Brooks McCall PowerPoint Bullets for 6/24/2010
Operational Period: 6/23/2010 Sampling Period

- Sampling commenced in the southwest quadrant at 0900. Initial approval for sampling a benchmark station 1.2km SW of the wellhead was granted by SIMOPS, but vessels were subsequently asked to stand down due to maneuvering of the Enterprise Explorer. They then relocated to 5km SSW and commenced sampling to try and locate the plumes outer edge.

- A total of 3 CTD casts were completed at stations BM100, BM101, and BM102.

- The readings at all stations (BM100, BM101, BM102) showed no appreciable fluorescence or DO signal indicative of oil. All surface waters around the stations were clear and free of oil.

- A total of 49 LISST samples were analyzed, including duplicates. The concentration of small particles was low at all depths for stations BM100 and BM101. Station BM102 at all depths, except at 2m, showed no evidence of small particles.
