Appendix H Phase 1 Soil Gas Investigation Results and Data Validation Reports

1. Introduction

This Site Characterization Technical Memorandum (SCTM) report presents the results for the soil/fill and soil gas investigation at the South Dayton Dump and Landfill Site (Site). The Site, located on the west side of Dryden Road (also known as Springboro Pike), at 1901 through 2153 Dryden Road and 2225 East River Road in Moraine, Ohio is shown on Figure 1.1 and the Site layout is shown on Figure 1.2, including the Operable Unit (OU) 1 boundary.

GHD prepared this SCTM report on behalf of the Respondents to the Administrative Settlement Agreement and Order on Consent for Remedial Investigation/Feasibility Study for OU1 and OU2, United States Environmental Protection Agency (USEPA) Docket No. V-W-16-C-011 (Respondents).

1.1 Overview

This SCTM report provides the soil/fill investigation activities results from work conducted from October 2017 to January 2019, which includes completion of test trenches, test pits, boreholes, sample collection/laboratory analysis, and data validation/assessment. Additionally, it incorporates previous investigations results in support of the data assessment as well as results of soil gas investigation activities that were reported separately.

The soil/fill and soil gas investigations were completed in accordance with the phased approach detailed in the Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2 (GHD, September 20, 2017) (RI/FS Work Plan), approved by USEPA September 22, 2017.

1.1.1 OU1 Soil and Fill Investigation Objectives

Section 5.2 of the RI/FS Work Plan details soil and fill investigation objectives, summarized as follows:

- Collect additional information to refine the lateral and vertical extent of the impacted soil, fill, and waste material to support the overall Site assessment and to refine the OU1 boundary.
- Characterization of the nature of impacted soil and fill (i.e., inert fill and/or waste) material at surface (0 to 2 feet below ground surface [feet BGS]) and subsurface (2 to 15 feet BGS, and >15 feet BGS if significant waste is present) to identify direct contact, inhalation, ingestion, and leaching risks for consideration in the Human Health Risk Assessment (HHRA) and Ecological Risk Assessment (ERA).
- Characterization of the soil and fill material for consideration as part of the soil gas investigation.
- Determine if chemical concentrations are from historical activities or are due to elevated background concentrations (either natural occurring or anthropogenic regional or localized contamination), as compared to background soil sample analytical results.

1.2 Report Organization

The SCTM report is organized as follows:

Section 1 is the introduction

Section 2 provides information regarding investigative activities conducted from October 2017 through January 2019

Section 3 provides descriptions of Site conditions for individual areas determined from investigations conducted to date

Section 4 presents the analytical results for soil/fill sampling conducted to date

Section 5 presents an assessment of the soil/fill analytical results including comparison to screening values

Section 6 presents information regarding soil gas investigations

Section 7 presents a summary of the investigation results and recommendations

2. Field Investigation Activities

2.1 General

The field investigation included the following:

- OU1 soil/fill investigation conducted from October 2017 through December 2018 (discussed in Section 2.2).
- Off-Site soil sampling including: Great Miami River (GMR) floodplain soil sampling adjacent to OU1 conducted in August 2018, upstream GMR floodplain soil sampling conducted in December 2018, and background soil sampling conducted in December 2018 (discussed in Section 2.3).
- Soil gas investigation conducted from January 10, 2018 to January 18, 2019 (discussed in Section 2.4).

2.2 OU1 Soil/Fill Investigation

The Phase 1A OU1 soil/fill investigation includes the following components:

- Test pits and test trenches to complete the investigation of geophysical anomalies identified in earlier investigations.
- Soil borings to investigate soil/fill conditions and depth to underlying native material and collection of surficial soil/fill samples.
- Laboratory analysis of soil/fill samples (surficial and subsurface material).

Soil/fill and soil gas probe Investigative locations (including test trenches, test pits, temporary monitoring wells/boreholes, surficial soil/fill, and landfill gas/soil gas probes) completed to date are shown on Figure 2.1. Groundwater investigative locations (including vertical aquifer sampling (VAS), temporary monitoring well/boreholes, and permanent monitoring wells) are shown on Figure 2.2. The figures also show the Exposure Unit (EU) designations with OU1.

2.2.1 Test Pits and Test Trenches

GHD completed 10 test pits and 13 test trenches to depths of up to 15 feet BGS between October 30, 2017 and March 20, 2018, to investigate geophysical anomalies and supplement the results of earlier investigations[1].

A total of 13 locations (TP-8, TP-9, TP-10, TP-11, TP-12, TP-13, TP-14, TT-24, TT-31, TT-32, TT-33, TT-39, and TT-43) were excavated to a maximum depth of 15 feet BGS, i.e., the limit of the excavator. Excavation was terminated at depths shallower than 15 feet BGS at seven locations (TP-15, TT-34, TT-35, TT-36 ,TT-37, TT-38, TT-41) due to the presence of water, one location (TT-40) due to collapse of the excavation walls and at two locations (TP-16 and TP-17) due to presence of native material. At one proposed location (TT-42) the property owner refused access thus this test trench could not be completed.

The test pit and test trench stratigraphic logs are presented in Appendix A and investigative locations are provided on Figure 2.1. Table 2.1 includes a summary of the materials encountered at each test pit and test trench location.

The investigative activities were undertaken in accordance with the procedures shown below (as outlined in the approved RI/FS Work Plan):

- *Excavate in 2-foot lifts to 15 feet minimum to native soil or the water table, where possible (as limited by the excavator, excavation wall stability and/or the presence of obstructions).*
- *Dimensions of test trenches (for geophysical anomalies) are approximately 30 feet long by 3 feet wide (i.e., the width of bucket) and dimensions for test pits (for non-geophysical anomalies) are approximately 6 feet long by 3 feet wide.*
- *Set spoil piles away from excavation, using two layers of 6-mil polyethylene sheeting for stockpiling excavated fill material.*
- *Screen recovered material using a photoionization detector (PID) and complete radiation monitoring using Victoreen meter. Complete Sudan IV field screening as required based on visual and olfactory observations.*
- *Log/ classify material using the Unified Soil Classification System (USCS). Describe any waste encountered and record intervals of fill and native soil in each location.*
- *Collect subsurface samples from 2 to 15 feet BGS at 23 test trench and test pit locations for laboratory analysis of volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs),polychlorinated biphenyls (PCBs), pesticides, and inorganics (metals, mercury, and cyanide), except as noted below.*
  - *If any ash or other evidence of burnt materials is encountered, collect a sample and submit for dioxins and furans analysis.*
  - *If potential friable asbestos-containing materials (ACM) (i.e., ceiling tiles, wall board, pipe insulation, automotive brake pad manufacturing refuse, etc.) is encountered in subsurface*

[1] The geophysical investigation conducted in 2008 identified geophysical anomalies within OU1; further investigated by completion of 6 test pits and 22 test trenches from September 23, 2008 to October 8, 2008 and 6 test trenches from June 18, 2013 to June 20, 2013.

intervals (2 to 15 feet BGS), submit a sample from each distinct type of potential ACM for asbestos analysis.

- *Sample collection from the 2 to 15 feet BGS interval is based on field screening as noted below (i.e., visual observations of staining, odor, positive Sudan IV dyes test, or greater than 50 parts per million (ppm) of undifferentiated VOCs based on PID readings), or from the deepest unsaturated interval within the non-native material.*
- *Inspect test pits for indication of leachate presence. Collect samples of leachate, if present, for target compound list (TCL) VOCs, 8011 VOCs, SVOCs, herbicides, pesticides, PCBs, target analyte list (TAL) metals (total and dissolved), cyanide, chloride, sulfate, nitrite, and nitrate.*
- *Backfill excavated materials into test trench/pit in reverse order to that in which they were removed. Compact material using bucket of excavator to restore test pit to grade.*
- *Measure and record center point and end points of test trenches with global positioning system (GPS), and mark each location with stakes for surveying.*

GHD submitted 21 soil/fill samples (excluding quality assurance/quality control [QA/QC]) from 2 to 15 feet BGS for laboratory analysis of VOCs, SVOCs, PCBs, pesticides, inorganics (metals, mercury, and cyanide) and dioxins and furans. Thirteen soil samples from depths greater than 0.5 feet BGS were submitted for asbestos analysis by USEPA method EPA/600/R-93/116. Sample collection (2 to 15 feet BGS) could not be completed at two test trench locations (TT-38 and TT-41) due to water encountered during the excavations at 3 feet BGS and 4.5 feet BGS, respectively. GHD did not encounter leachate at any location; therefore, no samples were submitted for leachate analysis. Appendix B - Table 1 presents a list of samples collected from OU1 test pit and test trench locations.

Sudan IV testing was negative for non-aqueous phase liquid (NAPL) on all screened samples. Radiation was not detected in the recovered soil materials at test pit and test trench locations (i.e., Victoreen meter readings = 0 millirem per hour (mrem/hr)). Excavated materials from each test trench and test pit location were field screened for organic vapors with a PID meter. The results are shown on the logs presented in Appendix A.

Surficial soil/fill samples collected from 0 to 2 feet BGS are discussed in Section 2.2.3 and subsurface soil samples from supplemental borings are discussed in Section 2.2.1.1.

2.2.1.1 Supplemental Soil Borings

Per the RI/FS Work Plan, supplemental soil borings were completed adjacent to test pit or test trench locations where native soil could not be reached by the excavator. The specific purpose of these borings is to investigate conditions from the maximum depth of the test pit or test trench to the depth of underlying native material. GHD completed 17 supplemental soil borings at such locations, as shown in Table 2.1. Supplemental soil borings were completed with direct push technology. Soil boring locations are shown on Figure 2.1. Stratigraphic logs are presented in Appendix A.

The investigative activities were undertaken in accordance with the procedures shown below (as outlined in the RI/FS Work Plan):

- *Collect continuous core through the entire thickness of the material and up to five feet into the underlying native material.*

- *Log/ classify soil/fill material using the USCS, describing waste materials encountered and recording intervals of fill and native soil in each location.*
- *Collect subsurface samples from >15 feet BGS at supplemental borings if required to further characterize the unsaturated non-native material based on field screening results described below:*
  - *Presence of fly ash, foundry-type sands, slag like material or staining, indicative of potential metals and polynuclear aromatic hydrocarbon (PAH) contamination.*
  - *Presence of staining and/or odor characteristic of petroleum and chemicals, including pesticides and herbicides; indicative of potential SVOC, PCB, pesticides/herbicides contamination.*
  - *Presence of identifiable storage containers (e.g., drums, pails, etc.) and transformer or electrical switch gear carcasses, indicative of potential SVOCs/pesticides/herbicides, or PCB contamination, respectively.*
- *Submit subsamples samples from >15 feet BGS for laboratory analysis of VOCs, SVOCs, PCBs, pesticides, and inorganics (metals, mercury, and cyanide), except as noted below:*
  - *If any ash or other evidence of burnt materials is encountered, collect a sample and submit for dioxins and furans analysis.*
  - *If potential friable ACM (i.e., ceiling tiles, wall board, pipe insulation, automotive brake pad manufacturing refuse, etc.) is encountered in subsurface intervals (2 to 15 feet BGS), submit a sample from each distinct type of potential ACM for asbestos analysis.*
- *Screen soil material using a PID and complete radiation monitoring using Victoreen meter. Complete Sudan IV field screening as required based on visual and olfactory observations.*

GHD submitted 18 soil/fill samples (excluding QA/QC) from supplementary boreholes, including eight samples from >15 feet BGS for laboratory analysis of VOCs, SVOCs, PCBs, pesticides, and inorganics (metals, mercury, and cyanide) and 10 samples from subsurface soils between 2 to 15 feet BGS for only chromium and chromium speciation analysis. GHD submitted seven samples for asbestos analysis by USEPA method EPA/600/R-93/116, including six samples from >15 feet BGS and one sample from 2 to 15 feet BGS. Appendix B - Table 1 presents a list of samples collected from OU1 supplementary borehole locations.

Sudan IV dye tests were negative for NAPL on all screened soil borehole samples. Radiation was not detected in the soil materials at any borehole location (i.e., Victoreen meter readings = 0 mrem/hr). Soil core from supplementary boreholes were field screened for organic vapors with a PID meter. Results of the Sudan IV dye tests, radiation monitoring and organic vapor screening are shown on the logs in Appendix A.

GHD did not complete three proposed supplemental soil borings at existing test trench locations TT-34, TT-36, and TT-37 (located in EU19) because sufficient data exists from nearby soil borings to delineate the vertical extent of the waste/fill material in EU19. One additional proposed supplemental soil boring co-located with TT-24 in EU16, could not be completed as the location was in accessible due to the presence of a reclaimed asphalt pile.

2.2.2 Soil Borings

GHD completed 59 soil borings to depths of up to 44 feet BGS between December 7, 2017 and December 14, 2018. Table 2.2 presents a list of the soil borings and the borehole depths (including the supplemental borings discussed in the preceding section). Borehole stratigraphic logs are included in Appendix A. The soil borehole locations are shown on Figure 2.1. Locations of additional boreholes completed as part of the Phase 1B and 2A groundwater investigations (i.e., monitoring well, temporary monitoring well/boreholes and VAS) are shown on Figure 2.2.

The investigative activities were undertaken in accordance with the procedures shown below (as outlined in the RI/FS Work Plan):

- *Collect continuous core through the entire thickness of the material and up to five feet into the underlying native material or to a minimum depth of 15 feet BGS*. (All locations were completed with direct push technology with the exception of three locations in EU2 [BH98-18, BH99-18, and BH100-18] which were completed with a jackhammer due to accessibility restrictions in EU2.)
- *Log/ classify soil/fill material using the USCS, describing waste materials encountered and recording intervals of fill and native soil in each location.*
- *Collect at least one unsaturated soil/fill sample from the 2 to 15 feet BGS interval based on field screening indicators described below:*
  - *Visual observations of staining*
  - *Odor*
  - *Positive Sudan IV dye test*
  - *Greater than 50 ppm of organic vapors based on PID readings*
  - *Presence of fly ash, foundry type sands, slag like material or staining, indicative of potential metals and PAH contamination.*
  - *Presence of staining and/or odor characteristic of petroleum and chemicals, including pesticides and herbicides; indicative of potential SVOC, PCB, pesticides/herbicides contamination.*
  - *Presence of identifiable storage containers (e.g., drums, pails, etc.) and transformer or electrical switch gear carcasses, indicative of potential SVOCs/pesticides/herbicides, or PCB contamination, respectively.*
- *Submit soil/fill samples (2 to 15 feet BGS intervals) from borehole locations for analysis of VOCs, SVOCs, PCBs, pesticides, and inorganics (metals, mercury, and cyanide). Additional analysis for chromium speciation, asbestos, and dioxins and furans will be conducted as described below:*
  - *Samples for chromium speciation (Cr3+ and Cr6+) will be collected and analyzed dependent on the results of the total chromium analysis. Any sample that contains total chromium at a concentration greater than USEPA Residential Soil Regional Screening Level (RSL) of 0.3 milligrams per kilogram (mg/kg) will also be analyzed for chromium speciation.*
  - *Samples for asbestos determination in subsurface material (deeper than 6 inches) will be collected and visually inspected in the field to determine whether friable material (easily crushed by hand pressure) is present. Samples of bulk soil/waste material and/or friable*

materials with no binder interference will be submitted for analysis by polarized light microscopy (PLM) using USEPA method EPA/600/R 93/116.

  - *Samples for dioxins and furans analysis will be collected for locations within designated areas most likely to exhibit the presence of burned materials and ash as described in RI/FS Work Plan Table 5.7b. Specifically, this includes EU16, EU18, EU19, and the western portions of EU12 through EU15.*

- *Screen soil/fill material using a PID and complete radiation monitoring using Victoreen meter. Complete Sudan IV field screening as required based on visual and olfactory observations.*

GHD submitted 62 subsurface (2 to 15 feet BGS) soil/fill samples (excluding QA/QC) for laboratory analysis of VOCs, SVOCs, PCBs, pesticides, and inorganics (metals, mercury, chromium speciation, and cyanide). An additional 18 subsurface soil/fill samples were submitted for dioxins and furans analysis. As required by the RI/FS Work Plan, sample selection for subsurface material included visual inspection to identify the presence of potential ACM. None of these materials were specifically observed during field investigations. GHD submitted 57 subsurface soil samples for asbestos analysis by USEPA method EPA/600/R-93/116, one of which was collected at TT-37 (from 4 to 6 feet BGS), where brake pad components were identified. Sample intervals for the remaining 56 samples were determined based on field screening indicators described above. Appendix B - Table 1 presents a list of samples collected from OU1 boreholes locations.

Sudan IV testing was positive for NAPL for six screened soil borehole samples, two from borehole BH141-18 (24 to 25 feet BGS and 28 to 30 feet BGS intervals), one from borehole BH137-18 (30 to 32 feet BGS), one from MW-235 borehole (32-33 feet BGS), one from VAS-33 borehole (24 to 25 feet BGS), and one from VAS-35 borehole (55-56 feet BGS). Radiation was not detected in the soil materials at any borehole location (i.e., Victoreen meter readings = 0 mrem/hr). Soil core from borehole locations were field screened for organic vapors with a PID meter. Results of the Sudan IV dye tests, radiation monitoring and organic vapor screening are presented in the stratigraphic logs shown in Appendix A.

2.2.3 Surficial Soil/Fill Sampling

GHD collected surficial soil/fill samples from 129 locations between October 30, 2017 and December 20, 2018. The surficial soil/fill samples were either co-located with test pits/ test trenches or soil borings; or were collected at separate locations depending on the sample parameters. Appendix A - Table 1a includes material description for each surficial soil/fill sample location. Appendix B - Table 1 presents a list of samples collected from OU1 surficial soil/fill sample locations. The surficial soil/fill sample locations are shown on Figure 2.1.

The investigative activities were undertaken in accordance with the procedures shown below (as outlined in the RI/FS Work Plan):

- *Collect surficial soil/fill (0 to 2 feet BGS) samples by hand auger, excavator (co-located with test pit and test trench locations), and by direct push technology. Surficial soil/fill samples exclude all overlaying non-soil materials including asphalt, concrete, gravel road base, and grass/topsoil.*

- *Log/classify soil/fill material using the USCS, describing waste materials encountered and recording intervals of fill and native soil in each location.*

- *Screen soil/fill material using a PID and complete radiation monitoring using Victoreen meter. Complete Sudan IV field screening as required based on visual and olfactory observations.*
- *Submit surficial soil/fill samples (0 to 2 feet BGS) from each location for analysis of VOCs, SVOCs, PCBs, pesticides, and inorganics (metals, mercury, and cyanide). Additional analysis for herbicides, chromium speciation, asbestos, fine fraction lead, and dioxins and furans will be conducted as described below:*
  - *Samples of surface material (0 to 2 feet BGS) from OU1 will be collected and analyzed for TCL herbicides. This will include up to 15 sample locations from each of the northern, central, and southern areas of OU1.* (The proposed sample locations were to include areas of stressed vegetation and bare ground, based on field observations prior to sampling. Due to the absence of such areas, the sample locations were selected to provide spatial representation.)
  - *Samples for chromium speciation (Cr3+Cr6+) will be collected and analyzed dependent on the results of the total chromium analysis. Any sample that contains total chromium at a concentration greater than USEPA Residential Soil RSL of 0.3 mg/kg will also be analyzed for chromium speciation.*
  - *Samples for asbestos determination in surface material (0 to 6 inches) will be collected from each exposure unit and analyzed by the modified CARB 435 method for screening purposes per OSWER Directive 9200.0-68, Framework for Investigating Asbestos Contaminated Superfund Sites, Appendix C.*
  - *Samples for fine fraction (<150 micrometer [µm]) lead will be collected and analyzed dependent on the results of the total lead analysis. Initially, approximately 20% of the surface material (0 to 2 feet BGS) samples analyzed for total lead will also be analyzed for lead fractionation (fine and coarse fractions). The sample selection will consider spatial representation of the EUs and the range of detected total lead concentrations.*
  - *Samples for dioxins and furans analysis will be collected and analyzed for locations within designated areas most likely to exhibit the presence of burned materials and ash as described in Table 5.7b in the RI/FS Work Plan. Specifically, this includes EU16, EU18, EU19, and the western portions of EU12 through EU15.*

GHD collected surficial soil/fill samples from 42 locations by hand auger, 15 locations from test pits/ test trenches, and 72 locations by direct push technology. GHD submitted 118 surficial (0 to 2 feet BGS) soil/fill samples (excluding QA/QC) for laboratory analysis of VOCs, SVOCs, PCBs, pesticides, and inorganics (metals, mercury, chromium speciation, and cyanide). GHD submitted 30 of the 118 samples for fractionated lead analysis, and six of the 118 samples for dioxins and furans analysis. In addition, GHD submitted 25 surficial soil/fill samples (0 to 2 feet BGS) for herbicide analysis, and 40 surficial soil/fill samples (0 to 6 inches BGS) were submitted for asbestos analysis by the modified CARB 435 method for screening purposes per OSWER Directive 9200.0-68, Framework for Investigating Asbestos Contaminated Superfund Sites, Appendix C. Appendix B - Table 1 presents a list of samples collected from OU1 surficial soil/fill sample locations.

Radiation was not detected in the soil materials at any surficial sample location (i.e., Victoreen meter readings = 0 mrem/hr). Soil material from each location were field screened for organic vapors with a PID meter. Results of the radiation monitoring and organic vapor screening are shown in Appendix A - Table 1a.

2.3 Off-Site Soil Sampling

2.3.1 GMR Floodplain Soil Sampling

GHD collected floodplain soil samples adjacent to OU1 as part of the Phase 1A GMR floodplain investigation and upstream of the Site as part of the Phase 1B off-Site background investigation (as shown on Figure 2.3a). GHD collected 30 surficial soil samples (including QA/QC) from 12 locations (SS-164 through SS-175) adjacent to OU1 (shown on Figure 2.3b) between August 6 and August 8, 2018. GHD collected 21 surficial soil samples (including QA/QC) from eight locations (SS-201 through SS-208) upstream of the Site (shown on Figure 2.3c) on December 10, 2018. Appendix A - Table 1b presents material descriptions for each sample location. Appendix B - Table 2 presents a list of samples collected from GMR floodplain soil sample locations.

A field inspection of the GMR floodplain was completed by GHD on July 12, 2018, with USEPA contractor (Jacobs), to select sample locations that were in topographic low-lying drainage pathways where runoff from the elevated OU1 area could have preferentially deposited material.

The investigative activities were undertaken in accordance with the procedures shown below (as outlined in the RI/FS Work Plan):

- *Collect soil samples (from upstream locations and locations adjacent to the Site) with a hand auger and log soil stratigraphy using the USCS.*
- *Screen recovered material using a PID and complete radiation monitoring using Victoreen meter.*
- *Collect subsurface samples from two intervals (0 to 0.5 feet BGS and 0.5 to 2 feet BGS) at 12 locations in the GMR floodplain adjacent to the Site and 8 locations in the GMR floodplain upstream from the Site for laboratory analysis of VOCs, SVOCs, PCBs, pesticides, herbicides, metals including mercury, and cyanide.* (Soil samples could not be collected from one proposed location within the GMR floodplain adjacent to the Site (SS-176), due to the presence of standing water.)

In most cases, samples were collected from native soils and all topsoil/grass materials present at each location were excluded from the sample collection. One location adjacent to the Site (SS-165) was not completed to the proposed depth due to refusal at 1.2 feet BGS. Waste material was not identified at any sample location, with the exception of a single location adjacent to the Site (SS-169), where a piece of “aluminum bag” was found at 1.83 feet BGS. Samples were not collected at one proposed location (SS-176) due to presence of standing water as noted above.

Organic vapors (PID readings > 0 ppm) and radiation (i.e., Victoreen meter readings >0 mrem/hr) were not detected in the recovered soil material at any floodplain sample location (as shown in Appendix A - Table 1b).

2.3.2 Background Soil Sampling

GHD completed background soil sampling at Ora Everett Park located approximately 1.5 miles south of the Site (as shown on Figure 2.4a). GHD collected 10 surficial soil samples (including QA/QC) from eight locations within Ora Everett Park (shown on Figure 2.4b) on December 7, 2018. Appendix A - Table 1c presents material description for each sample location. Appendix B - Table 2 presents a list of samples collected at the background soil sample locations.

