickness of the Pleistocene Sand and Gravel Unit, and models the groundwater capture zones of the two City of Jefferson municipal well fields screened within the Pleistocene Sand and Gravel Unit. The IDNR study indicates that the Site is located just beyond the 10-year capture zone (i.e., near the southwest corner of the Site) for the well field located within the city limits of Jefferson (i.e., approximately 4,200 southwest of the Site). The capture zone of a second well field, located approximately 5,700 feet northwest of the Site, did not extend towards the Site (see Appendix A for capture zone extent). In addition, the study indicates that the Site is located on the westernmost edge of the Pleistocene Sand and Gravel Unit and may only be 10 feet thick or less underlying the Site.

Golder also performed a desktop review of Iowa Geological Survey's GeoSam database (https://geosam.iihr.uiowa.edu/). This database provides location, identification, and other key information about available well, rock exposure, or geologic information submitted to the Iowa Geologic Survey. Based on Golder's review of the database, there are three geothermal wells located west of the Site in the clay till beyond the lateral extent of the Pleistocene Sand and Gravel Unit in this region. The database did not identify any private potable wells located within approximately 3/4 miles of the Site.

The Hamilton Redi-Mix Concrete Plant, located approximately 6,200 feet northeast of the Site, uses the Pleistocene Sand and Gravel Unit as a water source in their concrete production process. Based on the well screen and pump specifications, the amount of water that could be extracted from this well is several orders of magnitude lower than the City of Jefferson production wells located south of the concrete plant. Therefore, the pumping rate at the concrete plant is inconsequential compared to the City of Jefferson wells and would not alter the City's capture zone.

7. Vertical Delineation of Yellow-Brown Till and Pleistocene Sand and Gravel Unit: In August 2015 during follow-on discussions and a meeting with USEPA to discuss the latest CSM, Electrolux decided to perform additional assessment activities to address a perceived data gap in the downgradient extent of CVOC-impacted groundwater near MW-64 (i.e., near contact between yellow-brown till and underlying dark gray till) and to assess the Pleistocene Sand and Gravel Unit underlying the dark gray till. In October 2015, Golder installed two additional double-cased groundwater monitoring wells, designated MW-66 and MW-67, screened in the yellow-brown till and Pleistocene Sand and Gravel Unit, respectively. With concurrence of USEPA, monitoring well MW-66 was installed as a well pair near MW-64 and monitoring well MW-67 was installed in the former agricultural field in the southwest corner of the Site (i.e., between the suspected source area and the capture zone for the City of Jefferson well field). Golder collected groundwater samples from these wells and MW-65 in November 2015 and July 2016.

   Golder evaluated the 2015 and 2016 groundwater results and concluded the following:

   - The nature and extent of CVOC-impacted groundwater in the yellow-brown till has been appropriately delineated. CVOC concentrations in the downgradient wells installed in the yellow-brown till (MW-64 and MW-66) are less than 5 micrograms per liter (ug/l – MCL level).
   - The Pleistocene Sand and Gravel Unit has not been impacted by Site-related CVOCs (i.e., no CVOCs detected in the MW-67 groundwater samples).
   - TCE concentrations detected in the groundwater samples collected from MW-65 appear to have stabilized based upon the current data set.

   In addition to the groundwater monitoring event in July 2016, Golder completed a visual well inventory of properties located within approximately 0.3 miles of the Site to assess potential groundwater receptors (see Appendix A). Golder did not observe any private wells within the search radius, which confirmed Golder's desktop review of the Iowa Geological Survey's GeoSam database water well records.

3.0 SUMMARY OF ASSESSMENT METHODOLOGIES

Assessment activities were completed in accordance with field procedures described in the Work Plans (Golder, 2012, 2012b) to maintain consistency throughout the assessment field program. Golder subcontracted Matrix Environmental, LLC of Osseo, Minnesota (Matrix) to perform the MIP/LIF surveys, advance confirmatory soil borings, and install monitoring wells using DPT methods. Golder subcontracted Boart-Longyear (now Cascade) to install multi-cased wells using a combination of rotary auger and roto-sonic drilling methods. JEO Consulting Group, Inc. of Carroll, Iowa (JEO), a State-certified surveyor, provided Golder surveying services.

The following sections describe the methods used to complete the assessment activities.

3.1 MIP Assessment

Golder used the MIP to help delineate the extent of VOC impacts in the oxidized and unoxidized tills (i.e., upper 30 feet). The MIP detects the presence of total VOCs in the vapor, sorbed, and dissolved phases. The permeable membrane, which is located on the side of the probe, is a thin film polymer impregnated into a stainless steel screen for support. The membrane is heated to approximately 100 to 120 degrees Celsius to accelerate the volatilization of any VOCs near the probe. A clean carrier gas is continuously swept behind the membrane, which creates a concentration gradient, thereby causing the volatilized VOCs to diffuse across the membrane into the carrier gas. The carrier gas then flows to separate gas detectors located at the surface, including a photo-ionization detector (PID), a halogen specific detector (XSD), and flame ionization detector (FID).

The PID is most effective at detecting aromatic hydrocarbons such as benzene, toluene, ethylbenzene, and xylene (BTEX compounds). The XSD is most effective at detecting chlorinated compounds such as Tetrachloroethene (PCE) and TCE. The FID is most effective at detecting aromatic hydrocarbons beyond the typical ranges of the PID. Information from the detectors is logged in real-time as the probe is advanced into the subsurface, thereby producing a continuous log of VOC concentration with depth.

The detectors do not provide a quantitative concentration of VOCs in the groundwater or soil and requires the collection of samples to confirm the VOC concentrations in soil and groundwater. However, the response level from the detector generally corresponds to the amount of VOCs present in the carrier gas, which is proportional to the amount of VOCs in the soil or groundwater at the MIP location. The MIP equipment is a proven technology for delineating source area soils and groundwater and can detect CVOCs down to approximately 500 parts per billion.

The MIP also includes a soil electrical conductivity (EC) probe, which can assist in identifying changes in soil type. By advancing the MIP and EC at the same time, a detailed profile of subsurface lithology can be correlated with detections of VOCs.

Golder checked the MIP response to known groundwater concentrations (low to high VOC concentrations in groundwater) detected in several monitoring wells (i.e., MW-16, MW-19, and MW-21) to confirm that MIP was appropriate to detect VOCs on Site. The MIP responses were favorable and Matrix advanced a series of probe transects adjacent to the former Site building parallel and perpendicular to groundwater flow centered near MW-19 (i.e., highest groundwater VOC detections). Probes were also advanced at or adjacent to areas of interest such as known or suspected former solvent storage and use areas. The advancement depth of the MIP/EC points were based on the relative MIP response at each probe location. Golder evaluated the MIP/EC data daily and modified the probe locations and depths based on the findings.

Golder performed the MIP/EC investigation in general accordance with American Society for Testing and Materials (ASTM) *Standard Practice for Direct Push Technology for Volatile Contaminant Logging with the Membrane Interface Probe (MIP)–D7532-07*. Matrix advanced 77 MIP probes at the locations shown in Figure 4. The MIP logs, data tables, and associated figures are provided in Appendix B.

Golder used the MIP data to provide qualitative results of the VOC extent in the subsurface. Golder confirmed the MIP findings by installing monitoring wells to delineate the extent of the groundwater impacts.

3.2 LIF Assessment

Golder used the **UVOST™** survey to help delineate the extent of NAPL in the oxidized and unoxidized tills (i.e., upper 30 feet). LIF technology detects the presence of NAPL in the subsurface. The chemical sensor consists of a laser that fires short pulses of light into an optical fiber that runs through the probe. As the laser pulses pass into the soil through the probe window, NAPL responds by giving off a characteristic "glow." This emitted light is carried back to the surface over a second optical fiber, and its relative strength measured with a detector. The optical screening method provides a nearly continuous profile of NAPL distribution as the probe is advanced into the subsurface. LIF is a qualitative technology and requires the collection of soil samples to confirm the presence and type of NAPL in the subsurface.

Golder performed the LIF survey to assess the potential presence of NAPL along the southern edge of the building and beneath the Site building near former sumps, trenches, and petroleum storage locations. The LIF assessment was initiated with three probes (LIF-1, 2, and 3) in the area of MW-21, MW-21A, and MW-22 (see Figure 3) in known areas of NAPL to confirm LIF was capable of identifying petroleum impacts/NAPL in this area of the Site. LIF method was able to detect NAPL and was used to delineate the extent of NAPL throughout the Site. Golder evaluated the LIF data daily and modified the probe locations and depths as appropriate based on the findings. Matrix advanced 84 LIF probes at the locations shown in Figure 5. The LIF logs and figures are provided in Appendix C.

The driller immediately grouted the MIP and LIF boreholes with a cement-bentonite slurry using a tremie pipe following completion of each probe. Probe locations within the footprint of the concrete slab floor were also patched with concrete.

Golder used the LIF data to provide qualitative results of the NAPL extent in the subsurface. Figure 6 illustrates the general LIF response. Golder confirmed the LIF findings by collecting soil samples and installing monitoring wells to delineate the extent of the soil and groundwater impacts.

3.3 Soil Borings

3.3.1 Direct Push Technology Rig

Shallow soil borings (i.e., <30 ft bgs) were primarily advanced using a track-mounted Geoprobe® Direct Push Technology (DPT) rig, which pushes and pneumatically hammers a soil boring to the target depth. The driller collected continuous five-foot long soil samples from the ground surface (or approximate base of the asphalt or concrete pavement) to the bottom of the boring using a Geoprobe® steel macro-core sampler with dedicated inner polyethylene sleeves. After removal of the macro-core sampler from the ground, the driller extracted the dedicated inner polyethylene sleeve with the soil core from the steel sampler and cut the polyethylene tube lengthwise to expose the soil core for logging and collection of field screening and/or laboratory samples.

Field personnel screened the soil samples for the presence of VOCs using a Photovac MiniRae 2000 organic vapor analyzer (OVA) or equivalent equipped with a photoionization detector (PID). Subsequent to the soil OVA screening results, Golder field personnel collected soil samples for laboratory analyses at the interval with the highest OVA reading, from the interval with visual or olfactory indication of a release, and/or from the interval identified by the MIP/LIF assessment as having impacted soil. Soil boring logs are provided in Appendix D.

3.3.2 Roto-Sonic Drill Rig

Cascade used a roto-sonic drill rig to advance soil borings underlying the oxidized/unoxidized till units (i.e., below 30 ft bgs). The driller collected continuous soil samples from the ground surface (or approximate base of the asphalt or concrete pavement) to the bottom of the boring using a roto-sonic soil sampler. After removal of the roto-sonic sampler from the ground, the driller extruded the recovered sample core into a dedicated plastic sleeve for logging and collection of field screening and/or laboratory samples. Soil samples were screened using the PID as described above. Subsequent to the soil OVA screening results, Golder field personnel collected soil samples for laboratory analyses at the interval with the highest OVA reading or from the interval with visual or olfactory indication of a release. Soil boring logs are provided in Appendix D. Cuttings generated during the drilling activities were placed in 55-gallon drums for characterization and off-site disposal.

3.4 Soil Sampling

Golder collected soil samples based on the objective for each assessment phase and submitted the soil samples to TestAmerica in Cedar Falls, Iowa for analysis. Soil samples were analyzed for one or more of the following parameters:

- VOCs using EPA Method 8260B
- Total extractable hydrocarbons (TEH) using Iowa Method OA-2
- Total Petroleum Hydrocarbons (TPH) gasoline using Iowa Method OA-1
- Oil and grease using EPA Method 1664A or Method SW 9071 A
- Resource Conservation and Recovery Act (RCRA) eight metals (i.e., arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver) using various methods
- Polychlorinated biphenyls (PCBs) using EPA Method 8082

Golder submitted four soil samples to Alpha Analytical Inc. of Mansfield, Massachusetts (Alpha) to perform Parafinic, Isoparafinic, Aromatic, Naphthenic, Olefinic (PIANO) and Petroleum Hydrocarbon Identification analysis of the NAPL detected on Site (near LIF-1, LIF-3, LIF-8 and LIF-12 – see Figure 5). The soil analytical data are provided in Appendix E. The soil analytical results are provided in Table 1.

Golder collected a total of 22 representative soil samples from the oxidized till, unoxidized till, yellow-brown till, and underlying dark gray till for geotechnical analysis. Golder submitted the soil samples to Golder's geotechnical laboratory in Atlanta, Georgia for analysis. The laboratory analyzed the soils for grain size (ASTM D422) to define the gradation of the soil sample and Atterberg Limits (ASTM D4318) to define the plasticity of the soil sample (i.e., ML, MH, CL, CH). Golder used the laboratory Unified Soil Classification System (USCS) soil descriptions as a guide to classify Site soils on the boring logs. The geotechnical analytical reports are provided in Appendix F.

3.5 Monitoring Well Installation

Golder installed 75 monitoring wells to delineate the horizontal and vertical extent of petroleum and VOC-impacted groundwater at the locations shown in Figure 3. The well construction details are provided in Table 2 and the boring logs are provided in Appendix D. The groundwater monitoring well installation program included:

- Installation of 58 1.5-inch diameter, polyvinyl chloride (PVC) monitoring wells (MW-1 through MW-42, MW-43S, MW-43I, MW-44, MW-47S through MW-55S) using a DPT drill rig. The monitoring wells were constructed using five to ten feet of pre-packed well screen and approximately two to 25 feet of riser. The driller placed sand in the annulus space to approximately two feet above the well screen and then completed the monitoring well by placing bentonite chips to the ground surface. Matrix completed the wells with either a flush-mount protective cover or a stickup protective casing.
- Installation of two monitoring wells (MW-56S and MW-60) using roto-sonic drilling techniques. The wells were installed in the oxidized/unoxidized tills with a two-inch diameter PVC well with five feet of 0.01-inch slotted screen. The driller placed sand in the

annulus space to approximately two feet above the well screen and then completed the monitoring well by placing an approximate two-foot thick bentonite seal and then grout to the ground surface. Matrix completed the wells with a stickup protective casing.

- Installation of 12 double-cased monitoring wells and two modified double-cased monitoring wells using roto-sonic drilling techniques. The double-cased monitoring wells were installed as follows:
  - Double-cased wells (MW-43D, MW-45, MW-56D, MW-57, MW-58, MW-59, MW-61 through MW-64, MW-66, and MW-67): The driller advanced a 10-inch diameter borehole to an approximate depth of 29 to 32 ft bgs and installed a 6-inch steel casing keyed approximately two feet into the yellow-brown till (MW-67 six-inch casing installed to a depth of 80 ft bgs). The annulus between the borehole and casing was filled with a cement-bentonite grout. The driller allowed the grout to set before drilling within the six-inch steel casing and installing a two-inch diameter PVC well with 5 to 10 feet of 0.01-inch slotted screen. Matrix completed the wells with a stickup protective casing or flush-mount cover (see Table 2).
  - Modified double-cased wells (MW-46 and MW-47D): The driller advanced a 12-inch diameter borehole to an approximate depth of 22 ft bgs and set a temporary 12-inch casing. The driller then advanced a 10-inch diameter borehole within the 12-inch temporary casing to an approximate depth of 32 to 33 ft bgs (keyed approximately two-feet into the yellow-brown till) and set a six-inch steel casing. The driller removed the 10 and 12-inch diameter casings while grouting the six-inch permanent casing in place. The grout was allowed to set before drilling through the steel casing and installing a two-inch diameter PVC well with five feet of 0.01-inch slotted screen. Matrix completed the wells with flush-mount protective covers (see Table 2).
- Installation of one triple-cased monitoring well (MW-65) screened in the dark gray till at the location shown in Figure 3. The driller advanced a 17.25-inch diameter borehole using a rotary auger drill rig to an approximate depth of 29 ft. bgs and installed a 12-inch diameter steel casing (i.e., keyed into the unoxidized gray till). The annulus between the borehole and casing was filled with a cement-bentonite grout. The driller allowed the grout to set for a minimum of 48-hours before drilling within the steel casing with a ten-inch diameter borehole using roto-sonic drilling methods to an approximate depth of 61 ft. bgs and installed a 6-inch steel casing (i.e., keyed approximately 12 feet into the dark gray till). The driller allowed the grout to set a minimum of 24-hours before drilling within the 6-inch steel casing and installing a 2-inch diameter PVC well with 5 feet of 0.01-inch slotted screen in the dark gray till to an approximate depth of 73 ft. bgs. This well was completed with a flush-mount well cover.

3.6 Water Level Monitoring and Hydraulic Conductivity Testing

Prior to collecting groundwater samples during each monitoring event, Golder measured water levels in all or a subset of the monitoring wells. Golder calculated water elevations by subtracting the measured depth to groundwater from the surveyed top-of-casing elevations. Table 3 provides the water elevation data.

Golder performed hydraulic conductivity testing (slug testing) in 18 monitoring wells in accordance with the Work Plan (Golder, 2012). Due to slow recharge, Golder was able to perform manual rising-head slug tests (i.e., using a hand-held water level meter and stopwatch) in nine of the 18 monitoring wells. Golder field personnel used a pressure transducer and data logger to obtain slug test data from the other nine monitoring wells that had quicker recharge rates. Golder used Hvorslev and Bower, and Rice Methods to calculate the hydraulic conductivity values in accordance with SOP-11 of the Work Plan (Golder, 2012).

The slug test results are provided in Table 4 and slug test measurement data and calculations are provided in Appendix G.

3.7 Groundwater Sampling

Golder collected 191 groundwater samples and 21 quality control samples during the assessment activities in accordance with the Work Plan (Golder, 2012). Depending on the objective of the assessment phase, groundwater samples were analyzed for one or more of the following parameters:

- VOCs using EPA Method 8260C
- TEH using Iowa Method OA-2
- 1,4-Dioxane using EPA Method 8260B SIM
- PCBs using EPA Method 8082
- Extractable Petroleum Hydrocarbons/Volatile Petroleum Hydrocarbons (EPH/VPH) using the Massachusetts Department of Environmental Protection (MassDEP) – Volatile Petroleum Hydrocarbons (GC) Method
- MNA parameters including:
  - Nitrate using Method SM 4500 NO3 E
  - Nitrogen as Nitrite using Method SM 4500 NO2 B
  - Total Organic Carbon using EPA Method 9060A
  - Sulfate using EPA Method 9056A
  - Iron using EPA Method 6010C
  - Manganese using EPA Method 6010C
  - Chloride using EPA Method 9056A
  - Methane, Ethane and Ethene using AM20GAX

The groundwater collection forms and groundwater analytical data are provided in Appendix H and Appendix I, respectively. The groundwater analytical data are summarized in Table 5.

3.7.1 Light, Non-Aqueous Phase Liquid Sampling

Golder observed NAPL in monitoring well MW-21 during the April 2012 assessment and in monitoring wells MW-21 and MW-35 at approximate thicknesses of 0.21 feet and 0.09 feet, respectively during the November/December 2012 assessment. Golder collected an NAPL sample from each well for submittal to TestAmerica for analysis of VOCs using EPA Method 8260C and TEH using Iowa Method OA-2. In addition to the two NAPL samples, Golder collected groundwater samples at locations with possible petroleum-impacts for submittal to TestAmerica for analysis of VOCs using EPA Method 8260C, TEH using Iowa Method OA-2 and EPH/VPH using MassDEP methods. EPH/VPH is an EPA-approved method for assessing petroleum compounds in soil and groundwater, which has not been adopted by IDNR. The analytical laboratory reports are provided in Appendix I. The EPH/VPH groundwater analytical results are provided in Table 6.

4.0 ASSESSMENT RESULTS

The following sections present an interpretation of the geology, hydrogeology and groundwater quality based on the assessment activities.

4.1 Geology

4.1.1 Regional Geology

According to Bedrock Geology of South-Central Iowa (Pope, 2002), bedrock underlying the Site belongs to the Cherokee Group comprising lower Middle-Pennsylvanian deposits of shale, sandstone, coal, and mudstone. These materials were deposited in various environments that resulted from glacial-eustatic rise and fall of sea level (Heckel, 1994). During personal communication with Mr. Bob McKay, of the Iowa Geological Survey, he stated that depth to bedrock is approximately 200 feet near the Site.

The City of Jefferson 2010 Consumer Confidence Report (CCR) on Water Quality indicates that Pleistocene alluvial sands and gravel overlie bedrock in the Jefferson area. Boring logs for wells advanced near Jefferson obtained from the Iowa Geological Survey on-line website, indicate that approximately 100 feet of glacial till overlies the Pleistocene sand and gravel unit. The CCR identified, “the Pleistocene aquifer was determined to be not susceptible to contamination because the characteristics of the aquifer and overlying materials prevent easy access of contaminants to the aquifer.”

According to the U.S. Department of Agriculture on-line soil survey for Greene County (USDA, 2009), the surficial soils on the former manufacturing area of the Site include the Clarion Loam (Map ID 138B2) and the Canisteo Clay Loam (Map ID 507). These glacial deposits include silts and clayey loams to a depth of at least five feet below ground surface.

4.1.2 Site Geology

Golder observed the advancement of 77 soil borings (75 monitoring wells) and collection of 22 soil samples for geotechnical analysis to characterize the geology underlying the Site. In addition to the soil boring data, Golder reviewed the Jefferson Groundwater Investigation, Greene County, Iowa, - Iowa Geological and Water Survey Technical Information Series 56 (IDNR, 2013) to assess Site geology.

Golder has identified five till units and the Pleistocene Sand and Gravel Unit based on lithologic observations and grain size analysis. These units (shallow to deep) include the following:

- Oxidized brown till: from ground surface to approximately 13 to 17 ft. bgs - an oxidized, soft to stiff, mottled, brown to yellowish brown (10 YR 5/4) Silty Clay and fine to coarse Sand (CL), herein referred to as the “oxidized brown till”.

  Golder observed intermittent thin (i.e., 0.25- to 1-inch thick) sand seams within the silty clay at several locations. The moisture content of the silty clay varied with density (i.e., the softer the silty clay the higher the water content). Golder identified fill materials with a

greater sand content near the southwest corner of the former manufacturing building near monitoring wells MW-22 and MW-23 (see Figure 3).

Golder also observed potential fill near SB-04 (southwestern corner of the facility building) from approximately 0 to 17 ft. bgs. SB-04 is located in an area of the former Building 1 where multiple concrete-lined sub-slab pits were present (see Golder, 2013).

- Unoxidized gray till: from the base of the oxidized brown till to approximately 29 to 33 ft. bgs - an unoxidized, firm to stiff, gray to dark gray (N4), Silty Clay and fine to coarse Sand, with trace fine to coarse gravel (CL), hereafter referred to as the "unoxidized gray till". The unoxidized gray till is generally more plastic, has a greater clay content and has less coarse-grained material than the overlying oxidized brown till. Assessment results indicate that the grain size contrast between the oxidized brown till and unoxidized gray till reduces the potential for vertical migration of identified VOC and petroleum hydrocarbon constituents.
- Yellow-brown till: from approximately 29 to 33 ft. bgs to 42 to 49 ft. bgs – a loose to firm yellow-brown (10yr 6/2) fine to coarse Sand to Silt, trace fine to coarse gravel, moist to wet (SM to ML), hereafter referred to as "yellow-brown till". The grain size of the yellow-brown till varies vertically across the facility. Golder observed a dry, hard, pale yellowish brown (10yr 6/2), sandy (fine to coarse) Silty Clay, trace fine to coarse gravel (CL) layer near MW-47D underlying the unoxidized gray till. This silty clay layer was not observed in other areas of the Site. The yellow-brown till grain size also varies horizontally across the Site.
- Dark gray till: from approximately 42 to 49 ft. bgs to approximately 89 ft. bgs – a dense olive brown to gray to dark gray to black Silty Clay (CL) to Silt/Clayey Silt (ML), moist to dry, hereafter referred to as "dark gray till". The dark gray till appears to be dry and was more dense (i.e., typically very stiff to hard) than the overlying yellow-brown till. The silty clay (CL) soils observed in soil borings MW-62, MW-63, and MW-65 located on the central and southern side of the manufacturing facility were finer-grained and thicker than the silty soils (ML) observed in soil boring MW-61 advanced to the north of the former facility building. In the southwest portion of the Site, the stiff silty clays with trace to some sand and gravel were observed at a depth up to 89 ft bgs in soil boring MW-67.
- Pleistocene Sand and Gravel Unit: from approximately 89 to 97 ft bgs – a loose, wet, light brown fine to coarse sand with trace gravel (SP/SW) was observed in soil boring MW-67. This unit predominately consists of a medium sand with lesser amounts of fine and coarse sand and trace gravel that coarsened with depth. Fine sand lenses were present at 90 ft bgs and gravel was present at the base of the unit at 97 ft bgs. The observed thickness of the Pleistocene Sand and Gravel Unit at MW-67 is consistent with the Jefferson Groundwater Investigation (IDNR, 2013).
- Lower dark gray till: Below the Pleistocene Sand and Gravel, from 97 ft bgs to 105 ft bgs (end of boring), very stiff silty clay with some sand was observed in the soil boring MW-67.

A generalized geologic profile for the Site is provided in Figure 7. Boring logs are provided in Appendix D.

4.2 Hydrogeology

4.2.1 Regional Hydrogeology

As described in Section 4.1.2, the Jefferson area is underlain by approximately 90 to 100 feet or more of a predominately fine-grained glacial till that is not suitable as a potable water source due to low water yields. The low-permeability till serves as an aquitard that confines the underlying Pleistocene Sand and Gravel Unit. According to the Jefferson Groundwater Investigation, Greene County, Iowa, - Iowa Geological and Water Survey Technical Information Series 56 (IDNR, 2013), the City of Jefferson obtains its potable water

supply from two well fields screened in the Pleistocene Sand and Gravel Unit, which can produce 50 to 500 gallons per minute. Pleistocene Sand and Gravel hydraulic conductivity values, calculated from two pumping tests from wells located in Jefferson, ranged from 183 to 293 ft/day (mean of 240 ft/day or 8.5E-02 cm/sec; IDNR, 2013). The IDNR study indicates that the Site is located just beyond the 10-year capture zone (near the southwest corner of the Site) for the well field located within the Jefferson City limits (Wells 2, 4, 6, and 9 located approximately 4,200 southwest of the Site). The capture zone for the second Jefferson well field (Wells 7 and 8), located approximately 5,700 feet northwest of the Site, does not extend towards the Site. In addition, the study indicates that the Site is located on the westernmost edge of the Pleistocene Sand and Gravel Unit and appears to be 10 feet thick or less underlying the Site. According to the IDNR study, the Pleistocene Sand and Gravel Unit does not extend to the west of the Site but thickens to the east and south of the Site.

According to the Iowa Geological Survey, there are no potable water wells located within 0.75-miles of the Site. Golder did not observe any indication of residential or commercial wells during the drive-by well inventory performed in the surrounding neighborhoods in July 2016 (see Appendix A). Consistent with the lack of well observations, Golder observed blue water line markings (i.e., DigSafe utility locate markings) near several of the residential properties and observed fire hydrants throughout the neighborhoods north, west, and south of the Site (agricultural fields are located east of the Site). The blue water line marking and fire hydrants indicate that the neighboring properties obtain water from the City of Jefferson public water supply. Pictures of the fire hydrants and City of Jefferson wells are provided in Appendix A.

4.2.2 Site Hydrogeology

Golder performed hydraulic conductivity testing (slug tests) in 18 monitoring wells from 2012 through 2015. Hydraulic conductivity test results are summarized in Table 4 and hydraulic conductivity test data and calculations are provided in Appendix G. The following summarizes the average (geometric mean) horizontal hydraulic conductivity value for each lithologic unit:

- Oxidized brown till: 2.06×10^{-6} cm/sec (5.84×10^{-3} ft./day)
- Unoxidized gray till: 2.83×10^{-8} cm/sec (8.02×10^{-5} ft/day)
- Coarse-grained Yellow-brown till: 1.42×10^{-4} cm/sec (4.02×10^{-1} ft./day)
- Fine-grained Yellow-brown till: 4.90×10^{-6} cm/sec (1.39×10^{-2} ft./day)
- Fine-grained unoxidized dark gray till: 4.69×10^{-6} cm/sec (1.33×10^{-2} ft./day)
- Coarse-grained unoxidized dark gray till: 7.68×10^{-5} cm/sec (2.17×10^{-1} ft./day)

The calculated hydraulic conductivity values are generally consistent with Golder's lithologic observations. The finer-grained till material exhibit hydraulic conductivities ranging from approximately 3×10^{-8} cm/sec to 5×10^{-6} cm/sec. The coarser-grained tills and fill and/or reworked material exhibit hydraulic conductivities approximately one to two orders of magnitude higher.

All of the units, except the coarse-grained yellow-brown till and the Pleistocene Sand and Gravel are best characterized as aquitards. Many of the wells screened in the units are very slow to recover after purging and are typified by low horizontal hydraulic conductivity values. The rate and volume of groundwater flow in these units is very low and consistent with the observed limited horizontal migration of Site-related impacts. Vertical flow within and between these units is also expected to be very low. Vertical hydraulic conductivity in these types of materials is usually lower than horizontal hydraulic conductivity values. The findings from the Site assessments are consistent with regional descriptions of the tills as confining units.

The coarse-grained yellow brown till was found to be relatively more permeable than the other, finer-grained tills. Measured hydraulic conductivity values are consistent with the observed lithology. Horizontal groundwater flow in this unit is expected to be higher than the other till units. In addition, unlike the other units, a consistent potentiometric surface can be developed for the yellow-brown as illustrated in Figure 8, which illustrates a general groundwater flow direction towards the south/southeast. Golder calculated a horizontal hydraulic gradient based on the interpreted potentiometric surface at the locations illustrated in Figure 8. Calculated hydraulic gradients ranged from 0.003 ft./ft. to 0.03 ft./ft. and appears to steepen to the southeast.

Golder calculated a seepage flow velocity for the yellow-brown till based on the interpretation of the potentiometric surface presented in Figure 8 and an assumed effective porosity value of 25% (Fetter, 1988). Calculated horizontal seepage flow velocity values range from approximately 6.1×10^{-2} ft./yr. using the lowest calculated hydraulic conductivity and calculated hydraulic gradient to approximately 17 ft./yr. using the highest calculated hydraulic conductivity and calculated hydraulic gradient. The average calculated seepage velocity for the yellow-brown till was approximately 1.8 ft./yr. The seepage flow velocity calculations are provided in Appendix J.

The observed lithology of the Pleistocene Sand and Gravel is consistent with regional descriptions. Although relatively thin in the Site area (less than 10 feet) it is composed of predominantly medium-grained sand and is expected to have a much higher hydraulic conductivity than any of the other units encountered on Site.

4.3 Soil Sampling Results

Golder collected soil samples to confirm the results of the MIP/LIF results and to characterize soil conditions across the Site. Golder compared the detected concentrations to Iowa Department of Natural Resources (IDNR)'s Statewide Soil Standards and Environmental Protection Agency (EPA)'s Regional Screening Level (RSL).

4.3.1 March 2011 Soil Assessment Results

In March 2011, Golder collected 50 soil samples from 15 boring locations for analysis of one or more of the following parameters: VOC, TEH, TPH, RCRA-8 metals, and PCBs. The soil analytical results are provided in Table 1. Key findings from the March 2011 soil assessment included the following:

- No TEH, VOCs, or TPH gasoline constituents were detected in soil samples collected from the soil borings advanced along the southern manufacturing boundary of the Site (MW-10, MW-11, MW-12, MW-13, and MW-14) at concentrations above the laboratory reporting limits.
- Mercury was detected at concentrations just above the laboratory reporting limits in soil samples collected from MW-16, MW-20, MW-21, MW-21A, MW-22, and MW-23. Arsenic, barium, chromium, and lead were detected at concentrations above the laboratory reporting limits at concentrations consistent with background concentrations (i.e., well below the standards).
- TPH as gasoline was detected in soil samples collected from soil borings MW-19, MW-21, MW-21A, and MW-22 at concentrations above the laboratory reporting limits. The highest TPH gasoline concentrations were detected in samples collected from the five to ten foot depth interval. The TPH gasoline concentrations decreased with depth and were non-detect in samples collected below 10 ft bgs with the exception of MW-21 (15.3 mg/kg) at 10-12 ft bgs.
- Oil and grease were detected at concentrations above the laboratory reporting limits in most of the soil samples and detected at the highest concentrations (i.e., above 1,000 mg/kg) in soil samples collected from borings MW-17, MW-21, MW-21A, and MW-23.
- TEH was detected at concentrations above 1,000 mg/kg in soil samples collected from borings MW-17, MW-21, MW-21A, and MW-22. The TEH concentrations decreased with depth to below laboratory reporting limits or one to two orders of magnitude lower than the concentrations reported for the preceding interval.
- Certain CVOCs including TCE and 1,1,1-trichloroethane (TCA) were detected in all the soil borings located adjacent to the south side of the Site building. The highest detected concentrations of TCE and 1,1,1-TCA were located on the southeastern corner of the manufacturing building (i.e., MW-15, MW-16, MW-17, MW-18, and MW-19).
- PCBs were not detected in any of the analyzed soil samples at concentrations above the laboratory reporting limits.

