project TIM SHULAR

Department of conservation

thank you for opening this 15 day comment period. As a neighbor of Price Canyon oil production I am deeply concerned about water quality of underground water basin.

The groundwater is flowing parallel to the creeks and down stream well's would be affected. With hydrallic steam and break down fluids would be flowing at all directions contaminating all surrounding neighbors aquifers.

Going from 1,000 to 10,000 plus barrels a day is going to be a lot of ground water displacement

Due to human error there has been in our back yard many disasters: tank farm road, town of Avila beach, Guadalupe sand dunes, Refugio beach are the ones we know about.

What is in the exhaust emmission coming out of that pipe?

Why is there not a clean system of oil extraction?

No one wants a toxic waiste dump to live next to. Specially workers, supervisors, property tax payers, future generations and mother earth.

15 days is not enough time to decide the future of a priceless Price Canyon.