The investigative activities were undertaken in accordance with the procedures shown below (as outlined in the RI/FS Work Plan):

- *Collect soil samples with a hand auger and log soil stratigraphy using the USCS*
- *Screen recovered material using a PID and complete radiation monitoring using Victoreen meter*
- *Collect subsurface samples from two intervals (0 to 0.5 feet BGS and 0.5 to 2 feet BGS) at eight locations in Ora Everett Park for laboratory analysis of PAHs and metals, including mercury.*

Samples were collected from soil material and all topsoil/grass present at each location was excluded from sample collection. Waste material was not identified at any sample location within Ora Everett Park.

Organic vapors (PID readings >0 ppm) and radiation (i.e., Victoreen meter readings >0 mrem/hr) were not detected in the recovered soil material at any Ora Everettt Park sample location (as shown in Appendix A - Table 1c).

2.4 Soil/Fill Sample Laboratory Analysis and Data Validation

Soil/fill samples were collected and submitted for laboratory analysis as described in the preceding sections. The lists of samples submitted for laboratory analysis are presented in Appendix B – Tables 1 and 2, for OU1 soil/fill samples and outside OU1 soil samples, respectively. Per the RI/FS Work Plan the analytical laboratory deliverables were reviewed by GHD for data validation purposes. GHD's data validation reports for soil/fill samples are included in Appendix B. The results of GHD's assessment were used to identify data qualifiers for inclusion in the analytical database, as presented in the data tables within this report.

2.5 Soil Gas Investigation

GHD conducted soil gas field investigation activities from January 10, 2018 to January 15, 2019.

A total of 11 new soil gas probe installations were completed and three soil gas probes were re-installed (to depths greater than 5 feet BGS) from January 2018 to January 2019. In addition, one gas probe was re-installed since the original gas probe could not be found and one other was re-installed since the original probe could not be monitored. The soil gas probes (new probes and replacement probes) are listed in Table 2.3 and shown on Figure 2.5. One proposed soil gas probe (GP36-18) was not completed due to property access issues.

GHD completed three rounds of field parameter monitoring in 2018 from all accessible soil gas probes installed by GHD, as well as probes installed prior to 2018 including USEPA multi-level soil gas probes at six locations (GP-1, GP-3 through GP-7), as shown on Figure 2.5. Field parameter monitoring included organic vapors, carbon dioxide, oxygen, combustible gas (i.e., methane and other explosive gases), and hydrogen sulfide. Three soil gas probes that were not found include GP07-09; GP17-09; and GP18-09. The monitoring excluded USEPA soil gas probe GP-2, located adjacent to the Dayton Power and Light (DP&L) facility, based on the findings and conclusions of monitoring conducted through 2016.

GHD completed soil gas sampling from August 14 to August 24, 2018 from 32 GHD soil gas probes in accordance with RI/FS Work Plan procedures. GHD submitted 38 samples (including one trip

blank, one ambient air sample, and four field duplicates), to TestAmerica Knoxville for VOC (TO-15) analysis. GHD did not collect a sample from one GHD soil gas probe (GP08-09) due to insufficient gas flow. Section 6 provides details regarding the investigative procedures and the results of the soil gas investigation.

2.6 Summary of Remaining Activities

A summary of investigative activities, outlined in the RI/FS Work Plan that remain to be completed or could not be completed or altered are summarized in the following sections.

2.6.1 Soil/Fill Investigation

- One OU1 test trench location (TT-42) located within EU15 could not be completed due to property owner's refusal to allow access. GHD proposes to delete this from the investigation.
- Three proposed supplemental soil borings at existing test trench locations TT-34, TT-36, and TT-37 (located in EU19) were not completed because sufficient data exists from nearby locations that will be used to delineate the vertical extent of the waste/fill material in EU19. GHD proposes to delete these from the investigation.
- One additional proposed supplemental soil boring co-located with TT-24 in EU16, could not be completed as the location was not accessible due to the presence of a large reclaimed asphalt pile and nearby equipment and vehicle operations. Existing locations to the north of TT-24 will be used to delineate the vertical extent of soil/fill material in EU16.
- Some proposed surficial soil/fill locations were not completed due to ground conditions (e.g., inability to advance sampling device due to presence of large aggregate in roadways) and/or accessibility issues. These locations include: EU2 (three surficial soil/fill samples); EU9 (two surficial soil/fill samples); and EU14 (one surficial soil/fill sample location). GHD proposes to delete these from the investigation on the basis that other samples collected from within these EUs provide adequate representation.
- The number of surficial soil/fill sample locations in EU3 and EU4 was modified based on GHD and agency field meeting discussions (on June 6, 2018 and September 19/20, 2018) regarding the possibility of combining these into one EU (based on property ownership and land use). A total of four proposed surficial soil/fill sample locations were not completed (due to consideration of EU3 and EU4 as a single exposure unit) and have been deleted from the investigation.
- The number of surficial soil/fill sample locations in EU5, EU6, EU7, and EU8 was modified based on GHD and agency field meeting discussions (on June 6, 2018 and September 19/20, 2018). It was agreed during the meeting to combine these areas into one EU (based on property ownership and land use). A total of 25 proposed surficial soil/fill sample locations and three boreholes were not completed and have been deleted from the investigation.
- Soil samples could not be collected from one proposed location within the GMR floodplain adjacent to the Site (SS-176), due to the presence of standing water. GHD proposes to re-assess this sampling location as discussed in Section 5.2.
- Thirteen shallow test pits in the GMR floodplain adjacent to the OU1 boundary were not completed due to access/ work area restrictions (per Miami Conservancy District [MCD]) and the

presence of underground utilities (i.e., underground natural gas pipeline). GHD proposes to delete these from the investigation.

- Soil samples were not collected from a proposed background soil sampling location (New Greencastle Cemetery) since contact with the owner could not be established to request access. Discussions are ongoing with an alternate location owned by the City of Dayton (Madden Golf Course) but have been unsuccessful to date.
- Soil samples were not collected from a proposed background soil sampling location (Carillon Park) since GHD was informed by the property manager (in November 2018) that the location contains imported fill material and hence may not be representative of background soil conditions.

2.6.2 Soil Gas Investigation

- One proposed soil gas probe (GP36-18) located along East River Road could not be completed after numerous failed attempts to contact the property owner to arrange Site access. Possible alternate locations are under review.
- Re-installation of one soil gas probe at existing location (GP03-09) could not be completed due the shallow water table (~6 feet BGS). GHD proposes to retain GP03-09 since replacement to a greater depth is not possible.
- Based on the soil gas sampling results, a second round of sampling will be completed at a later date for TO-15 VOC analysis, and at a minimum will include the soil gas probes installed during Phase I.

3. Site Conditions

This section presents information regarding Site conditions compiled from RI soil/fill investigation activities conducted to date, i.e., 2008 to present. For investigation purposes, the Site is divided into three areas (Southern Area, Central Area, and Northern Area) as shown on Figure 1.2. The Site areas are divided further into EUs based on property ownership boundaries, current and reasonably foreseeable future activities and land use related to potential human exposure. The following subsections provide details of land use and ground conditions (i.e., stratigraphy) by area and by individual EU. The EU boundaries (and investigative locations) are shown on Figure 2.1. The individual EUs (including aerial imagery and sample locations) are illustrated on Figure 3.1 through Figure 3.16.

3.1 Southern Area

The Southern Area includes the Quarry Pond Parcels (Parcel 5178 and a portion of Parcel 3275), Jim City Parcels (Parcels 3753 and 4423), and [redacted] non-responsive, shown on Figure 1.2. The EUs within the Southern Area include:

- EU1 located within the unsubmerged northeastern portion of Quarry Pond Parcel 5178.
- EU2 located on the northwest side of the Quarry Pond, which includes a portion of Parcel 3275 within the OU1 boundary and the western unsubmerged portion of Parcel 5178.

- EU3 and EU4 located adjacent to the east side of the Quarry Pond and EU1. EU3 and EU4 primarily include Jim City Parcels (3753 and 4423) and portions of adjacent Parcel 5178, used for active business operations of Jim City Salvage.
- EU5 through EU8 located in the northeast part of the Southern Area. EU5 through EU8 include [redacted] and a portion of adjacent Parcel 5178, used for active business operations of [redacted]

Descriptions of the land use, field investigations, and observations of the soil/fill conditions for each EU within the Southern Area are presented in the following subsections.

3.1.1 EU1

EU1 comprises the undeveloped northeastern portion of Quarry Pond Parcel 5178, is 3.06 acres in size, consisting of open ground with vegetation. The southern and western limits of EU1 form the shoreline of the Quarry Pond. The ground elevation rises to the north and east toward adjoining OU1 areas; therefore, EU1 is occasionally partly submerged depending on the water level in the Quarry Pond.

Per the RI/FS Work Plan, the proposed investigation included two soil borings to a depth of 15 feet BGS; two deep soil borings (>15 feet BGS); one test trench/pit; and nine surficial soil/fill samples. Sampling locations completed by GHD include five soil borings to depths of 15 feet BGS (BH101-17 to BH104-17, BH158-17); one test trench (TT-41); and 10 surficial soil/fill samples (0 to 2 feet BGS) (SS-38 to SS-45, SS-122, and SS-124). Soil/fill and soil gas sampling locations completed to date in EU1 are shown on Figure 3.1.

Previous investigations in EU1 included three test trenches (TT-14, TT-16, and TT-16A) to investigate geophysical anomalies. Groundwater investigative locations in this area include VAS-19 and groundwater monitoring wells (MW-209, MW-209A, and MW-212), presented on Figure 2.2.

Observations:

A fill layer is present across EU1 increasing slightly in thickness moving from west to east. The fill layer is present to approximate depths ranging from 7.3 feet BGS to 13.3 feet BGS, at BH101-17, and BH158-17, respectively. It is noted that fill was observed at VAS-19 to a depth of 25 feet BGS, with the presence of a 6-inch layer of roofing shingles at 16.5 feet BGS. Below the fill layer, native sand or silty sand material is present.

Waste material was generally observed in EU1 investigative locations to depths ranging from 5 feet BGS to 9.5 feet BGS, with the exception of roofing shingles observed at 16.5 feet BGS in VAS-19. Observed waste material at EU1 investigative locations included foundry-type sand, concrete with rebar, metal rods, bricks, clay drainage tile, slag, and wood fragments.

---

[2] The Respondents initially divided [redacted] into multiple exposure units (EU5, EU6, EU7, and EU8). Based on the property boundary and current understanding of land use, it is more appropriate to consider these as a combined exposure unit. A portion of Parcel 5178 is fenced off and appears to be accessible only from EU7; therefore, EU7 encompasses portions of [redacted] and the adjacent portion of Parcel 5178. During a Site visit held on September 19 to 20, 2018, GHD and USEPA verbally discussed and agreed that EU5 through EU8 will be combined and considered as a single exposure unit since it is essentially one common area. This agreement recognizes that the portion at the back of EU7 is not owned by [redacted] and is contiguous with EU1.

3.1.2 EU2

EU2 comprises a portion of Parcel 3275 and the western unsubmerged portion of Parcel 5178, with a total size of approximately 0.5 acres. EU2 forms part of an embankment that separates the Quarry Pond from the floodplain area to the west.

In the RI/FS Work Plan, the proposed investigation included one soil boring to a depth of 15 feet BGS; two deep soil borings (>15 feet BGS); and eight surficial soil/fill samples. Sampling locations completed by GHD are discussed below.

The embankment is steep, heavily vegetated, and is not easily accessible. There is a narrow level area on top, which was cleared of vegetation to allow access, however the conditions prevented use of a direct-push drill rig. In an email dated June 28, 2018, GHD proposed to use portable means of drilling (i.e., jackhammer) the three soil borings in EU2, due to safety and accessibility concerns. GHD attempted to drill the three boreholes to 15 feet BGS using the jackhammer method, however, refusal occurred at depths ranging from 5.5 to 9.5 feet BGS. Sampling locations completed in EU2 by GHD include three soil borings (BH98-18 to BH100-18), and seven surficial soil/fill samples (SS-14 to SS-18, SS-148, and SS-152). Soil/fill and soil gas sampling locations completed to date in EU2 are shown on Figure 3.2.

Observations:

The embankment stratigraphy consists of silt topsoil to depths less than 0.45 feet BGS. Beneath the topsoil layer, predominantly fine-grained material (clay, trace silt, little gravel) is present to the borehole refusal depths. Trace sand and gray staining was observed at 4.7 feet BGS and 5.5 feet BGS in BH100-18. The material encountered below the topsoil was determined to be cohesive and very dense, consistent with a compacted engineered fill material. No waste material was observed.

3.1.3 EU3

EU3 comprises Parcel 3753 and the adjacent, unsubmerged portion of Parcel 5178, with a total size of 2.94 acres. EU3 is utilized for automobile scrap and salvage operations, and consists of open ground with gravel cover and/or vegetation. There are no buildings on EU3; however, scrap vehicles and trailers are present across the property.

In the RI/FS Work Plan, the proposed investigation included three soil borings to depths of 15 feet BGS; three deep soil borings (>15 feet BGS); and eight surficial soil/fill samples within EU3. Sampling locations completed by GHD include six deep soil borings (BH152-18 to BH157-18), and six surficial soil/fill samples (SS-146, SS-147, SS-149 to SS-151, and SS-153). In addition, GHD installed soil gas probe GP07-18, as GP07-09 was not found. Soil/fill and soil gas sampling locations completed to date in EU3 are shown on Figure 3.3.

Previous investigations in EU3 include one test trench (TT-18) to investigate geophysical anomalies; and soil gas probe (GP07-09).

Observations:

A fill layer is present across EU3 to approximate depths ranging from 4.2 feet BGS (GP07-18) to 18 feet BGS (BH155-18). Below the fill layer, native sand/gravel material is present. Clay till was observed at an approximate depth of 18 to 20 feet BGS in boreholes BH153-18 to BH155-18.

Waste material was observed at a limited number of EU3 investigative locations. Railroad ties, bricks, scrap metal, and concrete were observed in TT-18 at depths less than 10 feet BGS. Red clay brick fragments or crushed red clay brick observed in BH154-18 and BH157-18 at depths ranging from 12 to 14 feet BGS. Odors were noted during investigation of GP07-18 (4.2 to 7.4 feet BGS) and TT-18 (3 to 10 feet BGS).

3.1.4 EU4

EU4 comprises Parcel 4423 and the adjacent unsubmerged portion of Parcel 5178, with a total size of 3.64 acres. EU4 is utilized for automobile scrap and salvage operations, and consists of open ground with gravel cover and/or vegetation. There are no buildings on EU4; however, scrap vehicles and material are present across the property.

In the RI/FS Work Plan, the proposed investigation included three soil borings to depths of 15 feet BGS; three deep soil borings (>15 feet BGS); and eight surficial soil/fill samples within EU4.

Sampling locations completed by GHD include one soil boring (BH149-18); five deep soil borings (BH146-18 to BH148-18, BH150-18, and BH151-18); and six surficial soil/fill samples (SS-138 to SS-140, SS-142, SS-144, SS-145). In addition, GHD installed soil gas probe GP08-19, as field parameter monitoring of GP08-09 could not be completed. Soil/fill and soil gas sampling locations completed to date in EU4 are shown on Figure 3.4.

Previous investigations in EU4 include one test trench (TT-17) to investigate geophysical anomalies; and one soil gas probe (GP08-09). Groundwater investigative locations in this area include VAS-22 and VAS-22b, presented on Figure 2.2.

Observations:

A fill layer is present across EU4 to approximate depths ranging from 7.9 feet BGS (BH147-18) to 40 feet BGS (BH146-18). Below the fill layer, native silty gravel or sand and gravel is present.

Waste material was observed at some EU4 investigative locations, consisting of red clay brick and concrete fragments. Iron staining was noted in GH08-19, GP08-09, and BH147-18 at depths of 11 feet BGS, 18 to 20 feet BGS, and 25 feet BGS, respectively.

3.1.5 EU5 to EU8

EU5 through EU8 comprise [redacted] and a portion of the adjoining property (Parcel 5178) with a total size of 2.65 acres. [redacted] is 2.0 acres in size, and includes five buildings (Buildings 18 to 22), shown on Figure 2.5. Four of the buildings (19 to 22) are single-story structures used for equipment storage and maintenance operations. The remaining [redacted] is a residential trailer. [redacted] ground cover includes grass, vegetation and gravel.

In the RI/FS Work Plan, the proposed investigation included four soil borings (to a depth of 15 feet BGS), six deep soil borings (greater than 15 feet BGS), and 35 surficial soil/fill samples. The proposed number for samples was modified based on Site inspection by GHD and USEPA (September 2018 Site Visit), Sampling locations completed by GHD include nine deep soil borings (BH122-18, BH125-18 to BH130-18, BH132-18, and BH133-18) and 12 surface soil/fill samples (SS-98 to SS-104, SS-109, SS-112, SS-116, SS-120, SS-123). Soil/fill and soil gas sampling locations completed to date in EU5 to EU8 are shown on Figure 3.5.

Previous investigations in EU5 to EU8 include two soil gas probes (GP09-09 and GP10-09). Groundwater investigative locations in this area include four temporary monitoring wells (BH22-13 to BH25-13), presented on Figure 2.2.

Observations:

A fill layer is present across EU5 to EU8 to approximate depths ranging from 8.3 feet BGS (BH122-18) to greater than 44 feet BGS (BH128-18). The depth to native material was not determined at BH128-18 due to refusal. Similarly, the depth to native material was not determined at BH126-18 and BH129-18, located in Parcel 5178. Below the fill layer, where penetrated, native sand and gravel is present.

Waste material observed at EU5 to EU8 investigative locations includes wood pieces, red clay brick fragments, concrete pieces, foundry-type sand, and cinder.

3.2 Central Area

The Central Area includes the following: a portion of Parcel 5177 and portions of the adjoining GMR floodplain parcels; the unnumbered parcel at the Site entrance; and the Dryden Road businesses located on Parcels 5173, 5174, 5175, and 5176, shown on Figure 1.2. The EUs within the Central Area include:

- EU9 located within an unnumbered property parcel the southeast boundary of the Central Area adjoining Dryden Road.
- EU10 (Parcel 5176)[3], EU11 (Parcel 5175)[4], EU12 (Parcel 5174), and EU13 (Parcel 5173), all of which are located on the east side of the Central Area, adjoining Dryden Road. Each of these EUs are used for active business operations by tenants of the property owner, Dryden Road Investments LLC.
- EU18 and EU19 includes the undeveloped portion of Parcel 5177, owned by the South Dayton Landfill Environmental Remediation Trust. EU18 includes two low-lying areas within EU19.

Descriptions of the land use, field investigations, and observations of the soil/fill conditions for each EU within the Central Area are presented in the following subsections.

3.2.1 EU9

EU9 comprises the unnumbered parcel extending to the west from the Site entrance, is 1.09 acres in size, and includes roadway and open ground. There are no buildings located on EU9.

[3] In the RI/FS Work Plan, the limits of EU10 included the eastern portion of Parcel 5176 based on the presence of fencing along the western side of the active business area. During the September 2018 Site visit, GHD and USEPA verbally discussed and agreed that the limits of EU10 would be revised to include the entire limits of Parcel 5176, rather than be limited to the fenced portion. This revision is more consistent with GHD's understanding of current tenant rights.

[4] In the RI/FS Work Plan, the limits of EU11 included the eastern portion of Parcel 5175 based on the presence of fencing along the western side of the active business area. During the September 2018 Site visit, GHD and USEPA verbally discussed and agreed that the limits of EU11 would be revised to include the entire limits of Parcel 5175, rather than be limited to the fenced portion. This revision is more consistent with GHD's understanding of current tenant rights.

In the RI/FS Work Plan, the proposed investigation included two soil borings to a depth of 15 feet BGS; one test trench/pit; and eight surficial soil/fill sample locations within EU9. Sampling locations completed by GHD include one soil boring to a depth of 15 feet BGS (BH120-18), and one deep soil boring (BH121-18); one test pit (TP-17); and seven surficial soil/fill samples (SS-86 to SS-93). Soil/fill and soil gas probe sampling locations completed to date in EU9 are shown on Figure 3.6.

Previous investigations in EU9 included one test trench (TT-13) to investigate geophysical anomalies and one soil gas probe (GP11-09). Groundwater investigative locations in this area include 12 temporary monitoring wells (BH11-13 to BH21-13), groundwater monitoring wells (MW-210, MW-210A, MW-210B), and VAS (VAS-17, VAS-21, VAS-21B), presented on Figure 2.2.

Observations:

A fill layer is present across EU9 to approximate depths ranging from 9 to 12 feet BGS. Below the fill layer, native sand and gravel is present.

Waste material observed at EU9 investigative locations included foundry-type sand (to depths less than 4 feet BGS at BH121-18 and GP34-18), glass pieces (from approximately 4 to 5 feet BGS at BH12-13 and BH121-18), pieces of asphalt and bricks (to 2 feet BGS at VAS-21, VAS-21B, MW-210A&B, and 3.5 feet BGS at TT-13 and TP-17). Additional waste observed in only TP-17, the western-most investigative location on EU9 and adjacent to Parcel 5177 that was used for landfilling, included metal wiring, scrap metal, concrete, slag, and D-cell batteries, to an approximate depth of 9 feet BGS.

3.2.2 EU10

EU10 comprises Parcel 5176, is 1.13 acres in size, and includes open ground with gravel-covered surfaces and/or vegetation. There are temporary structures located on EU10, but no permanent building structures exist. The east side of EU10 fronts onto Dryden Road allowing road access for business operations. The property is bisected with fencing.

In the RI/FS Work Plan, the proposed investigation included four soil borings and eight surficial soil/fill sample locations within EU10. Sampling locations completed by GHD include four soil borings (BH97-17, BH117-18 to BH119-18) and nine surficial soil/fill sample locations (SS-78 to SS-85, SS-32). The number of sample locations was adjusted due to the change of the EU10 limits noted above. Soil/fill and soil gas probe sampling locations completed to date in EU10 are shown on Figure 3.7.

Previous investigations in EU10 included four temporary monitoring wells (BH07-13 to BH10-13), presented on Figure 2.2.

Observations:

A fill layer is present across EU10 increasing in thickness moving from east to west, to approximate depths ranging from approximately 10 feet BGS to 15 feet BGS (BH97-17). Below the fill layer, native sand and gravel or clayey gravel is present.

Waste material observed at EU10 investigative locations includes slag, foundry-type sand, concrete debris, crushed quartz, red clay brick fragments, and glass pieces.

3.2.3 EU11

EU11 comprises Parcel 5175 and is 3.05 acres in size. One building (Building 17, shown on Figure 2.5) is present on EU11, at 2075 Dryden Road, which is used for commercial operations. Potential VI at Building 17 is being addressed using a sub-slab depressurization system (SSDS) installed by the Respondents. The east side of EU11 fronts onto Dryden Road allowing road access for business operations and is paved. The ground surrounding Building 17 is gravel-covered. The remaining EU11 property is open ground with vegetation. The property is bisected with fencing.

In the RI/FS Work Plan, the proposed investigation included three soil borings and eight surficial soil/fill sample locations within EU11. Sampling locations completed by GHD include four soil borings (BH175-17, BH114-18 to BH116-18), one test pit (TP-13), and nine surficial soil/fill samples (SS-25, SS-70 to SS-77). The number of sample locations was adjusted due to the change of the EU11 limits noted above. Soil/fill and soil gas sampling locations completed to date in EU11 are shown on Figure 3.8.

Previous investigations in EU11 included two test trenches (TT-11 and TT-12) to investigate geophysical anomalies, and four soil gas probes (GP12-09, GP23-13, GP24A-13, and GP24B-13). Groundwater investigative locations in this area include VAS (VAS-35) and four temporary monitoring wells (BH04-13 to BH06-13, and BH89-13), presented on Figure 2.2.

Observations:

A fill layer is present across EU11 increasing in thickness moving from east to west, to approximate depths ranging from 5 feet BGS to 22 feet BGS. Below the fill layer, native sand, gravel/sand, or clay material is present. Odors were noted at BH03-13 (40.7 to 42.1 feet BGS), BH05-13 (52 to 60 feet BGS).

Waste material observed at EU11 investigative locations includes orange/red clay dust, slag-like material, granite fragments, foundry-type sand and/or staining, rubber, wood pieces, brick and concrete debris, metal debris, aluminum siding, partial drum top. The amount and types of waste materials was greatest in the western-most investigative locations (e.g., TT-11, TP-13, and BH175-17).