4.3.2 April and May 2012 Confirmation Soil Sampling Results

In April and May 2012, Golder collected 44 soil samples from 17 soil borings to confirm the MIP and LIF results. The laboratory analyzed the soil samples for one or more of the following parameters: VOCs, TEH, oil and grease, metals, SVOCs, PCBs, and for waste characterization. A summary of detected parameters in soil is provided in Table 1 and the laboratory analytical reports are provided in Appendix E. The following summarizes key findings from the April and May 2012 soil assessment by compound class.

4.3.2.1 Total Extractable Hydrocarbons and Oil and Grease

Golder collected 32 TEH and oil and grease samples to assess the horizontal and vertical extent of petroleum impacts observed during the MIP and LIF investigations. Findings include:

- TEH and oil and grease concentrations decrease with depth to concentrations at or near the laboratory reporting limits at an approximate depth of 12 ft bgs at all soil boring locations.
- Soil boring SB-16 was advanced near monitoring well MW-21/MIP-5/LIF-17. The MIP and LIF investigations indicated that NAPL was present to a depth of approximately 12 ft bgs. Golder collected three soil samples at depths ranging from 12 to 26 ft bgs from below the area with the known NAPL impacts. The reported TEH and oil and grease concentrations in the three soil samples collected from SB-16 were at or below the laboratory reporting limits. The analytical data indicates that petroleum impacts do not extend below 12 ft bgs.
- Golder collected five soil samples from SB-13 ranging from just below the concrete slab to 28 ft bgs. SB-13 is located near the northern end of the former concrete and steel-lined trench located on eastern side of Building 1 where petroleum impacts were detected during the MIP and LIF investigations. TEH concentrations of the three samples collected within the NAPL interval (i.e., 0 to 15 ft bgs) ranged from 453 mg/kg to 20,300 mg/kg. Oil and grease concentrations were similar to the TEH concentrations with the highest concentrations from the soil sample collected from 4 to 6 ft bgs. The TEH and oil and grease concentrations decreased with depth and were at or near the laboratory reporting limits in the two deeper soil sampling intervals.
- Golder collected two soil samples from SB-12, which is located in the landscaped area on the eastern side property near Building 2. The MIP and LIF investigations detected NAPL at this location to a depth of 11 ft bgs. The highest TEH and oil and grease concentrations were detected in the 4 to 6 ft bgs interval. The soil samples collected from 10 to 12 ft bgs had only slightly elevated TEH and oil and grease concentrations indicating that the NAPL does not extend beyond 12 ft bgs at this location.
- Golder collected three soil samples from soil boring SB-04, which is located adjacent to former concrete and/or steel-lined pits and trenches in the southwestern corner of the former manufacturing building. NAPL near this location extends to a depth of approximately 19 ft bgs based on the LIF investigation. The highest %RE response (i.e., above 10 %RE) is located in soils above 11 ft bgs. Soil sample collected from 6 to 8 ft bgs had a TEH and oil and grease concentration of 9,830 mg/kg and 8,600 mg/kg, respectively. The intermediate soil sample interval collected from 10 to 12 ft bgs, or near the base of the highest LIF response, had a TEH and oil and grease concentration of 949 mg/kg and 1,300 mg/kg, respectively. The deepest interval, collected from below the NAPL, had TEH and oil and grease concentrations near the laboratory reporting limits. These data indicate that petroleum concentrations decrease with depth and do not extend below 12 ft bgs.
- Soil boring SB-03 was advanced near monitoring well MW-27, MIP-30, and LIF-15 to assess petroleum impacts in this area. The LIF investigation indicated that NAPL was present from approximately 1 to 9 ft bgs. Golder collected four soil samples ranging from 2 to 24 ft bgs. TEH and oil and grease concentrations from the two soil samples collected from within the NAPL interval ranged from 103 mg/kg to 3,810 mg/kg and 150 mg/kg to 8,700 mg/kg, respectively. The two deeper soil sample intervals had TEH and oil and grease concentrations at or below the laboratory reporting limits indicating that petroleum impacts do not extend vertically beyond approximately 12 ft bgs.

4.3.2.2 Volatile and Semi-Volatile Organic Compounds

Golder collected 41 VOC and four SVOC soil samples to assess the horizontal and vertical extent of VOC and SVOC impacts (see Table 1). A summary of the VOC and SVOC results include:

- TCE, the primary CVOC detected, was detected at concentrations above the laboratory reporting limits in 7 of the 41 soil samples analyzed for VOCs. The highest CVOC concentrations were detected in soil samples advanced on the eastern side of the former

manufacturing building including SB-02, SB-10, SB-13, SB-14, and SB-15. CVOCs were not detected in soil samples advanced on the western side of the former manufacturing building. These data are consistent with the results of the MIP survey.

- Soil Boring SB-01, located in Building 2, was advanced near MIP-15, which had elevated MIP responses from the base of the concrete slab to the end of the boring at 33 ft bgs. Golder collected four soil samples to profile the VOC concentrations with depth. The highest TCE concentration was detected in the 15 to 17 ft bgs sample interval. TCE was not detected in the samples collected from the two shallower intervals (2 to 4 ft bgs and 7 to 9 ft bgs) or the deeper interval (31 to 33 ft bgs). Cis-1,2-DCE was detected in the three shallower sample intervals. The presence of cis-1,2-DCE indicates that dechlorination of the TCE is occurring on Site. The laboratory did not detect any VOCs at concentrations above the laboratory reporting limits in the deep soil sample interval or any other VOCs (besides TCE and cis-1,2-DCE) in the shallower sample intervals. These soil data confirm that VOC impacts in soil attenuate before reaching the deeper portion of the unoxidized till.
- Soil Boring SB-02 was advanced on the eastern side of the eastern concrete and steel-lined trench to assess VOC and petroleum-impacted soils and groundwater. Golder collected two soil samples to assess the peak MIP response interval from 14 to 16 ft bgs and from a deeper interval (28 to 30 ft bgs) where the MIP responses were close to background levels. The 14 to 16 ft bgs sample interval had the highest total VOC concentrations of any soil sample, which included a combination of TCE, cis-1,2-DCE, and vinyl chloride. SB-02 (MIP-34) 14-16 was the only soil sample to have a detection of vinyl chloride above the laboratory reporting limit. The presence of cis-1,2-DCE and vinyl chloride indicate that dechlorination of TCE is occurring on Site. The laboratory did not detect any VOCs in the deeper soil sample interval.
- Soil boring SB-03 was advanced in the southwestern corner of the former manufacturing building to assess petroleum impacts and confirm the absence of CVOCs. Golder collected four soil samples from this soil boring. 1,2,4-trimethylbenzene was the only constituent detected in the shallow soil interval (2 to 4 ft bgs) at a concentration above the laboratory reporting limit. The next sample (6 to 8 ft bgs) corresponds with the depth of the highest FID and LIF responses. The 6 to 8 ft bgs sample had an elevated total VOC concentration comprised primarily of 1,2,4-trimethylbenze and 1,3,5-trimethylbezne. Eight other petroleum-related compounds were also detected at concentrations above the laboratory reporting limits. VOCs were not detected in the two deeper sample intervals at concentrations above the laboratory reporting limits and no CVOCs were detected in any of the four soil samples collected from SB-03. The soil samples confirm that CVOCs are not present on the western portion of the Site and that petroleum impacts are confined to depths of less than 16 ft bgs.
- CVOCs were not detected in the soil samples collected from SB-04, SB-05, SB-06, SB-08, SB-16, and SB-17 at concentrations above the laboratory reporting limits. These borings, with the exception of SB-17, are all located on the western side of the former manufacturing building.
- SB-10 (MIP-12) was advanced along the eastern wall of the former manufacturing building to delineate the vertical extent of CVOCs in soil near the concrete and steel-lined trench located on the eastern side of Building 1. The laboratory did not detect any VOCs at a concentration above the laboratory reporting limits in the shallow sample (5 to 7 ft bgs) collected across an interval with an elevated MIP FID peak. Soil sample 16 to 18 ft bgs, collected from an area with elevated MIP XSD response, had a TCE concentration above the RSL. No other VOCs were detected in these samples. The extent of CVOC impact in the area is anticipated to decrease with depth as documented in other borings on Site (e.g., SB-13).
- Soil boring SB-15 was advanced adjacent to MW-19, which had elevated CVOC impacts in soil and groundwater as documented in the 2011 assessment activities (Golder, 2011)

and from the MIP investigation. Golder collected two soil samples from SB-15 including one soil sample (13 to 15 ft bgs) from the interval with the highest MIP XSD response and one soil sample (19 to 21 ft bgs) from an interval with decreasing MIP XSD response (although not at background level). The laboratory detected TCE, TCA, and 1,1-dichloroethene (1,1-DCE) at concentrations above the laboratory reporting limits in the soil sample collected from the 13 to 15 ft bgs interval. 1,1,1-TCA was also detected in the soil sample collected from MW-19 in 2011 and appears to be limited in horizontal extent to the area near MW-19. The deeper soil sample, collected approximately six feet lower than the shallow sample interval, was non-detect for VOCs. Therefore, XSD responses below zones of high XSD response are considered representative of equipment/instrument carry-over and not representative of soil and/or groundwater impacts at depth.

- The only VOCs detected in soil samples SB-12 (4 to 8 ft bgs) and SB-13 (4 to 6 ft bgs) were low levels (near reporting limits) of 1,2,4-trimethylbenzene and sec-butylbenzene (SB-13 only). Both of these soil samples had elevated TEH and oil and grease concentrations. The low number of VOC constituents detected in these samples, the elevated TEH and oil and grease concentrations, and the LIF results indicate that the petroleum is likely a machine or cutting oil and not associated with diesel fuel or gasoline.
- Di-n-octyl phthalate was the only SVOC detected at a concentration above the laboratory reporting limit in the four soil samples analyzed for SVOCs. The lack of SVOCs detected in the soil samples confirms that the diesel fuel, kerosene, and motor oils used as LIF and TEH laboratory standards are not a match for petroleum impacts observed on Site.

4.3.2.3 Polychlorinated Biphenyls

Golder collected four soil samples for PCB analysis. All four soil samples were collected from intervals with NAPL. Consistent with the previous 10 soil samples analyzed for PCBs (Golder, 2011), PCBs were not detected at concentrations above the laboratory reporting limits in any of the 2012 soil samples. Based on these result, Golder concluded that PCBs are not Site-related compounds of concern.

4.3.2.4 Metals

Golder collected 15 soil samples for analysis of metals including arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver from areas with elevated petroleum impacts as presented in Table 1. During previous soil sampling activities (Golder, 2011), Golder submitted 50 soil samples for metals analysis and the laboratory detected arsenic, barium, chromium, and lead at concentrations above the laboratory reporting limits but at concentrations consistent with area background concentrations. The 2012 metals soil sampling data are similar to the 2011 results. Based on these results. Golder concluded that although metals were detected at concentrations above the laboratory reporting limits, the reported concentrations are within area background levels and that metals do not represent Site-related compounds of concern.

4.3.3 November 2012 Soil Assessment Results

During the November 2012 assessment, Golder collected soil samples from the yellow-brown till from three soil borings (MW-43D, MW-46, and MW-47D) for VOC analysis and four soil samples for petroleum fingerprint analysis from areas with known NAPL impacts. Analytical results for the yellow-brown till are

summarized in Table 1 and the laboratory analytical reports are provided in Appendix E. The following summarizes key findings of the November 2012 soil assessment.

4.3.3.1 Volatile Organic Compounds

Golder collected six soil samples from the yellow-brown till (two per boring) for VOC analysis from the intervals with the highest PID readings (see boring logs in Appendix D). TCE, the only VOC detected in the yellow-brown till soil samples at concentrations above the laboratory reporting limits, was detected in three of the six soil samples. No VOCs were detected in the two soil samples collected from MW-43D. Comparison of the detected TCE concentrations to IDNR's Statewide Soil Standards and USEPA's RSLs indicated that the TCE detection in MW-46 and one of the two detections in MW-47D are below USEPA's TCE RSL for Industrial Soils of 6,400 ug/kg. The detected concentration of TCE in the deeper soil sample collected from MW-47D is equal to USEPA's TCE RSL for Industrial Soils.

The soil analytical results for samples collected from borings MW-46 and MW-47D indicate that TCE impacts extend into the yellow-brown till in areas of the highest TCE groundwater impact.

4.3.3.2 Petroleum Fingerprint Analysis

Golder submitted four soil samples from areas with known NAPL impacts (LIF-01, LIF-03, LIF-08, and LIF-12) to Alpha Analytical for fingerprint analyses as described in Section 3.4. The analytical data confirms the LIF waveform results that the petroleum observed at the facility is not gasoline or diesel fuel. The composition of the petroleum is consistent with lubricating or machining oils that do not contain the type of lower molecular weight aromatic hydrocarbons (e.g., benzene, toluene, ethylbenzene, polycyclic aromatic hydrocarbons, and C2-alkylbenzenes) that typically pose an environmental or human health risk. These results are similar to the soil analytical results from the April 2012 assessment. Fingerprint analysis of NAPL-impacted soils indicates that the oils have undergone significant weathering and degradation.

4.4 Groundwater Sampling Results

Groundwater analytical results are summarized in Tables 5 through 7 and the laboratory analytical reports are provided in Appendix I. Golder used USEPA MCLs and/or IDNR statewide groundwater standards to provide a frame-of-reference for data evaluation.

The most frequently detected compounds above USEPA's MCLs are TCE and its associated degradation product, cis-1,2-DCE. Other compounds detected above USEPA MCLs include PCE, vinyl chloride, 1,1-dichloroethene, trans-1,2-dichloroethene, and TCA. VOCs detected less frequently and/or at lower concentrations include additional breakdown products of TCE and TCA and 1,4-dioxane, a solvent stabilizer.

The distribution of VOCs in groundwater is illustrated in the following figures:

- Figure 9: TCE in the upper tills (i.e., oxidized brown and unoxidized gray tills), respectively
- Figure 10: cis-1,2-DCE in the upper tills
- Figure 11: 1,4-dioxane in the upper tills
- Figure 12: TCE in the yellow-brown till
- Figures 13 and 14: cross-sectional views of TCE
- Figure 15: TEH in the upper tills

Key findings include the following:

- The highest TCE concentrations in groundwater occur in the upper tills in the area around the former concrete steel-lined trench on the eastern portion of former Building 1 and just to the south of this area outside of the former building (see Figure 9). Detected concentrations attenuate rapidly horizontally downgradient of this area and generally reach non-detect levels along the southern facility boundary. TCE has not been detected above the MCL of 5 ug/L in samples from wells screened in the upper tills located along the facility boundary line.
- The horizontal distribution of cis-1,2-DCE impacted groundwater (see Figure 10) is similar to TCE except that it extends further to the west beneath former Building 1. At many sample locations (e.g., MW-25S, MW-28, MW-31, and MW-53) the concentration of cis-1,2-DCE is two or more times greater than the concentration of parent compound, TCE. This indicates that significant natural degradation of TCE is occurring within Site groundwater. The larger areal extent of cis-1,2-DCE suggests that some areas formerly impacted by TCE may have fully degraded to cis-1,2-DCE.
- The laboratory detected 1,4-dioxane in three (MW-25S, MW-28, and MW-53) of the 18 groundwater samples collected during the October 2013 sampling event. Detected concentrations ranged from 144 ug/L to 618 ug/L (see Figure 11). Laboratory reporting limits for 1,4-dioxane varied by sample depending on the concentration of other compounds (e.g., elevated TCE concentrations resulted in higher 1,4-dioxane reporting limits). EPA does not have an MCL for 1,4-dioxane. However, IDNR has 1,4-dioxane Statewide Standards for a Protected and Non-Protected Groundwater Source of 200 ug/L and 1,000 ug/L, respectively. The till units at the Site meet IDNR's definition of a Non-Protected Groundwater Source. All detected 1,4-dioxane concentrations and reporting limits for non-detect samples are below the Non-protected Groundwater Source Standard.
- TCE extends into the yellow-brown till beneath the area of highest TCE impact (see Figures 12 and 13). The downgradient extent of TCE impacts in the yellow-brown till extends to MW-64 and MW-66, a well pair screened in the yellow-brown till located south of the facility, but still on the Electrolux property. TCE in the groundwater samples collected from MW-64 decreased from 196 ug/l in October 2013 to non-detect in July and October 2014 (see Table 5). TCE concentrations in samples collected from MW-66 (screened below MW-64 in the yellow-brown till) ranged from 3.94 ug/l to 6.38 ug/l in November 2015 and July 2016, respectively. These data indicate that VOC concentrations attenuate downgradient and do not extend beyond the Electrolux property line located approximately 250 feet further downgradient of MW-64/MW-66 (see Figure 12).
- Except for one detection of TCE (1.1 ug/L) in a sample collected from MW-62, no Site-related VOCs have been detected at concentrations above the laboratory reporting limits in groundwater samples collected from monitoring wells MW-62 and MW-63 screened in the dark gray till.

- TCE concentrations in samples collected from monitoring well MW-65 (screened in the dark gray till) increased from non-detect in October 2013 to 2,370 ug/l in March, 2015. TCE was detected at a concentration of 2,420 ug/L in July 2016, indicating that TCE concentrations in MW-65 have appeared stabilized. Golder concluded that the initial MW-65 groundwater samples were likely influenced by drilling water used during installation of the well in 2013 and are not representative of groundwater conditions in the grey till or well installation. Golder considers the most recent sampling results (March 2015 and July 2016) to be representative of groundwater conditions in the grey till at this location and depth. Detected concentrations of other VOCs (i.e., cis-1,2-DCE and vinyl chloride) in all samples collected from MW-65 are below their respective MCLs. The stabilized concentration of TCE in MW-65 is an order of magnitude lower than samples collected from MW-47D (screened in the overlying yellow-brown till unit), indicating significant attenuation of VOCs with depth in the gray till beneath the source area (see Figures 13 and 14).
- No Site-related VOCs have been detected at concentrations above the laboratory reporting limit in groundwater samples collected from monitoring well MW-67 screened in the Pleistocene Sand and Gravel unit. Groundwater impacts from the Site do not extend to the Pleistocene Sand and Gravel Unit.
- The horizontal distribution of TEH includes three distinct areas of petroleum impacts as shown in Figure 15. This is consistent with LIF survey (see Figure 6). Based on the LIF survey and EPH/VPH analytical data (see Table 6), the petroleum is associated with a cutting or machining oils.

As indicated above, the presence of cis-1,2-DCE and other TCE degradation products (e.g., vinyl chloride) in groundwater suggests that natural attenuation of VOCs is occurring. From October 2013 to March 2015, Golder submitted groundwater samples for an expanded list of parameters to further confirm that natural degradation of CVOCs is occurring and to identify the conditions and processes responsible for the degradation (see Table 7).

Natural attenuation (commonly used interchangeably with “biodegradation” and the remediating effects of microbes) can generally be defined as the reduction of mass, toxicity, mobility, volume, flux or concentration of contaminants in soil or groundwater without human intervention, occurring by means of a number of physical, chemical and/or biological processes. The dominant attenuating process depends on the particular site conditions and on the interaction of the major contaminants with other co-existent constituents. The biodegradation of chlorinated solvents (such as PCE, TCE and cis-1,2-DCE present on Site) can occur in three ways:

- *The chlorinated hydrocarbon acts as electron acceptor:* In this process, known as reductive dechlorination, chlorine atoms are replaced sequentially with hydrogen atoms so that, for example, PCE degrades to TCE, which degrades further to cis-DCE. Reductive dechlorination is the most important process for the natural biodegradation of the highly chlorinated solvents (Wiedemeier et al., 1999), and occurs under reducing conditions.
- *The chlorinated hydrocarbon acts as electron donor:* Under aerobic and occasionally under ferric iron-reducing conditions, this is the primary mechanism for the biodegradation of the less chlorinated hydrocarbons. The oxidation of 1,2-dichloroethane (1,2-DCA) and VC are examples of less chlorinated solvents acting as electron donors under anaerobic conditions (Wiedemeier et al., 1999).

- *The chlorinated hydrocarbon is degraded fortuitously by an enzyme or co-factor produced during the microbial metabolism of another compound (co-metabolism):* The co-metabolic process is described as slow and incomplete (Gossett & Zinder, 1997), and very limited under natural conditions (Wiedemeier et al., 1999). However, VC has been noted as readily and very efficiently co-metabolized by methane, phenol or toluene oxidizers (McCarty, 1997).

Listed below are the geochemical parameters analyzed during this period and their significance in the natural attenuation evaluation:

- Dissolved oxygen (DO): must be broadly depleted (<0.5 mg/L) to permit reductive dechlorination, which requires anaerobic conditions.
- Oxidation/reduction potential (redox/ORP or Eh): indicates the possibility of reductive pathways and helps identify the terminal electron accepting processes (TEAP). For the biologically mediated transformations that represent the natural attenuation process, the following electron acceptor reactions illustrate the use of the terminal electron acceptor (e.g., oxygen, iron, sulfate) and production of various compounds involved in natural attenuation. For the electron acceptor reaction, the preferred oxidation-reduction potential (eH) is provided below:

  $1/4\ O_2 + H^+ + e^- = 1/2\ H_2O$ (aerobic) (Eh = +820 mV)

  $1/5\ NO_3^- + 6/5\ H^+ + e^- = 1/10\ N_2 + 3/5\ H_2O$ (anoxic) (Eh = +740 mV)

  $1/2\ FeOOH_{(s)} + 1/2\ HCO_3^- + H^+ + ½\ e^- = 1/2\ FeCO_3 + H_2O$ (anaerobic) (Eh = -50 mV)

  $1/8\ SO4^{-2} + 19/16\ H^+ + e^- = 1/16\ H_2S + 1/16\ HS^- + 1/2\ H_2O$ (anaerobic) (Eh = -220 mV)

  $1/8\ CO_2 + H^+ + e^- = 1/8\ CH_4 + 1/24\ H_2O$ (anaerobic) (Eh = -240 mV)
- Dissolved gases (methane, ethane, and ethene): methane is the ultimate daughter byproduct of reductive dechlorination; ethene is the ultimate daughter product of VC following a reductive dechlorination pathway; and ethane is the ultimate daughter product of 1,2-DCA/chloroethane following a reductive pathway.
- Nitrate/Nitrite: TEAP effected by nitrate-reducing bacteria
- Sulfate/Sulfite: TEAP effected by sulfate-reducing bacteria
- Ferric Iron/Ferrous Iron : TEAP effected by iron-reducing bacteria
- Manganese: TEAP effected by manganese-reducing bacteria
- Total organic carbon (TOC): a source of carbon and energy for intrinsic bioremediation

The relative abundance/concentration of each parameter can be compared to literature to further assess what processes are occurring. Table 8 provides a summary of key CVOC concentrations, dissolved gas concentrations, ORP, and DO concentrations in samples collected from upgradient, near source, and downgradient monitoring wells. Key findings from these data include the following:

- Sampling results indicate that DO concentrations in the areas most impacted with TCE in the upper till units are generally below 1 mg/l. DO concentrations in the yellow-brown till are also low, ranging from 0.0 mg/l to 0.58 mg/l. The low dissolved oxygen concentrations in the upper tills and yellow-brown till are conducive to anaerobic biological degradation of the more highly-chlorinated VOCs.
- Low ORP values (i.e., less than 100 mv) indicate that reducing (anaerobic) conditions, conducive to biologically-mediated reductive chlorination exist in groundwater over most of

the facility. In the most impacted areas, ORP values are typically negative, indicating strongly-reducing conditions.

- The laboratory detected dissolved gases (methane, ethane, and ethene) at concentrations above the laboratory reporting limits in all 18 groundwater samples collected in October 2013. The following summarizes the dissolved gases analytical results:
  - Methane concentrations ranged from 0. 3 ug/L (MW-24) to 2,900 ug/L (MW-25S). The highest concentrations of methane were detected in the groundwater samples collected from the upper till (oxidized brown and unoxidized gray) and yellow-brown till in the area of the former eastern steel-lined trench (MW-25S, MW-28, MW-31, MW-46, and MW-47D). The high concentrations of methane indicate a high level of biological reduction activity.
  - Ethene concentrations ranged from 0.026ug/L (MW-53) to 1,600 ug/L (MW-28). The highest concentrations of ethene were detected in the groundwater samples collected from the upper till (oxidized brown and unoxidized gray) and yellow-brown till in the former eastern steel-lined trench area (MW-19, MW-25S, MW-28, and MW-47D. The presence of ethene in groundwater indicates that the chlorinated ethenes (e.g., TCE, 1,2-DCE, vinyl chloride) are completely degrading to non-toxic byproducts.
  - Ethane concentrations ranged from 0.025 ug/L (MW-57) to 4 ug/L (MW-19). The presence of ethane in groundwater indicates that the chlorinated ethanes (e.g., 1,1,1-TCA, chloroethane, and 1,1-dichloroethane) are completely degrading to non-toxic byproducts.
- Nitrate (NO_3^-) and Nitrite (NO_2^-) concentrations were mostly non-detect (<0.1 milligrams per liter (mg/L)). Sulfate concentrations ranged <5 mg/L to 160 mg/L with most results in the 20 mg/l to 80 mg/l range. Iron concentrations were typically less than 1.0 mg/L in the groundwater monitoring wells screened in the upper till and yellow-brown till and near 20 mg/l in the groundwater samples collected from wells screened in the dark gray till. Manganese concentrations were typically less than 1 mg/L with a high of 1.84 mg/L.
- TOC concentrations ranged from 2 to 518 mg/L with most results in the 2 mg/l to 7 mg/l range. These concentrations are moderate to high indicating that sufficient substrate exists to support microbial activity. Additionally, petroleum-impacted soil and groundwater is present near the eastern steel-lined trench, which may provide a nutrient source for microbes to degrade VOCs in the most impacted area.

In summary, the analytical results for DO, ORP, and dissolved gases confirm that significant natural attenuation is occurring. TOC concentrations indicate that sufficient substrate exists to support microbial activity. Petroleum-impacted groundwater also increases TOC and may also support the natural degradation of CVOCs in groundwater by providing a nutrient source for the microbes. The available nitrate/nitrite, sulfate, iron, and manganese analytical results do not identify the specific TEAP supporting the natural attenuation. However, most ORP values range from 50 mV to -212 mV suggesting an iron to sulfate TEAP range.

4.5 Quality Assurance/Quality Control

A discussion of the project Quality Assurance/Quality Control is provided in Appendix K.

5.0 CONCEPTUAL SITE MODEL

Golder developed the Conceptual Site Model using assessment findings from 2011 through 2016, literature review, and information from IDNR databases. Key findings and conclusions include the following:

5.1 Geology/Hydrogeology

Golder has identified five till units and the Pleistocene Sand and Gravel Unit based on lithologic observations and grain size analysis. These units (shallow to deep) include the following:

- Oxidized brown till: from ground surface to approximately 13 to 17 ft. bgs - an oxidized, soft to stiff, mottled, brown to yellowish brown (10 YR 5/4) Silty Clay and fine to coarse Sand (CL).
- Unoxidized gray till: from the base of the oxidized brown till to approximately 29 to 33 ft. bgs - an unoxidized, firm to stiff, gray to dark gray (N4), Silty Clay and fine to coarse Sand, with trace fine to coarse gravel (CL). The unoxidized gray till is generally more plastic, has a greater clay content and has less coarse-grained material than the overlying oxidized brown till. Assessment results indicate that the grain size contrast between the oxidized brown till and unoxidized gray till reduces the potential for vertical migration of identified VOC and petroleum hydrocarbon constituents.
- Yellow-brown till: from approximately 29 to 33 ft. bgs to 42 to 49 ft. bgs – a loose to firm yellow-brown (10yr 6/2) fine to coarse Sand to Silt, trace fine to coarse gravel, moist to wet (SM to ML), hereafter referred to as “yellow-brown till”. The grain size of the yellow-brown till varies vertically across the facility. Golder observed a dry, hard, pale yellowish brown (10yr 6/2), sandy (fine to coarse) Silty Clay, trace fine to coarse gravel (CL) layer near MW-47D underlying the unoxidized gray till. This silty clay layer was not observed in other areas of the Site. The yellow-brown till grain size also varies horizontally across the Site.
- Dark gray till: from approximately 42 to 49 ft. bgs to approximately 89 ft. bgs – a dense olive brown to gray to dark gray to black Silty Clay (CL) to Silt/Clayey Silt (ML), moist to dry. The dark gray till appears to be dry and was more dense (i.e., typically very stiff to hard) than the overlying yellow-brown till.
- Pleistocene Sand and Gravel Unit: from approximately 89 to 97 ft bgs – a loose, wet, light brown fine to coarse sand with trace gravel (SP/SW) was observed in soil boring MW-67. This unit predominately consists of a medium sand with lesser amounts of fine and coarse sand and trace gravel that coarsened with depth. Fine sand lenses were present at 90 ft bgs and gravel was present at the base of the unit at 97 ft bgs.
- Lower dark gray till: Below the Pleistocene Sand and Gravel, from 97 ft bgs to 105 ft bgs (end of boring), very stiff silty clay with some sand.

The Site geology matches the information provide in the IDNR databases and literature review. All of the units, except the coarse-grained yellow-brown till and the Pleistocene Sand and Gravel Unit are best characterized as aquitards. The rate and volume of groundwater flow in the aquitards is low based on hydraulic conductivity values calculated for these units. Vertical hydraulic conductivity in these tills are usually lower than horizontal hydraulic conductivity values. Based on the low well yields, the till units are not suitable as a groundwater resource.

Groundwater flow direction across the Site in the yellow-brown till is towards the south/southeast. Groundwater flow direction in the upper tills is difficult to determine due to the low permeability and

heterogeneous nature of the till units. Hydraulic conductivity in the yellow-brown till coarse-grained materials is typically one to two orders of magnitude higher than the surrounding unoxidized and dark gray tills.

The IDNR GeoSam database indicates that the City of Jefferson uses the Pleistocene Sand and Gravel Unit for potable water. Boring logs indicate that the Pleistocene Sand and Gravel Unit is not present west of the Site. Consequently, the only wells installed west of the Site are three geothermal wells and one petroleum test boring. Golder did not observe any private wells within 0.3 miles of the Site during the well inventory study, which confirms the GeoSam database findings.

The capture zones of the two City of Jefferson municipal well fields screened within the Pleistocene Sand and Gravel Unit as delineated in the Jefferson Groundwater Investigation (IDNR, 2013) do not extend to the Site. The IDNR study indicates that the Site is located just beyond the 10-year capture zone (i.e., near the southwest corner of the Site) for the well field located within the city limits of Jefferson (i.e., approximately 4,200 southwest of the Site). The capture zone of a second Jefferson well field, located approximately 5,700 feet northwest of the Site, did not extend towards the Site.

5.2 Soil Conditions

Golder delineated soil impacts using MIP and/or LIF as screening tools and collecting confirmation soil samples. Shallow soils are primarily impacted by petroleum constituents, which were encountered below the base of the concrete slab floor or approximately two to three ft bgs in landscaped areas. The risk posed by the petroleum-impacted soil is low as analysis of the samples indicates the absence of typical risk-driving VOCs (e.g., benzene, ethylbenzene, toluene, xylene, etc.) and SVOCs (e.g., benzo-a-pyrene, benzo-a-anthracene, anthracene). Fingerprint analysis of NAPL-impacted soils indicates that the oils have undergone significant weathering and degradation.

Golder identified CVOC-impacted soils at depths ranging from approximately one to three feet below the base of the concrete floor slab to approximately five to seven ft bgs in the landscaped areas. In one of the most highly CVOC-impacted groundwater areas near monitoring wells MW-19, CVOCs were detected in MIP-3 at approximately six ft bgs. Based on the depth of the impacted soils, presence of the concrete slab floor, secure perimeter fence, the potential for direct exposure to impacted soils is limited.

Golder did not detect PCBs or metals at concentrations above the laboratory reporting limits and/or soil standards. Therefore, these constituents are no longer a concern on Site.