3.2.4 EU12

EU12 comprises Parcel 5174 and is 1.06 acres in size. One building (Building 16, shown on Figure 2.5) is present on EU12, at 2045 Dryden Road. The east side of Parcel 5174 front onto Dryden Road, allowing road access for business operations. The ground north and east of Building 16 is paved, and remaining areas of EU12 are open ground with vegetation.

In the RI/FS Work Plan, the proposed investigation included three soil borings and eight surficial soil/fill sample locations within EU12. Sampling locations completed by GHD include three soil borings (BH111-18 to BH113-18) and nine surficial soil/fill sample locations (SS-63 to SS-69, and SS-89) within EU12. Soil/fill and soil gas probe sampling locations completed to date in EU12 are shown on Figure 3.9.

Previous investigations in EU12 included one test trench (TT-10) to investigate geophysical anomalies, and one soil gas probe (GP13-09). Groundwater investigative locations in this area

include three temporary monitoring wells (BH02-13, BH83-13, and BH84-13), one groundwater monitoring well (MW-202), and VAS (VAS-15, VAS-15B), presented on Figure 2.2.

Observations:

A fill layer is present across EU12, increasing slightly in thickness moving from east to west. The fill layer is present in the eastern portion to an approximate depth range of 8 to 10 feet BGS, increasing to approximate depths of 20 feet BGS at the western boundary of EU12. Below the fill layer, native sand or sand-gravel material is present.

The amount and types of waste material observed in EU12 was greater in the western investigative locations compared to the eastern investigative locations. Glass was observed in the 0 to 5 feet BGS interval at in MW-202 and BH111-18. Wood fragments were observed at depths of 14 to 16 feet BGS in GP13-09 and BH112-17, respectively. Foundry-type sand was observed in the central to western portion of EU12, present at increasing depths of approximately 9 feet BGS to 25 feet BGS moving from east to west (BH111-18, BH113-18, TT-10, GP13-09, and BH112-17). Also, at TT-10, concrete cores, concrete blocks, and bricks were observed at a depth of 16 feet BGS.

3.2.5 EU13

EU13 comprises Parcel 5173 and is 1.44 acres in size. This includes one building (Building 15, shown on Figure 2.5) at 2031 Dryden Road, used for commercial purposes. Potential VI at Building 15 is being addressed using a sub-slab depressurization system (SSDS) installed by the Respondents. The area around the building includes paved surfaces, and open ground with gravel cover and/or vegetation. The east side of Parcel 5173 fronts onto Dryden Road, allowing road access for business operations.

In the RI/FS Work Plan, the proposed investigation included four soil borings, one test trench/pit, and eight surficial soil/fill sample locations within EU13. Sampling locations completed by GHD include five soil borings (BH159-17, BH107-18 to BH110-18), one test trench (TT-40), and nine surficial soil/fill sample locations within EU13 (SS-54 to SS-61, and SS-94). Soil/fill and soil gas probe sampling locations completed to date in EU13 are shown on Figure 3.10.

Previous investigations in EU13 included one soil gas probe (GP14-09). Groundwater investigative locations in this area include nine temporary monitoring wells (BH01-13, BH66-13, BH67-13, BH71-13 to BH74-13, BH80-13, and BH81-13), groundwater monitoring wells (MW-215A, MW-215B, and MW-234), and VAS (VAS-09, VAS-33), presented on Figure 2.2.

Observations:

A fill layer is present across EU13, increasing in thickness moving from east to west. The fill layer is present in the eastern portion to approximately 7 feet BGS, increasing to approximate depths of 30 feet BGS at the western boundary of EU13. Below the fill layer, native sand or sand-gravel material is present. Discrete till layers were encountered at investigative locations across EU13 at BH71-13 (31 to 33 feet BGS), VAS-09 (37.5 – 49.5 feet BGS), and MW-215B (33 to 35.5 feet BGS and 52 to 53.5 feet BGS).

Waste was not observed in the eastern portion of EU13 adjacent to Dryden Road or in the immediate vicinity of Building 15. Waste observations in the central to western portions of EU13 included red clay brick fragments, glass, chalk-like material, foundry-type sand, and/or concrete pieces. Additional

materials observed in western EU13 investigative locations included slag, rubber hose, metal wires, scrap metal, mortar material, gypsum-like material, and paper. Staining and odors (petrol-type and/or hydrocarbon odors) were noted at depths ranging from 6 to 22 feet BGS in BH110-18, BH72-13, BH66-13, VAS-09, and MW-215A/B.

3.2.6 EU18

EU18 is located in Parcel 177 and is 0.09 acres in size. EU18 is within a topographically low area that is occasionally submerged, and contains both the Large and Small Ponds. Trees and other types of vegetation are found in EU18.

In the RI/FS Work Plan the proposed investigation included surficial soil/fill sampling at six locations. Sampling locations completed by GHD include five surficial soil/fill locations within EU18 (SS-26 to SS-28, SS-33, SS-34), and one location for herbicides (SS-105). Sampling locations completed to date in EU18 are shown on Figure 3.15.

Surficial soil stratigraphy consisted of fine- to coarse-grained sand, with organics and plastic waste observed in SS-33 (0 – 0.17 feet BGS) only. Slag was observed in SS-26/SS-105 (1.75 to 2 feet BGS).

3.2.7 EU19

EU19 is 21.2 acres in size, comprising most of Parcel 5177, excluding the EU18 portion discussed in the preceding section. Historically, portions of Parcel 5177, and the western portions of Parcels 5175 and 5176 were either subject to excavation, filling, and/or were operated as a dump and landfill. Parcel 5177 is undeveloped and is currently covered with extensive vegetation including mature trees.

In the RI/FS Work Plan, the proposed investigation included three soil borings, 15 test trenches/pits, and 12 surficial soil/fill sample locations within EU19. Sampling locations completed by GHD included six test pits (TP-11, TP-12, TP-14 to TP17), seven test trenches (TT-31 to TT-37), and 16 surficial soil/fill sample locations (SS-20 to SS-24, SS-29, SS-30, SS-31, SS-35, S-36, SS-106 to SS-108, SS-110, SS-111, SS-113). Four soil boreholes (BH164-17 to BH166-17) were completed in the vicinity of test trenches, to depths greater than 15 feet BGS, at least 5 feet into native material, due to the limitations of the excavator reach. Eight boreholes (BH95-17, BH96-18, BH171-18 to BH174-18, BH176-18, and BH177-18) were completed at points across EU19. GHD also proposed to install five soil gas probes and reinstall one soil gas probe (GP03-09). GHD installed five soil gas probes (GP25-18 to GP29-18). GHD was unable to reinstall GP03-09 because the water table was encountered at 4 feet BGS. Soil/fill and soil gas probe sampling locations completed to date in EU19 are shown on Figure 3.16.

Previous investigations in EU19 included five test pits (TP-1 to TP-4, and TP-11) and four test trenches (TT-15, TT-28 to TT-30) to investigate geophysical anomalies, and three soil gas probes (GP03-09, GP04-09, GP21-09). Groundwater investigative locations in this area include 13 soil boreholes/temporary monitoring wells (BH75-13 to BH77-13, BH79-13, BH82-13, BH85-13 to BH88-13, BH90-13 to BH93-13), four monitoring wells (MW-101A, MW-203, MW-204, and MW-233), and VAS (VAS-11, VAS-12, VAS-37, VAS-38), presented on Figure 2.2.

Observations:

Fill is present across EU19 at varying depths ranging from 9 feet BGS to 42.6 feet BGS. Below the fill layer, native sand material is present, with discrete, discontinuous layers of till.

Waste material was observed in all portions of EU19, including one or more of the following: foundry-type sand, slag, cinders, plastic/rubber and glass debris/pieces including bottles, wood pieces, concrete debris, metal debris, bricks fragments, siding, laminated materials, poly tanks, crushed steel drums. Odors were noted at BH94-17 (25 – 25.5 feet BGS), BH95-17 (14.5 to 17 feet BGS), BH172-17 (37.1 to 42.6 feet BGS), BH77-13 (16.9 feet BGS), BH88-13 (12.5 feet BGS), TT-37 (10 feet BGS).

3.3 Northern Area

The Northern Area includes the following: Parcel 5054 and portions of the adjoining GMR floodplain parcels; a portion of Parcel 5177; and the Dryden Road businesses located on Parcels 5171 and 5172, shown on Figure 1.2. The EUs within the Northern Area include:

- EU14 (Parcel 5172) located on the eastern side of the Northern Area adjoining Dryden Road, used for active business operations by tenants of the property owner, Dryden Road Investments LLC.
- EU15 (Parcel 5171) located on the eastern side of the Northern Area, adjoining Dryden Road, used for active business operations by B&G Equipment & Truck Repair.
- EU16 includes Parcel 5054 and the northern portion of Parcel 5177[5], used for active business operations by Valley Asphalt.
- EU17 located adjacent to the GMR floodplain (within both the Northern Area and the Central Area) on various property parcels owned by MCD.

Descriptions of the land use, field investigations, and observations of the soil/fill conditions for each EU within the Northern Area are presented in the following subsections.

3.3.1 EU14

EU14 comprises Parcel 5172 and is 1.94 acres in size. This includes three buildings (Buildings 12, 13, and 14, shown on Figure 2.5) used for commercial purposes. Potential VI at Buildings 12 and 14 is being addressed using SSDS installed by the Respondents. The area around the buildings includes paved surfaces and open ground with gravel cover and/or vegetation. The east side of the parcel fronts onto Dryden Road allowing road access for business operations. The western boundary of EU14 is fenced; however, based on encroachment of the reclaimed asphalt pile belonging to Valley Asphalt, the fence may not be at the boundary of Parcel 5172.

In the RI/FS Work Plan, the proposed investigation included two soil borings to a depth of 15 feet BGS (BH105-18 and BH106-18), two soil gas probes (GP30-18 and GP31-18) and eight surficial soil/fill sample locations (SS-46 to SS-53) within EU14. GHD completed each location as

[5] The northern portion of Parcel 5177 is used by Valley Asphalt by agreement with the property owner (South Dayton Landfill Environmental Remediation Trust).

proposed. Soil/fill and soil gas probe sampling locations completed in EU14 are shown on Figure 3.11.

Previous investigations in EU14 included two test trenches (TT-8 and TT-9) to investigate geophysical anomalies, and one soil probe (GP15-09). Groundwater investigative locations in this area include seven temporary monitoring wells (BH62-13 to BH65-13, BH68-13 to BH70-13), one monitoring well (MW-208), and VAS (VAS-08 and VAS-34), presented on Figure 2.2.

Observations:

A fill layer is present across EU14, increasing slightly in thickness moving east to west. The fill layer is present in the eastern portion to approximate depths of 8.5 to 10 feet BGS, increasing to approximate depths of 10 to 12 feet BGS to the west. Below the fill layer, native sand or sand-gravel material is present.

There was comparatively little evidence of waste material in the eastern portion of EU14; glass and plastic pieces were observed at surficial depths (approximately 2 feet BGS) in GP30-18 and BH64-13. In the western portion of EU14, the following waste objects were observed from TT-8, TT-9, and/or BH65-13 to depths of 17 feet BGS: cinders, bricks, glass, concrete, old mop heads, broken stained-glass windows, crushed metal containers, cloth bags, springs, old glass milk bottles, scrap metal, and broken dishes. In addition, foundry-type sand was observed in TT-9 at 9 feet BGS. Orange/yellow/red staining was observed in BH65-13 (2.1 feet BGS), and BH105-18 (10.4 feet BGS).

Discrete clay layers were encountered at investigative locations across EU14. A clay layer was present at depths of 5.7 to 7 feet BGS in BH70-13 and GP13-18 in the eastern portion of EU14. A clay layer was encountered from 6.5 to 10 feet BGS in BH65-13 in the western portion of EU14. Based on depth to native material noted above, it appears that the clay layers are within the fill layer.

3.3.2 EU15

EU15 comprises Parcel 5171 and is 5.69 acres in size. This includes four buildings/structures (Buildings 8, 9, 10, and 11, shown on Figure 2.5), used for commercial purposes. Potential VI at Buildings 8 and 9 is being addressed using SSDS installed by the Respondents. The area around the buildings includes paved surfaces and open ground with gravel cover and/or vegetation. The east side of the parcel fronts onto Dryden Road allowing road access for business operations. The west portion of the parcel is fenced.

In the RI/FS Work Plan, the proposed investigation included three soil borings, two test trenches/pits, eight surficial soil/fill samples, one newly-installed soil gas probe, and two re-installed soil gas probes. Sampling locations completed by GHD include three soil borings (BH143-18, BH144-18, BH145-18), one test trench (TT-43), 11 surficial soil/fill samples (SS-130 to SS-137, SS-125, SS-141, and SS-143), one newly-installed soil gas probe (GH33-18), and two re-installed soil gas probes (GP19-18 and GP20-18). GHD also proposed and completed one additional soil boring (BH160-18) 5 feet into native soil at a test trench/pit location if fill was present at depths greater than 15 feet BGS, due to limitations of the excavator reach. One test trench (TT-42) was not completed due to property owner concerns about interference with business operations. Soil/fill and soil gas probe sampling locations completed in EU15 are shown on Figure 3.12.

Previous investigations in EU15 included four test trenches (TT-23, TT-25, TT-26, and TT-27) to investigate geophysical anomalies, and four soil gas probes (GP16-09, GP19-09, GP20-09, and GP22-13). Groundwater investigative locations in this area include NAPL investigation boreholes (BH01-09 to BH05-09), 14 soil boreholes/temporary monitoring wells (BH49-13 to BH61-13, and BH50B-13), groundwater monitoring wells (MW-216, MW-219, MW-225, and MW-227), and VAS (VAS-04, VAS-07, VAS-14, and VAS-44), presented on Figure 2.2.

Observations:

Fill is present across EU15 at varying depths ranging from 10 feet BGS (GP20-18) to 28 feet BGS (MW-219). Below the fill layer, native sand-gravel material is present.

Waste material was observed in all portions of EU15, including one or more of the following: foundry-type sand, fly ash, slag, plastic and glass debris/pieces, wood pieces, concrete, metal debris, empty drum carcass, steel tank, and/or bricks. This is based on observations at BH01-09, BH49-13, BH60-13, BH61-13, BH143-18, BH144-18, BH145-18, TT-23, TT-25, TT-26, TT-27, TT-43, VAS-04, VAS-07, VAS-14, VAS-44, GP16-09, GP19-09/18, GP20-18, GP22-13, GP33-18, MW-216, MW-219, MW-225, and MW-227. Odors were noted during investigation of BH01-09 (2.5 to 16 feet BGS, and 24 feet BGS), BH50-13 (24.5 feet BGS), TT-25 (7 to 18 feet BGS), VAS-04 (24 feet BGS and 27 to 30 feet BGS), and MW-219 (21.5 feet BGS and 24 to 36 feet BGS).

3.3.3 EU16

EU16 comprises Parcel 5054 and the northern portion of Parcel 5177, with a total area of 13.29 acres. EU16 includes various buildings/structures used for asphalt production by Valley Asphalt. Most of the area is utilized for storage of stockpiled production materials (aggregate) and reclaimed asphalt. A paved road exists to provide access from Dryden Road at the north end of Parcel 5054.

In the RI/FS Work Plan, the proposed investigation included seven soil borings (BH136-18 to BH141-18) and one test trench/pit in EU16 (TT-24). The investigations were completed as proposed. In addition, GHD installed soil gas probe GP01-18, as a replacement for GP01-09 which is inaccessible within the Valley Asphalt production area. Surficial soil/fill samples (0 – 2 feet BGS) were not proposed for EU16 due to the presence of large quantities of reclaimed asphalt, aggregate, and other stockpiled material. Soil/fill and soil gas probe sampling locations completed in EU16 are shown on Figure 3.13.

Previous investigations in EU16 included two test pits (TP-5 and TP-6) and four test trenches (TT-7, TT-21, TT-22, and TT-24) to investigate geophysical anomalies, and three soil gas probes (GP01-09, GP17-09, and GP18-09). Groundwater investigative locations in this area include NAPL investigation boreholes (BH06-09 and BH08-09), 16 soil boreholes/temporary monitoring wells (BH32-13 to BH40-13, BH42-13 to BH44-13, BH46-13 to BH48-13, and BH48B-13), monitoring well (MW-217, MW-228, and MW-229), and VAS (VAS-02, VAS-05, VAS-06, VAS-31, and VAS-32), presented on Figure 2.2.

Ground conditions:

Fill is present across EU16 at varying depths ranging from 16 feet BGS (GP01-18) to 30 feet BGS (BH137-18). Below the fill layer, native sandy gravel or silty sand material is present.

Waste material was observed in all portions of EU16, including one or more of the following: cinders, foundry-type sand, fly ash, slag, rubber pieces, plastic pieces, glass, wood debris, metal debris, concrete debris, solidified paint sludge, partial drum, red clay brick, wiring. This is based on observations from BH06-09, BH08-09, BH34-13, BH35-13, BH37-13, BH39-13, BH40-13, BH43-13, BH47-13, BH136-18, BH138-18 to BH142-18, TP-5, TP-6, TT-7, TT-21, TT-24, GP01-09/18, GP17-09, GP18-09, GP32-18, MW-217, MW-228, MW-229, VAS-02, and VAS-06.

Hydrocarbon odors and/or sheens were noted during investigation of BH07-09 (16 to 24 feet BGS), BH33-13 (1 to 20.5 feet BGS), BH46-13 (22 feet BGS), BH48-13 (28 to 30 feet BGS), BH137-18 (28 to 35 feet BGS), BH141-18 (20 to 30 feet BGS), TT-21 (3 to 22 feet BGS), TT-22 (1 to 24 feet BGS), and VAS-06 (9 to 33 feet BGS). A trash odor was noted during investigation of BH136-18 (16 feet BGS).

3.3.4 EU17

EU17 comprises portions of Parcels 3056, 3057, 3058, 3278, and the area (unnumbered parcel) adjoining Parcel 3278 and Parcel 5177; which is within the OU1 boundary. These parcels are managed by the MCD and include portions of the GMR floodplain and the Great Miami River Recreational Trail.

EU17 is 5.55 acres in size, and generally includes the sloped area that adjoins Parcels 5054 and 5177 with the GMR floodplain. As such, EU17 includes portions of the Northern Area and the Central Area. The northern part of EU17 (north of Parcel 5054) has a broad slope (embankment) with grass cover that is maintained by MCD, with some large trees. The portion of EU17 located to the west of Parcel 5054 and Parcel 5177 has an irregular slope that is covered with large trees and small vegetation.

In the RI/FS Work Plan, the proposed investigation included three test trenches/pits, and 11 surficial soil/fill sample locations within EU17. Sampling locations completed by GHD include three test pits (TP-8 to TP-10), and 17 surficial soil/fill sample locations (SS-1 to SS-11, SS-95 to SS-97, SS-127 to SS-129) in EU17. In addition, GHD completed three boreholes (BH161-18, BH04-18, and BH163-18) to depths of 32 feet BGS, 32 feet BGS, and 28 feet BGS, adjacent to TP-8, TP-9, and TP-10, respectively, since the depth of fill material exceeded the limits of the excavator (15 feet BGS). Soil/fill and soil gas probe sampling locations completed in EU17 are shown on Figure 3.14.

Previous investigations in EU17 included eight test trenches (TT-1 to TT-5, TT-1A, TT-19, and TT-20) to investigate geophysical anomalies. Groundwater investigative locations in this area include soil boreholes/temporary monitoring wells (BH30-13, BH31-13, and BH46B-13), one monitoring well (MW-230), and VAS (VAS-01), presented on Figure 2.2.

Observations:

Three test pits were excavated on top of the landscaped embankment north of Valley Asphalt. Fill was present to the termination depth of the test pits (15 feet BGS). Waste material was observed within two of the test pits (TP-9 and TP-10) and included wood, glass, scrap metal, and foundry-type sand. In 2008, test trenches (TT-1 to TT-5) were excavated into the embankment, and waste materials included glass debris, broken porcelain dishes, poly sheeting, scrap metals, cinders, concrete, pea stone, rubber hose, and asphalt. The boreholes (BH161-18, BH04-18, and BH163-18)

that were completed adjacent to the test pits (TP-8, TP-9, and TP10) encountered native silty clay or silty sand at approximately 18.8 to 20 feet BGS.

4. Analytical Results

This section provides analytical results for soil/fill samples collected from OU1 (Section 4.1) and areas outside of OU1 (Section 4.2).

4.1 Operable Unit 1

Analytical results for soil/fill samples collected from OU1 areas are tabulated in Appendix C (results for all parameters) and Appendix D (results for detected parameters). Each appendix includes individual tables for each EU. Each table includes analytical results for samples collected during the current RI program (2017 to present), and earlier investigation results. Sample locations for individual exposure units are shown on Figure 3.1 through Figure 3.16.

Tables 4.1 through 4.16 provides information for each detected parameter (number of samples, number of detects, minimum detected concentration, maximum detected concentration, and average detected concentration) for each exposure unit (reproduced from the tables included in Appendix D).

As discussed in Section 2, the characterization of soil/fill focuses on TCL/TAL parameters, including VOCs, SVOCs, metals, cyanide, PCBs, and pesticides. These parameters were analyzed in multiple samples from all exposure units. Additional parameters that were analyzed at a reduced frequency include asbestos, dioxins and furans, fractionated lead, and herbicides. The following provides an overview of the analytical results for each group of parameters.

4.1.1 Volatile Organic Compounds (VOCs)

VOCs were detected in soil/fill samples collected from all EUs but were variable in terms of the number and type of parameters, and the range of detected concentrations. The following table identifies the number of detected VOCs and the maximum individual VOC concentration (in micrograms per kilogram, i.e., µg/kg) in soil/fill samples.

Table 4.17 Summary of VOCs Results for OU1 Soil/Fill Samples

Area and Exposure Unit	# of detected parameters	Maximum detected concentration (µg/kg)
Southern Area:		
EU1	2	13
EU2	3	23
EU3	12	2,800
EU4	10	94
EU5 to EU8	10	250
Central Area:		
EU9	7	180
EU10	7	100
EU11	14	2,400
EU12	20	5,900

Table 4.17 Summary of VOCs Results for OU1 Soil/Fill Samples

Area and Exposure Unit	# of detected parameters	Maximum detected concentration (µg/kg)
EU13	25	140,000
EU18	7	55
EU19	34	3,000,000
Northern Area:		
EU14	26	140,000
EU15	22	2,000,000
EU16	29	590,000
EU17	18	2,500

As shown in the above table, the data distribution indicates greater number of VOCs and concentrations exist within certain parts of the Central and Northern areas of OU1. The information for detected VOC parameters (number of samples, number of detects, minimum detected concentration, maximum detected concentration, and average detected concentration) for each exposure unit (reproduced from Tables 4.1 to 4.16) are listed in the following subsections.

4.1.1.1 EU1

EU1 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
2-Butanone (Methyl ethyl ketone) (MEK)	13	4	2.5	4.7	3.5
Acetone	13	1	13	13	13

4.1.1.2 EU2

EU2 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
2-Butanone (Methyl ethyl ketone) (MEK)	8	1	7.2	7.2	7.2
Acetone	8	1	23	23	23
Toluene	8	1	1.1	1.1	1.1

4.1.1.3 EU3

EU3 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
1,4-Dichlorobenzene	15	1	23	23	23

Methylene chloride	78	9	1.5	110	30
Styrene	73	2	0.9	16	8.5
Tetrachloroethene	84	18	0.96	1,100	142
Toluene	86	36	0.41	1,600	175
trans-1,2-Dichloroethene	70	1	83	83	83
Trichloroethene	87	9	0.81	8,400	966
Trichlorofluoromethane (CFC-11)	70	1	79	79	79
Trifluorotrichloroethane (CFC-113)	69	1	21	21	21
Vinyl chloride	77	3	18	59	39
Xylenes (total)	82	24	0.89	3,000,000	126,384

4.1.2 Semi-volatile Organic Compounds (SVOCs)

SVOCs were detected in soil/fill samples collected from all exposure units but were variable in terms of the number and type of parameters, and the range of detected concentrations. The following table identifies the number of detected SVOCs and the maximum individual SVOC concentration in soil/fill samples.