5.3 Groundwater Conditions

A summary of the groundwater conditions at the Site includes the following:

- TEH-impacted groundwater is present in NAPL areas, but attenuates rapidly both horizontally and vertically. Petroleum-impacted soil may provide a benefit to CVOC degradation by providing a nutrient source for the microbes.
- Groundwater within the oxidized brown and unoxidized gray till aquitard is impacted by CVOCs, primarily TCE and its breakdown products in the area of the former concrete steel-lined trench located on the eastern portion of former Building 1.
- The vertical extent of CVOC impact in groundwater is limited to approximately 30 ft. bgs except in the area of the former concrete steel-lined trench located on the eastern portion of former Building 1 and downgradient (i.e., southeast) of the former concrete steel-lined trench. Groundwater samples collected from six monitoring wells installed within the yellow-brown till and one monitoring well in the dark grey till indicate presence of CVOCs, primarily TCE. An approximately 100-foot wide area of VOC-impacted groundwater is present from the area near the eastern concrete steel-lined trench and extends to the south/southeast towards MW-64 and MW-66. An analysis of TCE concentration trends (i.e., TCE concentrations <6 ug/l) indicates that TCE-impacted groundwater does not extend off Electrolux-owned property.
- Groundwater samples collected from the MW-62 and MW-63 screened within the dark gray till indicate that VOCs have not migrated vertically into this unit outside of the area near the eastern concrete steel-lined trench.
- Groundwater samples collected from MW-67 screened in the Pleistocene Sand and Gravel unit, indicate that Site impacts have not migrated to this unit.
- Previous groundwater sampling results indicated that 1,1,1-TCA was present in Site groundwater. Therefore, EPA requested that Electrolux screen groundwater for 1,4-dioxane; a solvent used as a stabilizer during the manufacture of 1,1,1-TCA. 1,4-dioxane was detected in a limited number of groundwater samples collected from wells screened in the upper till unit (oxidized brown and unoxidized gray). 1,4-dioxane has not migrated horizontally off of the facility or vertically to the yellow-brown till. There is no MCL for 1,4-dioxane. All detected 1,4-dioxane concentrations are below the Iowa Non-protected Groundwater Source Standard.
- Evidence of reductive dechlorination occurring on Site includes the following:
  - CVOC impacts, primarily TCE and its breakdown products including cis-1,2-DCE and vinyl chloride are present in the upper tills, and to a lesser extent the yellow-brown till. The concentration of daughter products is significantly higher than TCE in multiple well locations (e.g., MW-25S, MW-28, MW-31, MW-47S, MW-47D, and MW-53) indicating the reductive dechlorination of TCE is occurring.
  - Dissolved oxygen concentrations in the areas most highly-impacted with TCE in the upper till units are typically below 1 mg/l. Overall, the DO concentrations suggest that anaerobic conditions exist within the CVOC-impacted groundwater area.
  - Low ORP values (i.e., less than 100 mv) indicate that anaerobic conditions, conducive to biologically-mediated reductive dechlorination exist in groundwater over most of the facility. In the most-highly impacted areas, ORP values are typically less than zero, indicating strongly-reducing conditions.
  - The laboratory detected dissolved gases (ethene, ethane, and methane) at concentrations above the laboratory reporting limits in all 18 groundwater samples collected from the Site in October 2013. The detection of elevated concentrations of these gases within and downgradient of the most highly-impacted groundwater area supports evidence that TCE and other CVOCs are fully degrading to ethene, ethane, and methane.

CVOC impacts, primarily TCE and its breakdown products including cis-1,2-DCE and vinyl chloride are present in the upper tills, and to a lesser extent the yellow-brown till. MIP profiling indicates that the highest CVOC concentrations occur at the interface between the oxidized brown and unoxidized gray till, which is coincident with, and consistent with, a contrast in hydraulic conductivity between these two units. The unoxidized gray till is characterized by a very low hydraulic conductivity. Migration of CVOCs into the unoxidized gray till and yellow-brown till likely occurs through diffusion, rather than advection (groundwater) flow. Site data indicate that significant anaerobic biological reductive dechlorination is occurring in soils and groundwater which, along with the generally low transmissivity of the till materials, limits the horizontal and vertical extent and potential migration of CVOC impacts.

The recent assessment results confirm the March 2013 results that overall, the petroleum and CVOC-impacted soil and groundwater is confined primarily to the facility (i.e., former developed portion of the Site) boundaries. Golder did not detect any VOCs or petroleum compounds above the MCLs and/or laboratory reporting limits in the groundwater samples collected from the monitoring wells screened within the oxidized brown and unoxidized gray tills along the southern manufacturing boundary of the Site. VOC impacts to the yellow-brown till also attenuate near the southern facility boundary of the Site. Undeveloped fields, owned by Electrolux, are located south and east of the developed portion of the Site. The area of impacted groundwater is confined to the Electrolux-owned property.

The suspected source of the petroleum-impacted soils and groundwater is the historical use of cutting/machining oils associated with metal working operations within the former manufacturing buildings. A specific source of the CVOCs has not been identified. However, CVOCs in soil and groundwater are suspected to be associated with former manufacturing operations located within the eastern portion of former Building 1 and in former Building 2.

Assessment activities conducted at the former Electrolux facility in Jefferson, Iowa have systematically and adequately delineated the nature and extent of impacts to soil and groundwater at the Site. There are no receptors such as public drinking water supply wells, streams or rivers, public use areas, or occupied buildings (i.e., vapor intrusion concerns) near the Site. Most of the impacted soil and groundwater areas are located beneath the concrete slab of the former buildings or concrete-paved driveways. Impacted soils in the landscaped areas are typically encountered below two to three ft bgs. The former manufacturing facility is surrounded by a secure perimeter chain-link fence to deter trespassers. Electrolux has no current plans to develop the Site. Consequently, the potential exposure risks to human health and the environment at this Site are minimal and controlled.

6.0 FRAMEWORK FOR FUTURE SITE MANAGEMENT

Site soil and groundwater impacts have been assessed and confirmed not to extend off Electrolux-owned property. Electrolux intends to maintain control of the property and implement appropriate land use restrictions, if necessary. Although Electrolux has no immediate plans for redevelopment of the Jefferson property, future use of the property would be restricted to industrial use until such time it is determined to be suitable for other potential uses. As a next step toward moving the Site to a resolution of remedial actions, Electrolux asked Golder to prepare a document outlining the proposed plan for future management of Site-related impacts. The proposed plan will be supported by an evaluation of Site-related risks and is envisioned to include the following:

- Development and implementation of a long-term groundwater monitoring program as part of proposed approved MNA remedy
- Development and implementation of a well decommissioning program for wells not included in the long-term monitoring program
- Implementation of appropriate land use restrictions including securing and maintaining areas inside the fenced portion of the Site

Notes:
1. JEO Consulting Group, Inc. provided survey data in Iowa State Plane North 1401 coordinates.
2. DPT = Direct Push Technology rig
3. ft bgs = feet below ground surface
4. NAVD 88 = North American Vertical Datum 1988
5. PVC = polyvinyl chloride
6. Original survey data updated with data from 12/12 JEO survey.
7. NA = Not applicable
8. MD = modified double-cased well
9. Pleistocene = Pleistocene Sand and Gravel Unit

Notes:

1. NGVD = National Geodetic Vertical Datum of 1929
2. DTW = Depth to water
3. NI = Not installed
4. NM = Not measured - covered with snow and/or water
5. NA = Not applicable
6. NAPL = Non-aqueous phase liquid

5. NA = Not applicable
7. Wells were measured on 3/27/2013

Notes:
All Results are in micrograms per liter (ug/L).
mS/cm = milliSiemens per centimeter
mg/L = milligrams per liter
MCL = Environmental Protection Agency's Maximum Contaminant Level
Bold = Compound exceeds MCL
Total Extractable Petroleum Hydrocarbons are a sum of the three petroleum ranges: diesel, gasoline, and motor oil.

NS = No standard
NA = Not analyzed
NR = Not recorded
N = normal sample
FD = field duplicate sample

Notes:
Method OA-2 and SW8260B results are in micrograms per liter (ug/L).
mS/cm = milliSiemens per centimeter
mg/L = milligrams per liter
MCL = Environmental Protection Agency's Maximum Contaminant Level
Bold = Compound exceeds MCL
Total Extractable Petroleum Hydrocarbons are a sum of the three petroleum ranges: diesel, gasoline, and motor oil.

NS = No standard
NA = Not analyzed
NR = Not recorded
N = normal sample
FD = field duplicate sample

Notes:
Method OA-2 and SW8260B results are in micrograms per liter (ug/L).
mS/cm = milliSiemens per centimeter
mg/L = milligrams per liter
MCL = Environmental Protection Agency's Maximum Contaminant Level
Bold = Compound exceeds MCL
NS = No standard
NA = Not analyzed
NR = Not recorded
N = normal sample
FD = field duplicate sample
Total Extractable Petroleum Hydrocarbons are a sum of the three petroleum ranges: diesel, gasoline, and motor oil.

Notes:
Method OA-2 and SW8260B results are in micrograms per liter (ug/L).
mS/cm = milliSiemens per centimeter
mg/L = milligrams per liter
MCL = Environmental Protection Agency's Maximum Contaminant Level
Bold = Compound exceeds MCL
NS = No standard
NA = Not analyzed
NR = Not recorded
N = normal sample
FD = field duplicate sample
Total Extractable Petroleum Hydrocarbons are a sum of the three petroleum ranges: diesel, gasoline, and motor oil.

Notes:
Method OA-2 and SW8260B results are in micrograms per liter (ug/L).
mS/cm = milliSiemens per centimeter
mg/L = milligrams per liter
MCL = Environmental Protection Agency's Maximum Contaminant Level
Bold = Compound exceeds MCL
NS = No standard
NA = Not analyzed
NR = Not recorded
N = normal sample
FD = field duplicate sample
Total Extractable Petroleum Hydrocarbons are a sum of the three petroleum ranges: diesel, gasoline, and motor oil.

Notes:
Method OA-2 and SW8260B results are in micrograms per liter (ug/L).
mS/cm = milliSiemens per centimeter
mg/L = milligrams per liter
MCL = Environmental Protection Agency's Maximum Contaminant Level
Bold = Compound exceeds MCL
Total Extractable Petroleum Hydrocarbons are a sum of the three petroleum ranges: diesel, gasoline, and motor oil.

NS = No standard
NA = Not analyzed
NR = Not recorded
N = normal sample
FD = field duplicate sample

	Approximate Site Property Boundary
	Fence
	Edge of gravel
MW-51	Monitoring well screened in Oxidized Brown Till
MW-60	Monitoring well screened in Unoxidized Grey Till
MW-59	Monitoring well screened in Yellow/Brown Till
MW-62	Monitoring well screened in Dark Grey Till
MW-67	Monitoring well screened in Pleistocene Sand and Gravel
	Former Buildings (slab remains)

NOTES

1.) BM #1 elev. = 1052.49 (NAVD 88) center top non-operating bolt on fire hydrant Northwest of main building.

2.) JEO consulting group did not find useful NGS monuments in the Jefferson area. A USGS 24,000k Topographic map elevation (1054.00) at the intersection of Mulberry Street and East Central Street as the assumed NAVD 88 elevation. This elevation agreed with the elevation generated from Geoid-09.

3.) The coordinates for this site are approximate Iowa State Plane North 1401 with a ground scale factor of 1.0000463418.

REFERENCES

Basemap taken from JEO Consulting Group, Inc. drawing titled, "Electrolux Home Products base map", dated 11/21/10, revised May 2012.

FIGURE NARRATIVE

This figure shows the former buildings and well locations at the former Electrolux Home Products facility in Jefferson, Iowa. The features shown on the concrete slab are locations of former concrete-lined floor pits and drains.

Basemap taken from JEO Consulting Group, Inc. drawing titled, "Electrolux Home Products base map", dated 11/21/10, revised May 2012.

FIGURE NARRATIVE

This figure shows the approximate locations of the membrane interface probes (MIP), soil borings, light, non-aqueous phase liquid sampling locations, and deep soil boring location. The MIP locations are color coded to indicate the two separate MIP mobilizations performed in April 2012 and November 2012.

2.) JEO consulting group did not find useful NGS monuments in the Jefferson area. A USGS 24,000k Topographic map elevation (1054.00) at the intersection of Mulberry Street and East Central Street as the assumed NAVD 88 elevation. This elevation agreed with the elevation generated from Geoid-09.

3.) The coordinates for this site are approximate Iowa State Plane North 1401 with a ground scale factor of 1.0000463418.

4.) LNAPL = Light, non-aqueous phase liquid.

5.) RE = Reference emitter.

REFERENCES

Basemap taken from JEO Consulting Group, Inc. drawing titled, "Electrolux Home Products base map", dated 11/21/10, revised May 2012.

FIGURE NARRATIVE

This figure illustrates the maximum LIF response recorded at each LIF probe location during the LIF surveys performed in April and November 2012. The color flood of the discs is indicative of responses observed at each LIF location. The diameter of the borings is exaggerated.

This figure also includes the interpreted extent of light, non-aqueous phase liquid present on site based on LIF and MIP results and TEH groundwater concentrations. In same cases, the maximum LIF response may not be indicative of the presence of LNAPL. See text for additional discussion.

Conditions between LIF borings and wells may vary. Other interpretations are possible.

REFERENCES

Basemap taken from JEO Consulting Group, Inc. drawing titled, "Electrolux Home Products base map", dated 11/21/10, revised May 2012.

FIGURE NARRATIVE

This figure depicts the groundwater elevation, as measured in the nine monitoring wells screened within the yellow brown till, and is intended to represent the approximate elevation of the groundwater potentiometric surface. The posted data were calculated from depth to water measurements made by Golder on July 1, 2016. The direction of horizontal groundwater flow at and near the potentiometric surface can be generally interpreted as being perpendicular to the groundwater elevation contours.

Golder inferred the elevation contours based on the data illustrated. The actual elevation of the potentiometric surface is likely more heterogeneous than shown and actual conditions will vary. Other interpretations are possible. The depth to groundwater is known to vary with time.

CITY OF JEFFERSON WELLS #2, #4, #6, and #9

Municipal Well #6

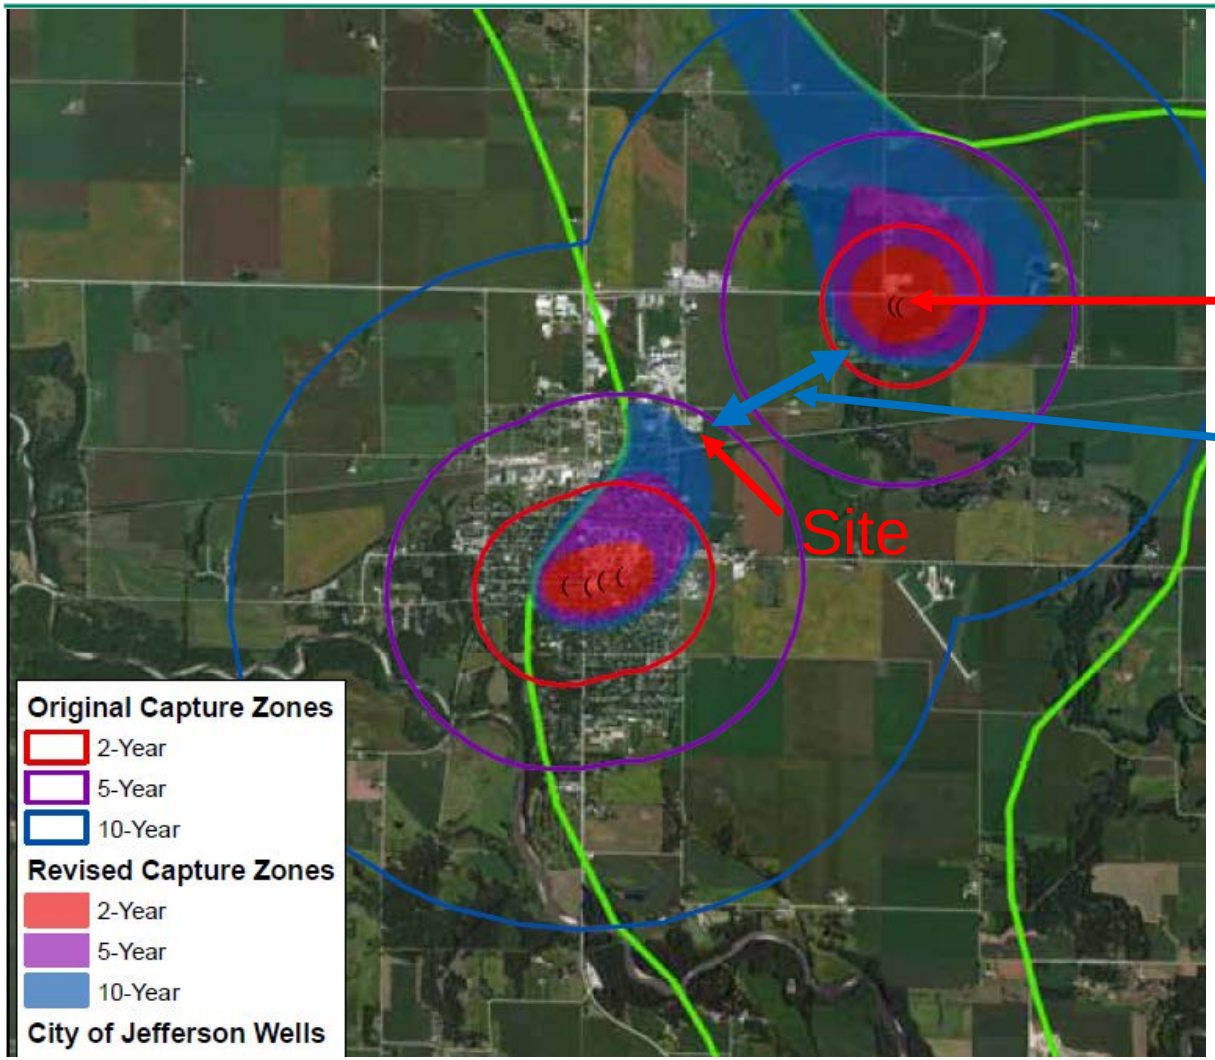
Water valve

Municipal Well #4

Municipal Well #9

Municipal Well #2

Projected Capture Zone – Wells 7 and 8



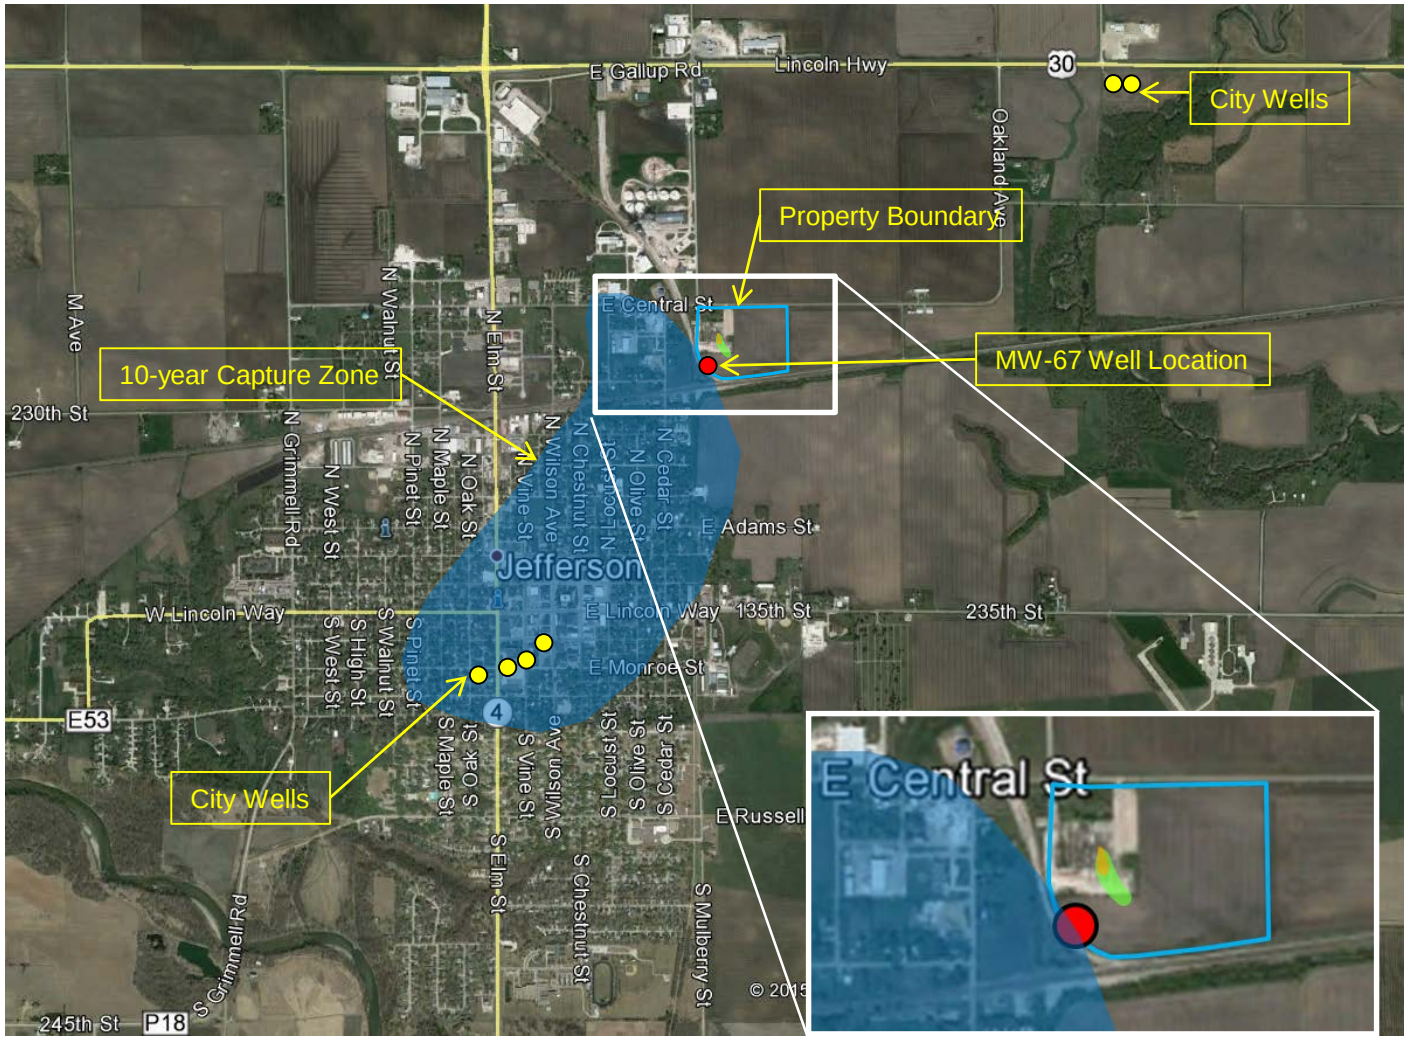
City Wells 7 and 8

Distance approximately 0.75 miles

Source
Jefferson Groundwater Investigation
Greene County, Iowa

Iowa Geological and Water Survey
Technical Information Series 56
December 2013

Pleistocene Sand and Gravel Monitoring Well Location



APPENDIX B

MIP PROBE LOGS AND ASSESSMENT RESULTS

Appendix B – MIP Logs and Assessment Results

Files from the Supplemental Soil and Groundwater Assessment (Golder, 2013)

Notes:
PID (photoionization detector), FID (flame ionization detector), and XSD (halogen specific detector) results in uV (microvolts).
LIF (Laser-induced fluorescence) data is provided as a comparison to a reference emitter (RE) as %RE.
Color flood criteria are different for April and Nov data due to differences in the detectors background values at the time of survey.

Color flood criteria:

	Min	Mid	Max
April 2012: MIP-01 to MIP-51, LIF-01 to LIF-24			
PID	70,000	150,000	1,500,000
FID	70,000	150,000	1,500,000
XSD	20,000	40,000	1,000,000
LIF	0.6	2.1	100
Nov 2012: MIP-52 to MIP-77, LIF-25 to LIF-84			
PID	30,000	100,000	1,500,000
FID	30,000	100,000	1,500,000
XSD	15,000	30,000	1,000,000
LIF	0.2	2.1	100

Notes:
PID (photoionization detector), FID (flame ionization detector), and XSD (halogen specific detector) results in uV (microvolts).
LIF (Laser-induced fluorescence) data is provided as a comparison to a reference emitter (RE) as %RE.
Color flood criteria are different for April and Nov data due to differences in the detectors background values at the time of survey.

Color flood criteria:

	Min	Mid	Max
April 2012: MIP-01 to MIP-51, LIF-01 to LIF-24			
PID	70,000	150,000	1,500,000
FID	70,000	150,000	1,500,000
XSD	20,000	40,000	1,000,000
LIF	0.6	2.1	100
Nov 2012: MIP-52 to MIP-77, LIF-25 to LIF-84			
PID	30,000	100,000	1,500,000
FID	30,000	100,000	1,500,000
XSD	15,000	30,000	1,000,000
LIF	0.2	2.1	100

Table 1: Summary of MIP Surveys
April and November 2012
Former Electrolux Facility
Jefferson, Iowa

Notes:
PID (photoionization detector), FID (flame ionization detector), and XSD (halogen specific detector) results in uV (microvolts).
LIF (Laser-induced fluorescence) data is provided as a comparison to a reference emitter (RE) as %RE.
Color flood criteria are different for April and Nov data due to differences in the detectors background values at the time of survey.

Color flood criteria:

	Min	Mid	Max
April 2012: MIP-01 to MIP-51, LIF-01 to LIF-24			
PID	70,000	150,000	1,500,000
FID	70,000	150,000	1,500,000
XSD	20,000	40,000	1,000,000
LIF	0.6	2.1	100
Nov 2012: MIP-52 to MIP-77, LIF-25 to LIF-84			
PID	30,000	100,000	1,500,000
FID	30,000	100,000	1,500,000
XSD	15,000	30,000	1,000,000
LIF	0.2	2.1	100

Notes:
PID (photoionization detector), FID (flame ionization detector), and XSD (halogen specific detector) results in uV (microvolts).
LIF (Laser-induced fluorescence) data is provided as a comparison to a reference emitter (RE) as %RE.
Color flood criteria are different for April and Nov data due to differences in the detectors background values at the time of survey.

Color flood criteria:			
	Min	Mid	Max
April 2012: MIP-01 to MIP-51, LIF-01 to LIF-24			
PID	70,000	150,000	1,500,000
FID	70,000	150,000	1,500,000
XSD	20,000	40,000	1,000,000
LIF	0.6	2.1	100
Nov 2012: MIP-52 to MIP-77, LIF-25 to LIF-84			
PID	30,000	100,000	1,500,000
FID	30,000	100,000	1,500,000
XSD	15,000	30,000	1,000,000
LIF	0.2	2.1	100

Table 1: Summary of MIP Surveys
April and November 2012
Former Electrolux Facility
Jefferson, Iowa

Notes:
PID (photoionization detector), FID (flame ionization detector), and XSD (halogen specific detector) results in uV (microvolts).
LIF (Laser-induced fluorescence) data is provided as a comparison to a reference emitter (RE) as %RE.
Color flood criteria are different for April and Nov data due to differences in the detectors background values at the time of survey.

Color flood criteria:			
	Min	Mid	Max
April 2012: MIP-01 to MIP-51, LIF-01 to LIF-24			
PID	70,000	150,000	1,500,000
FID	70,000	150,000	1,500,000
XSD	20,000	40,000	1,000,000
LIF	0.6	2.1	100
Nov 2012: MIP-52 to MIP-77, LIF-25 to LIF-84			
PID	30,000	100,000	1,500,000
FID	30,000	100,000	1,500,000
XSD	15,000	30,000	1,000,000
LIF	0.2	2.1	100

Table 1: Summary of MIP Surveys
April and November 2012
Former Electrolux Facility
Jefferson, Iowa

Notes:
PID (photoionization detector), FID (flame ionization detector), and XSD (halogen specific detector) results in uV (microvolts).
LIF (Laser-induced fluorescence) data is provided as a comparison to a reference emitter (RE) as %RE.
Color flood criteria are different for April and Nov data due to differences in the detectors background values at the time of survey.

Color flood criteria:

	Min	Mid	Max
April 2012: MIP-01 to MIP-51, LIF-01 to LIF-24			
PID	70,000	150,000	1,500,000
FID	70,000	150,000	1,500,000
XSD	20,000	40,000	1,000,000
LIF	0.6	2.1	100
Nov 2012: MIP-52 to MIP-77, LIF-25 to LIF-84			
PID	30,000	100,000	1,500,000
FID	30,000	100,000	1,500,000
XSD	15,000	30,000	1,000,000
LIF	0.2	2.1	100

Notes:
PID (photoionization detector), FID (flame ionization detector), and XSD (halogen specific detector) results in uV (microvolts).
LIF (Laser-induced fluorescence) data is provided as a comparison to a reference emitter (RE) as %RE.
Color flood criteria are different for April and Nov data due to differences in the detectors background values at the time of survey.

Color flood criteria:			
	Min	Mid	Max
April 2012: MIP-01 to MIP-51, LIF-01 to LIF-24			
PID	70,000	150,000	1,500,000
FID	70,000	150,000	1,500,000
XSD	20,000	40,000	1,000,000
LIF	0.6	2.1	100
Nov 2012: MIP-52 to MIP-77, LIF-25 to LIF-84			
PID	30,000	100,000	1,500,000
FID	30,000	100,000	1,500,000
XSD	15,000	30,000	1,000,000
LIF	0.2	2.1	100

Notes:
PID (photoionization detector), FID (flame ionization detector), and XSD (halogen specific detector) results in uV (microvolts).
LIF (Laser-induced fluorescence) data is provided as a comparison to a reference emitter (RE) as %RE.
Color flood criteria for MIP and LIF are different for April and Nov data due to differences in the detectors background values at the time of survey.
= Soil sample concentrations are displayed over the sampled interval in ug/kg (micrograms per kilogram) for TVOCS and mg/kg (milligrams per kilogram) for TEPH
= Groundwater (GW) results displayed over the screened interval of the well in ug/L (micrograms per liter)
TEPH = Total extractable petroleum hydrocarbons
TVOCs = total volatile organic compounds - includes the sum of all detected VOC parameters
TCE = trichloroethene
NAPL = Non-aqueous phase liquid
NS = Not Sampled
ND = no VOCs detected

Color flood criteria:

	Min	Mid	Max
April 2012: MIP-01 to MIP-51, LIF-01 to LIF-24			
PID	70,000	150,000	1,500,000
FID	70,000	150,000	1,500,000
XSD	20,000	40,000	1,000,000
LIF	0.6	2.1	100
Nov 2012: MIP-52 to MIP-77, LIF-25 to LIF-84			
PID	30,000	100,000	1,500,000
FID	30,000	100,000	1,500,000
XSD	15,000	30,000	1,000,000
LIF	0.2	2.1	100

Notes:
PID (photoionization detector), FID (flame ionization detector), and XSD (halogen specific detector) results in uV (microvolts).
LIF (Laser-induced fluorescence) data is provided as a comparison to a reference emitter (RE) as %RE.
Color flood criteria for MIP and LIF are different for April and Nov data due to differences in the detectors background values at the time of survey.
= Soil sample concentrations are displayed over the sampled interval in ug/kg (micrograms per kilogram) for TVOCS and mg/kg (milligrams per kilogram) for TEPH
= Groundwater (GW) results displayed over the screened interval of the well in ug/L (micrograms per liter)
TEPH = Total extractable petroleum hydrocarbons
TVOCs = total volatile organic compounds - includes the sum of all detected VOC parameters
TCE = trichloroethene
NAPL = Non-aqueous phase liquid
NS = Not Sampled
ND = no VOCs detected

Color flood criteria:

	Min	Mid	Max
April 2012: MIP-01 to MIP-51, LIF-01 to LIF-24			
PID	70,000	150,000	1,500,000
FID	70,000	150,000	1,500,000
XSD	20,000	40,000	1,000,000
LIF	0.6	2.1	100
Nov 2012: MIP-52 to MIP-77, LIF-25 to LIF-84			
PID	30,000	100,000	1,500,000
FID	30,000	100,000	1,500,000
XSD	15,000	30,000	1,000,000
LIF	0.2	2.1	100

Notes:
PID (photoionization detector), FID (flame ionization detector), and XSD (halogen specific detector) results in uV (microvolts).
LIF (Laser-induced fluorescence) data is provided as a comparison to a reference emitter (RE) as %RE.
Color flood criteria for MIP and LIF are different for April and Nov data due to differences in the detectors background values at the time of survey.
= Soil sample concentrations are displayed over the sampled interval in ug/kg (micrograms per kilogram) for TVOCS and mg/kg (milligrams per kilogram) for TEPH
= Groundwater (GW) results displayed over the screened interval of the well in ug/L (micrograms per liter)
TEPH = Total extractable petroleum hydrocarbons
TVOCs = total volatile organic compounds - includes the sum of all detected VOC parameters
TCE = trichloroethene
NAPL = Non-aqueous phase liquid
NS = Not Sampled
ND = no VOCs detected

Color flood criteria:

- 500,000 uV
- 200,000 uV
- 100,000 uV

NOTES

1.) BM #1 elev. = 1052.49 (NAVD 88) center top non-operating bolt on fire hydrant Northwest of main building.