Table 4.18 Summary of SVOCs Results for OU1 Soil/Fill Samples

Area and Exposure Unit	# of detected parameters	Maximum detected concentration (µg/kg)
Southern Area:		
EU1	25	5,200
EU2	14	47
EU3	22	590,000
EU4	25	4,700
EU5 to EU8	27	3,800
Central Area:		
EU9	25	65,000

Table 4.18 Summary of SVOCs Results for OU1 Soil/Fill Samples

Area and Exposure Unit	# of detected parameters	Maximum detected concentration (µg/kg)
EU10	28	2,100
EU11	29	2,000
EU12	27	3,200
EU13	28	11,000
EU18	27	15,000
EU19	34	840,000
Northern Area:		
EU14	27	3,900
EU15	30	23,000
EU16	31	21,000
EU17	28	16,000

As shown in the above table, the data distribution indicates that the number of SVOCs that were detected is relatively uniform across OU1, but greater concentrations exist within certain exposure units, e.g., EU3 and EU19. Generally, the most frequently detected SVOCs include polynuclear aromatic hydrocarbons (PAHs), as detailed below. The information for detected SVOC parameters (number of samples, number of detects, minimum detected concentration, maximum detected concentration, and average detected concentration) for each exposure unit (reproduced from Tables 4.1 to 4.16) are listed in the following subsections.

4.1.2.1 EU1

EU1 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
2-Methylnaphthalene	14	12	11	85	39
Acenaphthene	14	11	12	200	81
Acenaphthylene	14	14	9.8	320	82
Acetophenone	14	1	10	10	10
Anthracene	14	14	25	570	194
Benzaldehyde	14	1	16	16	16
Benzo(a)anthracene	14	14	210	3,400	926
Benzo(a)pyrene	14	14	190	3,100	879
Benzo(b)fluoranthene	14	14	270	3,900	1,220
Benzo(g,h,i)perylene	14	14	71	2,400	655
Benzo(k)fluoranthene	14	14	110	1,500	501
Biphenyl (1,1-Biphenyl)	14	4	8.1	13	11
bis(2-Ethylhexyl)phthalate (DEHP)	14	6	78	330	172

4.1.3 Metals and Cyanide

Metals were detected in soil/fill samples collected from all exposure units but are variable in terms of the range of detected concentrations. The following table identifies the detection frequency and the maximum individual concentration in soil/fill samples, for the overall OU1 samples set.

Table 4.19 Summary of Metals Results for OU1 Soil/Fill Samples

Metals	Detection frequency	Maximum detected concentration (mg/kg)
Aluminum	100.0%	16,000
Antimony	84.4%	120
Arsenic	99.7%	77
Barium	100.0%	2,300
Beryllium	95.9%	7
Cadmium	93.8%	54
Calcium	100.0%	410,000
Chromium	100.0%	380
Chromium III (trivalent)	100.0%	370
Chromium VI (hexavalent)	31.6%	16
Cobalt	99.7%	240
Copper	100.0%	191,000
Iron	100.0%	210,000
Lead	100.0%	13,,000
Magnesium	100.0%	97000
Manganese	100.0%	2,200
Mercury	81.6%	2
Nickel	99.4%	420
Potassium	97.5%	2,600
Selenium	81.9%	14
Silver	77.5%	8
Sodium	80.3%	3,110
Thallium	80.2%	5
Vanadium	100.0%	170
Zinc	100.0%	14,000

As shown in the above table, most of the metals were detected in a high proportion (up to 100%) of the samples. The information for detected parameters (number of samples, number of detects, minimum detected concentration, maximum detected concentration, and average detected concentration) for each exposure unit (reproduced from Tables 4.1 to 4.16) are listed in the following subsections.

4.1.3.1 EU1

EU1 – detected parameters	# of samples	# of detects	Min. detect (mg/kg)	Max. detect (mg/kg)	Average of detects (mg/kg)
Aluminum	14	14	3,000	11,000	6,296
Antimony	14	12	0.14	2.4	0.48
Arsenic	14	14	3.6	29	9.8

EU1 – detected parameters	# of samples	# of detects	Min. detect (mg/kg)	Max. detect (mg/kg)	Average of detects (mg/kg)
Barium	14	14	42	170	77
Beryllium	14	14	0.22	2.5	0.64
Cadmium	14	14	0.21	2.2	0.50
Calcium	14	14	45,000	190,000	93,443
Chromium	15	15	6.8	17	11
Chromium III (trivalent)	11	11	6.8	16	11

4.1.4 Polychlorinated Biphenyls (PCBs)

PCBs were detected in soil/fill samples collected from all exposure units with one exception (EU2). The following table identifies the number of detected parameters (aroclors) and the maximum individual PCB concentration in soil/fill samples.

Table 4.20 Summary of PCB Results for OU1 Soil/Fill Samples

Area and Exposure Unit	# of detected parameters	Maximum detected concentration (µg/kg)
Southern Area:		
EU1	2	16,000
EU2	0	--
EU3	2	1,300
EU4	2	210
EU5 to EU8	3	400

Table 4.20 Summary of PCB Results for OU1 Soil/Fill Samples

Area and Exposure Unit	# of detected parameters	Maximum detected concentration (µg/kg)
Central Area:		
EU9	1	170
EU10	1	760
EU11	2	910
EU12	1	210
EU13	3	140,000
EU18	3	4,200
EU19	4	930,000
Northern Area:		
EU14	4	14,000
EU15	5	8,600
EU16	4	29,000
EU17	3	8,100

As shown in the above table, the data distribution indicates that the number of PCB parameters and the detected concentrations are greatest in parts of the Central and Northern areas of OU1, e.g., EU13 and EU19. The information for detected PCB parameters (number of samples, number of detects, minimum detected concentration, maximum detected concentration, and average detected concentration) for each exposure unit (reproduced from Tables 4.1 to 4.16) are listed in the following subsections.

4.1.4.1 EU1

EU1 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1254 (PCB-1254)	14	5	33	16,000	3,275
Aroclor-1260 (PCB-1260)	14	1	24	24	24

4.1.4.2 EU2

PCBs were not detected in samples collected from EU2.

4.1.4.3 EU3

EU3 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1242 (PCB-1242)	15	1	980	980	980
Aroclor-1254 (PCB-1254)	15	2	70	1,300	685

4.1.4.4 EU4

EU4 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1248 (PCB-1248)	15	1	59	59	59

EU4 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1254 (PCB-1254)	15	5	27	210	83

4.1.4.5 EU5 to EU8

EU5 to EU8 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1248 (PCB-1248)	23	2	74	400	237
Aroclor-1254 (PCB-1254)	23	4	54	160	95
Aroclor-1260 (PCB-1260)	23	1	74	74	74

4.1.4.6 EU9

EU9 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1254 (PCB-1254)	12	3	41	170	87

4.1.4.7 EU10

EU10 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1254 (PCB-1254)	14	4	40	760	348

4.1.4.8 EU11

EU11 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1254 (PCB-1254)	20	7	20	910	232
Aroclor-1260 (PCB-1260)	20	2	23	36	30

4.1.4.9 EU12

EU12 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1254 (PCB-1254)	15	2	150	210	180

4.1.4.10 EU13

EU13 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1242 (PCB-1242)	21	2	44	380	212
Aroclor-1254 (PCB-1254)	21	13	49	140,000	13,095
Aroclor-1260 (PCB-1260)	21	2	54	110	82

4.1.4.11 EU14

EU14 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1242 (PCB-1242)	19	2	370	490	430
Aroclor-1248 (PCB-1248)	19	1	430	430	430
Aroclor-1254 (PCB-1254)	19	8	54	3,700	799
Aroclor-1260 (PCB-1260)	19	4	250	14,000	3,783

4.1.4.12 EU15

EU15 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1232 (PCB-1232)	22	1	1,100	1,100	1,100
Aroclor-1242 (PCB-1242)	22	2	230	1,100	665
Aroclor-1248 (PCB-1248)	22	3	1,300	8,600	3,933
Aroclor-1254 (PCB-1254)	22	6	40	1,,800	508
Aroclor-1260 (PCB-1260)	22	5	44	1100	459

4.1.4.13 EU16

EU16 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1242 (PCB-1242)	25	9	53	29,000	6,291
Aroclor-1248 (PCB-1248)	25	2	59	160	110
Aroclor-1254 (PCB-1254)	25	16	23	10,000	1,837
Aroclor-1260 (PCB-1260)	25	2	58	63	61

4.1.4.14 EU17

EU17 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1248 (PCB-1248)	40	1	8,100	8,100	8,100
Aroclor-1254 (PCB-1254)	40	18	35	1,700	338
Aroclor-1260 (PCB-1260)	40	6	23	1,300	398

4.1.4.15 EU18

EU18 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1248 (PCB-1248)	8	1	4,200	4,200	4,200
Aroclor-1254 (PCB-1254)	7	2	130	240	185
Aroclor-1260 (PCB-1260)	8	2	200	2,800	1,500

4.1.4.16 EU19

EU19 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1242 (PCB-1242)	55	8	51	930,000	117,188
Aroclor-1248 (PCB-1248)	64	6	360	2,700	1,382
Aroclor-1254 (PCB-1254)	55	28	19	450,000	17,933
Aroclor-1260 (PCB-1260)	64	15	23	1,400	424

4.1.5 Pesticides

Pesticides were detected in soil/fill samples collected from all exposure units. The following table identifies the number of detected parameters and the maximum individual pesticide concentration in soil/fill samples.

Table 4.21 Summary of Pesticides Results for OU1 Soil/Fill Samples

Area and Exposure Unit	# of detected parameters	Maximum detected concentration (µg/kg)
Southern Area:		
EU1	8	130
EU2	1	3.5
EU3	9	36
EU4	7	21
EU5 to EU8	9	14
Central Area:		
EU9	6	20
EU10	11	37
EU11	5	43
EU12	6	27
EU13	7	760
EU18	6	6.6
EU19	15	3,400
Northern Area:		
EU14	8	270
EU15	8	54
EU16	4	130
EU17	12	820

As shown in the above table, the data distribution indicates that the number of pesticide parameters is variable within OU1, and the detected concentrations are greatest in EU19. The information for detected pesticide parameters (number of samples, number of detects, minimum detected concentration, maximum detected concentration, and average detected concentration) for each exposure unit (reproduced from Tables 4.1 to 4.16) are listed in the following subsections.

4.1.5.1 EU1

EU1 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
4,4'-DDE	14	1	12	12	12

4.1.6 Additional Parameters

Additional parameters that were analyzed at a reduced frequency include asbestos, dioxins and furans, fractionated lead, and herbicides.

4.1.6.1 Asbestos

GHD collected 118 samples of soil/fill from OU1 for asbestos determination; 78 samples from boreholes and test trenches based on field observations to identify material with possible asbestos content; and 40 samples of surficial soil/fill (up to 1-foot BGS) for general characterization of surface soil within OU1. Sample locations for asbestos analysis are shown on Figure 3.17.

Table 4.22 includes a summary of the asbestos testing results. This includes samples discussed above and results from earlier investigations. As shown in the table, asbestos (chrysotile) was identified in some samples of both surface and subsurface soil. The maximum concentration in the surface samples was 0.5%, i.e., less than the 1% criterion for identification of ACM. As shown in Table 4.22, four subsurface samples contain asbestos concentrations greater than 1%, listed below.

Sample location	Sample depth (feet BGS)	Testing result	Location
BH116-18	11 to 13	2% chrysotile	Southeast part of EU11
BH139-18	13 to 15	10% chrysotile	West side of EU16
BH173-17	17.5 to 19.5	8% chrysotile	Northwest part of EU19
VAS-5	7	60% chrysotile	Northeast part of EU16

4.1.6.2 Dioxins and Furans

GHD collected 49 samples (including duplicates) for dioxins and furans analysis from specific areas where the presence of potentially impacted material (ash, cinders) was identified within the central

and northern areas. This includes 45 sample locations within the following exposure units: EU9 (one), EU10 (one), EU11 (one), EU12 (one), EU13 (one), EU14 (one), EU15 (four), EU16 (11), EU17 (three), EU18 (five), and EU19 (16). This biased sampling approach resulted in collection of eight surface soil/fill samples (less than 2 feet BGS), and 41 subsurface soil samples (greater than 2 feet BGS). The sample locations are shown on Figure 3.18.

The analytical results are included in the tables for individual exposure units in Appendix C and Appendix D. The results for detected parameters are also included in Table 4.23, which also provides calculated total toxicity equivalent values. The maximum calculated Total Equivalency (TEQ) in all samples is 827 picograms per gram (pg/g).

4.1.6.3 Fractionated Lead

GHD collected 30 soil/fill samples for fractionated lead analysis. The samples selected for fractionated lead analysis are a subset of the samples analyzed for lead analysis in 2017/2018, which were retained by the laboratory pending further instructions. The sample selection for fractionated lead analysis is based on the range of detected lead concentrations from the initial analysis, and the spatial distribution of sample locations for the various exposure units within OU1. Sample locations for fractionated lead analysis are shown on Figure 3.19. The analytical results are provided in Table 4.24.

As shown in the table, the fractionated lead results include separate results for the coarse fraction and the fine fraction (<150 µm), which are used by the laboratory to calculate a total lead result based on the relative proportions of coarse- and fine-fraction material. Overall, this produces four separate results:

1. Lead concentration without fractionation from initial analysis
2. Lead concentration in coarse fraction
3. Lead concentration in fine fraction
4. Calculated lead concentration (from coarse fraction and fine fraction results)

GHD's observations based on review of the lead results shown in Table 4.24 are summarized as follows:

- The lead concentrations from initial sample analysis range from 20 mg/kg to 13,000 mg/kg. The coarse fraction concentrations range from 18 mg/kg to 47,000 mg/kg and the fine fraction concentrations range from 25 mg/kg to 28,000 mg/kg. The calculated lead concentrations (based on coarse and fine fraction results) range from 22 mg/kg to 43,000 mg/kg.
- Comparison of the lead concentrations from initial sample analysis to the calculated lead concentrations indicates variability. Similar values (within one order of magnitude) are observed for the majority of samples. Notable exceptions include SS-50 (in EU14) and SS-59 (in EU13) where the calculated values are significantly greater than the initial results. Conversely, the initial results for SS146 (EU03) and SS-22 (EU19) are elevated compared to the calculated total results.

- Comparison of the coarse fraction and fine fraction results indicates that the fine fraction concentrations are greater than the coarse fraction concentrations for 22 samples, while only six samples showed the opposite condition.

4.1.6.4 Herbicides

GHD collected 97 samples of soil/fill for herbicides testing. This includes 26 surface soil samples collected in 2018; and other samples collected from multiple locations (boreholes, test trenches and test pits) in earlier investigations. Sample locations for herbicides analysis are shown on Figure 3.20. The analytical results are provided in Table 4.25.

In summary, one herbicide (2,4,5-TP (Silvex)) was detected in one OU1 soil/fill sample collected in 2008 from one test trench (TT-3, 5 feet deep). The detected concentration in the sample was 4.6 µg/kg (estimated).

4.2 Other Soil Samples

4.2.1 Floodplain Soil

GHD collected 26 soil samples (including duplicates) from 12 locations within the floodplain area adjacent to OU1 (see Figure 2.3b) and 18 samples (including duplicates) from eight locations within the floodplain area upstream of OU1 (see Figure 2.3c). Soil samples were collected from two depth intervals at each location, i.e., upper 0.5 feet and 0.5 to 2 feet BGS. All floodplain soil samples were analyzed for VOCs, SVOCs, metals, cyanide, PCBs, pesticides, and herbicides.

Analytical results for floodplain soil samples are provided in the following tables:

- Appendix E – Table 1: floodplain soil adjacent to OU1 (results for all parameters)
- Appendix E – Table 2: floodplain soil adjacent to OU1 (results for detected parameters)
- Appendix E – Table 3: upstream floodplain soil (results for all parameters)
- Appendix E – Table 4: upstream floodplain soil (results for detected parameters)

Each table in Appendix E also shows statistical information for each parameter (number of samples, number of detects, minimum detected value, maximum detected value, and average detected concentration). Table 4.26 and Table 4.27 provide information for each detected parameter (number of samples, number of detects, minimum detected concentration, maximum detected concentration and average detected concentration) for locations adjacent to OU1 and upstream locations, respectively (reproduced from the tables included in Appendix E). The following provides an overview of the analytical results for each group of parameters.

4.2.1.1 VOCs

The information for detected parameters (number of samples, number of detects, minimum detected concentration, maximum detected concentration, and average detected concentration) for each floodplain area (reproduced from Tables 4.26 and 4.27) are listed below.

Floodplain adjacent to OU1 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
1,4-Dichlorobenzene	26	1	1.2	1.2	1.2
Acetone	26	6	22	140	67
Methylene chloride	26	1	21	21	21
Toluene	26	1	1.3	1.3	1.3

VOCs were not detected in samples collected in upstream floodplain soil samples.

As shown above, VOCs were infrequently detected in floodplain soil samples collected adjacent to OU1, with a maximum individual VOC concentration of 140 µg/kg.

4.2.1.2 SVOCs

The information for detected parameters (number of samples, number of detects, minimum detected concentration, maximum detected concentration, and average detected concentration) for each floodplain area (reproduced from Tables 4.26 and 4.27) are listed below.

Floodplain adjacent to OU1 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
2-Methylnaphthalene	26	25	5.7	110	26
Acenaphthene	26	23	4.5	150	41
Acenaphthylene	26	26	5.5	80	34
Anthracene	26	26	6.6	1,500	141
Benzaldehyde	26	1	49	49	49
Benzo(a)anthracene	26	26	38	1,900	469
Benzo(a)pyrene	26	26	43	1,600	509
Benzo(b)fluoranthene	26	26	50	2,700	853
Benzo(g,h,i)perylene	26	26	20	810	298
Benzo(k)fluoranthene	26	26	23	1,100	301
bis(2-Ethylhexyl)phthalate (DEHP)	26	18	68	160	117
Butyl benzylphthalate (BBP)	26	3	28	110	62
Carbazole	26	18	32	280	102
Chrysene	26	26	40	1,900	562
Dibenz(a,h)anthracene	26	16	17	190	97
Dibenzofuran	26	14	16	100	46
Di-n-butylphthalate (DBP)	26	13	26	59	37
Fluoranthene	26	26	54	4,600	1,182
Fluorene	26	24	4.7	260	46
Indeno(1,2,3-cd)pyrene	26	26	17	690	278
Naphthalene	26	24	5	99	26
Phenanthrene	26	26	18	2,500	596
Phenol	26	1	15	15	15
Pyrene	26	26	68	3,900	934

Floodplain upstream - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
2-Methylnaphthalene	18	17	4.3	27	14
Acenaphthene	18	14	9.6	38	18
Acenaphthylene	18	18	6.2	63	30
Anthracene	18	18	6.9	130	49
Benzaldehyde	18	3	34	85	55
Benzo(a)anthracene	18	18	52	500	311
Benzo(a)pyrene	18	18	63	540	352
Benzo(b)fluoranthene	18	18	110	990	588
Benzo(g,h,i)perylene	18	18	54	390	267
Benzo(k)fluoranthene	18	18	30	380	212
bis(2-Ethylhexyl)phthalate (DEHP)	18	15	76	240	116
Butyl benzylphthalate (BBP)	18	2	30	38	34
Carbazole	18	16	29	84	42
Chrysene	18	18	71	600	400
Dibenz(a,h)anthracene	18	14	20	110	69
Dibenzofuran	18	4	16	22	20
Di-n-butylphthalate (DBP)	18	6	28	30	29
Fluoranthene	18	18	120	1,300	697
Fluorene	18	15	10	37	18
Indeno(1,2,3-cd)pyrene	18	18	48	350	235
Naphthalene	18	15	8.9	22	13
Phenanthrene	18	18	43	610	256
Pyrene	18	18	98	820	552

As shown above, SVOCs were detected in multiple floodplain soil samples collected from adjacent to OU1 and upstream. The results for detected parameters for each area are summarized below.

Adjacent to OU1

- Multiple SVOCs (24 total) were detected.
- The most frequently detected SVOCs include various PAHs: 2-methylnaphthalene; acenaphthene; acenaphthylene; anthracene; benzo(a)anthracene; benzo(a)pyrene; benzo(b)fluoranthene; benzo(g,h,i)perylene; benzo(k)fluoranthene; chrysene; dibenz(a,h)anthracene; fluoranthene; fluorene; indeno(1,2,3-cd) pyrene; naphthalene; phenanthrene; and pyrene. Twelve of these were detected in all 26 samples. The other PAHs were detected in at least 23 of 26 samples, with the exception of dibenz(a,h)anthracene (16 of 26 samples).
- Other detected SVOCs include the following: benzaldehyde (one sample); bis(2-ethylhexyl)phthalate (18 samples); butyl benzylphthalate (three samples); carbazole (18 samples); dibenzofuran 14 samples); di-n-butylphthalate (13 samples); and phenol (one sample).
- SVOCs with the greatest detected concentrations (maximum detected value equal to or greater than 1,000 µg/kg) include the following: anthracene; benzo(a)anthracene; benzo(a)pyrene; benzo(b)fluoranthene; benzo(k)fluoranthene; chrysene; fluoranthene; phenanthrene; and pyrene.

- SVOCs with maximum detected concentrations equal to or greater than 100 µg/kg (and less than 1,000 µg/kg) include the following: 2-methylnaphthalene; acenaphthene; benzo(g,h,i)perylene; bis(2-ethylhexyl)phthalate; butyl benzylphthalate; carbazole; dibenz(a.h)anthracene; dibenzofuran; fluorene; and indeno(1,2,3-cd)pyrene. The detected concentrations for all other SVOCs are less than 100 µg/kg.

Upstream

- Multiple SVOCs (23 total) were detected, consistent with the results for samples collected the floodplain adjacent to OU1.
- The most frequently detected SVOCs include various PAHs: 2-methylnaphthalene; acenaphthene; acenaphthylene; anthracene; benzo(a)anthracene; benzo(a)pyrene; benzo(b)fluoranthene; benzo(g,h,i)perylene; benzo(k)fluoranthene; chrysene; dibenz(a.h)anthracene; fluoranthene; fluorene; indeno(1,2,3-cd) pyrene; naphthalene; phenanthrene; and pyrene. Twelve of these were detected in all 18 samples. The other PAHs were detected in at least 14 of 18 samples.
- Other detected SVOCs include the following: benzaldehyde (three samples); bis(2-ethylhexyl)phthalate (15 samples); butyl benzylphthalate (two samples); carbazole (16 samples); dibenzofuran four samples); and di-n-butylphthalate (six samples).
- One SVOC (fluoranthene) was detected with a maximum concentration greater than 1,000 µg/kg.
- SVOCs with maximum detected concentrations equal to or greater than 100 µg/kg (and less than 1,000 µg/kg) include the following: anthracene; benzo(a)anthracene; benzo(a)pyrene; benzo(b)fluoranthene; benzo(g,h,i)perylene; benzo(k)fluoranthene; bis(2-ethylhexyl)phthalate; chrysene; dibenz(a.h)anthracene; indeno(1,2,3-cd) pyrene; phenanthrene; and pyrene.

4.2.1.3 Metals and Cyanide

The information for detected parameters (number of samples, number of detects, minimum detected concentration, maximum detected concentration, and average detected concentration) for each floodplain area (reproduced from Tables 4.26 and 4.27) are listed below.