2.) JEO consulting group did not find useful NGS monuments in the Jefferson area. A USGS 24,000k Topographic map elevation (1054.00) at the intersection of Mulberry Street and East Central Street as the assumed NAVD 88 elevation. This elevation agreed with the elevation generated from Geoid-09.

3.) The coordinates for this site are approximate Iowa State Plane North 1401 with a ground scale factor of 1.0000463418.

FIGURE NARRATIVE

This figure shows the maximum FID results obtained from the MIP survey performed in April and November 2012. The MIP borings were advanced to a maximum depth of approximately 30 feet below ground surface. The color flood indicates the relative FID response observed at each MIP location.

Basemap taken from JEO Consulting Group, Inc. drawing titled, "Electrolux Home Products base map", dated 11/21/10, revised May 2012.

FIGURE NARRATIVE

This figure shows the maximum XSD results obtained from the MIP survey performed in April and November 2012. The MIP borings were advanced to a maximum depth of approximately 30 feet below ground surface. The color flood indicates the relative FID response observed at each MIP location.

NOTES

1.) Golder developed the geologic cross sections using Environmental Visualization System (EVS) software developed by CTech Corporation (Version 9.84). Where necessary, Golder adjusted EVS output using professional judgment.

2.) Geologic contacts illustrated between and below borings are inferred and should not be interpreted as exact indicators of geologic conditions at, between or below borings.

3.) The projection of well screens onto geologic units may not reflect actual geologic conditions at the well screen interval due to variations in the elevation of geologic layers with distance from the cross-section centerline.

ABBREVIATIONS

ft-msl = Feet Mean Sea Level

MIP = Membrane Interface Probe

FID = Flame Ionization Detector

XSD = Halogen Specific Detector

uV = microvolts

FIGURE NARRATIVE

This figure shows the FID and XSD responses for the north-south cross-section (A - A') on the western side of Building 1. The cross-sections include data obtained during the April and November 2012 MIP assessments. The color flood and diameter of the discs shown on the cross-sections indicate the relative FID and XSD response at each MIP location. The diameter of the borings is exaggerated proportionally to the MIP response.

This figure also illustrates the interpreted geologic conditions. Contacts shown in the cross-section are Golder's interpretation of the lithology, obtained from borings installed during the assessment activities in April and November 2012. Conditions between borings may vary. Other interpretations are possible.

Client:	**Golder Associates**
Project Name:	**Electrolux**
Location:	**Jefferson, IA**
Project Number:	**047-MNDS-12MIP**

The analysis and opinions expressed in this report are based upon data obtained from the samples collected at the indicated locations and from other information discussed in this report. Exceptions, if any, are discussed in the accompanying comments section of this report. This report is prepared for the exclusive use of our client for specific application to the project discussed and has been prepared in accordance with generally accepted laboratory practices. Reported results shall not be reproduced, except in full, without written approval of Matrix Environmental, LLC. The sample results relate only to the analytes of interest tested. No warranties, expressed or implied are intended or made.

I certify that the data contained in this final report has been generated and reviewed in accordance with approved methods and our Standard Operating Procedure. Release of this final report is authorized by Laboratory management, which is verified by the following signature.

Approval Signature Date 5/1/12

MIP SYSTEM DESCRIPTION AND ON-SITE CHEMICAL ANALYSIS

VOCs are semi-quantitatively analyzed in-situ using a membrane interface probe (MIP). The probe is pushed into the ground at a rate of 1 foot per minute (including 45 second residence time). The membrane block heats to a temperature of approximately 121°C. Any volatile organic compounds present diffuse across the membrane into the trunkline carrier gas tubing and are brought to the surface and into the GC analytical system. The carrier gas containing samples from the subsurface then passes through a naphion dryer and/or heated GC oven to remove any moisture prior to detector analysis. Compounds appropriate for the detectors and in high enough concentrations (ppm) will produce an electrical signal which is analyzed.

The GC system is comprised of the following three detector system – a PID/FID tandem and XSD detector. The MIP's trunkline return gas is Y-split in the GC to accomplish this detector configuration. The PID has a 10.0 eV lamp and will ionize multiple-bonded petroleum or halogenated hydrocarbons with an ionization potential less than the 10.0 eV. The FID will respond to all types of hydrocarbons including methane or halogenated hydrocarbons (generally the FID response gives a good indication of total hydrocarbons present.) The XSD responds to halogenated compounds.

Electrical Conductivity (EC) is a measure of the soils ability to conduct an electrical current between two dipoles on the MIP/EC probe. Conductivity is the reciprocal of electrical resistivity and has the units (in our application) of millisiemens per meter (mS/m). Since soil is in the pathway of the charge flow, the grain size can be determined by comparing the EC log to a soil boring. Conductivity readings in the 100s indicate smaller grain (size such as clay). Larger grain size (sand and gravels) are typically in the 10s of mS/m range. Prior to every log the EC point of the MIP probe is checked for proper operation by performing a voltage test with a voltage meter and a conductivity test with a test block.

Since the MIP system is a screening tool, some laboratory analysis of soil or groundwater samples or some historical analytical data is needed in order to obtain optimum MIP log correlation. The following quality assurance/control measures are routinely conducted to ensure the validity of the analytical results:

> *Chemical Response Test*: MIP data needs to be validated with passing QC at the beginning and end of every log. The probe is immersed into a 500 mL cylinder of water containing the compound(s) of interest. This test will be performed at multiple concentration levels at the beginning of each day to verify detector response and generate detection limits of the system (For example: 3 levels of TCE @ 1, 5, & 50 ppm). QC tests of at least one level are checked between each boring to determine system integrity and monitor membrane and detector fluctuations. The results of this are listed in the QA/QC report.
>
> *Butane response*: May be run between each boring by dispensing butane over the membrane. Measuring the lag time of the carrier gas from the probe to the detectors is used to determine trip time and to verify FID detector response.
>
> *Continuity check*: Performed before and after each boring to verify system continuity throughout the project for the electrical conductivity data.

DISCUSSION AND COMMENTS

Matrix performed chemical response tests at 1, 5, 25 and 50 ppm TCE at various times throughout the project. At a minimum, one set of 0.5, or 5 ppm TCE response tests were performed before or after each log on the MIP system (PID/FID & XSD). The response tests appeared normal and were indicative of a functional MIP system. Some post-log QC test were use for the sequential MIP logs pre-log QC tests if this log immediately followed.

For each log, the probe was advanced one foot and then the probe was allowed residence time of 45 seconds or longer - time for the probe to reach temperature and for contaminants to diffuse through the membrane and into the trunkline. The trip time was about 60 seconds for the trunkline.

Electrical conductivity (EC) data was collected simultaneously at each MIP location. The EC was tested before and after each log for continuity and performance. There were two failures of over 10% (see MIP-01 pre-log, MIP-3 post-log) (Geoprobe's specification is 10%). Since the EC test block failed , the EC system was then tested internally through Geoprobe's troubleshooting software and it was determined that the failures as likely caused by a bad solder connection between a printed circuit board stack. Matrix discussed this problem with the MIP specialist and the Electrical engineer at Geoprobe. It was determined that the EC data may be very slightly suppressed, but that the data surrounding these failures was still a good representation of electrical conductivity. The EC board was inspected and stabilized after MIP-03 and as a result the EC failures were eliminated for the remainder of the project.

-Direct Sensing Report, MIP-

Client:	**Golder Associates**
Project Name:	**Electrolux**
Location:	**Jefferson, IA**
Project Number:	**131-MNDS-12MIP**

The analysis and opinions expressed in this report are based upon data obtained from the samples collected at the indicated locations and from other information discussed in this report. Exceptions, if any, are discussed in the accompanying comments section of this report. This report is prepared for the exclusive use of our client for specific application to the project discussed and has been prepared in accordance with generally accepted laboratory practices. Reported results shall not be reproduced, except in full, without written approval of Matrix Environmental, LLC. The sample results relate only to the analytes of interest tested. No warranties, expressed or implied are intended or made.

I certify that the data contained in this final report has been generated and reviewed in accordance with approved methods and our Standard Operating Procedure. Release of this final report is authorized by Laboratory management, which is verified by the following signature.

Approval Signature _____ Date 11/26/12

MIP SYSTEM DESCRIPTION AND ON-SITE CHEMICAL ANALYSIS

VOCs are semi-quantitatively analyzed in-situ using a membrane interface probe (MIP). The probe is pushed into the ground at a rate of 1 foot per minute (including 45 second residence time). The membrane block heats to a temperature of approximately 121°C. Any volatile organic compounds present diffuse across the membrane into the trunkline carrier gas tubing and are brought to the surface and into the GC analytical system. The carrier gas containing samples from the subsurface then passes through a naphion dryer (if used) and a heated GC oven to remove any moisture prior to detector analysis. Compounds appropriate for the detectors and in high enough concentrations (about 1 ppm or higher for Standard MIP and about 100 ppb or higher for Low Level MIP) will produce an electrical signal which is analyzed.

The GC system is comprised of the following three detector system – a PID/FID tandem and XSD detector. The MIP's trunkline return gas is Y-split in the GC to accomplish this detector configuration. The PID has a 10.0 eV lamp and will ionize multiple-bonded petroleum or halogenated hydrocarbons with an ionization potential less than the 10.0 eV. The FID will respond to all types of hydrocarbons including methane or halogenated hydrocarbons (generally the FID response gives a good indication of total hydrocarbons present.) The XSD responds to halogenated compounds.

Electrical Conductivity (EC) is a measure of the soils ability to conduct an electrical current between two dipoles on the MIP/EC probe. Conductivity is the reciprocal of electrical resistivity and has the units (in our application) of millisiemens per meter (mS/m). Since soil is in the pathway of the charge flow, the grain size can be determined by comparing the EC log to a soil boring. Conductivity readings in the 100s indicate smaller grain (size such as clay). Larger grain size (sand and gravels) are typically in the 10s of mS/m range. Prior to every log the EC point of the MIP probe is checked for proper operation by performing a voltage test with a voltage meter and a conductivity test with a test block.

Since the MIP system is a screening tool, some laboratory analysis of soil or groundwater samples or some historical analytical data is needed in order to obtain optimum MIP log correlation. The following quality assurance/control measures are routinely conducted to ensure the validity of the analytical results:

Chemical Response Test: MIP data needs to be validated with passing QC at the beginning and end of every log. The probe is immersed into a 500 mL cylinder of water containing the compound(s) of interest. This test will be performed at multiple concentration levels at the beginning of each day to verify detector response and generate detection limits of the system (For example: 3 levels of TCE @ 1, 5, & 25 ppm). QC tests of at least one level are checked between each boring to determine system integrity and monitor membrane and detector fluctuations. The results of this are listed in the QA/QC report.

Butane response: May be run between each boring by dispensing butane over the membrane. Measuring the lag time of the carrier gas from the probe to the detectors is used to determine trip time and to verify FID detector response.

Continuity check: Performed before and after each boring to verify system continuity throughout the project for the electrical conductivity data.

DISCUSSION AND COMMENTS

Matrix performed chemical response tests at 1, 5, and 25 ppm TCE at various times throughout the project. At a minimum, a one level response test was performed before or after each log on the MIP system (PID/FID/XSD). The response tests appeared normal and were indicative of a functional MIP system. Some post-log QC test were use for the sequential MIP logs pre-log QC tests if this log immediately followed.

For each log, the probe was advanced one foot and then the probe was allowed residence time of 45 seconds or longer - time for the probe to reach temperature and for volatile organic compounds to diffuse through the membrane and into the trunkline. The trip time was about 60 seconds for the trunkline.

Electrical conductivity (EC) data was collected simultaneously at each MIP location. The EC was tested before and after each log for continuity and performance. All tests passed Geoprobe QC specs.

MIP-54 is the original field log data. MIP-54 ADJUSTED is that same log after attenuation corrections were made to the PIF/FID. Notice MIP-54 ADJUSTED log plot no longer contains the abrupt signal shift at 23' and that the PID and FID responses for MIP-54 ADJUSTED are 4 times higher from 0-23 feet as they should be.

MIP POST-LOG RESPONSE TEST

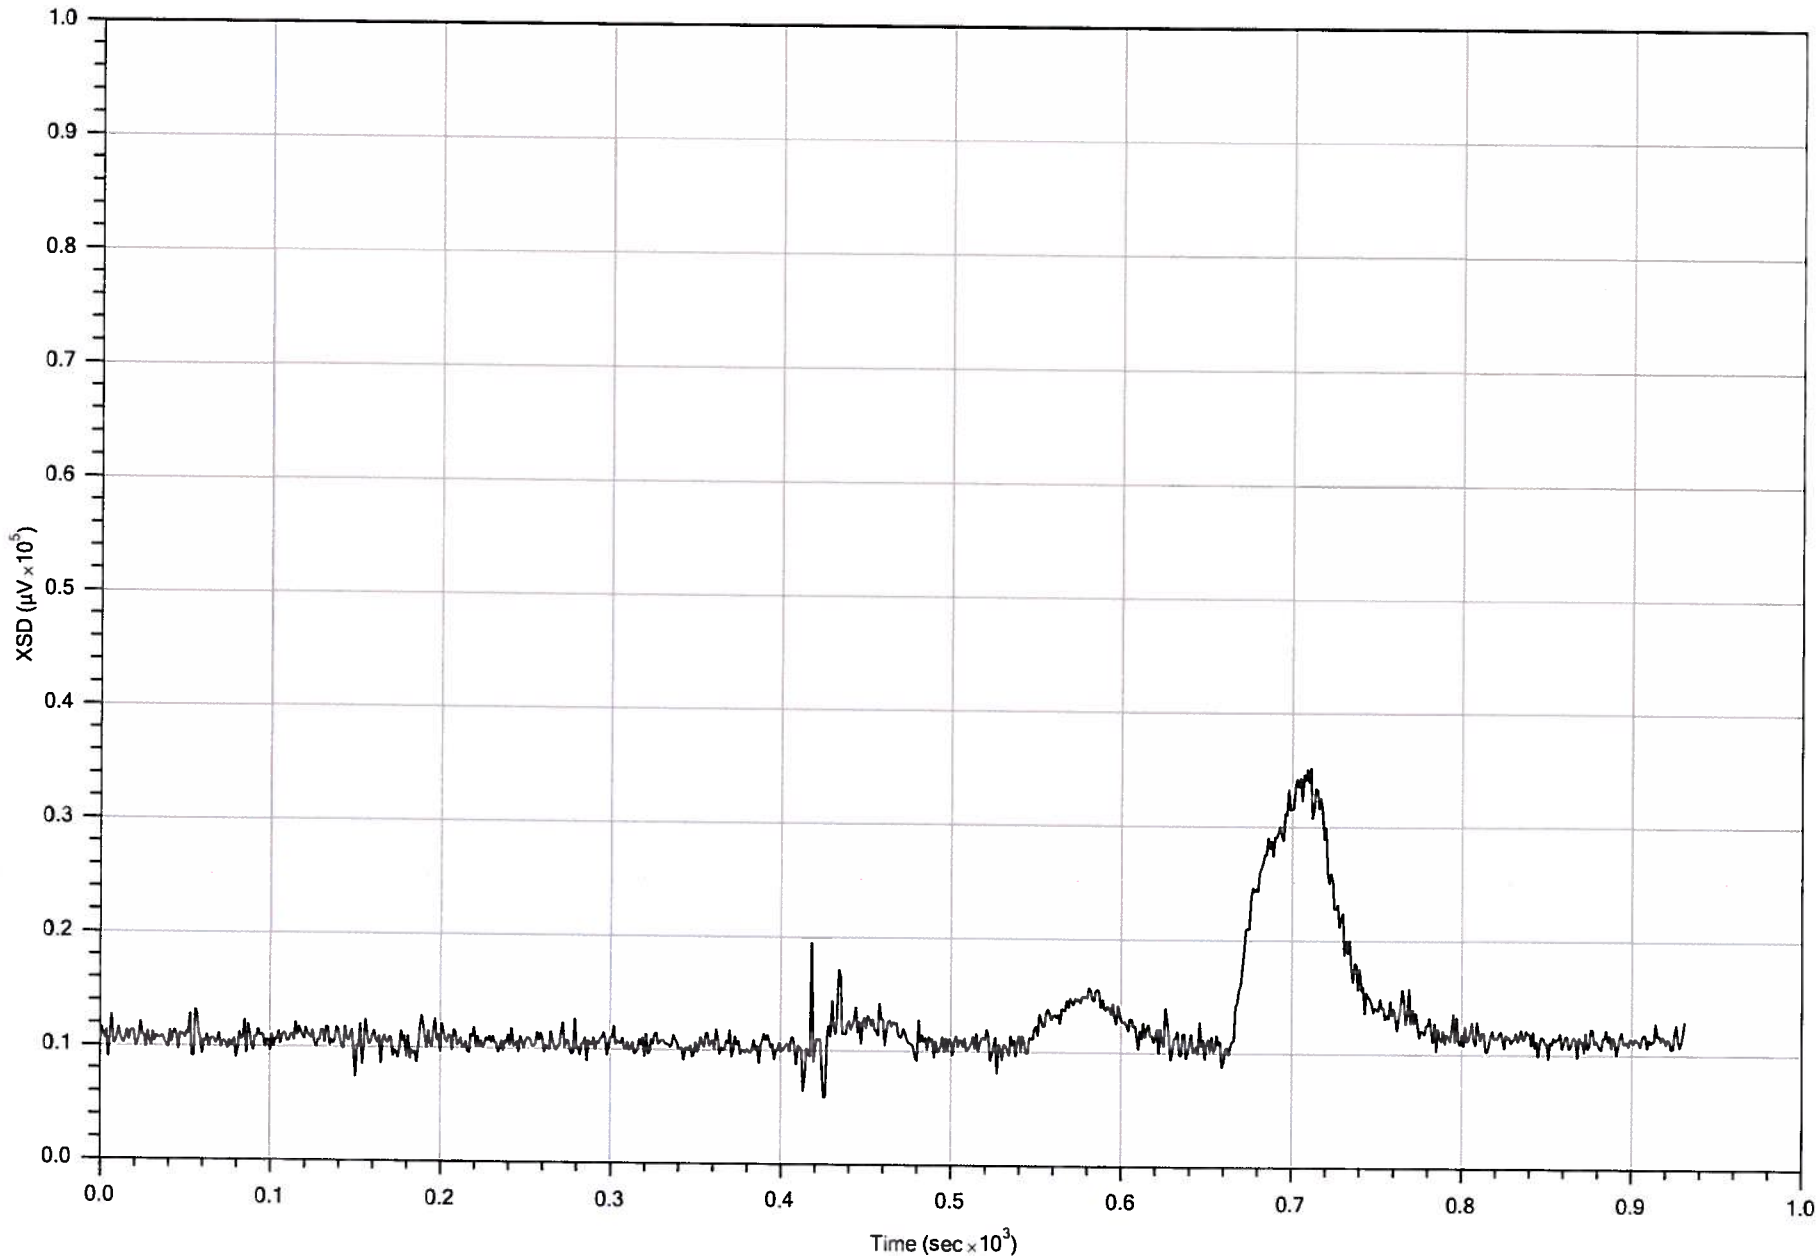
FILENAME: MIP-53.post.tim
COMPOUND: TCE
CONCENTRATION: 1, 5, 25 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Mon Nov 5 2012 16:58:30

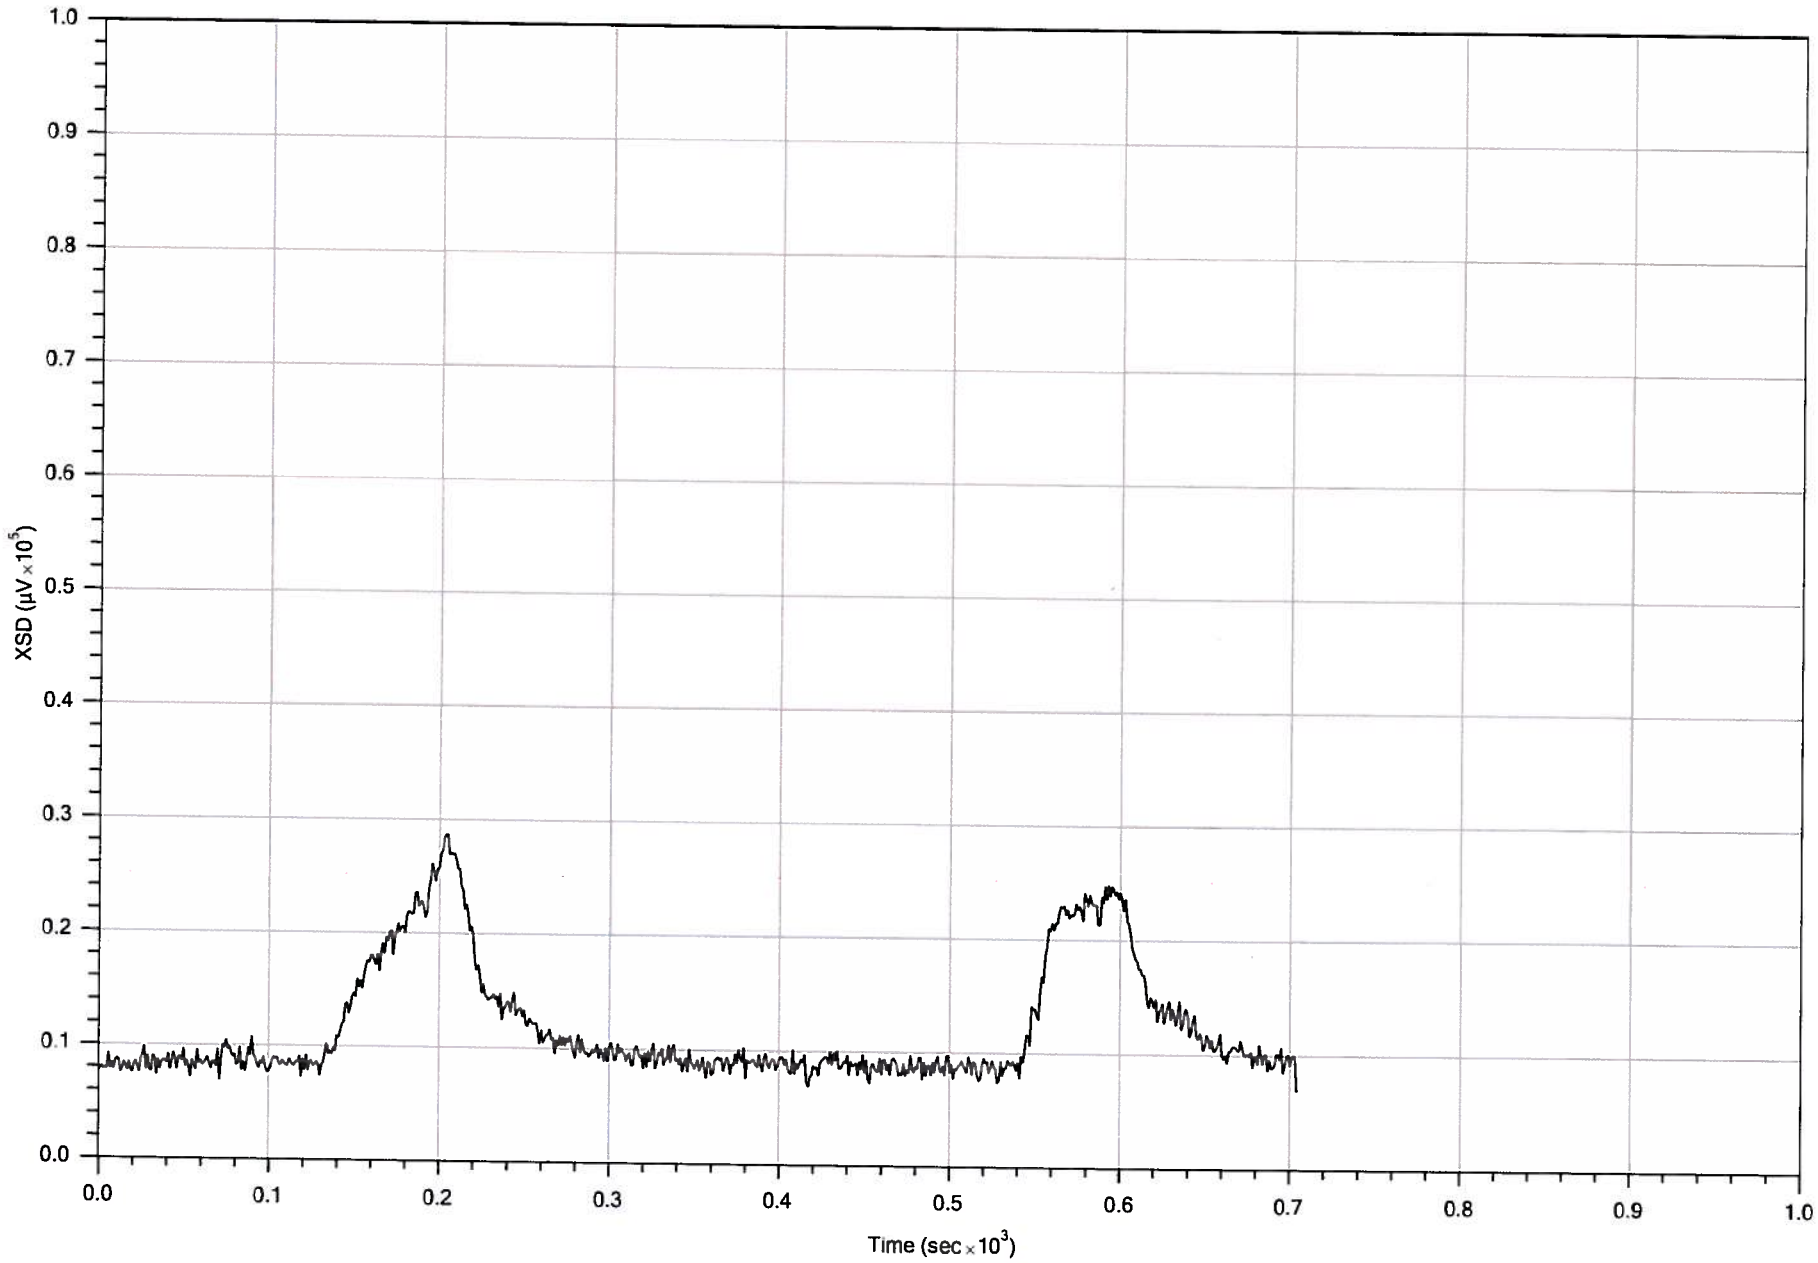
RESPONSE TEST ATTENUATION CHANGES

TIME	DET1	DET2	DET3	DET4
0	4	4	10	1



PRE-LOG RESPONSE

Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-54.PRE.TIM	Date: 11/6/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 0.5, 1, 5 ppm
		Compound: TCE	Peak Response: 35249 µV



POST-LOG RESPONSE

Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-54.POST.TIM	Date: 11/6/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 5, 5 ppm
		Compound: TCE	Peak Response: 28687 µV

MIP PRE-LOG RESPONSE TEST

FILENAME: MIP-54.pre.tim
COMPOUND: TCE
CONCENTRATION: 0.5, 1, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Tue Nov 6 2012 07:09:05

RESPONSE TEST ATTENUATION CHANGES

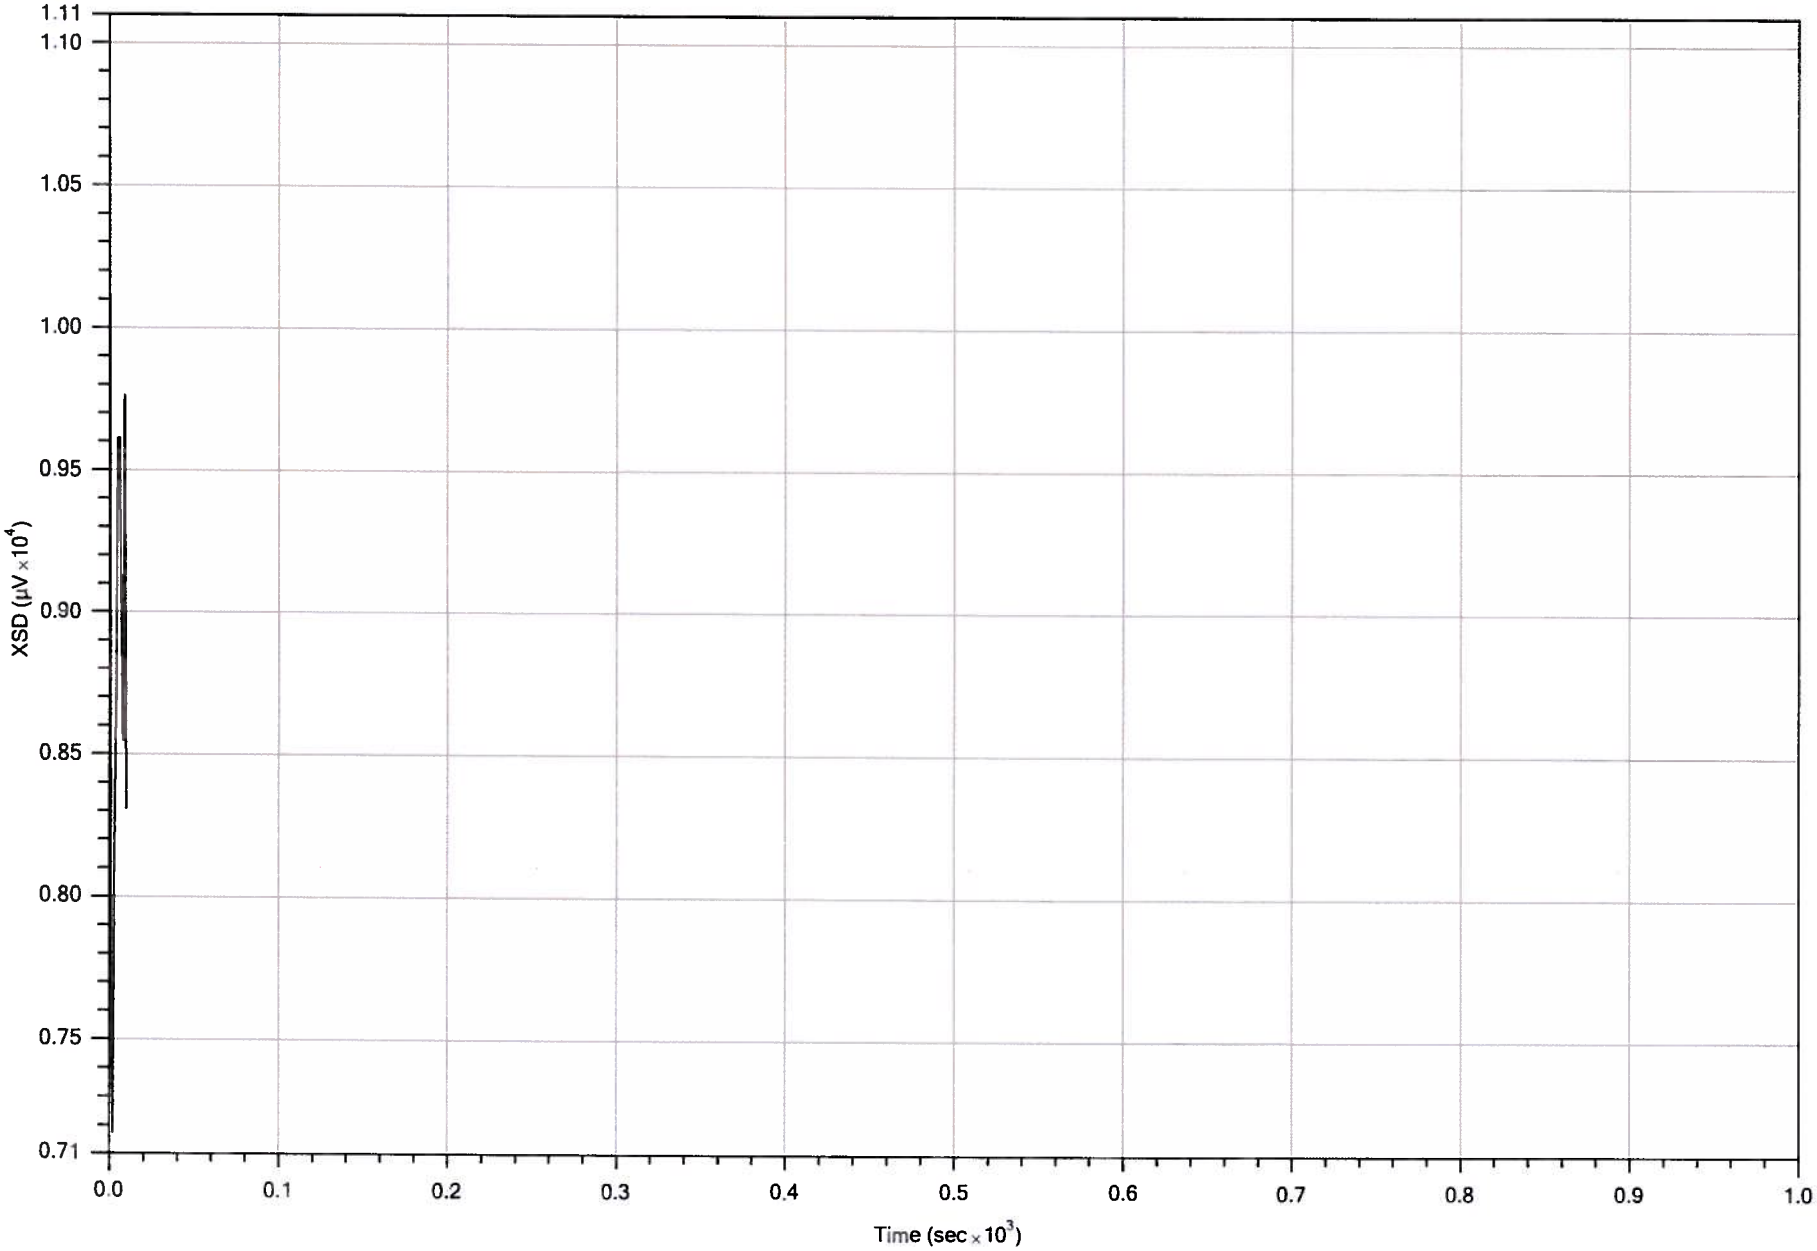
TIME	DET1	DET2	DET3	DET4
0	1	1	10	1

MIP POST-LOG RESPONSE TEST

FILENAME: MIP-54.post.tim
COMPOUND: TCE
CONCENTRATION: 5, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Tue Nov 6 2012 08:14:27

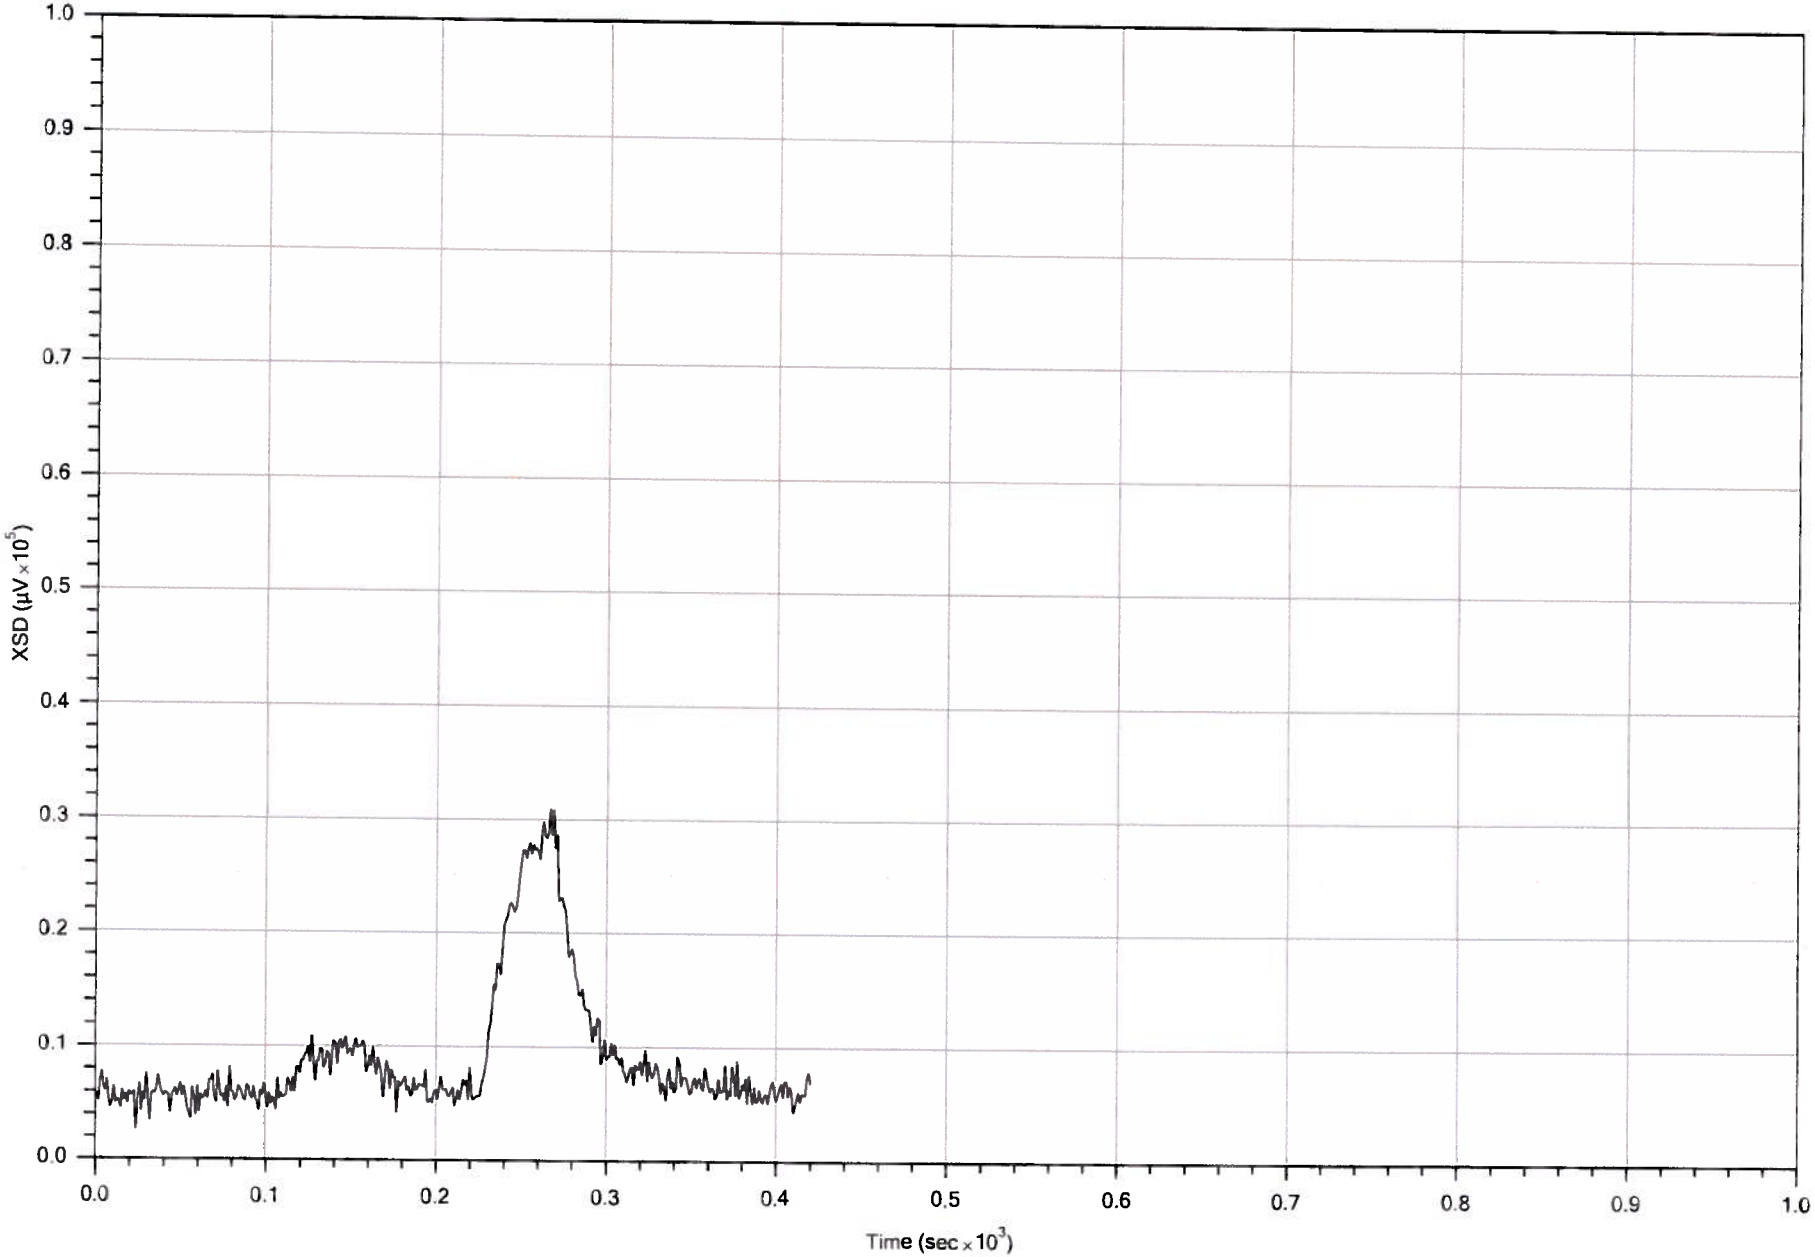
RESPONSE TEST ATTENUATION CHANGES

TIME	DET1	DET2	DET3	DET4
0	4	4	10	1



PRE-LOG RESPONSE

Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-55.PRE.TIM	Date: 11/6/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 5, 5 ppm
		Compound: TCE	Peak Response: 10681 µV



POST-LOG RESPONSE

Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-55.POST.TIM	Date: 11/6/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 1, 5 ppm
		Compound: TCE	Peak Response: 30976 µV

MIP PRE-LOG RESPONSE TEST

FILENAME: MIP-55.pre.tim
COMPOUND: TCE
CONCENTRATION: 5, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Tue Nov 6 2012 08:39:11

RESPONSE TEST ATTENUATION CHANGES

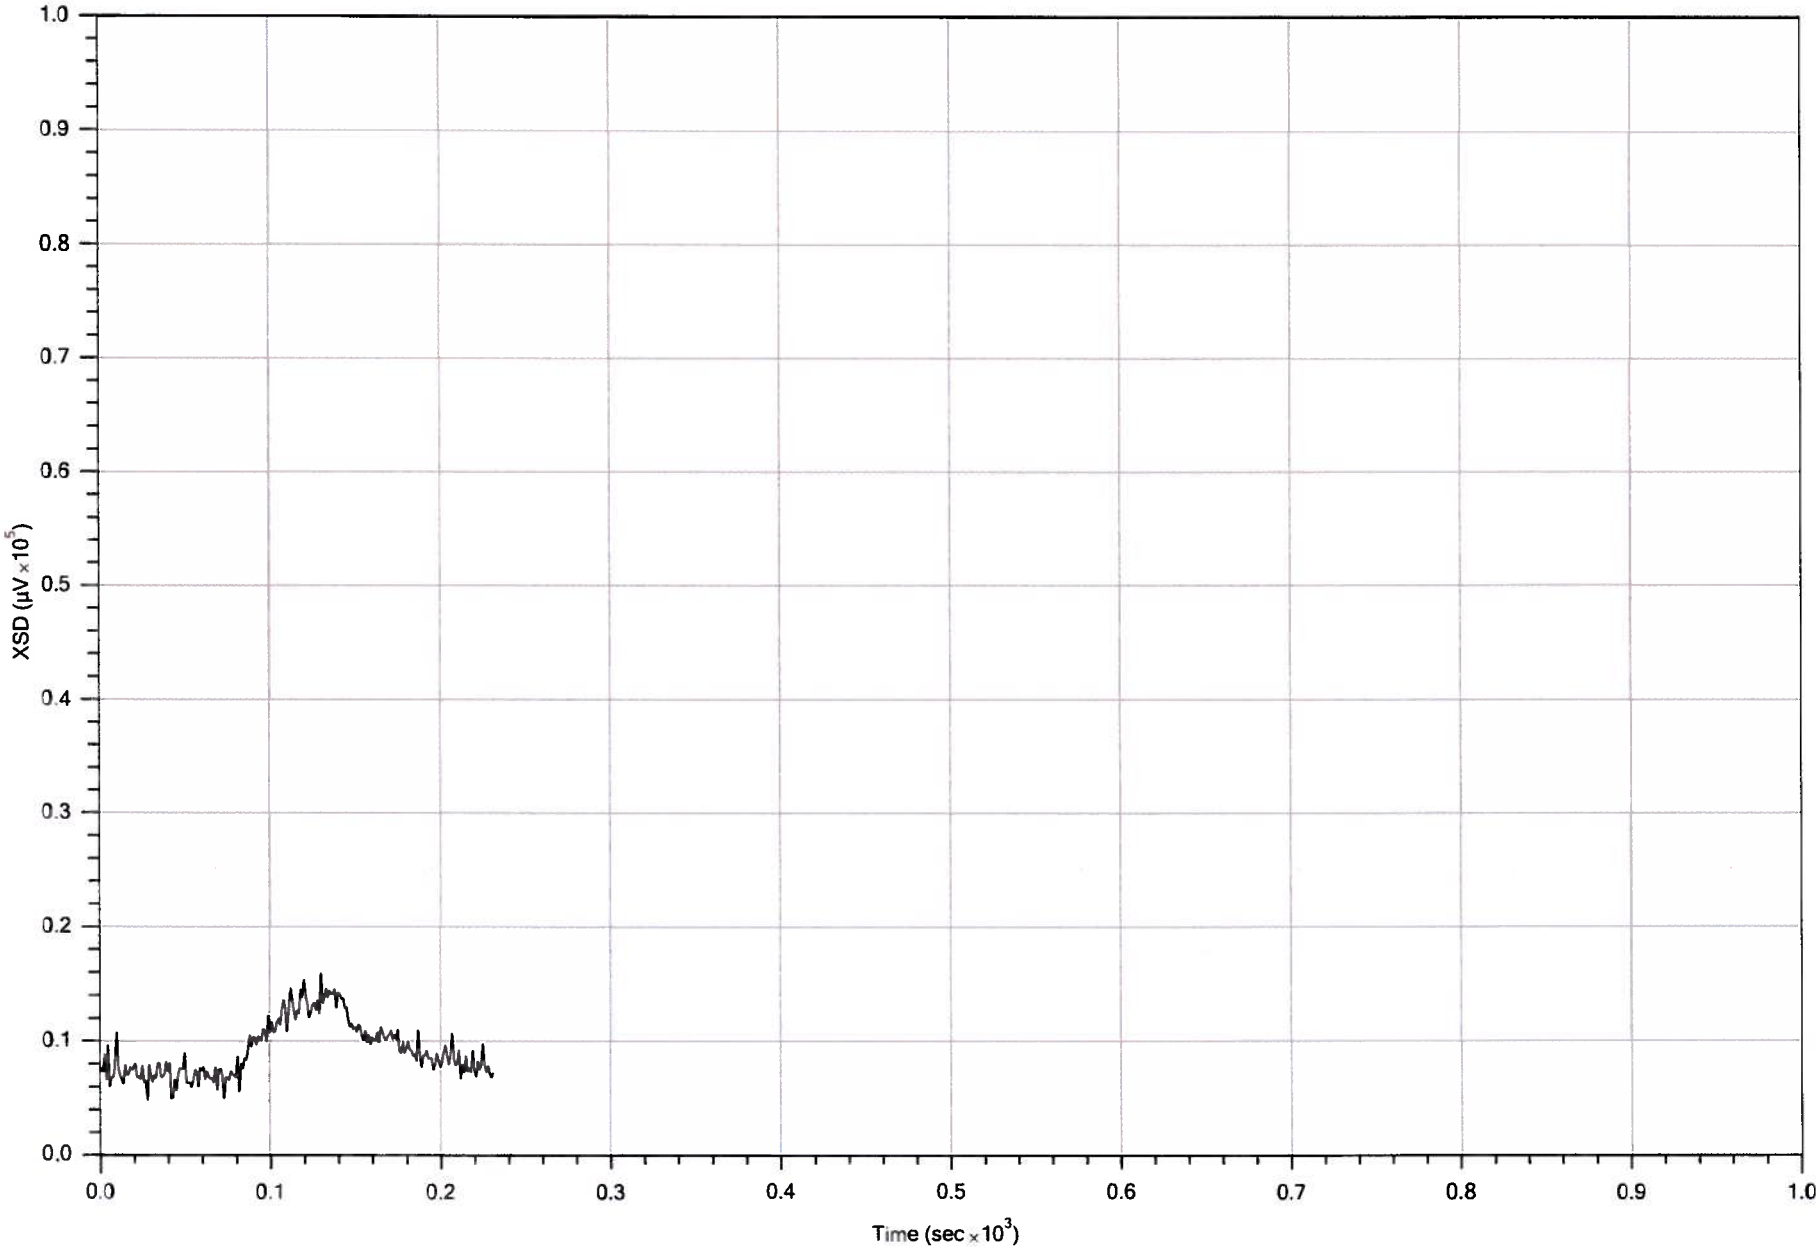
TIME	DET1	DET2	DET3	DET4
0	4	4	10	1
9	4	4	10	1

MIP POST-LOG RESPONSE TEST

FILENAME: MIP-55.post.tim
COMPOUND: TCE
CONCENTRATION: 1, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Tue Nov 6 2012 09:25:58

RESPONSE TEST ATTENUATION CHANGES

TIME	DET1	DET2	DET3	DET4
0	4	4	10	1



POST-LOG RESPONSE

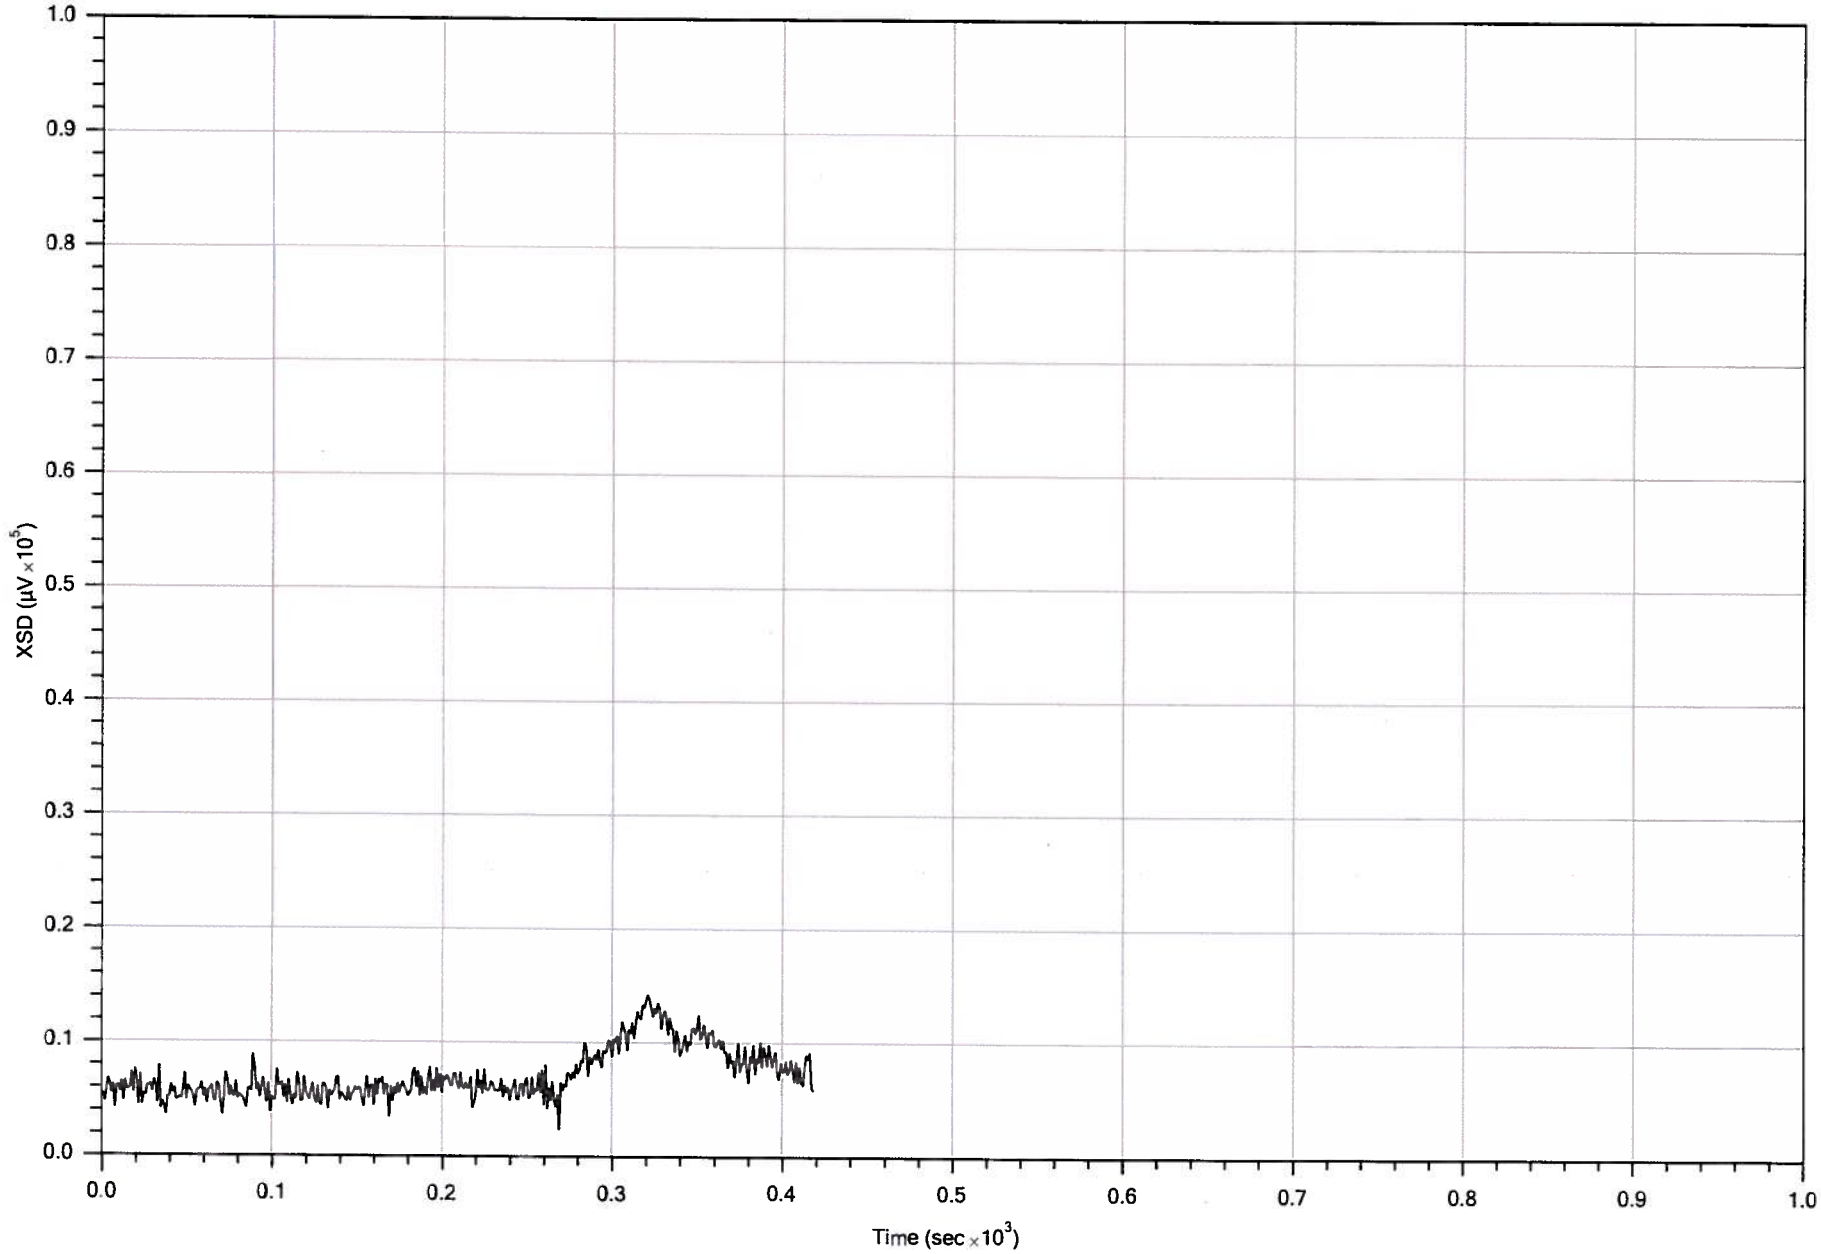
File: MIP-56.POST.TIM			Date: 11/6/2012
Company: Matrix Environmental	Operator: Mike Jenson	Detector: XSD	Concentration: 5 ppm
Project ID: 131-MNDS-12MIP	Client: Golder	Compound: TCE	Peak Response: 15946 µV

MIP POST-LOG RESPONSE TEST

FILENAME: MIP-56.post.tim
COMPOUND: TCE
CONCENTRATION: 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Tue Nov 6 2012 10:49:45

RESPONSE TEST ATTENUATION CHANGES

TIME	DET1	DET2	DET3	DET4
0	4	4	10	1



POST-LOG RESPONSE

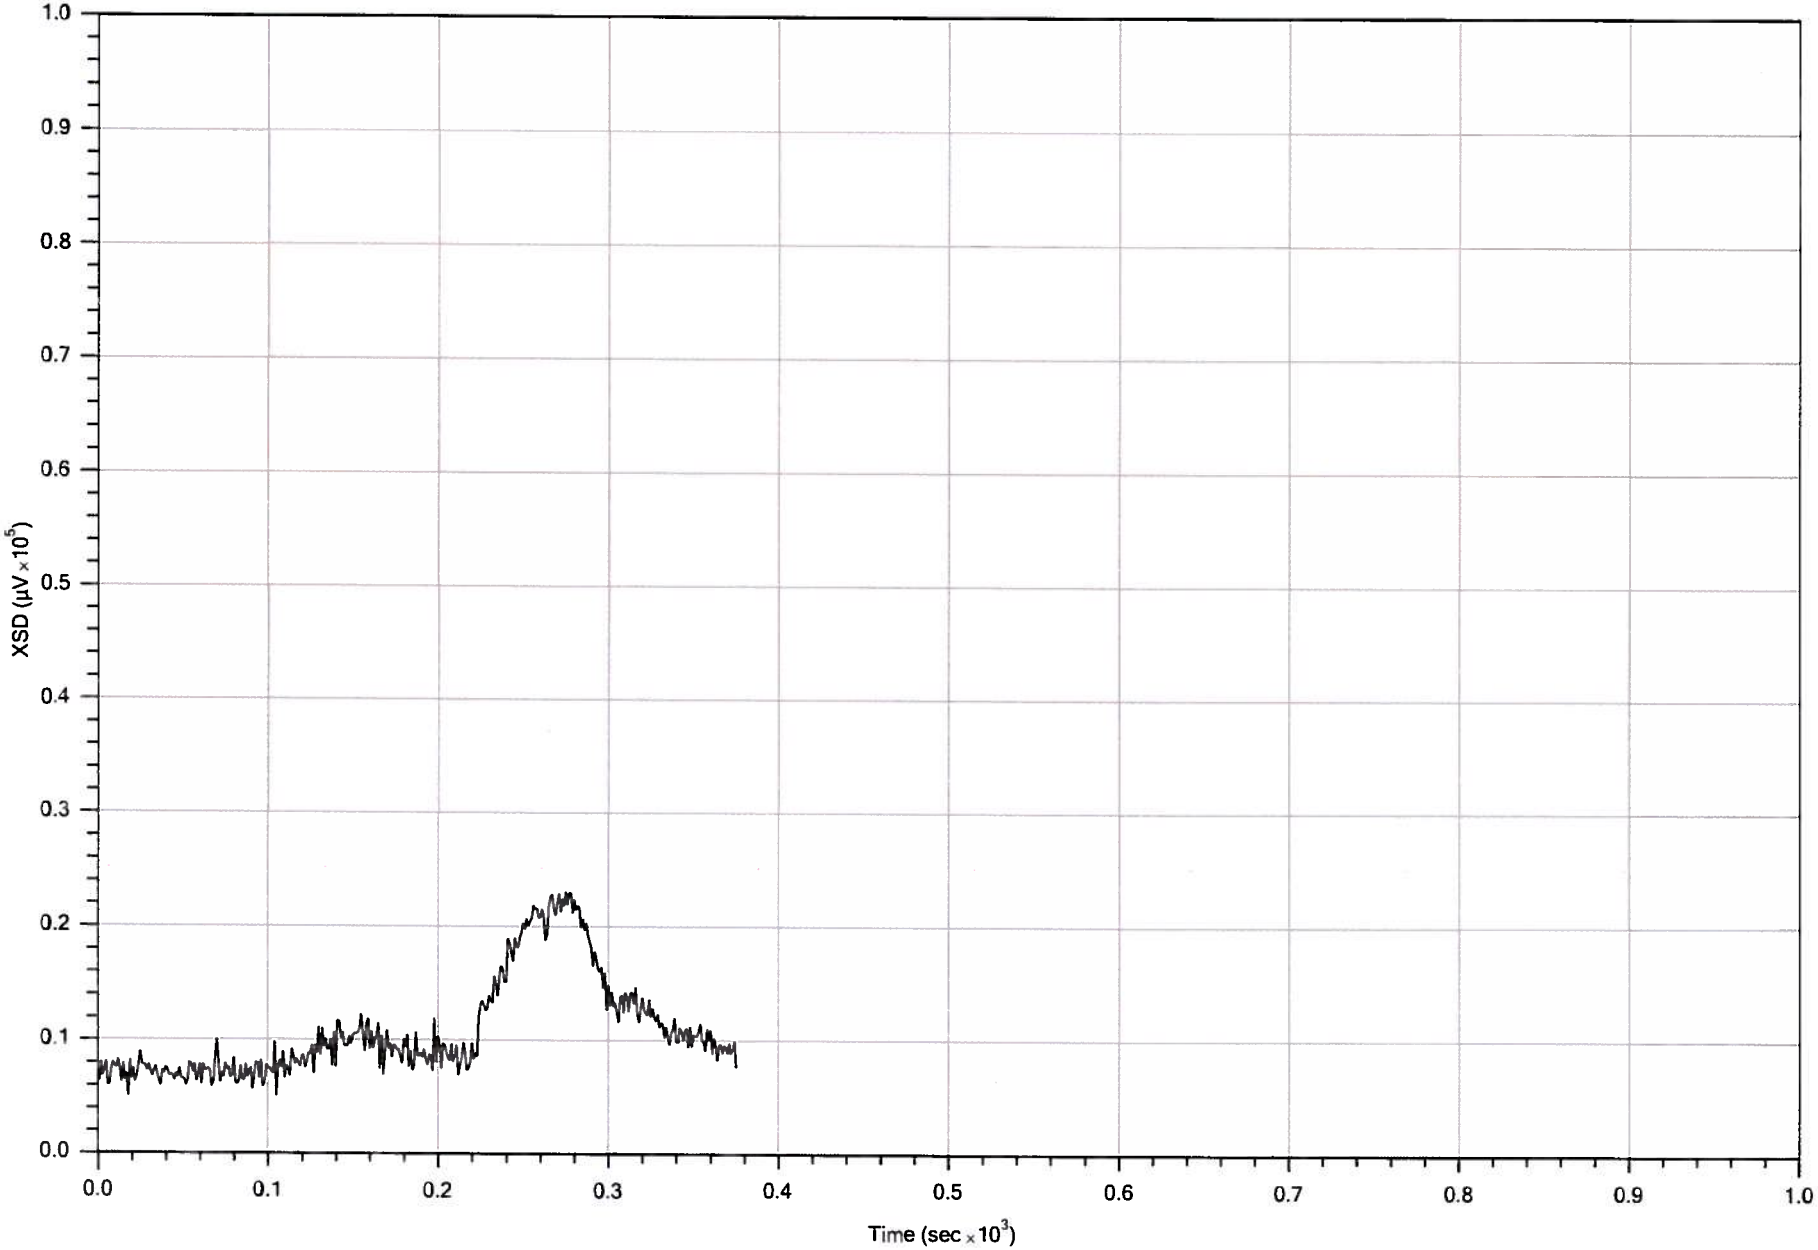
Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-57.POST.TIM	Date: 11/6/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 1, 5 ppm
		Compound: TCE	Peak Response: 14191 µV