Floodplain adjacent to OU1 - detected parameters	# of samples	# of detects	Min. detect (mg/kg)	Max. detect (mg/kg)	Average of detects (mg/kg)
Aluminum	26	26	3,900	14,000	7,188
Antimony	26	26	0.13	1.3	0.35
Arsenic	26	26	4.7	12	7.7
Barium	26	26	61	160	110
Beryllium	26	25	0.3	0.83	0.5
Cadmium	26	26	0.2	2.5	0.8
Calcium	26	26	42,000	100,000	78,385
Chromium	26	26	7.6	54	20
Chromium III (trivalent)	26	26	7.3	53	19
Chromium VI (hexavalent)	26	6	0.36	0.76	0.51
Cobalt	26	26	3.3	9.7	5.6
Copper	26	26	9.7	60	26
Iron	26	26	8,700	25,000	14,665

Floodplain adjacent to OU1 - detected parameters	# of samples	# of detects	Min. detect (mg/kg)	Max. detect (mg/kg)	Average of detects (mg/kg)
Lead	26	26	11	92	39
Magnesium	26	26	18,000	35,000	24,500
Manganese	26	26	320	690	487
Mercury	26	25	0.035	0.16	0.08
Nickel	26	26	9.1	32	17
Potassium	26	26	460	1,900	1,026
Selenium	26	26	0.49	1.6	1.0
Silver	26	26	0.036	1.3	0.34
Sodium	26	26	82	130	104
Thallium	26	26	0.11	0.49	0.24
Vanadium	26	26	12	33	19
Zinc	26	26	28	180	88
Cyanide (total)	26	1	0.27	0.27	0.27

Floodplain upstream - detected parameters	# of samples	# of detects	Min. detect (mg/kg)	Max. detect (mg/kg)	Average of detects (mg/kg)
Aluminum	18	18	6,400	13,000	10,400
Antimony	18	18	0.19	0.35	0.27
Arsenic	18	18	6.7	10	8.9
Barium	18	18	73	150	133
Beryllium	18	18	0.32	0.77	0.59
Cadmium	18	18	0.33	2	1
Calcium	18	18	20,000	82,000	59,833
Chromium	18	18	15	45	26
Cobalt	18	18	5	13	8
Copper	18	18	15	54	32
Iron	18	18	13,000	23,000	19,389
Lead	18	18	26	77	46
Magnesium	18	18	8,900	32,000	22,328
Manganese	18	18	350	1,000	596
Mercury	18	18	0.041	0.26	0.12
Nickel	18	18	15	30	23
Potassium	18	18	870	1,600	1,393
Selenium	18	18	0.34	0.83	0.67
Silver	18	18	0.06	1.2	0.52
Sodium	18	17	61	110	95
Thallium	18	18	0.19	0.4	0.3
Vanadium	18	18	17	30	24
Zinc	18	18	60	150	111
Cyanide (total)	18	3	0.26	0.29	0.27

As shown above, metals were detected in multiple floodplain soil samples collected from adjacent to OU1 and upstream. The results for detected parameters for each area are summarized below.

Adjacent to OU1

- Multiple metals (23 total) were detected in all samples (26 of 26) with the following exceptions; beryllium and mercury were detected in 25 of 26 samples; and hexavalent chromium was detected in six of 26 samples.
- Metals with the greatest detected concentrations (maximum detected value equal to or greater than 10,000 mg/kg) include the following: aluminum, calcium, iron, and magnesium.
- Metals with maximum detected concentrations equal to or greater than 100 mg/kg (and less than 10,000 mg/kg) include the following: barium, manganese, potassium, sodium, and zinc. The detected concentrations for all other metals are less than 100 mg/kg.
- Cyanide was detected in one sample (0.27 mg/kg).

Upstream

- Multiple metals (23 total) were detected, consistent with the results for samples collected from the floodplain adjacent to OU1. Each of the metals were detected in all samples (18 of 18) with the exception of sodium, which was detected in 17 of 18 samples. Chromium speciation was not conducted for the upstream samples.
- Metals with the greatest detected concentrations (maximum detected value equal to or greater than 10,000 mg/kg) include aluminum, calcium, iron, and magnesium.
- Metals with maximum detected concentrations equal to or greater than 100 mg/kg (and less than 10,000 mg/kg) include: barium, manganese, potassium, sodium, and zinc. The detected concentrations for all other metals are less than 100 mg/kg.
- Cyanide was detected in three samples (up to 0.29 mg/kg).

4.2.1.4 PCBs

The information for detected parameters (number of samples, number of detects, minimum detected concentration, maximum detected concentration, and average detected concentration) for each floodplain area (reproduced from Tables 4.26 and 4.27) are listed below.

Floodplain adjacent to OU1 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1248 (PCB-1248)	26	1	4,600	4,600	4,600
Aroclor-1254 (PCB-1254)	26	20	39	860	171

Floodplain upstream - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
Aroclor-1254 (PCB-1254)	18	16	72	3,300	712

As shown above, PCBs were detected in multiple floodplain soil samples collected from adjacent to OU1 and upstream. The results for detected parameters for each area are summarized below.

Adjacent to OU1

- Aroclor-1248 was detected in one of 26 samples, at a concentration of 4,600 µg/kg (4.6 mg/kg).

- Aroclor-1254 was detected in 20 of 26 samples, with a maximum detected value of 860 µg/kg (0.86 mg/kg).

Upstream

- Aroclor-1254 was detected in 16 of 18 samples, with a maximum detected value of 3,300 µg/kg (3.3 mg/kg).

4.2.1.5 Pesticides

The information for detected parameters (number of samples, number of detects, minimum detected concentration, maximum detected concentration, and average detected concentration) for each floodplain area (reproduced from Tables 4.26 and 4.27) are listed below.

Floodplain adjacent to OU1 - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
4,4'-DDE	25	2	2.4	2.5	2.5
4,4'-DDT	25	1	17	17	17
alpha-Chlordane	26	2	2.5	11	6.8
Endosulfan sulfate	25	1	2.9	2.9	2.9
Endrin aldehyde	25	2	2	8.9	5.5
gamma-BHC (lindane)	25	1	29	29	29
gamma-Chlordane	25	1	1.5	1.5	1.5
Heptachlor epoxide	26	1	2.8	2.8	2.8
Toxaphene	26	1	51	51	51

Floodplain upstream - detected parameters	# of samples	# of detects	Min. detect (µg/kg)	Max. detect (µg/kg)	Average of detects (µg/kg)
4,4'-DDD	18	1	4.1	4.1	4.1
4,4'-DDE	18	2	2	4.5	3
4,4'-DDT	18	4	1.9	3.6	2.6
Endrin aldehyde	18	1	2	2	2

As shown above, pesticides were infrequently detected in floodplain soil samples collected from adjacent to OU1 and upstream. The results for detected parameters for each area are summarized below.

Adjacent to OU1

- The detected pesticides include the following: 4,4'-DDE; 4,4'-DDT; alpha-chlordane; endosulfan sulfate; endrin aldehyde; gamma-BHC (lindane); gamma-chlordane; heptachlor epoxide; and toxaphene.
- The detection frequency for pesticides was low, i.e. none of the pesticides were detected in more than two samples (of 25 or 26).
- The maximum detected concentration value was 51 µg/kg (for toxaphene).

Upstream

- The detected pesticides include the following: 4,4'-DDD; 4,4'-DDE; 4,4'-DDT; and endrin aldehyde.
- The detection frequency for pesticides was low, i.e., none of the pesticides were detected in more than four samples (of 18).
- The maximum detected concentration value was 4.5 µg/kg (for 4,4'-DDE).

4.2.1.6 Herbicides

The results for detected parameters for each area are summarized below.

Adjacent to OU1

- One parameter (2,4,5-TP (Silvex)) was detected in one sample (73 µg/kg).

Upstream

- Herbicides were not detected in any samples.

4.2.2 Background Soil

GHD collected nine soil samples (including duplicates) from eight locations within Ora Everett Park (see Figure 2.4b) to assist with determining background conditions. Soil samples were collected from 0 to 2 feet deep at each location. All soil samples were analyzed for select SVOCs and metals.

Table 4.28 provides analytical results for background soil samples and information for each parameter (number of samples, number of detects, minimum detected value, maximum detected value, and average detected concentration). The following provides an overview of the analytical results for each group of parameters.

4.2.2.1 SVOCs

The results for detected parameters are summarized below.

- Multiple SVOCs (14 total) were detected.
- The most frequently detected SVOCs include various PAHs: 2-methylnaphthalene; benzo(a)anthracene; benzo(a)pyrene; benzo(b)fluoranthene; benzo(k)fluoranthene; chrysene; fluoranthene; indeno(1,2,3-cd) pyrene; and pyrene. Each of these was detected in at least seven (of nine) samples.
- Other less frequently detected SVOCs (four samples or fewer) include the following: acenaphthene; anthracene; dibenz(a,h)anthracene; fluorene; and naphthalene.
- The maximum detected concentration of individual parameters is 310 µg/kg (for fluoranthene).

4.2.2.2 Metals

The results for detected parameters are summarized below.

- Multiple metals (22 total) were detected. Each of the metals were detected in all samples (9 of 9).

- Metals with the greatest detected concentrations (maximum detected value equal to or greater than 10,000 mg/kg) include aluminum, calcium, and iron.
- Metals with maximum detected concentrations equal to or greater than 100 mg/kg (and less than 10,000 mg/kg) include: magnesium, manganese, and potassium. The detected concentrations for all other metals are less than 100 mg/kg.

5. Soil/Fill Data Assessment

5.1 OU1 Soil/Fill

GHD conducted an initial assessment of the OU1 soil/fill data involving comparison of analytical results to human health screening criteria. The purpose of the initial assessment is to identify preliminary chemicals of potential concern (COPCs) for each EU. In addition, GHD calculated exposure point concentrations (EPCs) for each COPC to facilitate review of data distribution and identify potential data gaps. The following sections describe the procedure used for this assessment.

5.1.1 Data Selection

The analytical data for OU1 soil/fill samples were compiled and categorized for each individual EU, with the following modifications:

- EU3 and EU4 were examined both separately and combined, based on property ownership and land use.
- EU5, EU6, EU7, and EU8 were combined based on property ownership and land use.
- EU18 was combined with EU19 for purposes of human health screening, since EU18 is wholly located within EU19.

The soil/fill analytical data were then further categorized by sample depth. All samples collected within the upper 2 feet BGS were grouped as "surface soil". If the sample range had a mid-point of 2 feet BGS or shallower, it was grouped into the surface soil data set. All samples collected within the upper 15 feet BGS were grouped as "soil", which comprises "surface soil" and "subsurface soil".

5.1.2 Identification of Preliminary COPCs

The preliminary COPCs selection process is presented herein using the format identified by USEPA guidance, i.e., RAGS Part D Table 2. Every parameter that was detected in at least one sample was included in the assessment. Data qualified as estimated (J value) are treated as detected concentrations at the estimated concentration reported by the laboratory.

The following media were screened for preliminary COPC identification:

- Surface soil: 0 to 2 feet BGS (all exposure units)
- Soil (surface and subsurface soil): 0 to 15 feet BGS (all exposure units except EU1, EU2, EU17, EU18, EU19)

For each medium, the parameters with maximum concentrations greater than their respective screening value are identified as preliminary COPCs. The maximum detected concentrations were

compared to the Regional Screening Levels (RSLs) for Superfund (USEPA, 2018), based on a target cancer risk of 1×10^{-6} and a target hazard quotient (HQ) of 0.1 to identify the preliminary COPCs within the surface soil and soil data sets. Residential soil RSLs were conservatively applied for screening. The USEPA Residential RSLs consider ingestion, dermal contact, and inhalation exposure pathways. Naturally occurring nutrients, such as calcium, magnesium, potassium, and sodium, are not considered as preliminary COPCs.

The TEQ of the dioxins and furans congeners were calculated using the toxicity equivalence factors (TEF) as defined by the World Health Organization (Van den Berg et al., 2006). Dioxins and furans congeners that were non-detect were assumed as half of the method detection limit (MDL) (ND = 0.5*MDL) or ND = 0 for the calculation of the dioxins and furans TEQ.

The total chromium analytical data, that were not speciated into either trivalent or hexavalent chromium, were adjusted to chromium (III) and chromium (VI) based on the conservative 6:1 ratio used in the USEPA RSL User Guide (USEPA, 2018).

Those analytes without applicable screening values due to lack of toxicity information have been identified as preliminary COPCs and appropriate surrogate analytes have been chosen based on structural and toxicological similarity for evaluation as listed below.

Parameter	Surrogate screening parameter
1,3-dichlorobenzene	1,2-dichlorobenzene
Methyl cyclohexane	Cyclohexane
3&4-methylphenol	3-methylphenol
Acenaphthylene	Acenaphthene
Benzo(g,h,i)perylene	Pyrene
Phenanthrene	Pyrene
Dimethylphthalate	Diethylphthalate

Surrogate chemical parameters were chosen due to their similarity in molecular structure and thus assumed toxicity. Pyrene was used as a surrogate for benzo(g,h,i)perylene and phenanthrene given that these analytes are all non-carcinogenic PAHs.

The screening information for individual exposure units is provided in Appendix F, Tables 1 through 28. The results are discussed in Section 5.1.4.

5.1.3 Calculation of Exposure Point Concentrations

An EPC is a conservative estimate of the contaminant concentration at an exposure point or in an exposure area. EPCs were calculated for each analyte selected as a preliminary COPC via the screening process described above. EPCs are calculated for surface soil and soil (surface and subsurface).

EPCs are presented in RAGS Part D Table 3 format, which includes the maximum detected concentration, the arithmetic mean concentration, and the 95% upper confidence limit (UCL) of the mean (Reasonable Maximum Exposure [RME]), calculated using USEPA's ProUCL software Version 5.1 (2016). The RME values have been conservatively based on the 95% UCL of the mean.

ProUCL 5.1 contains statistical methods to address data sets both with and without non-detects and computes the 95% UCL for a given data set by a variety of alternative statistical approaches

(including several approaches that do not require the assumption of normality or log-normality). ProUCL 5.1 then identifies specific UCL values as being the most appropriate for that particular data set. For EPCs based on a 95% UCL, the distribution type and specific 95% UCL type selected by the ProUCL software have been indicated in the EPC table. Non-detect and duplicate results were handled as follows:

- The method detection limit (MDL) was considered for non-detect results in the calculation of 95% UCL values.
- Arithmetic mean calculations used the MDL to account for non-detect results.
- Only data deemed usable based on the data validation process were included.
- Duplicate samples were averaged to calculate EPCs.
- In cases where more than one 95% UCL is calculated by ProUCL, the greater of the two values was assigned as the EPC for that analyte.

For data sets containing less than four distinct detected values, ProUCL could not calculate a 95% UCL and therefore the maximum detected concentration was used as the EPC.

The EPC calculations for individual exposure units are summarized in Appendix F, Tables 29 through 56. The results are discussed in Section 5.1.4.

5.1.4 Summary of Results

Preliminary COPCs were identified for each EU based on RSLs for residential soil exposure and EPCs were calculated as described in the preceding sections. The information for preliminary COPCs (maximum detected concentration, detection frequency, screening value, and EPC) for each exposure unit and medium (reproduced from Appendix F) are listed in the following subsections. EPC values that are greater than the maximum detected concentrations are shown in red font.

In summary, preliminary COPCs were identified for organic and inorganic parameters for all exposure units with the exception of EU2 (inorganics only). Based on review of the information provided for each exposure unit GHD identified four exposure units (EU3, EU4, EU9, and EU13) where individual EPCs are notably elevated with respect to maximum detected concentrations, as follows:

- In EU3 surface soil, EPCs for several parameters (13 SVOCs and two metals) exceed the respective maximum detected concentrations due to data distribution. In EU4 surface soil, EPCs for some SVOCs and metals marginally exceed the respective maximum detected concentrations. When EU3 and EU4 datasets are combined, none of the EPCs exceed the maximum concentrations.
- In EU9 surface soil, EPCs for six SVOCs exceed the respective maximum detected concentrations due to data distribution.
- In EU13 surface soil, EPCs for one VOC and three SVOCs exceed the respective maximum detected concentrations due to data distribution. In addition, the EPC for one PCB parameter significantly exceeds the maximum detected concentration.

Preliminary COPCs for each exposure unit are listed in each subsection below.

5.1.4.1 EU1

EU1 – preliminary COPCs	Max. detect	Units	Detection frequency	Screening value	EPC
Surface Soil (0 to 2 feet BGS)					
Benzo(a)anthracene	3,400	µg/kg	9/9	1,100	2,400
Benzo(a)pyrene	3,100	µg/kg	9/9	110	2,300
Benzo(b)fluoranthene	3,900	µg/kg	9/9	1,100	2,900
Carbazole	330	µg/kg	7/9	--	230
Dibenz(a,h)anthracene	570	µg/kg	7/9	110	570
Indeno(1,2,3-cd)pyrene	1,900	µg/kg	9/9	1,100	1,500
Aluminum	8,400 J	mg/kg	9/9	7,700	6,700
Arsenic	29	mg/kg	9/9	0.68	14
Chromium VI (hexavalent)	2.3	mg/kg	4/9	0.3	1.1
Cobalt	9.6	mg/kg	9/9	2.3	6.3
Iron	16,000	mg/kg	9/9	5,500	14,000
Manganese	624 J	mg/kg	9/9	180	470
Thallium	0.82	mg/kg	8/9	0.078	0.5
PCB-1254	180	µg/kg	2/9	120	140

5.1.4.2 EU2

EU2 – preliminary COPCs	Max. detect	Units	Detection frequency	Screening value	EPC
Surface Soil (0 to 2 feet BGS)					
Aluminum	17,000	mg/kg	5/5	7,700	16,000
Arsenic	14	mg/kg	5/5	0.68	13
Cobalt	8.4	mg/kg	5/5	2.3	8.4
Iron	26,000	mg/kg	5/5	5,500	25,000
Manganese	730	mg/kg	5/5	180	710
Thallium	0.26	mg/kg	5/5	0.078	0.25
Vanadium	43	mg/kg	5/5	39	40

5.1.4.3 EU3

EU3 – preliminary COPCs	Max. detect	Units	Detection frequency	Screening value	EPC
Surface Soil (0 to 2 feet BGS)					
Benzo(a)anthracene	260,000	µg/kg	6/6	1,100	470,000
Benzo(a)pyrene	270,000	µg/kg	6/6	110	490,000
Benzo(b)fluoranthene	330,000	µg/kg	6/6	1,100	600,000
Benzo(k)fluoranthene	130,000	µg/kg	6/6	11,000	240,000
Carbazole	92,000	µg/kg	2/6	--	210,000
Chrysene	250,000	µg/kg	6/6	110,000	460,000
Dibenz(a,h)anthracene	39,000	µg/kg	4/6	110	140,000
Dibenzofuran	30,000	µg/kg	2/6	7,300	69,000
Fluoranthene	590,000	µg/kg	6/6	240,000	1,100,000
Indeno(1,2,3-cd)pyrene	120,000	µg/kg	6/6	1,100	220,000

EU3 – preliminary COPCs	Max. detect	Units	Detection frequency	Screening value	EPC
Naphthalene	18,000	µg/kg	4/6	3,800	66,000
Phenanthrene	480,000	µg/kg	6/6	180,000	880,000
Pyrene	450,000	µg/kg	6/6	180,000	820,000
Aluminum	9,800	mg/kg	6/6	7,700	8,000
Arsenic	9.4	mg/kg	6/6	0.68	8
Chromium VI (hexavalent)	0.85 J	mg/kg	2/6	0.3	0.86
Cobalt	7.9	mg/kg	6/6	2.3	6.4
Iron	54,000	mg/kg	6/6	5,500	51,000
Lead	1,000	mg/kg	6/6	400	1,800
Manganese	6,000	mg/kg	6/6	180	11,000
Thallium	0.25	mg/kg	5/6	0.078	0.22
Vanadium	170	mg/kg	6/6	39	150
Soil (0 to 15 feet BGS)					
Benzo(a)anthracene	260,000	µg/kg	13/14	1,100	200,000
Benzo(a)pyrene	270,000	µg/kg	13/14	110	210,000

5.2 Floodplain Soil

GHD conducted an initial assessment of the floodplain soil data involving comparison of analytical results to human health criteria (RSLs) and ecological screening values (ESVs). The purpose of the initial assessment is to identify parameters that exceed criteria and requirements for further characterization.

The analytical results for detected parameters in floodplain soil samples are provided in Appendix G with comparison to screening criteria, in the following tables:

- Appendix G – Table 1: floodplain soil adjacent to OU1 with comparison to RSLs (residential and industrial)
- Appendix G – Table 2: floodplain soil adjacent to OU1 with comparison to ESVs (soil and sediment)

5.2.1 Comparison to RSLs

The floodplain soil samples collected adjacent to OU1 with at least one detection greater than the RSLs (based on conservative residential soil values) are listed in the table below (Table 5.1) with other details (maximum detected concentration and detection frequency). The table also shows the maximum detected concentration and detection frequency for upstream soil samples.

Table 5.1 Floodplain Soil Sample Results – Comparison to RSLs

Floodplain soil – parameters with max detect > than RSLs	Units	Max. detect – adjacent to OU1	Detection frequency	Screening value - residential	Max. detect – upstream	Detection frequency

Aroclor-1254 (PCB-1254)	µg/kg	860	20/26	120	3,300	16/18

GHD observations based on inspection of the results in Table 5.1 are as follows:

- Parameters that were detected with maximum concentrations greater than RSLs include SVOCs (four); metals (seven); and PCBs (two).
- The SVOCs detected with maximum concentrations greater than RSLs in soil samples collected adjacent to OU1 include four PAH compounds: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenz(a,h)anthracene. Three of these were detected in all 26 samples, and the fourth was detected in 16 of 26 samples. Similarly, each of the four PAHs was detected in all or most of the upstream soil samples. The detected concentrations are marginally greater in the soil samples adjacent to OU1 compared to the upstream samples.

- The metals detected with maximum concentrations greater than RSLs in soil samples collected adjacent to OU1 include aluminum, arsenic, chromium VI, cobalt, iron, manganese, and thallium. Each of these was detected in all soil samples collected adjacent to OU1, and all upstream soil samples, with the following exception. Chromium VI was detected in 6 of 26 soil samples collected adjacent to OU1 and was not analyzed in the upstream soil samples. In general, the detected metals concentrations in the soil samples collected adjacent to OU1 are consistent with the concentrations in the upstream soil samples.
- The PCBs detected with maximum concentrations greater than RSLs in soil samples collected adjacent to OU1 include PCB-1248 and PCB-1254. PCB-1248 was detected in one soil sample collected adjacent to OU1 (4,600 µg/kg) and was not detected in any upstream soil samples. PCB-1254 was detected the majority of soil samples collected both adjacent to OU1 (up to 860 µg/kg) and upstream (up to 3,300 µg/kg).

In addition to the above, GHD's assessment included review of the spatial distribution of the analytical results for soil samples with respect to the parameters discussed above, i.e., those with maximum concentrations greater than RSLs. For this part of the assessment the soil sample locations adjacent to OU1 (12 total) were subdivided into three segments as follows:

- Segment 1 includes four northernmost sample locations (SS-164, SS-165, SS-166, and SS-167). These sample locations are situated on higher ground, compared to the more pronounced drainage pathway where Segment 2 and 3 sample locations are situated.
- Segment 2 includes four sample locations (SS-168, SS-169, SS-170, and SS-171) within the drainage pathway below Segment 1.
- Segment 3 includes four sample locations (SS-172, SS-173, SS-174, and SS-175) within the drainage pathway below Segment 2.

The sample locations are shown on Figure 2.3b. Segment 1 and Segment 2 sample locations are situated to the north and west of the Valley Asphalt facility. Segment 3 sample locations are situated west of the central area of OU1 and the Quarry Pond. Table 5.2 provides a summary of the analytical results for each segment expressed as mean values. Table 2 shows mean values for each segment for three cases: all results; upper sample interval (0 to 6 inches deep), and lower sample interval (6 to 24 inches deep).

GHD observations based on inspection of the results in Table 5.2 are as follows:

- The greatest mean SVOC concentration values are found in Segment 2, which includes the upper reach of the drainage pathway adjacent to OU1 (west of the Valley Asphalt facility).
- The mean SVOC concentration values in Segment 3 (downgradient) are lower compared to Segment 2 (upgradient). The mean SVOC concentration values in Segment 1 (located on higher ground above the Segment 2/3 drainage pathway) are the least of the three segments.
- In Segment 2, the mean SVOC concentration values are slightly greater in the lower sample interval compared to the upper sample interval. Conversely, the mean SVOC concentrations in Segments 1 and 3 are generally slightly greater in the upper sample interval compared to the lower sample interval.

- The greatest mean concentration values for metals are found in Segment 2 and are slightly greater in the lower samples compared to upper samples, similar to the SVOC distribution as noted above.
- The mean concentration values for metals in Segment 1 and Segment 3 are generally comparable. Arsenic concentrations appear to be greater in Segment 1 (and Segment 2) compared to Segment 3.
- The greatest mean concentration values for PCB-1254 are found in Segment 2 and are greater in the lower samples compared to upper samples. The mean PCB-1254 concentration values in Segment 3 are lower compared to Segment 2, and the least values are found in Segment 1. This is similar to the SVOC distribution as noted above. Note that the single detection of PCB-1248 is also found in Segment 2.

5.2.2 Comparison to ESVs

The floodplain soil samples collected adjacent to OU1 with at least one detection greater than the ESVs (based on the more conservative of either soil or sediment screening values) are listed in Table 5.3 with other details (maximum detected concentration and detection frequency). The table also shows the maximum detected concentration and detection frequency for upstream soil samples.