MIP POST-LOG RESPONSE TEST

FILENAME: MIP-57.post.tim
COMPOUND: TCE
CONCENTRATION: 1, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Tue Nov 6 2012 11:53:13

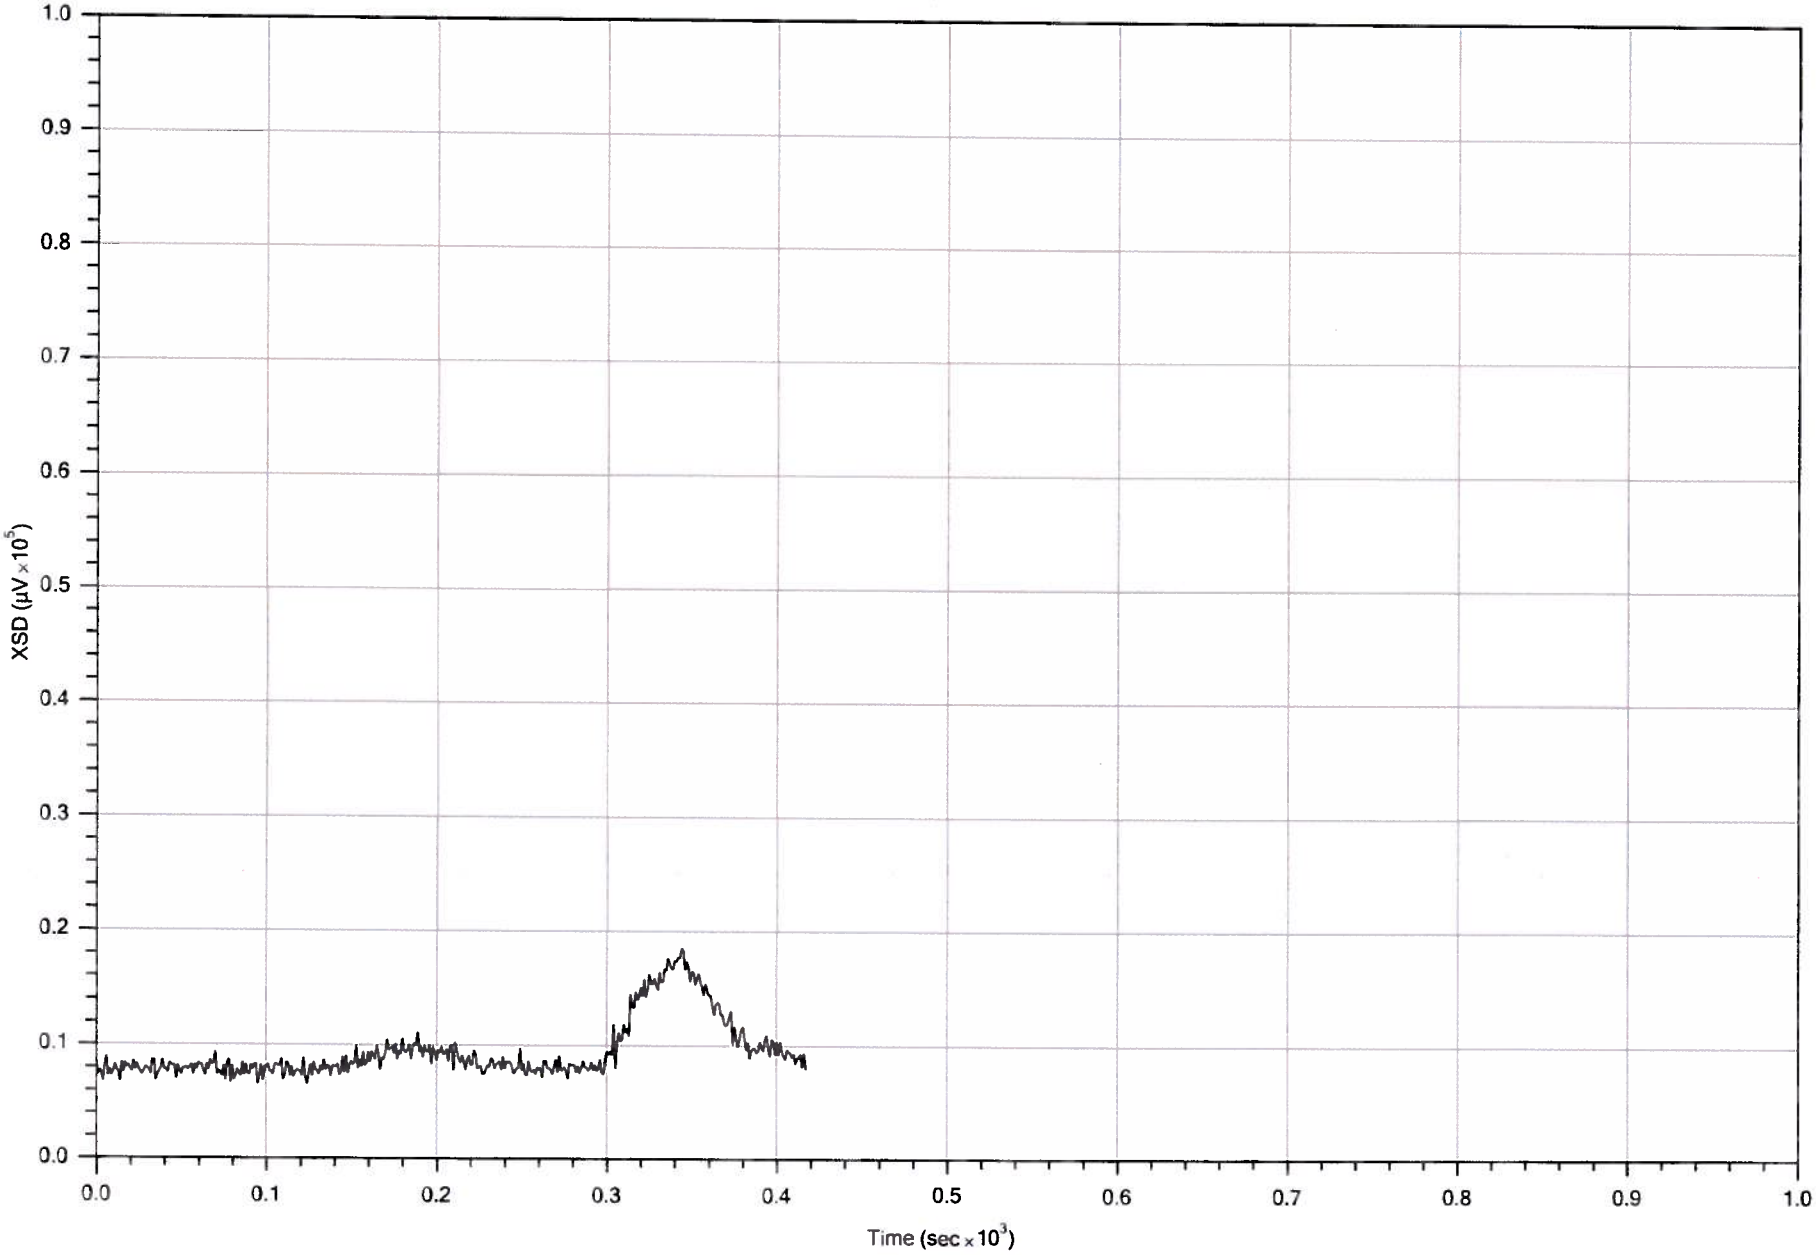
RESPONSE TEST ATTENUATION CHANGES

TIME	DET1	DET2	DET3	DET4
0	4	4	10	1



PRE-LOG RESPONSE

Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-58.PRE.TIM	Date: 11/6/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 1, 5 ppm
		Compound: TCE	Peak Response: 23041 µV



POST-LOG RESPONSE

Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-58.POST.TIM	Date: 11/6/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 1, 5 ppm
		Compound: TCE	Peak Response: 18540 µV

MIP PRE-LOG RESPONSE TEST

FILENAME: MIP-58.pre.tim
COMPOUND: TCE
CONCENTRATION: 1, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Tue Nov 6 2012 13:36:45

RESPONSE TEST ATTENUATION CHANGES

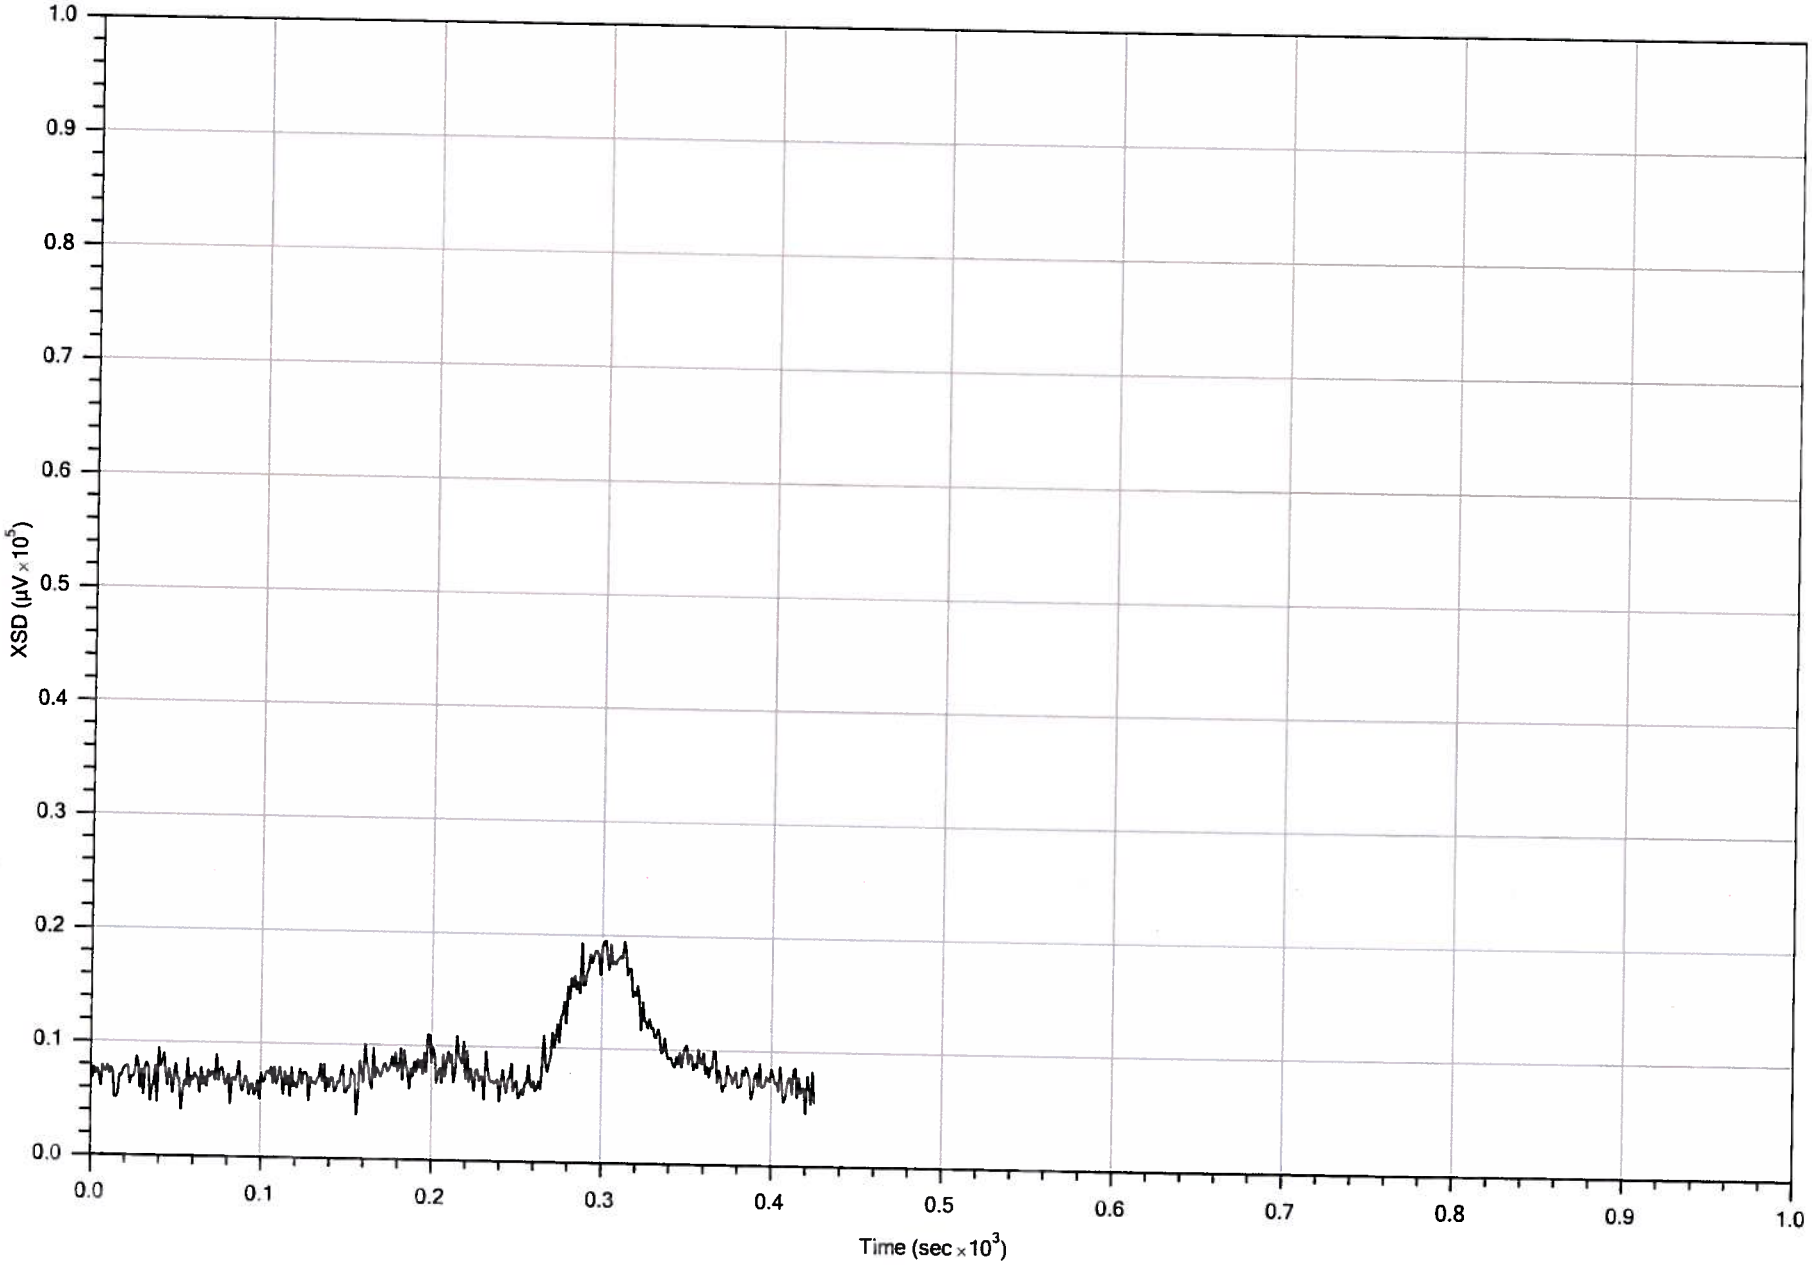
TIME	DET1	DET2	DET3	DET4
0	4	4	10	1

MIP POST-LOG RESPONSE TEST

FILENAME: MIP-58.post.tim
COMPOUND: TCE
CONCENTRATION: 1, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Tue Nov 6 2012 14:27:44

RESPONSE TEST ATTENUATION CHANGES

TIME	DET1	DET2	DET3	DET4
0	4	4	10	1



POST-LOG RESPONSE

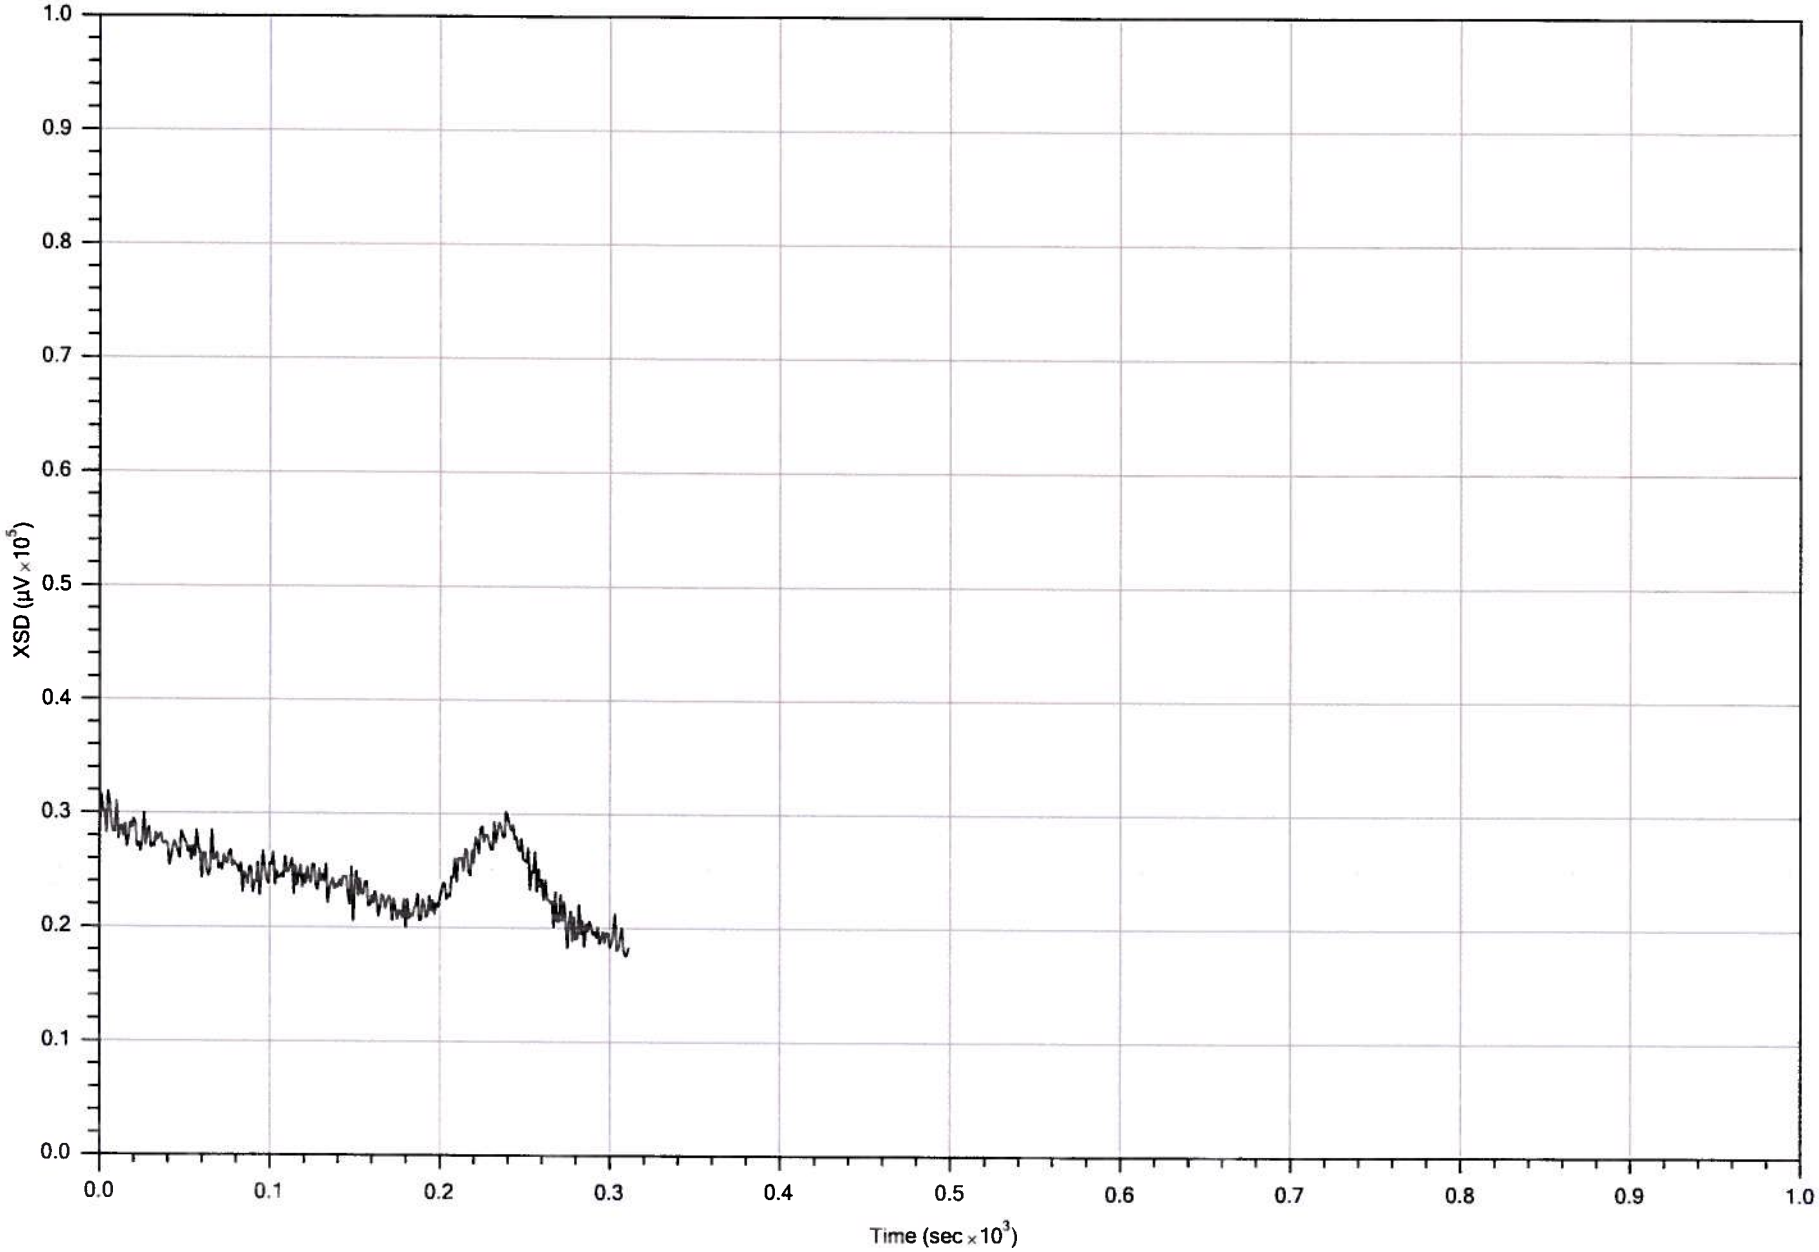
Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-59.POST.TIM	Date: 11/6/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 1. 5 ppm
		Compound: TCE	Peak Response: 19608 µV

MIP POST-LOG RESPONSE TEST

FILENAME: MIP-59.post.tim
COMPOUND: TCE
CONCENTRATION: 1, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Tue Nov 6 2012 15:29:47

RESPONSE TEST ATTENUATION CHANGES

TIME	DET1	DET2	DET3	DET4
0	4	4	10	1



POST-LOG RESPONSE

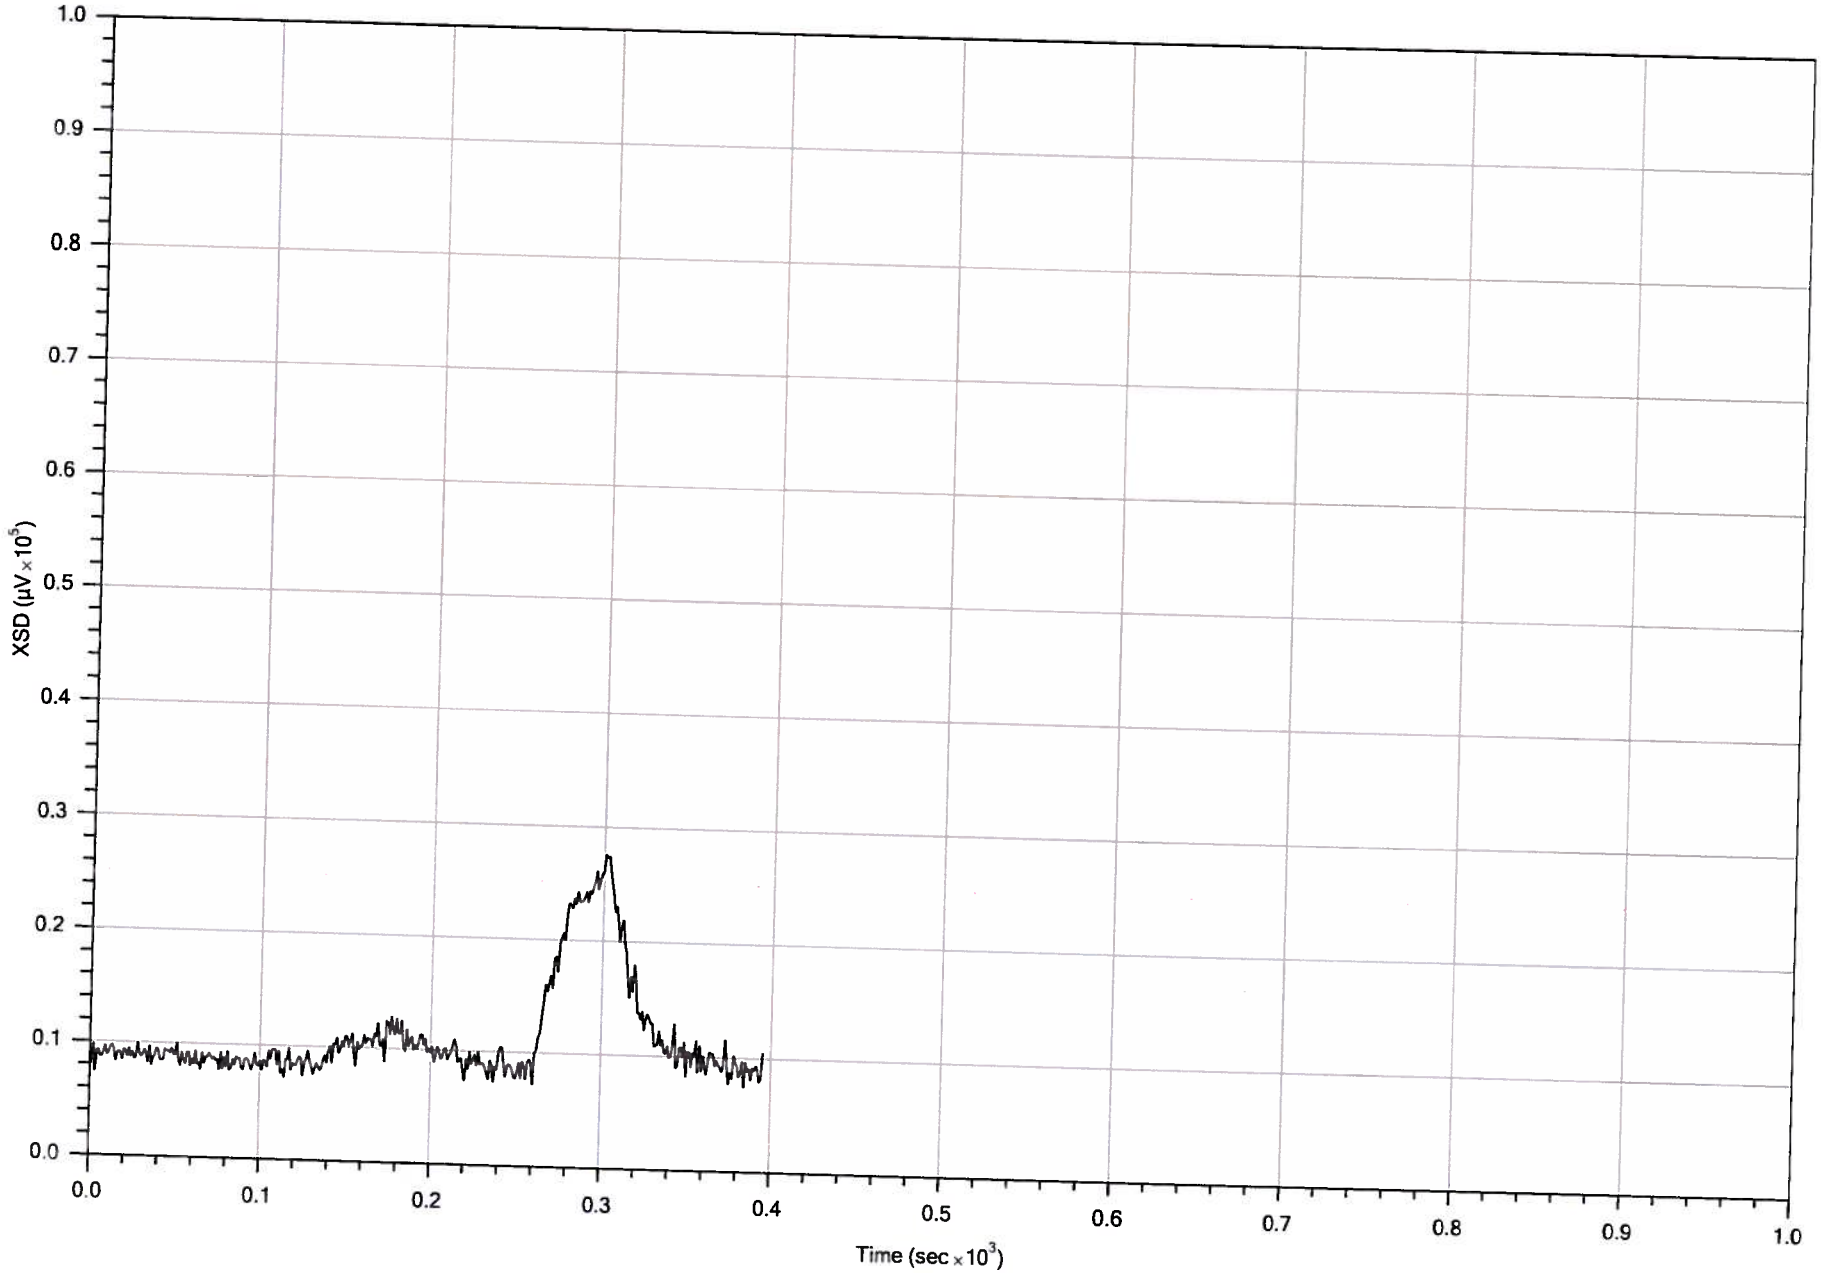
Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-60.POST.TIM	Date: 11/6/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 1, 5 ppm
		Compound: TCE	Peak Response: 31892 µV

MIP POST-LOG RESPONSE TEST

FILENAME: MIP-60.post.tim
COMPOUND: TCE
CONCENTRATION: 1, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Tue Nov 6 2012 16:44:06

RESPONSE TEST ATTENUATION CHANGES

TIME	DET1	DET2	DET3	DET4
0	4	4	10	1



POST-LOG RESPONSE

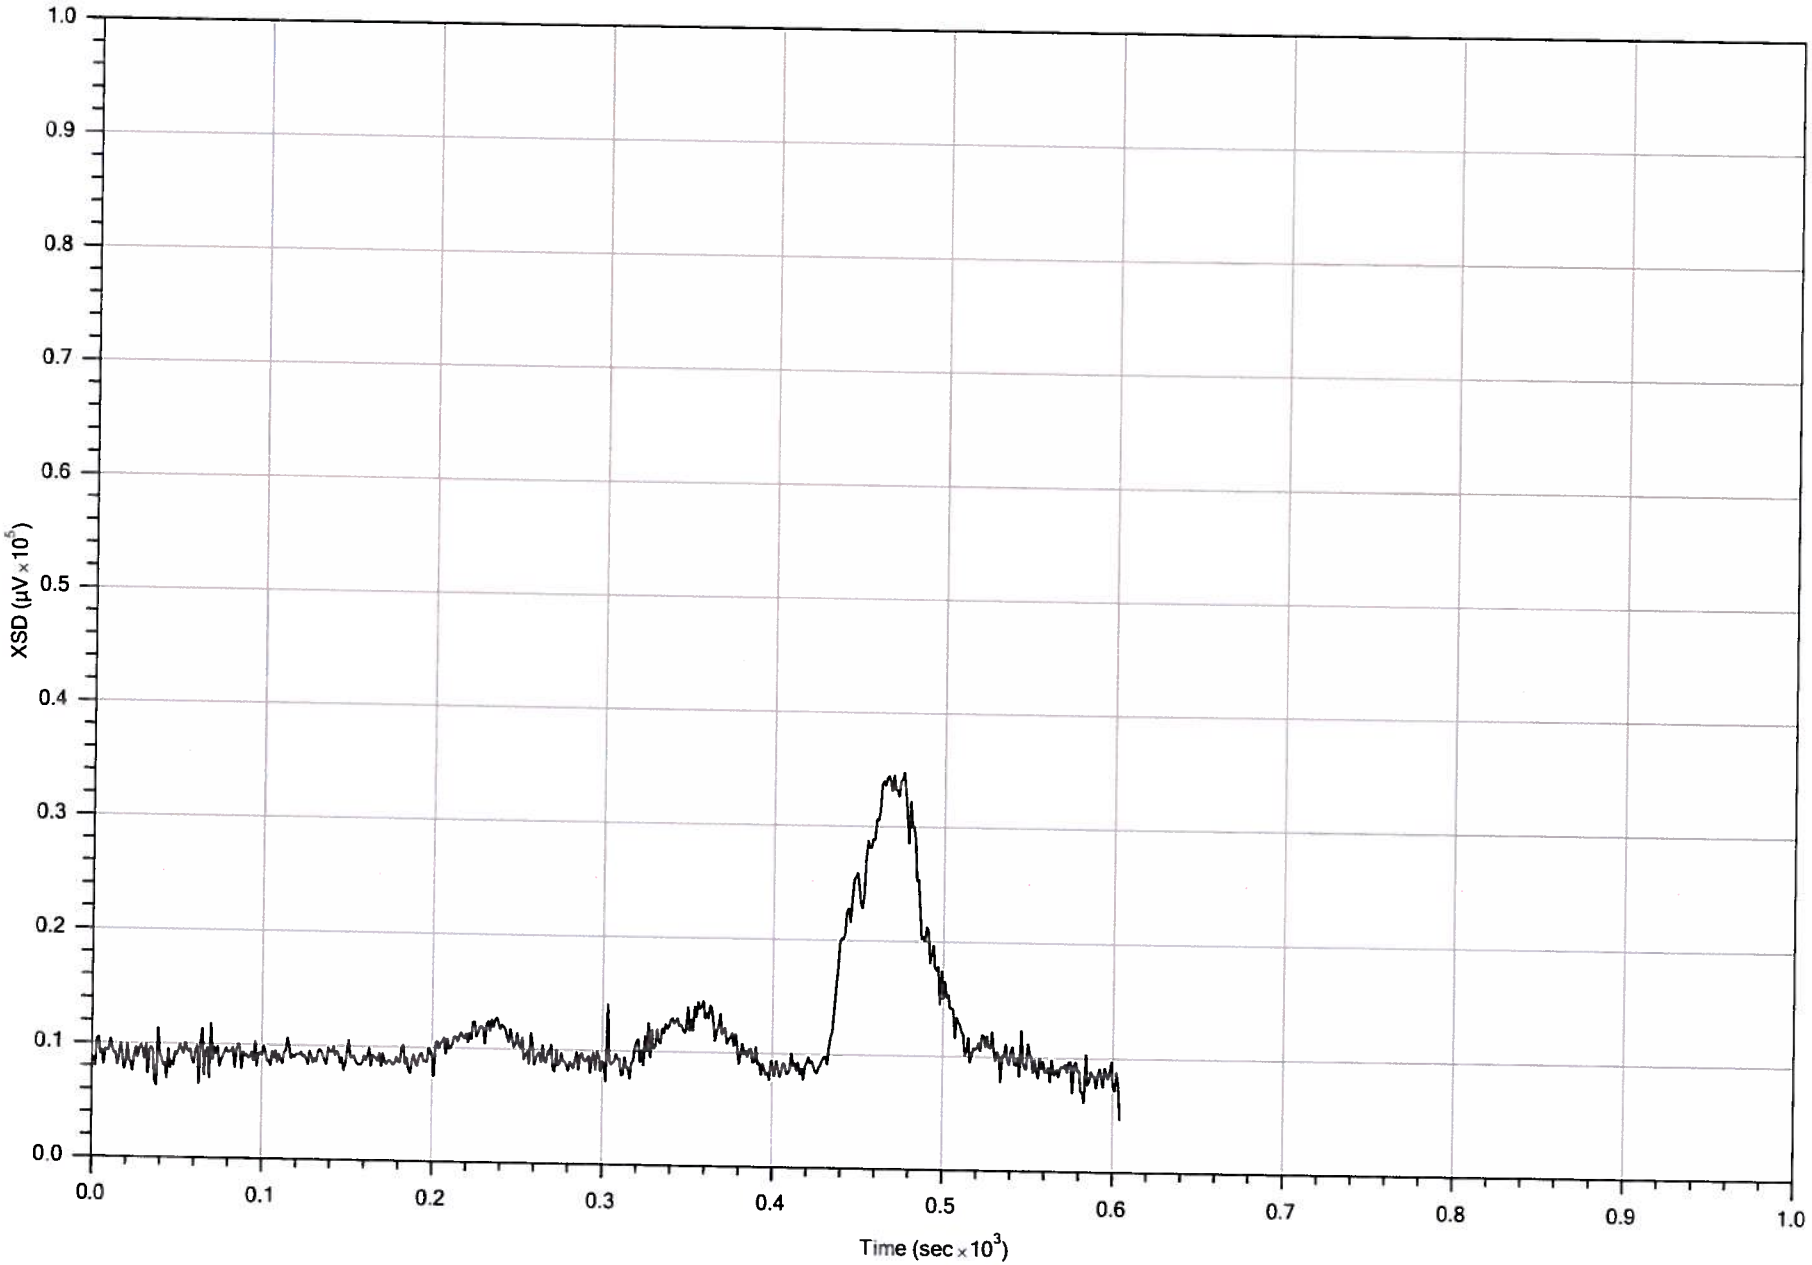
Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-61.POST.TIM	Date: 11/6/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 1, 5 ppm
		Compound: TCE	Peak Response: 27619 µV

MIP POST-LOG RESPONSE TEST

FILENAME: MIP-61.post.tim
COMPOUND: TCE
CONCENTRATION: 1, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Tue Nov 6 2012 17:36:30

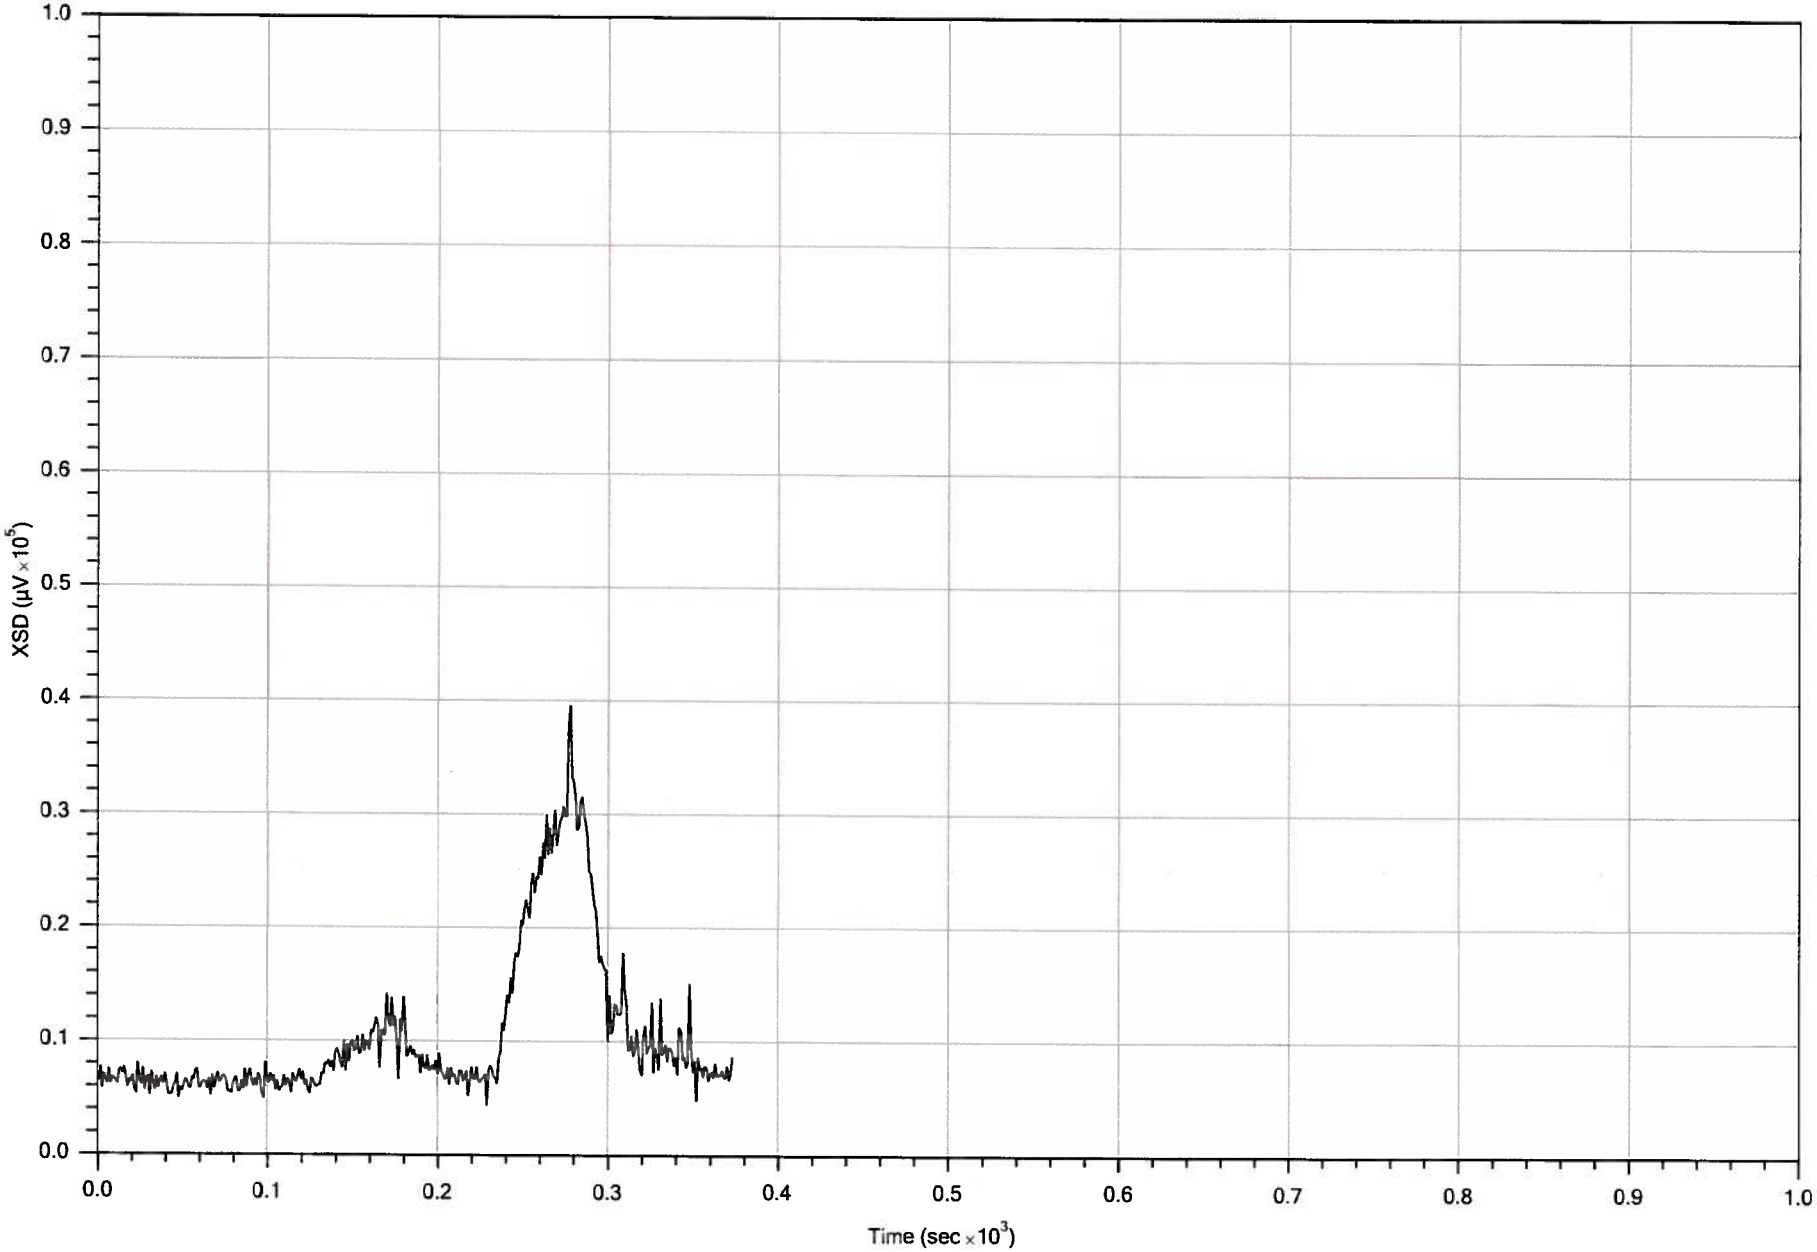
RESPONSE TEST ATTENUATION CHANGES

TIME	DET1	DET2	DET3	DET4
0	4	4	10	1



PRE-LOG RESPONSE

Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-62.PRE.TIM	Date: 11/7/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 0, 0.5, 1, 5 ppm
		Compound: TCE	Peak Response: 34791 µV



POST-LOG RESPONSE

Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-62.POST.TIM	Date: 11/7/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 1, 5 ppm
		Compound: TCE	Peak Response: 39598 µV

MIP PRE-LOG RESPONSE TEST

FILENAME: MIP-62.pre.tim
COMPOUND: TCE
CONCENTRATION: 0, 0.5, 1, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Wed Nov 7 2012 07:20:10

RESPONSE TEST ATTENUATION CHANGES

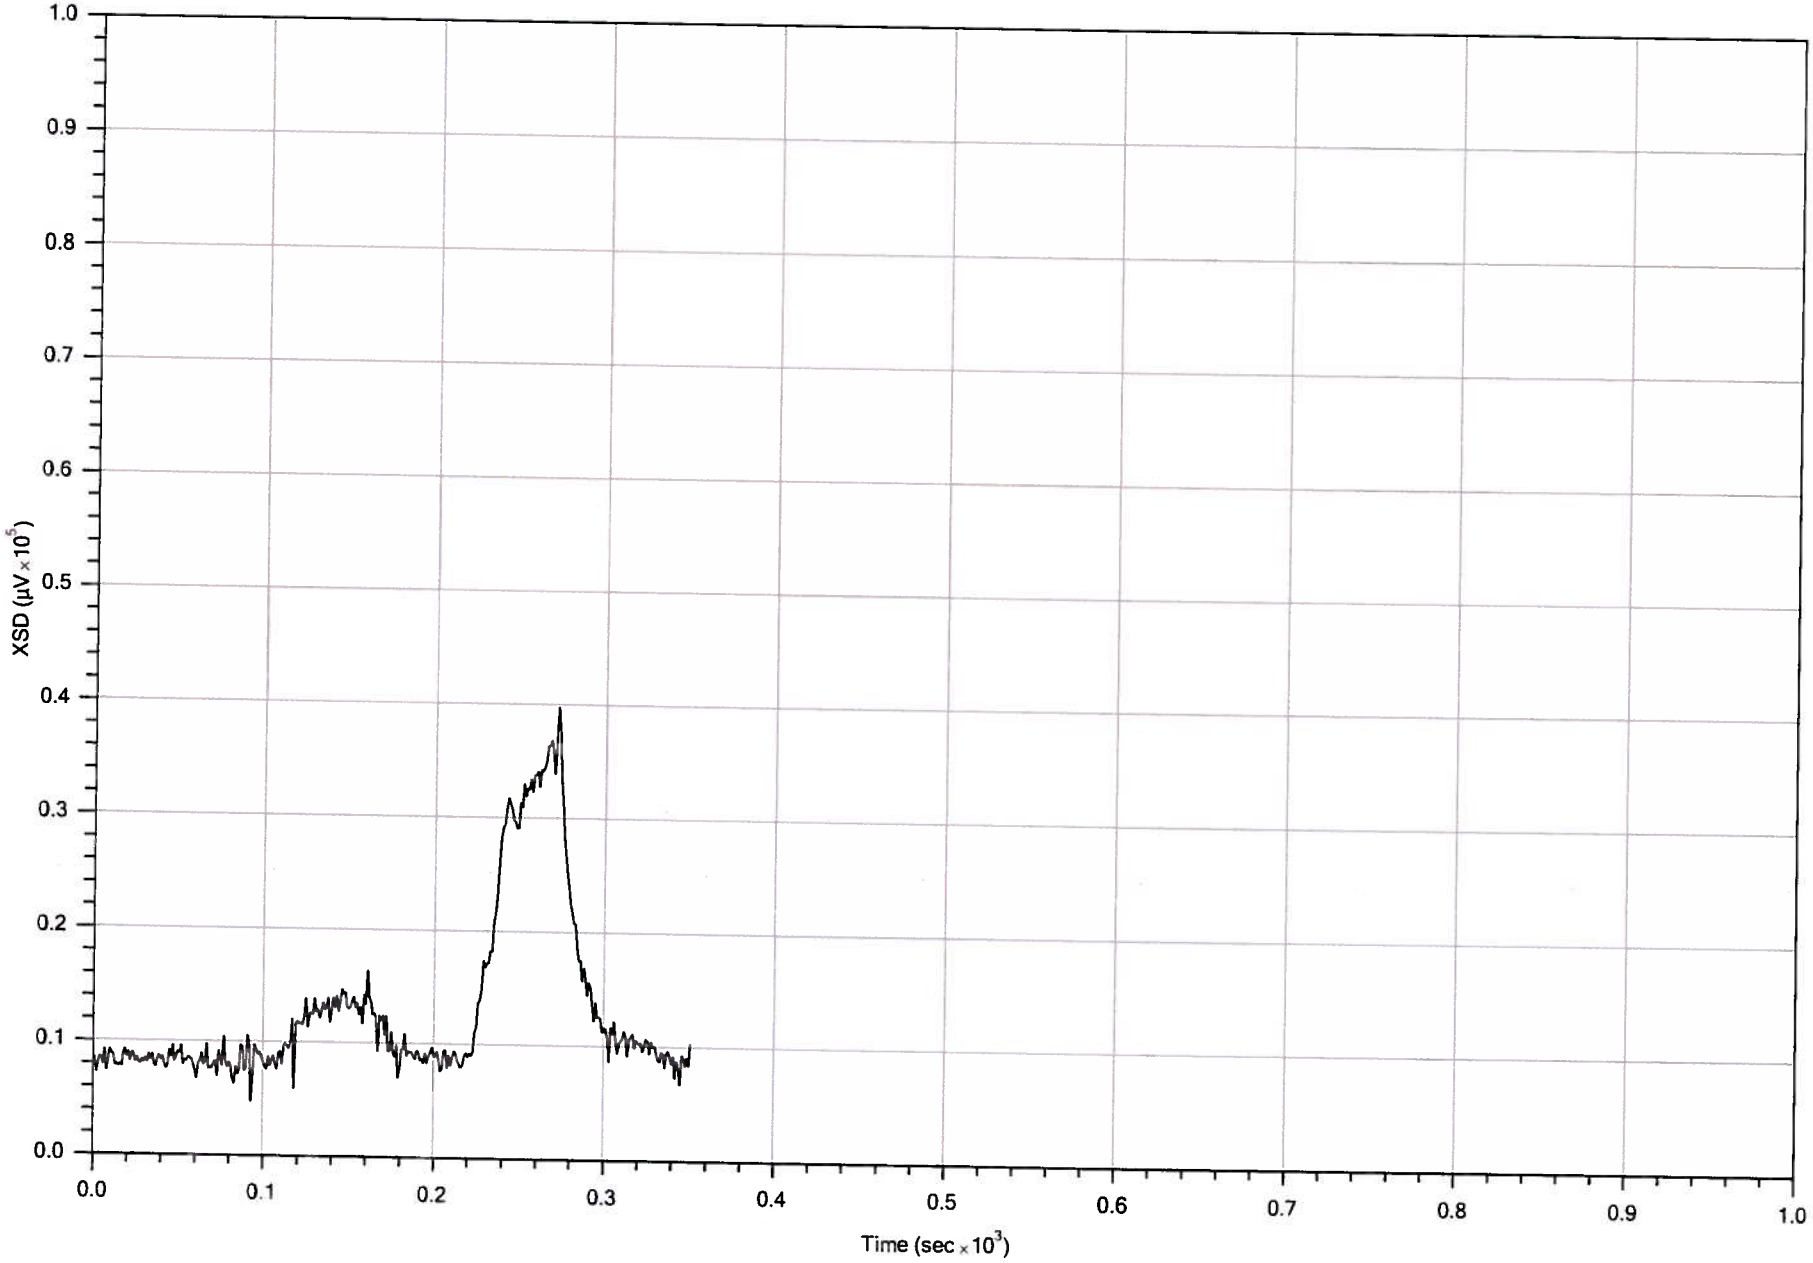
TIME	DET1	DET2	DET3	DET4
0	4	4	10	1

MIP POST-LOG RESPONSE TEST

FILENAME: MIP-62.post.tim
COMPOUND: TCE
CONCENTRATION: 1, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Wed Nov 7 2012 08:28:29

RESPONSE TEST ATTENUATION CHANGES

TIME	DET1	DET2	DET3	DET4
0	4	4	10	1



POST-LOG RESPONSE

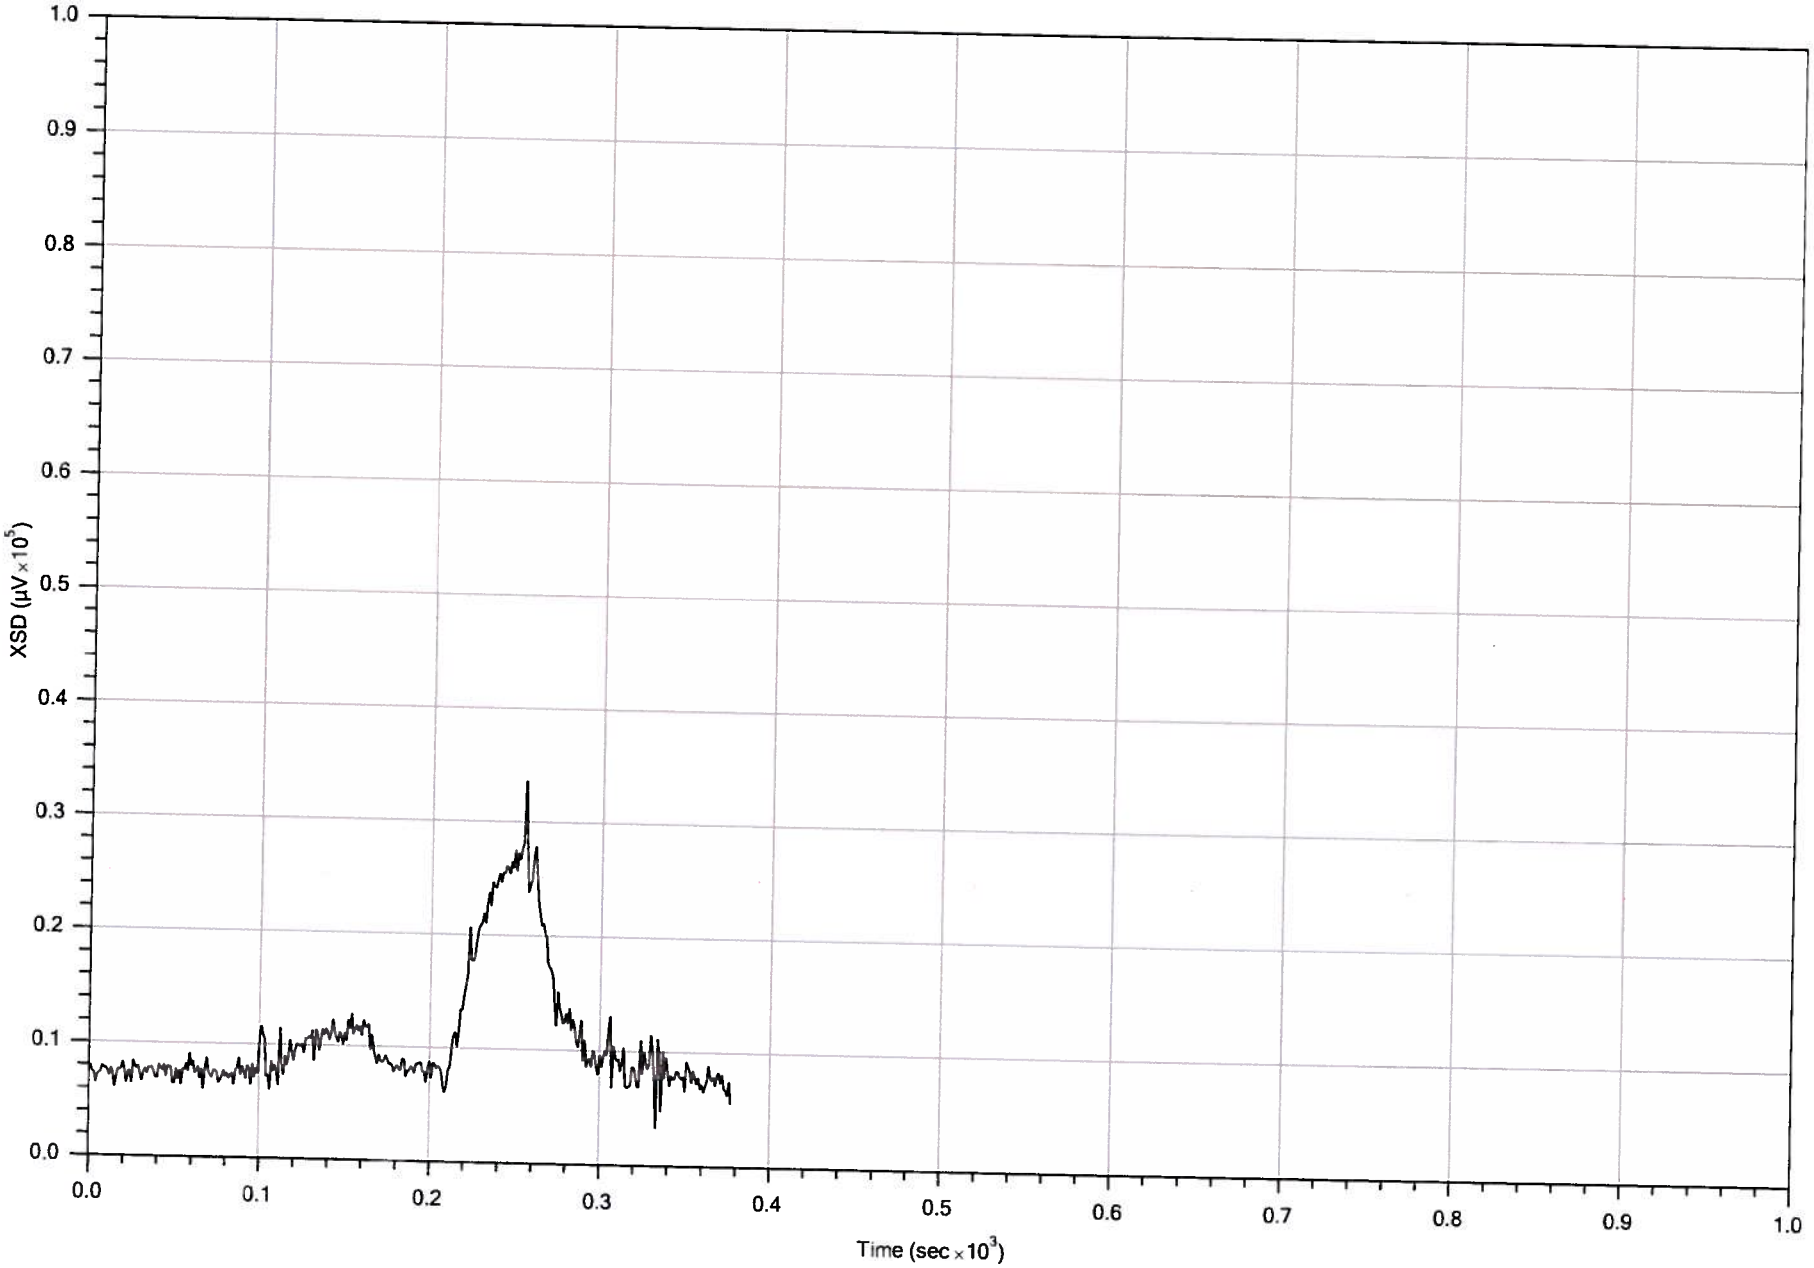
Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-63.POST.TIM	Date: 11/7/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 1, 5 ppm
		Compound: TCE	Peak Response: 39827 µV

MIP POST-LOG RESPONSE TEST

FILENAME: MIP-63.post.tim
COMPOUND: TCE
CONCENTRATION: 1, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Wed Nov 7 2012 09:27:15