GHD observations based on inspection of the results in Table 5.3 are as follows:

- Parameters that were detected with maximum concentrations greater than ESVs include VOCs (two), SVOCs (20), pesticides (seven), herbicides (one), metals (18), and cyanide.
- The VOCs detected with maximum concentrations greater than ESVs in soil samples adjacent to OU1 include acetone (six of 26 samples, up to 140 µg/kg) and methylene chloride (one of 26 samples, at 21 µg/kg). The results demonstrate that VOCs presence is not significant due to the limited number of detections and low concentrations compared to the screening values.
- The SVOCs detected with maximum concentrations greater than ESVs in soil samples collected adjacent to OU1 include the following: 2-methynaphthalene, acenaphthene, acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g.h,i)perylene, benzo(k)fluoranthene, bis(2-Ethyhexyl)phthalate, butyl benzylphthalate, carbazole, chrysene, dibenz(a,h)anthracene, di-n-butylphthalate, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, phenanthrene, and pyrene. These SVOCs predominantly include PAH compounds, in terms of frequency of detection and concentrations. The detected concentrations are marginally greater in the soil samples adjacent to OU1 compared to the upstream samples.
- The metals detected with maximum concentrations greater than ESVs in soil samples collected adjacent to OU1 include antimony, arsenic, barium, chromium, chromium III, chromium VI, copper, iron, lead, manganese, mercury, nickel, selenium, silver, thallium, vanadium, and zinc. Each of these was detected in all soil samples collected adjacent to OU1, and all upstream soil samples, with the following exception: Chromium VI was detected in six of 26 soil samples collected adjacent to OU1 and was not analyzed in the upstream soil samples. In general, the detected metals concentrations in the soil samples collected adjacent to OU1 are consistent with the concentrations in the upstream soil samples.
- Cyanide was detected in one soil sample location adjacent to OU1 (0.27 mg/kg) and three upstream soil samples at similar concentrations (up to 0.29 mg/kg). These results demonstrate

that cyanide presence is not significant due to the limited number of detections and low concentrations compared to the screening values.

- Pesticides that were detected with maximum concentrations greater than ESVs in soil samples collected adjacent to OU1 include the following: 4,4'-DDE (two of 25 samples, 2.5 µg/kg), 4,4'-DDT (one of 25 samples, 17 µg/kg), alpha-chlordane (two of 26 samples, 11 µg/kg), endosulfan sulfate (one of 25 samples, 2.9 µg/kg), gamma-BHC (lindane) (one of 25 samples, 29 µg/kg), heptachlor epoxide (one of 26 samples, 2.8 µg/kg), and toxaphene (one of 26 samples, 51 µg/kg). Two of these (4,4'-DDE and 4,4'-DDT) were also detected in upstream sample locations. The results demonstrate that pesticide presence is not significant due to the limited number of detections and low concentrations compared to the screening values.
- Herbicides that were detected with maximum concentrations greater than ESVs in soil samples collected adjacent to OU1 include 2,4,5-TP (Silvex) in one of 26 samples at 73 µg/kg. The results demonstrate that herbicide presence is not significant due to the very limited number of detections and low concentrations compared to the screening values.

5.2.3 Summary

As demonstrated by the analytical results discussed above, the floodplain soil samples collected at locations adjacent to OU1 contain concentrations of various parameters that are greater than RSLs and/or ESVs. It is evident that a number of these parameters are present at greater concentrations within the segment adjacent to the Valley Asphalt facility (within the upper reach of the drainage pathway adjacent to OU1). Also, a number of these parameters are detected in upstream floodplain soil samples, indicating that the floodplain soil may be affected by upstream effects, not related to the Site.

In accordance with the RI/FS Work Plan additional characterization is required due to the presence of parameters at concentrations greater than relevant screening criteria. GHD proposes to collect soil samples at up to nine locations shown on Figure 5.1. This includes one location (SS-176) that was not completed previously due to the presence of standing water. GHD proposes to analyze the soil samples for SVOCs, metals, and PCBs.

6. Soil Gas Investigation

The Phase 1 soil gas investigation activities and results are presented in the GHD letter to USEPA and Ohio EPA dated April 22, 2019 (reproduced in Appendix H), and summarized below.

Soil Gas Probe Locations:

A total of 35 soil gas probes installed by GHD currently exist. Most (28 of 35) are located within the northern and central areas of OU1, providing spatial coverage of undeveloped areas and Dryden Road business parcels. Soil gas probes exist at four locations within the southern area of OU1, including GP07-18 and GP08-19 (Jim City property); and GP09-09 and GP10-09 (non-responsive). Soil gas probes exist at three locations within the East River Road properties including GP06-09 (Parcel 3261); GP34-18 (Parcel 3207); and GP35-19 (Parcel 3255). One proposed soil gas probe (at non-responsive) was not installed due to access issues and will be installed at an alternative location pending access approval.

In 2012, USEPA installed multi-level gas probes at one location along East River Road and six locations along Dryden Road, identified as GP-1 through GP-7. The soil gas probe locations are shown on Figure 2.5 (and on the figures in Appendix H).

Field Parameter Monitoring:

Field parameter monitoring for organic vapors, carbon dioxide, oxygen, combustible gas (i.e., methane and other explosive gases), and hydrogen sulfide was completed in three monitoring rounds in 2018 (March, August/ September, and November), using all accessible soil gas probes installed by GHD. The current monitoring program also includes USEPA multi-level soil gas probe locations GP-1 and GP-3 through GP-7, comprising 17 discrete soil gas probe screen intervals.

GHD conducted a review of previous (2009 through 2016) and current (2018) monitoring results for combustible gases, summarized as follows:

- The pre-2018 results indicate the presence of total combustible gases and methane at six on-site soil gas probes exceeding the lower explosive limit (LEL) for methane, i.e., 5%. Three of these soil gas probes (GP01-09, GP17-09, and GP18-09) are located in the Valley Asphalt property. Two of these (GP17-09 and GP18-09) no longer exist, and the other (GP01-09) has been replaced by GP01-18. The remaining three soil gas probes are located within the central portion of OU1.
- Based on pre-2018 monitoring results, combustible gas readings greater than the 5% threshold were also recorded at one off-site soil gas probe (GP-2), which is located adjacent to the DP&L transportation building. The combustible gas detected at GP-2 is unrelated to OU1.
- The 2018 results indicate the presence of total combustible gases and methane at three locations within the northern and central portions of OU1, including GP01-18 (at Valley Asphalt property)[6], GP02-09 and GP28-18 (both located within the central portion of OU1). Total combustible gases were not detected above the 5% threshold at any of the remaining soil gas probes, with the exception of GP07-18 (at Jim City property).
- At GP07-18, a significant difference between the unfiltered and filtered results was identified (5.2% and 0.2%, respectively), and the filtered results are well below the 5% threshold for methane. This finding indicates that the instrument readings for total combustible gases (unfiltered methane) are affected by the presence of other hydrocarbons, and methane is not present above the 5% threshold, at GP07-18.

Field parameter monitoring for organic vapors, carbon dioxide, oxygen, and hydrogen sulfide completed in three monitoring rounds in 2018 are summarized below:

- Organic vapor readings, measured using a PID, were typically less than 25 ppm during all three rounds. The greatest readings were recorded at GP07-18 located at Jim City property (up to 205 ppm, in August/September 2018).
- Carbon dioxide levels ranged from 0 to 16.4%, and oxygen levels ranged from 0 to 21.4%.
- Hydrogen sulfide was detected at eight soil gas probe locations in the August/September monitoring round (max of 8 ppm at GP02-09), and at five soil gas probe locations in the

[6] Two soil gas probes at Valley Asphalt that are no longer accessible (GP17-09 and GP18-09) identified the presence of combustible gas prior to 2018 but current conditions have not been assessed.

November 2018 monitoring round (max of 4.3 ppm at USEPA GP-7 (west)). Hydrogen sulfide was not detected during the March 2018 monitoring round.

Soil Gas Probe Sampling and Analysis:

GHD completed soil gas sampling for VOC analysis, using 32 GHD soil gas probes[7] in August 2018. The detected VOCs in soil gas samples were compared to vapor intrusion screening levels (VISLs) for commercial use. The results are summarized in Table 6.1.

Table 6.1 Summary of Soil Gas VOCs Results for Parameters that Exceed Commercial Screening Criteria – August 2018 Sampling Event

Soil Gas Probe	Location	VOCs detected (with concentration > than commercial screening criteria)	Concentration (µg/m^3)
GP01-18	Northern area – EU16 (Valley Asphalt)	Benzene	2,200 / 2,100
		Chlorobenzene	110,000 / 110,000
		Ethylbenzene	500 / 500
		Vinyl Chloride	1,000 / 960
GP02-09	Central area – EU19	--	
GP03-09	Central area – EU19	TCE	120
GP04-09	Central area – EU19	--	
GP05-09	Central area – EU19	--	
GP06-09	East River Road – parcel 3261	--	
GP07-18	Southern area – EU3 (Jim City)	1,2,4-trimethylbenzene	8,400
		Benzene	110,000
		Cyclohexane	230,000
		Ethylbenzene	140,000
		Hexane	630,000
		Isopropyl benzene	9,800
		N-Heptane	1,100,000
		o-xylene	180,000
		Toluene	1,700,000
		Xylenes	770,000
GP09-09	Southern area – EU5 to EU8	TCE	690
GP10-09	Southern area – EU5 to EU8	TCE	34
GP11-09	Central area – EU9	--	
GP12-09	Central area – EU11	TCE	690
GP13-09	Central area – EU12	1,1-DCA	310
GP14-09	Central area – EU13	TCE	520 / 510
GP15-09	Northern area – EU14	1,1-DCA	3,200
		TCE	3,400
GP16-09	Northern area – EU15	Vinyl chloride	370
GP19-18	Northern area – EU15	Vinyl chloride	2,500
GP20-18	Northern area – EU15	TCE	6,700

[7] Two soil gas probes (GP08-19 and GP35-19) were installed in 2019 and have not been sampled yet.

Table 6.1 Summary of Soil Gas VOCs Results for Parameters that Exceed Commercial Screening Criteria – August 2018 Sampling Event

Soil Gas Probe	Location	VOCs detected (with concentration > than commercial screening criteria)	Concentration (µg/m^3)
GP21-09	Central area – EU19	--	
GP22-13	Northern area – EU15	--	
GP23-13	Central area – EU11	TCE	600
GP24A-13	Central area – EU11	--

GP28-18	Central area – EU19	Benzene	87 / 120
		Chlorobenzene	1,700 / 2,200
		Vinyl chloride	160 / 200
GP29-18	Central area – EU19	--	
GP30-18	Northern area – EU14	--	
GP31-18	Northern area – EU14	Chloroform	110
		TCE	27,000
GP32-18	Northern area – EU16	TCE	590
GP33-18	Northern area – EU15	--	
GP34-18	East River Road – parcel 3207	--	

As shown in Table 6.1, the analytical results indicate variable presence of VOCs. The locations with the greatest detected VOC concentrations include GP07-18 (Jim City) and GP01-18 (Valley Asphalt), and significantly lower concentration were detected at the remaining locations. The spatial distribution of the VOCs results is indicative of localized areas of soil gas impact at GP01-18 and GP07-18 potentially related to operations being conducted within the respective properties.

TCE is the most frequently detected and broadly distributed VOC with concentrations exceeding commercial screening criteria, in 11 soil gas probes. Other VOCs that were detected at concentrations exceeding commercial screening criteria exhibit a more isolated distribution.

The screening comparison identified VOC concentrations greater than residential screening criteria at 26 soil gas probe locations, as identified in Appendix H. Potential residential exposure within OU1 is limited to one location, i.e., the elevated mobile home structure located on Parcel non-responsive shown on Figure 2.5).

GHD recommendations provided in the April 22, 2019 Phase 1 soil gas investigation report (Appendix H) are reproduced below (in italics):

- *Regarding* non-responsive *), inform the property owner of the findings based on the 2018 soil gas sampling results*

- *Regarding Parcel 3753 (Jim City property), inform the property owner of the findings based on the 2018 soil gas sampling results*
- *Complete the installation of the proposed soil gas probe within the East River Road property subject to obtaining property access or selection of a suitable alternate location*
- *Collect crawl space and outdoor ambient air samples from* non-responsive *(mobile home structure) during the July VI sampling event, subject to property owner agreement.*
- *Collect soil gas sample from GP08-19 and GP35-19 for analysis of VOCs during the July VI sampling event.*
- *Complete the soil gas data assessment in accordance with the RI/FS Work Plan.*

GHD is in process of implementing the above recommendations.

USEPA provided comments on the April 22 report via e-mail on May 9, 2019 reproduced below (in italics):

1. *Because access to install GP36-18 doesn't seem likely, consider installing it on Parcel 3256 near the residence of concern (Building 31).*
2. *Table 3 shows soil gas contained 600 µg/m^3, 690 µg/m^3, 6,700 µg/m^3, 27,000 µg/m^3 of TCE at sample locations GP23-13, GP12-09, GP20-18, and GP31-18, respectively. These concentrations exceed both the U.S. EPA commercial sub-slab vapor intrusion screening level and the Ohio EPA commercial accelerated response action level. EPA recommends installing three soil gas probes to the east of Dryden Rd. on Parcel 3061 to determine the extent of TCE contamination in soil gas and if additional vapor intrusion investigation is needed for buildings located on this parcel.*

GHD notes that item 1 above is under consideration consistent with the recommendations of the April 22 report. With regard to Item 2, Region 5 Office of Regional Counsel (ORC) and counsel to the Respondents are addressing this request.

7. Summary and Recommendations

7.1 Summary

The OU1 soil/fill material has been extensively investigated as described in Sections 2 through 4 of this report, meeting the OU1 soil/fill investigation objectives and providing the information needed for Site characterization. Sections 5 and 6 of this report provide assessment of soil/fill analytical data and soil gas data, respectively. The results of the assessment and additional comments are summarized below.

OU1 Soil/fill

- GHD conducted an initial assessment of the OU1 soil/fill data involving comparison of analytical results to human health screening criteria (RSLs) for each exposure unit, with the following modifications:

- EU3 and EU4 were examined both separately and combined, based on property ownership and land use.
- EU5, EU6, EU7, and EU8 were combined based on property ownership and land use.
- EU18 was combined with EU19 for purposes of human health screening, since EU18 is wholly located within EU19.

- The assessment considered two media, surface soil (0 to 2 feet BGS) and soil (0 to 15 feet BGS) to identify preliminary COPCs based on USEPA risk assessment guidance. For surface soil (0 to 2 feet BGS) all EUs were assessed. For soil (0 to 15 feet BGS) all EUs were assessed except the undeveloped parcels (including EU1, EU2, EU17, EU18, and EU19) per the RI/FS Work Plan.
- EPCs were calculated for each preliminary COPC based on USEPA risk assessment guidance. The calculated EPCs were examined to determine reasonableness with respect to data distribution.
- Preliminary COPCs were identified for organic and inorganic parameters for all exposure units with the exception of EU2 (inorganics only). Based on review of the information provided for each exposure unit GHD identified four exposure units (EU3, EU4, EU9, and EU13) where individual EPCs are notably elevated with respect to maximum detected concentrations, as follows:
  - In EU3 surface soil, EPCs for several parameters (13 SVOCs and two metals) exceed the respective maximum detected concentrations due to data distribution. In EU4 surface soil, EPCs for some SVOCs and metals marginally exceed the respective maximum detected concentrations. When EU3 and EU4 datasets are combined, none of the EPCs exceed the maximum concentrations.
  - In EU9 surface soil, EPCs for six SVOCs exceed the respective maximum detected concentrations due to data distribution.
  - In EU13 surface soil, EPCs for one VOC and three SVOCs exceed the respective maximum detected concentrations due to data distribution. In addition, the EPC for one PCB parameter significantly exceeds the maximum detected concentration.
- GHD proposes to assess the significance of the elevated EPCs noted above through the HHRA process, to identify potential uncertainties. GHD does not propose any additional soil/fill sampling pending identification of significant uncertainties based on the HHRA process.
- Comparison of soil/fill analytical results with other criteria, i.e., ESVs and Soil Screening Levels (SSLs) remains to be completed. The ESV comparison will be presented with the SLERA. The SSL comparison will be presented with the Site Characterization Technical Memorandum for the groundwater investigation.

Floodplain Soil

- Floodplain soil samples were collected at 12 locations adjacent to OU1, and eight locations upstream of the Site. Soil samples at each location were typically collected from two depth intervals (0 to 0.5 feet BGS and 0.5 to 2 feet BGS).
- The analytical results for soil samples collected adjacent to OU1 were compared to residential RSLs. Parameters that were detected with maximum concentrations greater than RSLs include SVOCs (four); metals (seven); and PCBs (two). Most of these parameters were also detected in the upstream samples.

- Variability in the detected concentrations of individual compounds is apparent, within the soil samples collected adjacent to OU1, and in comparison, to the upstream samples. For the samples collected adjacent to OU1, detected concentrations of multiple parameters are greater within the segment adjacent to the Valley Asphalt property, compared to the adjacent segments, to the north and south. The detected concentrations of some parameters are similar to or greater in the upstream samples compared to the samples collected adjacent to OU1.
- The analytical results were also compared to ESVs. Parameters that were detected with maximum concentrations greater than ESVs in soil samples collected adjacent to OU1 include VOCs (two), SVOCs (20), pesticides (seven), herbicides (one), metals (18), and cyanide. Many of these parameters were also detected in upstream soil samples.
- The results demonstrate that presence of multiple parameters (VOCs, cyanide, pesticides, and herbicides) is not significant due to the limited number of detections and low concentrations compared to the screening values.
- In accordance with the RI/FS work plan, additional characterization is required due to the presence of parameters at concentrations greater than relevant screening criteria in soil samples collected adjacent to OU1. GHD proposes to collect additional floodplain soil samples for analysis of SVOCs, metals, and PCBs.

Soil Gas

- Soil gas conditions have been characterized including field monitoring and VOCs sampling using existing and new soil gas probes.
- Combustible gas monitoring conducted before 2018 indicate presence of total combustible gases and methane at six on-site soil gas probes exceeding the LEL for methane, i.e., 5%. Three of these locations are within Valley Asphalt property and the remaining three are within the central portion of OU1.
- Combustible gas monitoring conducted in 2018 indicates concentrations greater than 5% exist at three locations within the northern and central portions of OU1, including Valley Asphalt property and the central portion of OU1. Total combustible gases were not detected above the 5% threshold at any of the remaining soil gas probes with the exception of GP07-18 (at Jim City property). At GP07-18 the combustible gas readings are affected by the presence of other hydrocarbons, and methane is not present above the 5% threshold.
- The analytical results for soil gas samples indicate variable presence of VOCs. The locations with the greatest detected VOC concentrations include GP07-18 (Jim City) and GP01-18 (Valley Asphalt), and significantly lower concentration were detected at the remaining locations. The results are indicative of localized areas of soil gas impact at GP01-18 and GP07-18 potentially related to operations being conducted within the respective properties.
- TCE is the most frequently detected and broadly distributed VOC with concentrations exceeding commercial screening criteria, in 11 soil gas probes. Other VOCs that were detected at concentrations exceeding commercial screening criteria exhibit a more isolated distribution.
- The screening comparison identified VOC concentrations greater than residential screening criteria at 26 soil gas probe locations. Potential residential exposure within OU1 is limited to one location, i.e., the elevated mobile home structure located on [redacted]

- GHD recommendations for the soil gas investigation were presented in a previous report submission, see Section 6.

7.2 Recommendations

GHD recommendations based on the preceding are as follows:

1. Use available OU1 soil/fill data as input to the HHRA process, including further assessment of the data distribution within individual exposure units to identify potential uncertainties or data gaps.
2. Conduct screening using OU1 soil/fill data relative to ESVs and SSLs, in support of the ecological risk assessment and the groundwater investigation.
3. Conduct additional floodplain soil sampling to further characterize concentrations of SVOCs, metals, and PCBs in soil adjacent to OU1. GHD will prepare a work plan addendum for agency review and approval, in order to complete the sampling in fall of 2019.
4. Conduct additional soil background sampling at Madden Golf Course subject to obtaining access, or other suitable location if possible.
5. Complete the soil gas investigation including installation of one soil gas probe (GP36) at East River Road, subject to obtaining property access; and VOC (TO-15) sampling for soil gas probes not previously sampled (GP35-19, GP08-19) and GP36 (when installed). Also complete the second round of TO-15 sampling as required by the RI/FS Work Plan, and the recommended actions outlined in the GHD letter dated April 22, 2019.

Table 2.1

List of Test Pit, Test Trench and Supplemental Borings
South Dayton Dump and Landfill
Moraine, Ohio

Location	Exposure Unit	Material Encountered	Supplemental Boring	Borehole Depth (feet BGS)
TP-8	EU17	Soil from 0 to 15 feet BGS	BH161-18	32
TP-9	EU17	A mixture of trace glass, ½-inch metal banding and foundry type sand from 0 to 4 feet; soil from 4 to 15 feet BGS	BH04-18	32
TP-10	EU17	A mixture of brick, wood block, glass, trace scrap metal and foundry type sand from 0 to 9.5 feet BGS; soil from 9.5 to 15 feet BGS	BH163-18	28
TP-11	EU19	A mixture of glass, wiring, brick debris, cinder block, soda bottles, and plastic sheeting from 0 to 15 feet BGS; foundry type sand from 0.0 to 6.0 feet BGS	BH173-17	25
TP-12	EU19	A mixture of concrete and brick debris, metal wiring, scrap metal, cinder block, wood timbers, plastic sheeting and foundry type sand from 0 to 15 feet BGS; a crushed partial drum at 6 feet BGS	BH174-18	40
TP-13	EU11	A mixture of concrete and brick debris, metal wiring, aluminum siding, glass fragment and foundry type sand from 0 to 15 feet BGS; a partial drum top was at 9.0 feet BGS	BH175-17	30
TP-14	EU19	A mixture of timbers, concrete block, brick, ¼-inch metal wire, metal shaving and foundry type sand from 0 to 15 feet BGS	BH176-18	24
TP-15	EU19	A mixture of concrete, brick and wood debris, rubber hose, and 2-inch metal pipe from 0 to 6.0 feet BGS; foundry type sand from 6.0 to 12 feet BGS; water at 12.0 feet BGS	BH177-18	18 (refusal)
TP-16	EU19	12-inch sections of concrete from 0 to 6.2 feet BGS; native material at 6.2 ft BGS	n/a	n/a
TP-17	EU9	A mixture of concrete and asphalt debris, wood timbers, metal wiring and slag from 0 to 12.0 feet BGS; crushed scrap metal at 7.5 feet BGS and 10-inch thick concrete slabs at 9.0 feet BGS; native material was encountered at 12.0 feet BGS	n/a	n/a
TT-24	EU16	A mixture of concrete, brick and wood debris, glass bottles, metal strap and metal banding from 4.1 to 11.0 feet BGS; glass, wood, trace scrap metal and foundry type sand from 11.0 to 15 feet BGS; solidified paint sludge at 13.0 feet BGS, a partial drum and two 55-gallon steel buckets at 14.0 feet BGS	n/a	n/a
TT-31	EU19	A mixture of partial drum rings, partial drum remnants, steel mattress springs, metal wiring, aluminum scrap, glass debris, heavy duty rubber wheels, cinder block and brick debris from 0 to 8.0 feet BGS; concrete and brick debris, glass, scrap metal and foundry type sand from 8.0 to 15.0 ft BGS	BH164-17	25
TT-32	EU19	A mixture of scrap metal, glass debris, tire iron, plastic bottle, concrete and brick debris from 0 to 15.0 feet BGS; a partial drum ring at 2.0 feet BGS and ½-inch steel cables at 6.7 and 12.5 ft BGS	BH165-17	35

Table 2.1

List of Test Pit, Test Trench and Supplemental Borings
South Dayton Dump and Landfill
Moraine, Ohio

Location	Exposure Unit	Material Encountered	Supplemental Boring	Borehole Depth (feet BGS)
TT-33	EU19	A mixture of concrete and wood debris, glass bottles, mortar, thin metal wiring, scrap metal and foundry type sand from 0 to 15.0 feet BGS; a 2-foot wide, ¼-inch thick, 2-foot long piece of metal at 11.2 ft BGS	BH166-17	45
TT-34	EU19	A mixture of partial drum remnants, rubber tires, aluminum siding, glass and ceramic debris, metal shavings, rubber washers, ½-inch metal banding, tarp material, glass soda bottles, cinder block, brick debris, and partial ceramic toilet from 0 to 10.2 feet BGS; an insulator at 5.0 feet BGS; water at 10.0 feet BGS	n/a	n/a
TT-35	EU19	A mixture of brick debris, scrap metal, slag, rubber washer, ¼-inch diameter metal wiring and foundry type sand from 0 to 14.5 feet BGS; glass bottles, a drum ring lid, and slag debris from 12.5 to 13.0 feet BGS; water at 14.0 feet BGS.	BH168-17	25
TT-36	EU19	A mixture of metal wire springs, circular metal disc, wood timbers, scrap metal bandings, scrap metal, concrete and brick debris, plastic sheeting, aluminum and foundry type sand from 0 to 13.5 feet BGS; partial drum remnants at 2.5 and 4.0 feet BGS; water at 13.5 feet BGS	n/a	n/a
TT-37	EU19	A mixture of brake pad components and trace ½-inch metal banding from 0 to 6.5 feet BGS; a mixture of trash, plastic sheeting, concrete and brick debris, light bulb, and wood debris from 9.0 to 12.0 feet BGS; foundry type sand from 0.0 to 9.0 feet BGS	n/a	n/a
TT-38	EU19	A mixture of concrete and brick debris, plastic bucket, metal cutting wheel, cinder block wood timbers, and metal wiring from 0 to 4.5 feet BGS; a 3-foot thick, 6-foot wide, 8-foot long concrete slab at 1.0 foot BGS; water at 4.0 feet BGS	BH171-18	30
TT-39	EU19	A mixture of concrete and brick debris, metal wiring, wood timbers and metal from 0 to 15.0 feet BGS	BH172-17	43.5
TT-40	EU13	A mixture of concrete, brick, wood and slag debris, rubber hose, metal wires, mortar and foundry type sand from 0 to 10.0 feet BGS; a 3-foot section of intertwined slag and scrap metal at 6.0 feet BGS. The excavation was terminated at 10.0 feet BGS due to wall collapse	BH159-17	21
TT-41	EU1	A mixture of concrete debris, 10-foot long, 3-inch wide metal strapping, 3/8-inch diameter metal rod and foundry type from 0 to 3.0 feet BGS; water at 3.0 feet BGS.	BH158-17	15
TT-43	EU15	A mixture of concrete, brick, plastic wrapping, glass debris, and wood block from 0 to 15.0 feet BGS; ¼-inch metal cable at 12.0 feet BGS; foundry type sand at 8.5 to 9.0 ft BGS.	BH160-18	28

Asbestos						
Chrysotile asbestos	%	17	17	0.25	8	1
General Chemistry						
Cyanide (total)	mg/kg	55	20	0.084	120	7
Fraction organic carbon (FOC)	%	5	5	0.7	10.5	5
Total solids	%	15	15	59.7	91.5	83

Notes:

< - Less than reported value.
B - Estimated concentration (Inorganics).
B - Compound was found in the blank and sample (Organics).
D - Compounds at secondary dilution factor.
E - Estimated because of the presence of interference (Inorganics).
E - Exceed calibration range of GC/MS instrument (Organics).
J - Estimated concentration.
NJ - Tentatively identified compound, estimated concentration.
P - The %RPD between the primary and confirmation column/detector is >40%.
R - Rejected.
U - Not detected at the associated reporting limit.
UJ - Not detected; associated reporting limit is estimated.
W - Unknown description
X - Unknown description
- - Not applicable.