RESPONSE TEST ATTENUATION CHANGES

TIME	DET1	DET2	DET3	DET4
0	4	4	10	1



POST-LOG RESPONSE

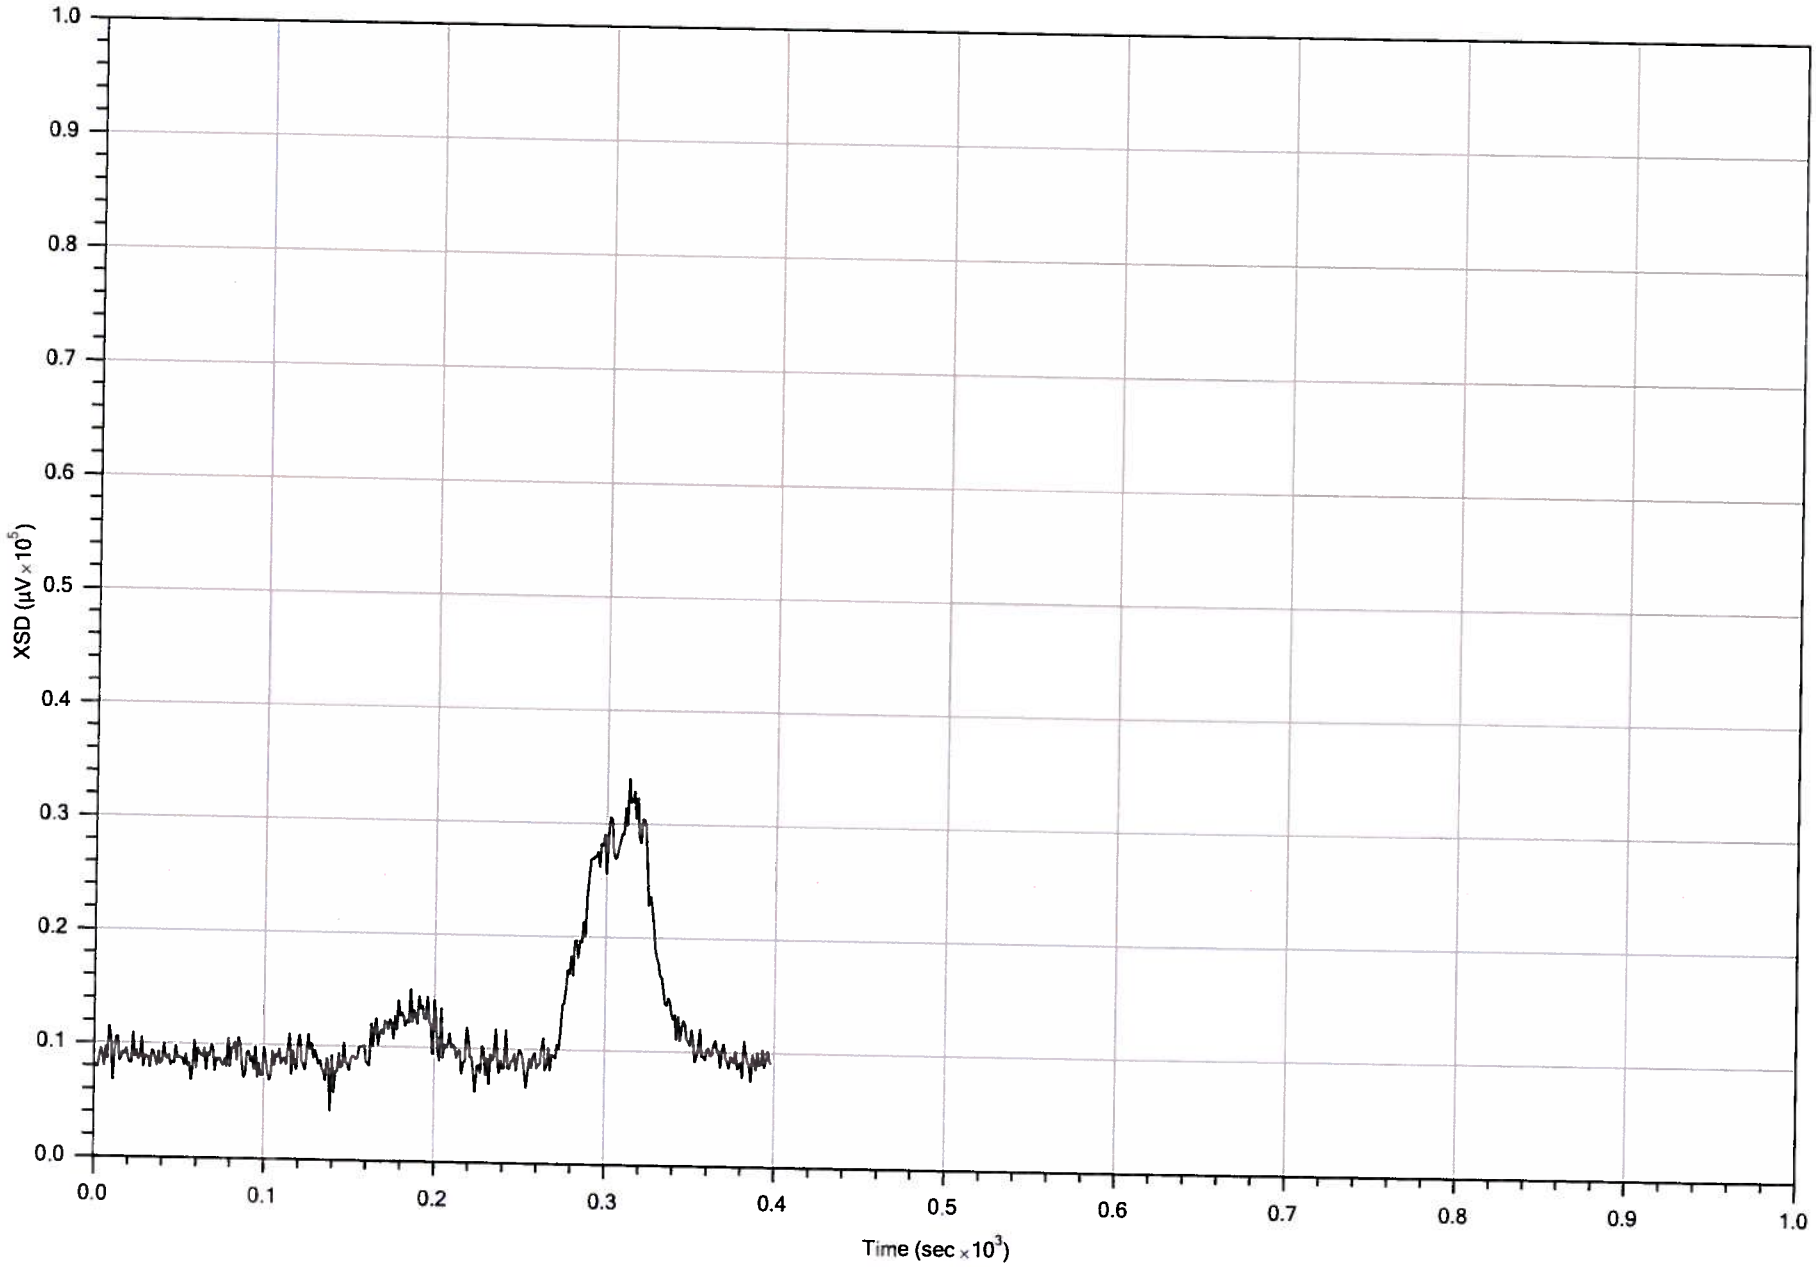
Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-64.POST.TIM	Date: 11/7/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 1, 5 ppm
		Compound: TCE	Peak Response: 33647 µV

MIP POST-LOG RESPONSE TEST

FILENAME: MIP-64.post.tim
COMPOUND: TCE
CONCENTRATION: 1, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Wed Nov 7 2012 10:27:26

RESPONSE TEST ATTENUATION CHANGES

TIME	DET1	DET2	DET3	DET4
0	4	4	10	1



POST-LOG RESPONSE

Company: Matrix Environmental	Operator: Mike Jenson	File: MIP-65.POST.TIM	Date: 11/7/2012
Project ID: 131-MNDS-12MIP	Client: Golder	Detector: XSD	Concentration: 1, 5 ppm
		Compound: TCE	Peak Response: 34028 µV

MIP POST-LOG RESPONSE TEST

FILENAME: MIP-65.post.tim
COMPOUND: TCE
CONCENTRATION: 1, 5 ppm
FLOW: 40 mL/min
RESPONSE TEST START TIME: Wed Nov 7 2012 11:36:14

RESPONSE TEST ATTENUATION CHANGES

TIME	DET1	DET2	DET3	DET4

- 5 RE
- 1 RE
- 0.01 RE

NOTES

1.) BM #1 elev. = 1052.49 (NAVD 88) center top non-operating bolt on fire hydrant Northwest of main building.

2.) JEO consulting group did not find useful NGS monuments in the Jefferson area. A USGS 24,000k Topographic map elevation (1054.00) at the intersection of Mulberry Street and East Central Street as the assumed NAVD 88 elevation. This elevation agreed with the elevation generated from Geoid-09.

3.) The coordinates for this site are approximate Iowa State Plane North 1401 with a ground scale factor of 1.0000463418.

4.) LNAPL = Light, non-aqueous phase liquid.

5.) RE = Reference emitter.

REFERENCES

Basemap taken from JEO Consulting Group, Inc. drawing titled, "Electrolux Home Products base map", dated 11/21/10, revised May 2012.

FIGURE NARRATIVE

This figure illustrates the maximum LIF response recorded at each LIF probe location during the LIF surveys performed in April and November 2012. The color flood of the discs is indicative of responses observed at each LIF location. The diameter of the borings is exaggerated.

This figure also includes the interpreted extent of light, non-aqueous phase liquid present on site based on LIF and MIP results and TEH groundwater concentrations. In same cases, the maximum LIF response may not be indicative of the presence of LNAPL. See text for additional discussion.

Conditions between LIF borings and wells may vary. Other interpretations are possible.

- Unoxidized gray till
- Yellow brown till
- Indicates more coarse-grained soil, sand and gravel

NOTES

1.) Golder developed the geologic cross sections using Environmental Visualization System (EVS) software developed by CTech Corporation (Version 9.84). Where necessary, Golder adjusted EVS output using professional judgment.

2.) Geologic contacts illustrated between and below borings are inferred and should not be interpreted as exact indicators of geologic conditions at, between or below borings.

3.) The projection of well screens onto geologic units may not reflect actual geologic conditions at the well screen interval due to variations in the elevation of geologic layers with distance from the cross-section centerline.

FIGURE NARRATIVE

This figure shows the LIF responses and TEH groundwater concentrations for the north-south cross-section (C - C') on the eastern side of Building 1. The cross-section includes LIF data obtained during April and November 2012 and groundwater data collected in December 2012 and March 2013. The color flood and diameter of the discs shown on the cross-section indicate the reference emitter (RE) response at each LIF location. The diameter of the borings is exaggerated proportionally to the LIF response.

This figure also illustrates the interpreted geologic conditions. Contacts shown in the cross-section are Golder's interpretation of the lithology, obtained from borings installed during the assessment activities in April and November 2012 and February 2013. Conditions between borings may vary. Other interpretations are possible.

FIGURE NARRATIVE

This figure shows the LIF responses and TEH groundwater concentrations for the east-west cross-section (E - E') for the area south of Building 1 and center of Building 2. The cross-section includes LIF data obtained during April and November 2012 and groundwater data collected in December 2012 and March 2013. The color flood and diameter of the discs shown on the cross-section indicate the percent reference emitter (RE) response at each LIF location. The diameter of the borings is exaggerated proportionally to the LIF response.

This figure also illustrates the interpreted geologic conditions. Contacts shown in the cross-section are Golder's interpretation of the lithology, obtained from borings installed during the assessment activities in April and November 2012 and February 2013. FIGURE NARRATIVE

This figure shows the LIF responses and TEH groundwater concentrations for the north-south cross-section (G - G') on the west/central side of Building 1. The cross-section includes LIF data obtained during April and November 2012 and groundwater data collected in April and December 2012. The color flood and diameter of the discs shown on the cross-section indicate the reference emitter (RE) response at each LIF location. The diameter of the borings is exaggerated proportionally to the LIF response.

This figure also illustrates the interpreted geologic conditions. Contacts shown in the cross-section are Golder's interpretation of the lithology, obtained from borings installed during the assessment activities in April and November 2012. Conditions between borings may vary. Other interpretations are possible.

-Direct Sensing Report, UVOST-

Client:	**Golder Associates**
Project Name:	**Electrolux**
Location:	**Jefferson, IA**
Project Number:	**047-MNDS-12UV**

The analysis and opinions expressed in this report are based upon data obtained from UVOST logs generated (and samples collected for emulations if applicable) at the location specified, and from other information discussed in this report. Exceptions, if any, are discussed in the accompanying discussion if applicable. This report is prepared for the exclusive use of our client for specific application to the project discussed and has been prepared in accordance with generally accepted practices. Reported results shall not be reproduced, except in full, without written approval of the lab. The sample results relate only to the analytes of interest tested. No warranties, expressed or implied are intended or made.

I certify that the data contained in this final report has been generated and reviewed in accordance with approved methods and our Standard Operating Procedure. Release of this final report is authorized by Laboratory management, which is verified by the following signature.

Approval Signature Date 4/26/12

LIF SYSTEM DESCRIPTION & ANALYSIS

UVOST

Fluorescence is a property of some compounds where absorbed UV light stimulates the emission of photons (light) of a longer wavelength relative to the source emission. The release of the photons can be used to detect small amounts of substance (i.e. polycyclic aromatic hydrocarbons or PAHs) in a larger matrix (soil). This method of detection has been used in laboratories for decades. Now, with the availability of lasers and optical fibers, this technology can be applied down hole in the field.

The UVOST system sends light (via 308 nm laser) through a fiber optic cable strung within probe rods. The light, reflected by a parabolic mirror, then exits through a sapphire window in the side of the probe. As the probe is advanced, the soil is exposed to the UV laser light. If PAHs are present (compounds in POLs that fluoresce, i.e. LNAPL) longer wavelength light is emitted by the contaminants. This "signal" light is transmitted through a return fiber, back up hole to be analyzed. Responses are indicated in real-time on a graph of signal vs. depth. The UVOST log displays "color mixed" signal logs (contributions from 4 channels) and waveforms ("fingerprint" of multi-wavelength) to aid in identification and relative quantity of the contaminant present.

Prior to every log the UVOST system is checked for optical quality by observing the background signal for sources of signal in the fiber, filter, mirror and sapphire window. Also, the reference emitter (a standard proprietary NAPL mixture called the "RE") is placed on the window to determine the qualitative and semi-quantitative properties of the laser system. This is to assure that the RE response has the correct shape and intensity and that the UVOST system is ready to log. Typically the RE will fall between 10,000 and 12,000 pVs (picovolt-seconds, a measure of waveform area) and the background can vary from 0.1% to 1% (area of about 0-100 pVs). It is important to remember that the relationship between the NAPL in the ground and the RE depends on that particular NAPL. The calibration of the system is not to a concentration, but to a known fluorescence signature.

EC (Electrical Conductivity)

Electrical Conductivity (EC) is a measure of the soils ability to conduct an electrical current between two dipoles on the LIF/EC probe. Conductivity is the reciprocal of electrical resistivity and has the units (in our application) of millisiemens per meter (mS/m). Since soil is in the pathway of the charge flow, the grain size can be determined by comparing the EC log to a soil boring. Conductivity readings in the 100s indicate smaller grain (size such as clay). Larger grain size (sand and gravels) are typically in the 10s of mS/m range. Prior to every log the EC point of the UVOST probe is checked for proper operation by performing a voltage test with a voltage meter and a conductivity test with a test block.

UVOST Log Reference Guide

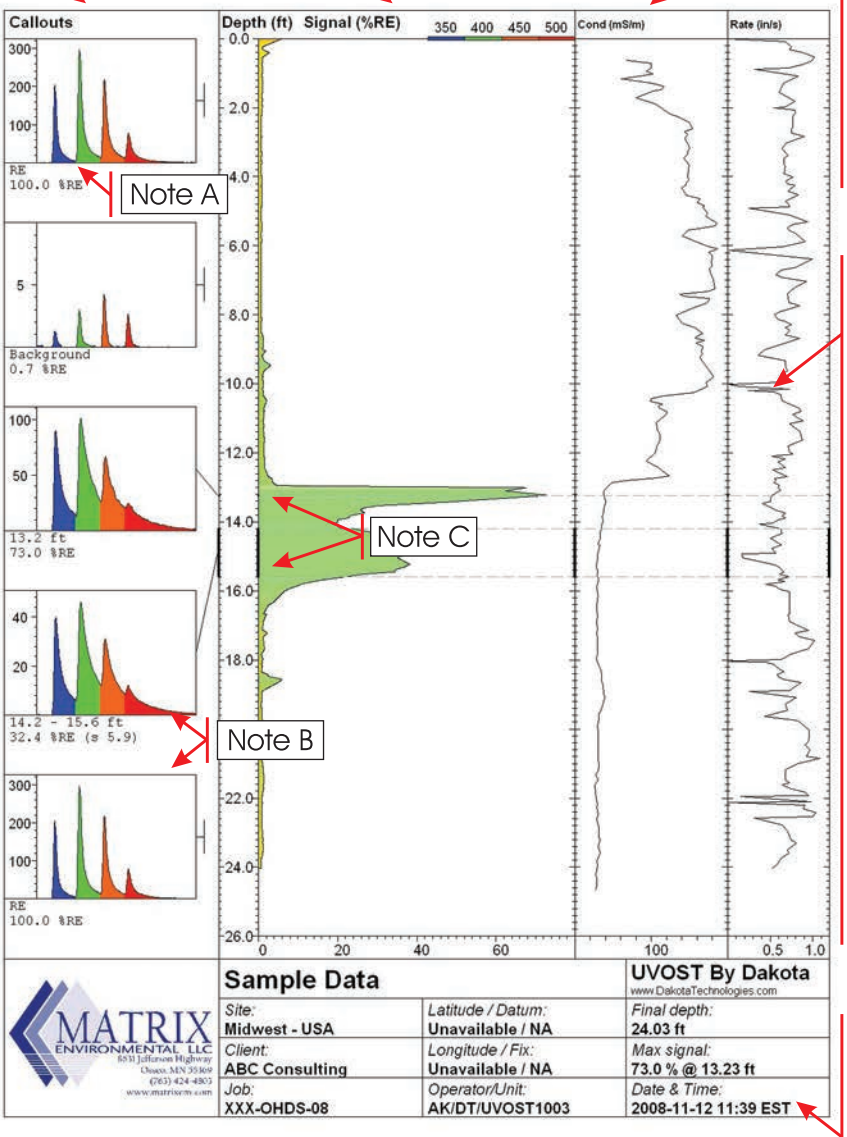
Main Plot :
Signal (total fluorescence) versus depth where signal is relative to the Reference Emitter (RE).The total area of the waveform is divided by the total area of the Reference Emitter yielding the %RE.This %RE scales with the NAPL fluorescence. The fill color is based on relative contribution of each channel's area to the total waveform area (see callout waveform).The channel-to-color relationship and corresponding wavelengths are given in the upper right corner of the main plot.

Callouts :
Waveforms from selected depths or depth ranges showing the multi-wavelength waveform for that depth.

The four peaks are due to fluorescence at four wavelengths and referred to as "channels". Each channel is assigned a color.

Various NAPLs will have a unique waveform "fingerprint" due to the relative amplitude of the four channels and/or broadening of one or more channels.

Basic waveform statistics and any operator notes are given below the callout.



Conductivity Plot :
The Electrical Conductivity (EC) of the soil can be logged simultaneously with the UVOSTdata. EC often provides insight into the stratigraphy.
Note the drop in EC from 10 - 13 ft, indicating a shift from consolidated to unconsolidated stratigraphy.This correlates with the observed NAPL distribution.

Rate Plot :
The rate of probe advancement. ~ 0.8 in (2cm) per second is preferred.

A noticeable decrease in the rate of advancement may be indicative of difficult probing conditions (gravel, angular sands, etc.).

Notice that this log was terminated arbitrarily, not due to "refusal", which would have been indicated by a sudden rate drop at final depth.

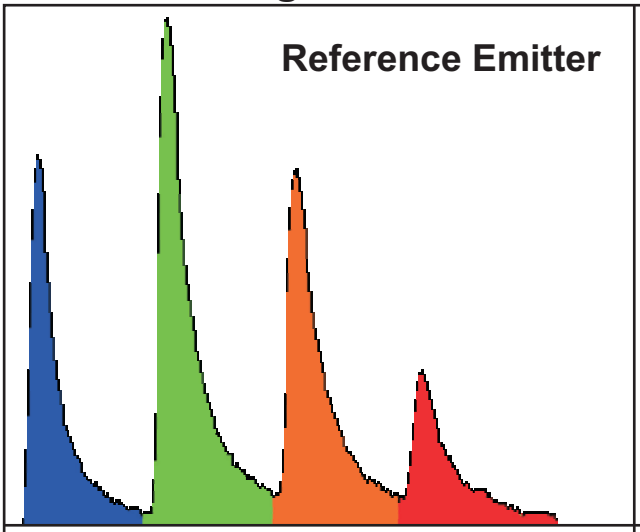
Info Box :
Contains pertinent log info including name and location.

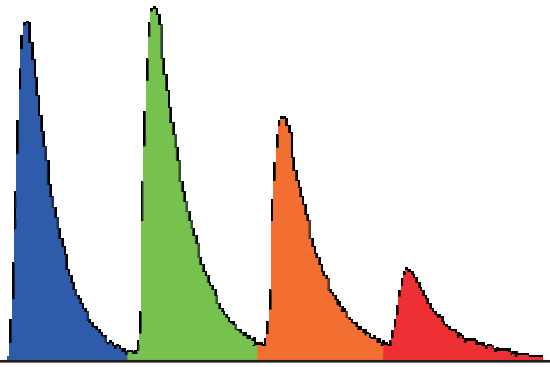
NoteA:
Time is along the x axis. No scale is given, but it is a consistent 320ns wide.
The y axis is in mV and directly corresponds to the amount of light striking the photodetector.

Note B :
These two waveforms are clearly different.The first is weathered diesel from the log itself while the second is the Reference Emitter (a blend of NAPLs) always taken before each log for calibration.

Note C :
Callouts can be a single depth (see 3rd callout) or a range (see 4th callout).The range is noted on the depth axis by a bold line. When the callout is a range, the average and standard deviation in %RE is given below the callout.

Waveform Signal Calculation





CH1		CH2		CH3		CH4		Total		CH1		CH2		CH3		CH4		Total

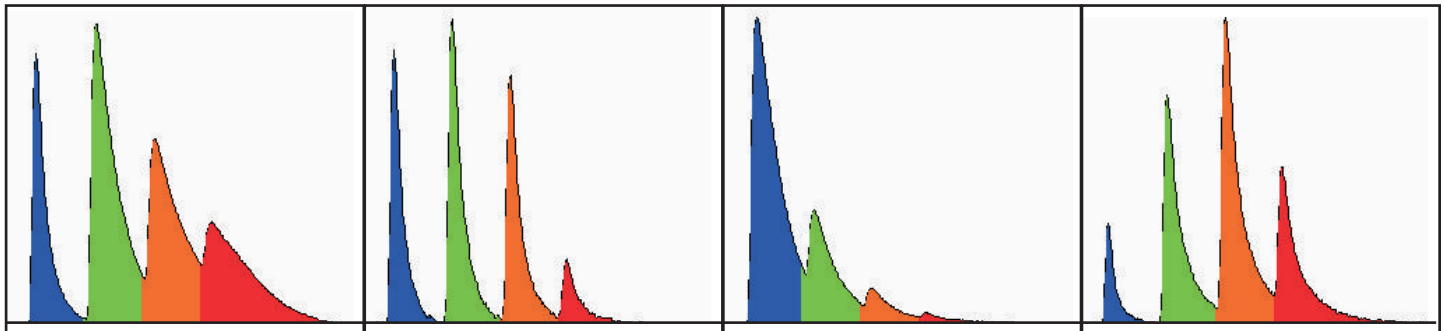
Data Files

***.lif.raw.bin**	Raw data file. Header is ASCII format and contains information stored when the file was initially written (e.g. date, total depth, max signal, gps, etc., and any information entered by the operator). All raw waveforms are appended to the bottom of the file in a binary format.
***.lif.plt**	Stores the plot scheme history (e.g. callout depths) for associated Raw file. Transfer along with the Raw file in order to recall previous plots.
***.lif.jpg**	A jpg image of the OST log including the main signal vs. depth plot, callouts, information, etc.
***.lif.dat.txt**	Data export of a single Raw file. ASCII tab delimited format. No string header is provided for the columns (to make importing into other programs easier). Each row is a unique depth reading. The columns are: Depth, Total Signal (%RE), Ch1%, Ch2%, Ch3%, Ch4%, Rate, Conductivity Depth, Conductivity Signal. Summing channels 1 to 4 yields the Total Signal.
***.lif.sum.txt**	A summary file for a number of Raw files. ASCII tab delimited format. The file contains a string header. The summary includes one row for each Raw file and contains information for each file including: the file name, gps coordinates, max depth, max signal, and depth at which the max signal occured.
***.lif.log.txt**	An activity log generated automatically located in the OST application directory in the 'log' subfolder. Each OST unit the computer operates will generate a separate log file per month. A log file contains much of the header information contained within each separate Raw file, including: date, total depth, max signal, etc.

Common Waveforms (highly dependent on soil, weathering, etc.)



Diesel	Gas	Kerosene	Motor Oil

-Direct Sensing Report, UVOST-

Client:	**Golder Associates**
Project Name:	**Electrolux**
Location:	**Jefferson, IA**
Project Number:	**131-MNDS-12UV**

The analysis and opinions expressed in this report are based upon data obtained from UVOST logs generated (and samples collected for emulations if applicable) at the location specified, and from other information discussed in this report. Exceptions, if any, are discussed in the accompanying discussion if applicable. This report is prepared for the exclusive use of our client for specific application to the project discussed and has been prepared in accordance with generally accepted practices. Reported results shall not be reproduced, except in full, without written approval of the lab. The sample results relate only to the analytes of interest tested. No warranties, expressed or implied are intended or made.

I certify that the data contained in this final report has been generated and reviewed in accordance with approved methods and our Standard Operating Procedure. Release of this final report is authorized by Laboratory management, which is verified by the following signature.

Approval Signature _____ Date 11/26/12

LIF SYSTEM DESCRIPTION & ANALYSIS

UVOST

Fluorescence is a property of some compounds where absorbed UV light stimulates the emission of photons (light) of a longer wavelength relative to the source emission. The release of the photons can be used to detect small amounts of substance (i.e. polycyclic aromatic hydrocarbons or PAHs) in a larger matrix (soil). This method of detection has been used in laboratories for decades. Now, with the availability of lasers and optical fibers, this technology can be applied down hole in the field.

The UVOST system sends light (via 308 nm laser) through a fiber optic cable strung within probe rods. The light, reflected by a parabolic mirror, then exits through a sapphire window in the side of the probe. As the probe is advanced, the soil is exposed to the UV laser light. If PAHs are present (compounds in POLs that fluoresce, i.e. LNAPL) longer wavelength light is emitted by the contaminants. This "signal" light is transmitted through a return fiber, back up hole to be analyzed. Responses are indicated in real-time on a graph of signal vs. depth. The UVOST log displays "color mixed" signal logs (contributions from 4 channels) and waveforms ("fingerprint" of multi-wavelength) to aid in identification and relative quantity of the contaminant present.

Prior to every log the UVOST system is checked for optical quality by observing the background signal for sources of signal in the fiber, filter, mirror and sapphire window. Also, the reference emitter (a standard proprietary NAPL mixture called the "RE") is placed on the window to determine the qualitative and semi-quantitative properties of the laser system. This is to assure that the RE response has the correct shape and intensity and that the UVOST system is ready to log. Typically the RE will be set between 10,000 and 12,000 pVs (picovolt-seconds, a measure of waveform area) and the background can vary from 0.1% to 1% (area of about 0-100 pVs). It is important to remember that the relationship between the NAPL in the ground and the RE depends on that particular NAPL. The calibration of the system is not to a concentration, but to a known fluorescence signature.

EC (Electrical Conductivity)

Electrical Conductivity (EC) is a measure of the soils ability to conduct an electrical current between two dipoles on the LIF/EC probe. Conductivity is the reciprocal of electrical resistivity and has the units (in our application) of millisiemens per meter (mS/m). Since soil is in the pathway of the charge flow, the grain size can be determined by comparing the EC log to a soil boring. Conductivity readings in the 100s indicate smaller grain (size such as clay). Larger grain size (sand and gravels) are typically in the 10s of mS/m range. Prior to every log the EC point of the UVOST probe is checked for proper operation by performing a voltage test with a voltage meter and a conductivity test with a test block.

DISCUSSION

Laser was charged on 11/14/12 after LIF-46 was completed.
LIF-56 and LIF-57 were done east of the property outside of fence in the corn field.
LIF-66 was done in the middle loading dock area about 3 feet lower in elevation than all other locations.

SW 9071 A analysis performed at TestAmerica Chicago - Lab ID: 82

Case Narrative: This report was amended to include OA-1 TPH as Gasoline results for TA Sample ID CUD0086-47. DK 05/05/11

Samples were received into laboratory on ice.

NELAC states that samples which require thermal preservation shall be considered acceptable if the arrival temperature is within 2 degrees C of the required temperature or the method specified range. For samples with a temperature requirement of 4 degrees C, an arrival temperature from 0 degrees C to 6 degrees C meets specifications. Samples that are delivered to the laboratory on the same day that they are collected may not meet these criteria. In these cases, the samples are considered acceptable if there is evidence that the chilling process has begun, such as arrival on ice.

Please refer to the Temperature and Sample Receipt form that is included with this report for additional information regarding the condition of samples at the time of receipt by the laboratory.

The reported results were obtained in compliance with the 2003 NELAC standards unless otherwise noted.

GOLDER ASSOCIATES - MANCHESTER, NH 670 North Commercial Street, Suite 103 Manchester, NH 03101 James Peace	Work Order: CUD0086 Project: Electrolux Jefferson, IA Project Number: 103-87305	Received: 04/01/11 Reported: 05/05/11 08:34	

Reproduction of this analytical report is permitted only in its entirety. This report shall not be reproduced except in full without the written approval of the laboratory.

TestAmerica Laboratories, Inc. certifies that the analytical results contained herein apply only to the specific sample analyzed.

GOLDER ASSOCIATES - MANCHESTER, NH 670 North Commercial Street, Suite 103 Manchester, NH 03101 James Peace	Work Order: CUD0086 Project: Electrolux Jefferson, IA Project Number: 103-87305	Received: 04/01/11 Reported: 05/05/11 08:34	

DATA QUALIFIERS AND DEFINITIONS

B	Analyte was detected in the associated Method Blank.
Ba	Compound was found in the blank and sample.
C	Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.
C9	Calibration Verification recovery was outside the method control limits for this analyte. The LCS for this analyte met CCV acceptance criteria, and was used to validate the batch.
CIN	The % RSD for this compound was above 15%. The average % RSD for all compounds in the calibration met the 15% criteria specified in EPA methods 8260B/8270C.
F	MS or MSD exceeds the control limits
H	Sample analysis performed past method-specified holding time.
ICV	ICV recovery was above control limits. Analyte not detected, data not impacted.
IE	Elevated reporting limit due to interelement interference.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
L	Laboratory Control Sample and/or Laboratory Control Sample Duplicate recovery was above the control limits. Analyte not detected, data not impacted.
L1	Laboratory Control Sample and/or Laboratory Control Sample Duplicate recovery was outside control limits.
M1	The MS and/or MSD were outside control limits.
Q	Poor chromatographic match to standard.
R	Sample duplicate RPD exceeded the laboratory control limit.
R7	LCS/LCSD RPD exceeded the acceptance limit. Recovery met acceptance criteria.
RL1	Reporting limit raised due to sample matrix effects.
S2	Compound is a common lab solvent and contaminant.
ZX	Due to sample matrix effects, the surrogate recovery was outside the control limits.

ADDITIONAL COMMENTS

Results are reported on a wet weight basis unless otherwise noted.

Custody seals intact?

☑ Yes ☐ No

☐ Non-Conformance report started

Exceptions Noted

☐ Sample(s) not received in a cooler.

☐ Samples(s) received same day of sampling.

☐ Evidence of a chilling process

☐ Temperature not taken:

***Refer to SOP CF-SS-01 for Temperature Criteria**

Comments
No additional comments.

Receipt
The samples were received on 5/8/2012 11:07 AM; the samples arrived in good condition, properly preserved and, where required, on ice.
The temperature of the cooler at receipt was 3.1º C.

Metals
No analytical or quality issues were noted.

General Chemistry
No analytical or quality issues were noted.

Qualifiers

GCMS Volatiles

Qualifier	Qualifier Description
CIN	The % RSD for this compound was above 15%. The average % RSD for all compounds in the calibration met the 15% criteria specified in EPA methods 8260B/8270C.
R	Sample duplicate RPD exceeded the laboratory control limit.
M1	The MS and/or MSD were outside control limits.

GC Semivolatiles

Qualifier	Qualifier Description
Q	Poor chromatographic match to standard.

Metals-ICP

Qualifier	Qualifier Description
R	Sample duplicate RPD exceeded the laboratory control limit.

General Chemistry

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

Job Narrative
500-46172-1

Comments
No additional comments.

Receipt
The samples were received on 5/9/2012 10:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 2.9º C and 3.1º C.

GC Semi VOA
No analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

General Chemistry
Method(s) 9071B: The oil and grease matrix spike duplicate (MSD) recovery for sample 500-46172-8 in batch 149727 was outside control limits. The precision RPD was also outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

cis-1,2-Dichloroethene	<549		549		ug/kg dry	☼	05/16/12 00:00	05/16/12 15:35	100
trans-1,2-Dichloroethene	<549		549		ug/kg dry	☼	05/16/12 00:00	05/16/12 15:35	100
1,2-Dichloropropane	<549		549		ug/kg dry	☼	05/16/12 00:00	05/16/12 15:35	100

Client Sample Results

Client: GOLDER ASSOCIATES - MANCHESTER, NH
Project/Site: 103-87305

TestAmerica Job ID: CVE0494

Client Sample ID: SB-04(LIF-06) 10-12

Date Collected: 05/04/12 13:30
Date Received: 05/04/12 19:30

Lab Sample ID: CVE0494-36

Matrix: Soil
Percent Solids: 80.9

Method: SW 8260B - Volatile Organic Compounds (Continued)

Analyte	Result	Qualifier	RL	MDL	Unit	D	Prepared	Analyzed	Dil Fac
1,3-Dichloropropane	<549		549		ug/kg dry	☼	05/16/12 00:00	05/16/12 15:35	100