Notes:

J - Estimated concentration.
U - Not detected at the associated reporting limit.
UJ - Not detected; associated reporting limit is estimated.
(1) The TEQs of various dioxin and furan congeners were calculated using the toxicity equivalence factors as defined by the World Health Organization (Van den Berg et al., 2006), as outlined below.

Dioxin and Furan Congener	**TEQ**
1,2,3,4,6,7,8,9-Octachlorodibenzofuran (OCDF)	0.0003
1,2,3,4,6,7,8,9-Octachlorodibenzo-p-dioxin (OCDD)	0.0003
1,2,3,4,6,7,8-Heptachlorodibenzofuran (HpCDF)	0.01
1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin (HpCDD)	0.01
1,2,3,4,7,8,9-Heptachlorodibenzofuran (HpCDF)	0.01
1,2,3,4,7,8-Hexachlorodibenzofuran (HxCDF)	0.1
1,2,3,4,7,8-Hexachlorodibenzo-p-dioxin (HxCDD)	0.1
1,2,3,6,7,8-Hexachlorodibenzofuran (HxCDF)	0.1
1,2,3,6,7,8-Hexachlorodibenzo-p-dioxin (HxCDD)	0.1
1,2,3,7,8,9-Hexachlorodibenzofuran (HxCDF)	0.1
1,2,3,7,8,9-Hexachlorodibenzo-p-dioxin (HxCDD)	0.1
1,2,3,7,8-Pentachlorodibenzofuran (PeCDF)	0.03
1,2,3,7,8-Pentachlorodibenzo-p-dioxin (PeCDD)	1
2,3,4,6,7,8-Hexachlorodibenzofuran (HxCDF)	0.1
2,3,4,7,8-Pentachlorodibenzofuran (PeCDF)	0.3
2,3,7,8-Tetrachlorodibenzofuran (TCDF)	0.1
2,3,7,8-Tetrachlorodibenzo-p-dioxin (TCDD)	1

(2) Dioxin and furan congeners that were below the detection limit were conservatively assumed as half of the method detection limit (MDL) (ND = 0.5MDL) for the calculation of the the dioxins and furans TEQ.

Notes:

J - Estimated concentration.
U - Not detected at the associated reporting limit.
UJ - Not detected; associated reporting limit is estimated.
(1) The TEQs of various dioxin and furan congeners were calculated using the toxicity equivalence factors as defined by the World Health Organization (Van den Berg et al., 2006), as outlined below.

Dioxin and Furan Congener	**TEQ**
1,2,3,4,6,7,8,9-Octachlorodibenzofuran (OCDF)	0.0003
1,2,3,4,6,7,8,9-Octachlorodibenzo-p-dioxin (OCDD)	0.0003
1,2,3,4,6,7,8-Heptachlorodibenzofuran (HpCDF)	0.01
1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin (HpCDD)	0.01
1,2,3,4,7,8,9-Heptachlorodibenzofuran (HpCDF)	0.01
1,2,3,4,7,8-Hexachlorodibenzofuran (HxCDF)	0.1
1,2,3,4,7,8-Hexachlorodibenzo-p-dioxin (HxCDD)	0.1
1,2,3,6,7,8-Hexachlorodibenzofuran (HxCDF)	0.1
1,2,3,6,7,8-Hexachlorodibenzo-p-dioxin (HxCDD)	0.1
1,2,3,7,8,9-Hexachlorodibenzofuran (HxCDF)	0.1
1,2,3,7,8,9-Hexachlorodibenzo-p-dioxin (HxCDD)	0.1
1,2,3,7,8-Pentachlorodibenzofuran (PeCDF)	0.03
1,2,3,7,8-Pentachlorodibenzo-p-dioxin (PeCDD)	1
2,3,4,6,7,8-Hexachlorodibenzofuran (HxCDF)	0.1
2,3,4,7,8-Pentachlorodibenzofuran (PeCDF)	0.3
2,3,7,8-Tetrachlorodibenzofuran (TCDF)	0.1
2,3,7,8-Tetrachlorodibenzo-p-dioxin (TCDD)	1

(2) Dioxin and furan congeners that were below the detection limit were conservatively assumed as half of the method detection limit (MDL) (ND = 0.5MDL) for the calculation of the the dioxins and furans TEQ.

Notes:

J - Estimated concentration.
U - Not detected at the associated reporting limit.
UJ - Not detected; associated reporting limit is estimated.
(1) The TEQs of various dioxin and furan congeners were calculated using the toxicity equivalence factors as defined by the World Health Organization (Van den Berg et al., 2006), as outlined below.

Dioxin and Furan Congener	**TEQ**
1,2,3,4,6,7,8,9-Octachlorodibenzofuran (OCDF)	0.0003
1,2,3,4,6,7,8,9-Octachlorodibenzo-p-dioxin (OCDD)	0.0003
1,2,3,4,6,7,8-Heptachlorodibenzofuran (HpCDF)	0.01
1,2,3,4,6,7,8-Heptachlorodibenzo-p-dioxin (HpCDD)	0.01
1,2,3,4,7,8,9-Heptachlorodibenzofuran (HpCDF)	0.01
1,2,3,4,7,8-Hexachlorodibenzofuran (HxCDF)	0.1
1,2,3,4,7,8-Hexachlorodibenzo-p-dioxin (HxCDD)	0.1
1,2,3,6,7,8-Hexachlorodibenzofuran (HxCDF)	0.1
1,2,3,6,7,8-Hexachlorodibenzo-p-dioxin (HxCDD)	0.1
1,2,3,7,8,9-Hexachlorodibenzofuran (HxCDF)	0.1
1,2,3,7,8,9-Hexachlorodibenzo-p-dioxin (HxCDD)	0.1
1,2,3,7,8-Pentachlorodibenzofuran (PeCDF)	0.03
1,2,3,7,8-Pentachlorodibenzo-p-dioxin (PeCDD)	1
2,3,4,6,7,8-Hexachlorodibenzofuran (HxCDF)	0.1
2,3,4,7,8-Pentachlorodibenzofuran (PeCDF)	0.3
2,3,7,8-Tetrachlorodibenzofuran (TCDF)	0.1
2,3,7,8-Tetrachlorodibenzo-p-dioxin (TCDD)	1

(2) Dioxin and furan congeners that were below the detection limit were conservatively assumed as half of the method detection limit (MDL) (ND = 0.5MDL) for the calculation of the the dioxins and furans TEQ.

Aroclor-1254 (PCB-1254)	µg/kg	20	66.8	90.6	37.0	256.3	77.5	435.0	131.9	130.3	133.2

Notes:

1 Segment 1 includes SS-164, SS-165, SS-166 and SS-167
Segment 2 includes SS-168, SS-169, SS-170 and SS-171
Segment 3 includes SS-172, SS-173, SS-174 and SS-175

2 Mean values were calculated for 3 cases for each Segment
"All" results includes upper and lower sample intervals
"Upper" results includes samples collected from shallow interval (top 6 inches)
"Lower" results includes samples collected from deeper interval (6 to 24 inches)

3 Mean values were not calculated for chromium VI and PCB-1248 due to low detection frequency

4 Mean value includes detected values and non-detect values (assumed equal to reporting limit)

Subject: **Analytical Results and Full Validation**
Test Pit Soil Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
October-November 2017

1. Introduction

This document details a validation of analytical results for soil samples collected in support of the Test Pit Soil Sampling Program at the Moraine, Ohio site during October-November 2017. Samples were submitted to TestAmerica Laboratories, Inc. (TA) located in North Canton, Ohio. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, duplicate data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spike (MS) samples and field quality assurance/quality (QA/QC) samples. The assessment of analytical and in-house data included checks for data consistency (by observing comparability of duplicate analyses), adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2, Appendix E – Quality Assurance Project Plan", September 20, 2017

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review", USEPA 540-R-10-011, January 2010

iii) "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008

iv) "National Functional Guidelines for High Resolution Superfund Methods Data Review", United States Environmental Protection Agency (USEPA) 542-B-16-001, April 2016.

Items ii), iii), and iv) will subsequently be referred to as the "Guidelines" in this Memorandum.

2. Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Gas Chromatography/Mass Spectrometer (GC/MS) – Tuning and Mass Calibration (Instrument Performance Check) and Inductively Coupled Plasma/Mass Spectrometer (ICP/MS)

3.1 Organic Analyses

Prior to volatile organic compound (VOC) and semi-volatile organic compound (SVOC) analysis, GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, methods require the analysis of specific tuning compounds bromofluorobenzene (BFB) and decafluorotriphenylphosphine (DFTPP), respectively. The resulting spectra must meet the criteria cited in the methods before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument.

Tuning compounds were analyzed at the required frequency throughout VOC and SVOC analysis periods. All tuning criteria were met indicating that proper optimization of the instrumentation was achieved.

3.2 High Resolution GC/MS Analyses

GC/MS system performance checks are performed to ensure mass resolution, identification, and calibration. The following criteria must be met before sample analysis can begin:

i) For the PFK (perfluorokerosene) molecular leak, the resolution must be greater than or equal to 10,000. The deviation between the exact mass and the theoretical mass for each of the three to five ions monitored must be less than 5 parts per million (ppm).

ii) The Window Defining Mix (WDM) should be analyzed after the PFK, prior to calibration and every 12 hours during sample analysis.

iii) The Isomer Specificity Check standard should be analyzed after the WMD, prior to calibration and every 12 hours during sample analysis.

All GC/MS performance checks were performed and all criteria were met.

3.3 Inorganic Analyses

To ensure adequate mass resolution, identification, and to some degree, sensitivity, the performance of each ICP/MS instrument used for metals analyses is checked prior to calibration and initiating an analysis sequence through the analysis of a tuning solution.

Instrument performance check data were reviewed. The tuning solution was analyzed at the required frequency throughout the analyses. The results of all instrument performance checks were within the method acceptance criteria, indicating that proper optimization of the instrumentation was achieved.

4. Initial Calibration - Organic Analyses

4.1 GC/MS

To quantify VOCs and SVOCs of interest in samples, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity of the calibration curve and instrument sensitivity are evaluated against the following criteria:

i) All relative response factors (RRFs) must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent (40.0 percent for compounds that exhibit poor response) or a minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

The initial calibration data for VOCs and SVOCs were reviewed. All compounds met the above criteria for sensitivity and linearity.

4.2 High Resolution GC/MS

To quantify dioxins/furans of interest, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds required by the method is analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity and sensitivity of the calibration curve are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) for the relative response (RR) of congeners calibrated by isotope dilution must not exceed 20.0 percent or a minimum correlation coefficient (R) of 0.99 if linear calibration curves are used

ii) The percent relative standard deviation (%RSD) for the relative response factor (RRF) of congeners calibrated by internal standard must not exceed 35.0 percent or a minimum correlation coefficient (R) of 0.99 if linear calibration curves are used

iii) The signal to noise ratio (S/N) must be ≥ 10 percent for all analytes and the ion abundance ratios must be within the method required window

The initial calibration data were reviewed. All compounds met the above criteria for linearity and sensitivity.

4.3 GC

To quantify pesticides, the performance evaluation mixture (PEM) is analyzed at the beginning and end of the initial calibration sequence and throughout the analytical sequence. The results of these analyses are used to evaluate dichlorodiphenyltrichloroethane (DDT)/endrin breakdown, using the method degradation criteria of <15 percent. PEM standards were analyzed at the required frequency throughout sample analysis and all method performance criteria were met.

4.2.1 Internal Standard Calibration – PCBs and Organochlorine Pesticides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Polychlorinated biphenyls (PCBs) and organochlorine pesticides were calibrated with a dual column analysis using internal standardization. Five peaks, representing five congeners, were used for the analysis of each Aroclor with a separate curve fitted to the calibration data for each congener. A calibration curve consisting of a minimum of five concentration levels was analyzed for all single component compounds of interest. Linearity of the calibration curves are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent

ii) A minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

5. Initial Calibration – Inorganic Analyses

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For ICP/MS analysis, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve. For mercury atomic absorption (AA) analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater. For instrumental general chemistry analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	Parameter	Control Limits
ICP/MS	Metals	90 - 110%
Cold Vapor AA	Mercury	80 - 120%
Instrumental Wet Chemistry	Cyanide	85 - 115%

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that all of the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals and general chemistry analyses were properly calibrated prior to sample analysis.

6. Continuing Calibration - Organic Analyses

6.1 GC/MS

To ensure that instrument calibration for VOC and SVOC analyses is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) All RRF values must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) Percent difference (%D) values must not exceed 25.0 percent (40.0 percent for compounds that exhibit poor response)

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability with the exception of the sample results presented with qualifiers in Table 4.

6.2 High Resolution GC/MS

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) The percent difference (%D) for the relative response (RR) of congeners calibrated by isotope dilution must not exceed 25.0 percent

ii) The percent difference (%D) for the relative response factor (RRF) of congeners calibrated by internal standard must be within the method required windows

iii) The signal to noise ratio (S/N) must be ≥ 10 percent for all analytes and the ion abundance ratios must be within the method required window

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability

6.3 GC

To ensure that the calibration of the instrument for organic analyses by GC is valid throughout the sample analysis period, continuing calibration standards are analyzed and evaluated on a regular basis. To evaluate the continued linearity of the calibration, %D values are calculated for each compound. As specified in the methods, all %D values should not exceed 15 percent. To ensure that compound retention times do not vary over the analysis period, all retention times for continuing calibration compounds must fall within the established retention time windows.

All continuing calibration standards were analyzed at the required frequency. All %D values and compound retention times met the above criteria indicating acceptable instrument calibration throughout the analysis period with the exception of the results presented with qualifiers in Table 4.

7. Continuing Calibration - Inorganic Analyses

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. All analyte recoveries reported for the CCVs were within the specified limits.

8. Laboratory Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for the inorganic parameters.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

8.1 Organic Analyses

Most method blank results were non-detect. Table 5 presents the sample results that were qualified as non-detect due to analyte concentrations in the method blanks.

8.2 Inorganic Analyses

Upon review of the ICBs, CCBs, and method blanks, it was noted that metal concentrations were observed above the method detection limit (MDL). Most investigative samples associated with the low-level detections reported either non-detect concentrations or concentrations significantly greater than the associated laboratory blank concentrations for the analytes of interest. These sample results were not impacted by the

contamination detected. Associated positive sample results with similar concentrations to the levels reported in the blanks were qualified as non-detect (see Table 5).

9. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for organic determinations were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. Due to dilutions equal to or greater than 5 times that were necessary to successfully analyze the samples, numerous surrogate recoveries in investigative samples analyzed for pesticides, PCBs, and SVOCs were not assessed. Most remaining surrogate recoveries were within the laboratory criteria. Where surrogate recoveries were above the control limits, non-detect sample results were not impacted by the implied high bias and were not qualified. Table 6 presents the sample results that were qualified due to outlying surrogate recoveries.

10. Spiked C-13 Labeled PCDD/PCDF

In accordance with the method employed, all samples, blanks, and QC samples analyzed for PCDD/PCDF are spiked with labeled congeners prior to extraction to be an internal standard for the quantitation of native congeners, and to serve as surrogates for the assessment of method performance in the sample matrix.

All samples submitted for PCDD/PCDF determinations were spiked with the appropriate number of labeled compounds prior to sample extraction analysis.

Labeled congener recoveries were assessed against method control limits. All recoveries met the method criteria.

11. Internal Standards (IS) Analyses

IS data were evaluated for all VOC, SVOC, PCB, Pesticide, and ICP/MS metals sample analyses.

11.1 Organics Analyses

To ensure that changes in the GC/MS and GC sensitivity and response do not affect sample analysis results IS compounds are added to each sample prior to analysis. All results are then calculated as a ratio of the IS responses.

The sample IS results were evaluated against the following criteria:

i) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard

ii) IS area counts must not vary by more than a factor of two (-50 percent to +100 percent) from the associated calibration standard

Most organic IS recoveries and retention times met the above criteria. Table 7 presents the sample results that were qualified or rejected due to outlying IS recoveries.

11.2 Inorganic Analyses

IS elements were added to all samples prior to metals analysis by ICP/MS. Overall instrument stability and performance for metals analyses were monitored using the IS intensity data. IS recoveries were assessed using control limits of 60-125 percent.

Most inorganic IS recoveries were within the acceptance limits. Table 7 presents the sample results that were qualified as estimated due to outlying IS recoveries.

12. Cleanup Standard Recoveries-High Resolution GC/MS-PCDD/PCDF

Two C-13 labeled cleanup standards are added to all samples, blanks, and blank spike samples subsequent to extraction, but prior to the cleanup procedures to assess the efficiency of the cleanup procedures.

Cleanup standards were added to all samples and blanks prior to cleanup. All recoveries were within the method acceptable ranges.

13. Laboratory Control Sample Analyses

LCS or LCS/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

13.1 Organic Analyses

The LCS or LCS/LCSD contained all compounds of interest or the compounds specified in the method. All LCS recoveries and RPDs were within the laboratory control limits demonstrating acceptable analytical accuracy and precision.

13.2 Inorganic Analyses

The LCS or LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries and RPDs were within the control limits demonstrating acceptable analytical accuracy and precision.

14. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

If the original sample concentration is significantly greater than the spike concentration, the recovery is not assessed.

If only the MS or MSD recovery was outside of control limits, no qualification of the data was performed based on the acceptable recovery of the companion spike and the acceptable RPD.

Due to dilutions that were necessary to successfully analyze the samples, some MS/MSD recoveries were not assessed.

MS/MSD analyses were performed as specified in Table 1.

14.1 Organic Analyses

The MS/MSD samples were spiked with all compounds of interest or the compounds specified in the method. All percent recoveries and RPD values were within the laboratory control limits demonstrating acceptable analytical accuracy and precision with the exception of the dioxin/furan sample results presented with qualifiers in Table 8.

14.2 Inorganic Analyses

The MS or MS/MSD samples were spiked with the analytes of interest, and the results were evaluated using the "Guidelines". All percent recoveries and RPD values, if applicable, were within the control limits, demonstrating acceptable analytical accuracy and precision with the exception of the sample results presented with qualifiers in Table 8.

15. Duplicate Sample Analyses – Inorganic Analyses

Analytical precision is evaluated based on the analysis of laboratory duplicate samples. For this study, duplicate samples were prepared and analyzed by the laboratory as specified in Table 1. The duplicate results were evaluated per the "Guidelines".

All duplicate analyses performed were acceptable, demonstrating acceptable analytical precision.

16. ICP/MS Serial Dilution

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. A minimum of 1 per 20 investigative samples or at least 1 per analytical batch must be analyzed at a five-fold dilution. For samples with sufficient analyte concentrations (>50 times the method detection limit), the serial dilution results must agree within 10 percent of the original results.

A serial dilution was performed on each MS/MSD sample. All results met the criteria above.

17. ICP Interference Check Sample Analysis (ICS)

To verify that the laboratory has established proper inter-element and background correction factors, ICSs are analyzed. These samples contain high concentrations of aluminum, calcium, magnesium, and iron and are analyzed at the beginning and end of each sample analysis period. The ICSs are evaluated against recovery control limits in the "Guidelines" of 80 to 120 percent.

ICS analysis results were evaluated for all samples using the criteria in the "Guidelines". All ICS recoveries and results were acceptable.

18. Field QA/QC Samples

The field QA/QC consisted of three field duplicate sample sets.

18.1 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, three field duplicate sample sets were collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 100 percent for soil samples. If the reported concentration in either the investigative sample or its duplicate is less than five times the reporting limit (RL), the evaluation criterion is two times the RL value for water samples.

Most field duplicate results were within acceptable agreement demonstrating acceptable sampling and analytical precision. Table 9 presents the sample results that were qualified due to variability in the field duplicate results.

19. Analyte Reporting

The laboratory reported detected results down to the laboratory's method detection limit (MDL) for each analyte adjusted for specific sample dilutions, weights, and volumes. Positive analyte detections less than the RL but greater than the sample-specific MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the sample specific MDL in Table 2.

All soil results were reported on a dry weight basis.

20. Target Compound Identification

To minimize erroneous compound identification during organic analyses, qualitative criteria including compound retention time and mass spectra (if applicable) were evaluated according to the identification criteria established by the methods. The samples identified in Table 1 were reviewed. The organic compounds reported adhered to the specified identification criteria.

Pesticide and PCB analyses were performed using dual column analyses. In general, the results showed good correlation between the two columns (<40 RPD). Variability was observed between some of the results. The associated data were qualified in Table 10 as estimated (J) or tentatively identified and estimated (NJ) where RPD > 100 to reflect the indicated variability.

Table 11 presents the qualified samples results for dioxin/furans due to outlying identification criteria.

21. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are acceptable with the specific exceptions and qualifications noted herein.

Total tetrachlorodibenzofuran (TCDF)	pg/g	-	-	-	-	-
Total tetrachlorodibenzo-p-dioxin (TCDD)	pg/g	-	-	-	-	-
General Chemistry						
Cyanide (total)	mg/kg	0.59 UJ	0.51 UJ	0.46 U	0.60 U	0.53 U

Notes:

J - Estimated concentration
NJ - Tentatively identified compound, estimated concentration
R - Rejected
U - Not detected at the associated reporting limit
UJ - Not detected; associated reporting limit is estimated
- - Not applicable

Subject: **Analytical Results and Full Validation**
Soil Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
November 2017

1. Introduction

This document details a validation of analytical results for soil samples collected at the Moraine, Ohio site during November 2017. Samples were submitted to TestAmerica Laboratories, Inc. (TA) located in North Canton, Ohio. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. The final results and supporting quality assurance/quality control (QA/QC) data were assessed. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, and recovery data from laboratory control samples (LCS). The assessment of analytical and in-house data included checks for data consistency, adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2, Appendix E – Quality Assurance Project Plan", September 20, 2017

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review", USEPA 540-R-10-011, January 2010

Item ii) will subsequently be referred to as the "Guidelines" in this Memorandum.

2. Sample Holding Time and Preservation

The sample holding time criteria and sample preservation requirements for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Initial Calibration – Inorganic Analyses

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For ICP analysis, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	Parameter	Control Limits
ICP	Metals	90 - 110%

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals analyses were properly calibrated prior to sample analysis.

4. Continuing Calibration - Inorganic Analyses

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. All analyte recoveries reported for the CCVs were within the specified limits.

5. Laboratory Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for metals analysis.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

A review of the ICBs, CCBs, and method blanks was performed, and all laboratory blanks were non-detect for the analyte of interest.

6. Internal Standards (IS) Analyses

IS data were evaluated for all ICP metals sample analyses.

IS elements were added to all samples prior to metals analysis by ICP. Overall instrument stability and performance for metals analyses were monitored using the IS intensity data. IS recoveries were assessed using control limits of 60-125 percent.

All inorganic IS recoveries were acceptable demonstrating adequate analytical performance.

7. Laboratory Control Sample Analyses

An LCS is prepared and analyzed as a sample to assess the analytical efficiencies of the method employed, independent of sample matrix effects.

For this study, an LCS was analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

The LCS contained the analyte of interest. The LCS recovery was assessed per the "Guidelines". The LCS recovery was within the control limits, demonstrating acceptable analytical accuracy.

8. ICP Interference Check Sample Analysis (ICS)

To verify that the laboratory has established proper inter-element and background correction factors, ICSs are analyzed. These samples contain high concentrations of aluminum, calcium, magnesium, and iron and are analyzed at the beginning and end of each sample analysis period. The ICSs are evaluated against recovery control limits of 80 to 120 percent.

ICS analysis results were evaluated for all samples using the criteria in the "Guidelines". All ICS recoveries and results were acceptable.

9. Analyte Reporting

The laboratory reported detected results down to the laboratory's method detection limit (MDL) for each analyte adjusted for specific sample dilutions, weights, and volumes. Positive analyte detections less than the RL but greater than the sample-specific MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum.

All soil sample results were reported on a dry weight basis.

10. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are acceptable without qualification.

Subject: **Analytical Results and Full Validation**
Floodplain Soil Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
August 2018

1. Introduction

This document details a validation of analytical results for soil samples collected in support of the Floodplain Soil Sampling Program at the Moraine, Ohio site during August 2018. Samples were submitted to TestAmerica Laboratories, Inc. (TA) located in North Canton, Ohio. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, duplicate data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spike (MS) samples and field quality assurance/quality (QA/QC) samples. The assessment of analytical and in-house data included checks for data consistency (by observing comparability of duplicate analyses), adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2, Appendix E – Quality Assurance Project Plan", September 20, 2017

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review", USEPA 540-R-10-011, January 2010

iii) "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008

Items ii) and iii) will subsequently be referred to as the "Guidelines" in this Memorandum.

2. Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Gas Chromatography/Mass Spectrometer (GC/MS) – Tuning and Mass Calibration (Instrument Performance Check) and Inductively Coupled Plasma/Mass Spectrometer (ICP/MS)

3.1 Organic Analyses

Prior to volatile organic compound (VOC) and semi-volatile organic compound (SVOC) analysis, GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, methods require the analysis of specific tuning compounds bromofluorobenzene (BFB) and decafluorotriphenylphosphine (DFTPP), respectively. The resulting spectra must meet the criteria cited in the methods before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument.

Tuning compounds were analyzed at the required frequency throughout VOC and SVOC analysis periods. All tuning criteria were met indicating that proper optimization of the instrumentation was achieved.

3.2 Inorganic Analyses

To ensure adequate mass resolution, identification, and to some degree, sensitivity, the performance of each ICP/MS instrument used for metals analyses is checked prior to calibration and initiating an analysis sequence through the analysis of a tuning solution.

Instrument performance check data were reviewed. The tuning solution was analyzed at the required frequency throughout the analyses. The results of all instrument performance checks were within the method acceptance criteria, indicating that proper optimization of the instrumentation was achieved.

4. Initial Calibration - Organic Analyses

4.1 GC/MS

To quantify VOCs and SVOCs of interest in samples, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific concentration range.

Linearity of the calibration curve and instrument sensitivity are evaluated against the following criteria:

i) All relative response factors (RRFs) must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent (40.0 percent for compounds that exhibit poor response) or a minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

The initial calibration data for VOCs and SVOCs were reviewed. All compounds met the above criteria for sensitivity and linearity.

4.2 GC

To quantify pesticides, the performance evaluation mixture (PEM) is analyzed at the beginning and end of the initial calibration sequence and throughout the analytical sequence. The results of these analyses are used to evaluate dichlorodiphenyltrichloroethane (DDT)/endrin breakdown, using the method degradation criteria of <15 percent. PEM standards were analyzed at the required frequency throughout sample analysis and all method performance criteria were met.

4.2.1 Internal Standard Calibration – PCBs and Organochlorine Pesticides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Polychlorinated biphenyls (PCBs) and organochlorine pesticides were calibrated with a dual column analysis using internal standardization. Five peaks, representing five congeners, were used for the analysis of each Aroclor with a separate curve fitted to the calibration data for each congener. A calibration curve consisting of a minimum of five concentration levels was analyzed for all single component compounds of interest. Linearity of the calibration curves are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent

ii) A minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

4.2.2 External Standard Calibration – Herbicides

In order to quantify the herbicide compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Initially, a calibration curve consisting of a minimum of five concentration levels is analyzed for all single component compounds of interest. Linearity of the calibration curve is acceptable if all RSD values are less than or equal to 20.0 percent or if the correlation coefficient (R) is 0.995 or greater for linear regression curves.

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

5. Initial Calibration – Inorganic Analyses

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For ICP/MS analysis, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve. For mercury atomic absorption (AA) analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater. For instrumental general chemistry analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	Parameter	Control Limits
ICP/MS	Metals	90 - 110%
Cold Vapor AA	Mercury	80 - 120%
Instrumental Wet Chemistry	Cyanide	85 - 115%

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that all of the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals and general chemistry analyses were properly calibrated prior to sample analysis.

6. Continuing Calibration - Organic Analyses

6.1 GC/MS

To ensure that instrument calibration for VOC and SVOC analyses is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) All RRF values must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) Percent difference (%D) values must not exceed 25.0 percent (40.0 percent for compounds that exhibit poor response)

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability.

6.2 GC

To ensure that the calibration of the instrument for organic analyses by GC is valid throughout the sample analysis period, continuing calibration standards are analyzed and evaluated on a regular basis. To evaluate the continued linearity of the calibration, %D values are calculated for each compound. As specified in the methods, all %D values should not exceed 15 percent. To ensure that compound retention times do not vary over the analysis period, all retention times for continuing calibration compounds must fall within the established retention time windows.

All continuing calibration standards were analyzed at the required frequency. All %D values and compound retention times met the above criteria indicating acceptable instrument calibration throughout the analysis period.

7. Continuing Calibration - Inorganic Analyses

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. All analyte recoveries reported for the CCVs were within the specified limits.

8. Laboratory Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for the inorganic parameters.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

8.1 Organic Analyses

Most method blank results were non-detect. Table 4 presents the sample results that were qualified as non-detect due to analyte concentrations in the method blanks.

8.2 Inorganic Analyses

Upon review of the ICBs, CCBs, and method blanks, it was noted that metal concentrations were observed above the method detection limit (MDL). Most investigative samples associated with the low-level detections reported either non-detect concentrations or concentrations significantly greater than the associated laboratory blank concentrations for the analytes of interest. These sample results were not impacted by the contamination detected. Associated positive sample results with similar concentrations to the levels reported in the blanks were qualified as non-detect (see Table 4).

9. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for organic determinations were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. Due to dilutions equal to or greater than 5 times that were necessary to successfully analyze the samples, numerous surrogate recoveries in investigative samples analyzed for pesticides and PCBs were not assessed. Most remaining surrogate recoveries were within the laboratory criteria. Where surrogate recoveries were above the control limits, non-detect sample results were not impacted by the implied high bias and were not qualified. Table 5 presents the sample results that were qualified due to outlying surrogate recoveries.

10. Internal Standards (IS) Analyses

IS data were evaluated for all VOC, SVOC, PCB, Pesticide, and ICP/MS metals sample analyses.

10.1 Organics Analyses

To ensure that changes in the GC/MS and GC sensitivity and response do not affect sample analysis results IS compounds are added to each sample prior to analysis. All results are then calculated as a ratio of the IS responses.

The sample IS results were evaluated against the following criteria:

i) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard

ii) IS area counts must not vary by more than a factor of two (-50 percent to +100 percent) from the associated calibration standard

All organic IS recoveries and retention times met the above criteria.

10.2 Inorganic Analyses

IS elements were added to all samples prior to metals analysis by ICP/MS. Overall instrument stability and performance for metals analyses were monitored using the IS intensity data.

The test requested was method SW-846 6020, which states IS recoveries of 30% to 120% must be met for investigatory samples. Method 200.8 states that IS recoveries be within 60% to 125% for QC samples and investigatory samples. All of the samples analyzed were within the 30% to 120% criteria. Method SW-846 6020 also has recoveries of 80% to 120% for the CCV/CCB. The laboratory has allowed deviation of the method in the internal SOP, which states: “Internal standard recoveries may be less than 80% in CCVs and CCBs as long as QC criteria are met and that no anomalies are observed by the analyst.”

All inorganic IS recoveries were within the acceptance limits or were acceptable based on the laboratory analyst professional judgment.

11. Laboratory Control Sample Analyses

LCS or LCS/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

11.1 Organic Analyses

The LCS or LCS/LCSD contained all compounds of interest or the compounds specified in the method. All LCS recoveries and RPDs were within the laboratory control limits demonstrating acceptable analytical accuracy and precision.

11.2 Inorganic Analyses

The LCS or LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries and RPDs were within the control limits demonstrating acceptable analytical accuracy and precision.

12. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

If the original sample concentration is significantly greater than the spike concentration, the recovery is not assessed.

If only the MS or MSD recovery was outside of control limits, no qualification of the data was performed based on the acceptable recovery of the companion spike and the acceptable RPD.

Due to dilutions that were necessary to successfully analyze the samples, some MS/MSD recoveries were not assessed.

MS/MSD analyses were performed as specified in Table 1.

12.1 Organic Analyses

The MS/MSD samples were spiked with all compounds of interest or the compounds specified in the method. All percent recoveries and RPD values were within the laboratory control limits demonstrating acceptable analytical accuracy and precision with the exception of the sample results in Table 6. Where MS/MSD recoveries were less than 10%, the associated non-detect results were rejected, and detected results were qualified as estimated. Where the MS/MSD recoveries were greater than or equal to 10% but less than the lower control limit, the associated sample results were qualified as estimated.

12.2 Inorganic Analyses

The MS or MS/MSD samples were spiked with the analytes of interest, and the results were evaluated using the "Guidelines". All percent recoveries and RPD values, if applicable, were within the control limits, demonstrating acceptable analytical accuracy and precision with the exception of the sample results presented with qualifiers in Table 6.

13. ICP/MS Serial Dilution

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. A minimum of 1 per 20 investigative samples or at least 1 per analytical batch must be analyzed at a five-fold dilution. For samples with sufficient analyte concentrations (>50 times the method detection limit), the serial dilution results must agree within 10 percent of the original results.

A serial dilution was performed on each MS/MSD sample. All results met the criteria above.

14. ICP Interference Check Sample Analysis (ICS)

To verify that the laboratory has established proper inter-element and background correction factors, ICSs are analyzed. These samples contain high concentrations of aluminum, calcium, magnesium, and iron and are analyzed at the beginning and end of each sample analysis period. The ICSs are evaluated against recovery control limits in the "Guidelines" of 80 to 120 percent.

ICS analysis results were evaluated for all samples using the criteria in the "Guidelines". All ICS recoveries and results were acceptable.

15. Field QA/QC Samples

The field QA/QC consisted of three trip blank samples and three rinse blank samples.

15.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, three trip blanks were submitted to the laboratory for VOC analysis. Acetone was detected in one trip blank. The associated sample results were significantly greater than the trip blank result. Qualification of the sample results was not necessary on this basis. All remaining results were non-detect for the compounds of interest.

15.2 Rinse Blank Sample Analysis

To assess field decontamination procedures, ambient conditions at the site, and cleanliness of sample containers, three rinse blank were submitted for analysis, as identified in Table 1. Most results were non-detect for the analytes of interest. Table 7 presents the sample results that were qualified as non-detect due to analyte concentrations in the rinse blanks that were similar to the sample result.

16. Analyte Reporting

The laboratory reported detected results down to the laboratory's method detection limit (MDL) for each analyte adjusted for specific sample dilutions, weights, and volumes. Positive analyte detections less than the RL but greater than the sample-specific MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the sample specific MDL in Table 2.

All soil results were reported on a dry weight basis.

17. Target Compound Identification

To minimize erroneous compound identification during organic analyses, qualitative criteria including compound retention time and mass spectra (if applicable) were evaluated according to the identification criteria established by the methods. The samples identified in Table 1 were reviewed. The organic compounds reported adhered to the specified identification criteria.

Pesticide, herbicide, and PCB analyses were performed using dual column analyses. In general, the results showed good correlation between the two columns (<40 RPD). Variability was observed between some of the results. The associated data were qualified in Table 8 as estimated (J) or tentatively identified and estimated (NJ) where RPD > 100 to reflect the indicated variability.

18. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are acceptable with the specific exceptions and qualifications noted herein.

Vanadium	mg/kg	20	12	13	33	28	27
Zinc	mg/kg	140	28	35	150	120	180
General Chemistry							
Cyanide (total)	mg/kg	0.27 J	0.20 U	0.19 U	0.25 U	0.23 U	0.22 U

Notes:

PCBs - Polychlorinated Biphenyls
J - Estimated concentration
U - Not detected at the associated reporting limit
UJ - Not detected; associated reporting limit is estimated
R - Rejected
ft BGS - Feet below ground surface

Subject: **Analytical Results and Full Validation**
Soil Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
December 2017, January through May 2018

1. Introduction

This document details a validation of analytical results for soil samples collected in support of the Soil Sampling Program at the Moraine, Ohio site during December 2017, January through May 2018. Samples were submitted to TestAmerica Laboratories, Inc. (TA) located in North Canton, Ohio and Knoxville, Tennessee. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, duplicate data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spike (MS) samples and field quality assurance/quality (QA/QC) samples. The assessment of analytical and in-house data included checks for data consistency (by observing comparability of duplicate analyses), adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2, Appendix E – Quality Assurance Project Plan", September 20, 2017

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review", USEPA 540-R-10-011, January 2010

iii) "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008

iv) "National Functional Guidelines for High Resolution Superfund Methods Data Review", United States Environmental Protection Agency (USEPA) 542-B-16-001, April 2016.

Items ii), iii), and iv) will subsequently be referred to as the "Guidelines" in this Memorandum.

2. Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Gas Chromatography/Mass Spectrometer (GC/MS) – Tuning and Mass Calibration (Instrument Performance Check) and Inductively Coupled Plasma/Mass Spectrometer (ICP/MS)

3.1 Organic Analyses

Prior to volatile organic compound (VOC) and semi-volatile organic compound (SVOC) analysis, GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, methods require the analysis of specific tuning compounds bromofluorobenzene (BFB) and decafluorotriphenylphosphine (DFTPP), respectively. The resulting spectra must meet the criteria cited in the methods before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument.

Tuning compounds were analyzed at the required frequency throughout VOC and SVOC analysis periods. All tuning criteria were met indicating that proper optimization of the instrumentation was achieved.

3.2 High Resolution GC/MS Analyses

GC/MS system performance checks are performed to ensure mass resolution, identification, and calibration. The following criteria must be met before sample analysis can begin:

i) For the PFK (perfluorokerosene) molecular leak, the resolution must be greater than or equal to 10,000. The deviation between the exact mass and the theoretical mass for each of the three to five ions monitored must be less than 5 parts per million (ppm).

ii) The Window Defining Mix (WDM) should be analyzed after the PFK, prior to calibration and every 12 hours during sample analysis.

iii) The Isomer Specificity Check standard should be analyzed after the WMD, prior to calibration and every 12 hours during sample analysis.

All GC/MS performance checks were performed and all criteria were met.

3.3 Inorganic Analyses

To ensure adequate mass resolution, identification, and to some degree, sensitivity, the performance of each ICP/MS instrument used for metals analyses is checked prior to calibration and initiating an analysis sequence through the analysis of a tuning solution.

Instrument performance check data were reviewed. The tuning solution was analyzed at the required frequency throughout the analyses. The results of all instrument performance checks were within the method acceptance criteria, indicating that proper optimization of the instrumentation was achieved.

4. Initial Calibration - Organic Analyses

4.1 GC/MS

To quantify VOCs and SVOCs of interest in samples, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity of the calibration curve and instrument sensitivity are evaluated against the following criteria:

i) All relative response factors (RRFs) must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent (40.0 percent for compounds that exhibit poor response) or a minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

The initial calibration data for VOCs and SVOCs were reviewed. All compounds met the above criteria for sensitivity and linearity.

4.2 High Resolution GC/MS

To quantify dioxins/furans of interest, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds required by the method is analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity and sensitivity of the calibration curve are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) for the relative response (RR) of congeners calibrated by isotope dilution must not exceed 20.0 percent or a minimum correlation coefficient (R) of 0.99 if linear calibration curves are used

ii) The percent relative standard deviation (%RSD) for the relative response factor (RRF) of congeners calibrated by internal standard must not exceed 35.0 percent or a minimum correlation coefficient (R) of 0.99 if linear calibration curves are used

iii) The signal to noise ratio (S/N) must be ≥ 10 percent for all analytes and the ion abundance ratios must be within the method required window

The initial calibration data were reviewed. All compounds met the above criteria for linearity and sensitivity.

4.3 GC – Internal Standard Calibration – PCBs and Organochlorine Pesticides

To quantify pesticides, the performance evaluation mixture (PEM) is analyzed at the beginning and end of the initial calibration sequence and throughout the analytical sequence. The results of these analyses are used to evaluate dichlorodiphenyltrichloroethane (DDT)/endrin breakdown, using the method degradation criteria of <15 percent. PEM standards were analyzed at the required frequency throughout sample analysis and all method performance criteria were met.

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Polychlorinated biphenyls (PCBs) and organochlorine pesticides were calibrated with a dual column analysis using internal standardization. Five peaks, representing five congeners, were used for the analysis of each Aroclor with a separate curve fitted to the calibration data for each congener. A calibration curve consisting of a minimum of five concentration levels was analyzed for all single component compounds of interest. Linearity of the calibration curves are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent

ii) A minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the method.

5. Initial Calibration – Inorganic Analyses

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For ICP and ICP/MS analysis, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve. For mercury atomic absorption (AA) analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater. For instrumental general chemistry analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	Parameter	Control Limits
ICP and ICP/MS	Metals	90 - 110%
Cold Vapor AA	Mercury	80 - 120%
Instrumental General Chemistry	Cyanide, Cr+6, and Cr+3	85 - 115% or laboratory established limits

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that all of the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals and general chemistry analyses were properly calibrated prior to sample analysis.

6. Continuing Calibration - Organic Analyses

6.1 GC/MS

To ensure that instrument calibration for VOC and SVOC analyses is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) All RRF values must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) Percent difference (%D) values must not exceed 25.0 percent (40.0 percent for compounds that exhibit poor response)

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability with the exception of the sample results presented with qualifiers in Table 4.

6.2 High Resolution GC/MS

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) The percent difference (%D) for the relative response (RR) of congeners calibrated by isotope dilution must not exceed 25.0 percent

ii) The percent difference (%D) for the relative response factor (RRF) of congeners calibrated by internal standard must be within the method required windows

iii) The signal to noise ratio (S/N) must be ≥ 10 percent for all analytes and the ion abundance ratios must be within the method required window

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability.

6.3 GC

To ensure that the calibration of the instrument for organic analyses by GC is valid throughout the sample analysis period, continuing calibration standards are analyzed and evaluated on a regular basis. To evaluate the continued linearity of the calibration, %D values are calculated for each compound. As specified in the methods, all %D values should not exceed 15 percent. To ensure that compound retention times do not vary over the analysis period, all retention times for continuing calibration compounds must fall within the established retention time windows.

All continuing calibration standards were analyzed at the required frequency. All %D values and compound retention times met the above criteria indicating acceptable instrument calibration throughout the analysis period with the exception of the results presented with qualifiers in Table 4.

7. Continuing Calibration - Inorganic Analyses

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. All analyte recoveries reported for the CCVs were within the specified limits.

8. Laboratory Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for the inorganic parameters.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

8.1 Organic Analyses

Most method blank results were non-detect. Table 5 presents the sample results that were qualified as non-detect due to analyte concentrations in the method blanks.

8.2 Inorganic Analyses

Upon review of the ICBs, CCBs, and method blanks, it was noted that metal concentrations were observed above the method detection limit (MDL). Most investigative samples associated with the low-level detections reported either non-detect concentrations or concentrations significantly greater than the associated laboratory blank concentrations for the analytes of interest. These sample results were not impacted by the

contamination detected. Associated positive sample results with similar concentrations to the levels reported in the blanks were qualified as non-detect (see Table 5 and Table 6).

9. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for organic determinations were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. Due to dilutions equal to or greater than 5 times that were necessary to successfully analyze the samples, numerous surrogate recoveries in investigative samples analyzed for pesticides, PCBs, and SVOCs were not assessed. Most remaining surrogate recoveries were within the laboratory criteria.

Where surrogate recoveries were above the control limits, non-detect sample results were not impacted by the implied high bias and were not qualified. The associated detected sample results were qualified as estimated.

Where surrogate recoveries were excessively low (<10%), the associated non-detect results were rejected and the detected results were qualified as estimated due to the implied low bias.

Table 7 presents the sample results that were qualified or rejected due to outlying surrogate recoveries.

10. Spiked C-13 Labeled PCDD/PCDF

In accordance with the method employed, all samples, blanks, and QC samples analyzed for PCDD/PCDF are spiked with labeled congeners prior to extraction to be an internal standard for the quantitation of native congeners, and to serve as surrogates for the assessment of method performance in the sample matrix.

All samples submitted for PCDD/PCDF determinations were spiked with the appropriate number of labeled compounds prior to sample extraction analysis.

Labeled congener recoveries were assessed against method control limits (40-135 percent). Low recoveries were observed for various congeners. All associated results were qualified as estimated in Table 8. All remaining recoveries met the method criteria.

11. Internal Standards (IS) Analyses

IS data were evaluated for all VOC, SVOC, PCB, Pesticide, and ICP/MS metals sample analyses.

11.1 Organics Analyses

To ensure that changes in the GC/MS and GC sensitivity and response do not affect sample analysis results IS compounds are added to each sample prior to analysis. All results are then calculated as a ratio of the IS responses.

The sample IS results were evaluated against the following criteria:

i) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard

ii) IS area counts must not vary by more than a factor of two (-50 percent to +100 percent) from the associated calibration standard

Most organic IS recoveries and retention times met the above criteria. Table 8 presents the sample results that were qualified or rejected due to outlying IS recoveries.

11.2 Inorganic Analyses

IS elements were added to all samples prior to metals analysis by ICP/MS. Overall instrument stability and performance for metals analyses were monitored using the IS intensity data. IS recoveries were assessed using control limits of 60-125 percent.

All inorganic IS recoveries were within the acceptance limits.

12. Cleanup Standard Recoveries-High Resolution GC/MS-PCDD/PCDF

Two C-13 labeled cleanup standards are added to all samples, blanks, and blank spike samples subsequent to extraction, but prior to the cleanup procedures to assess the efficiency of the cleanup procedures.

Cleanup standards were added to all samples and blanks prior to cleanup. All recoveries were within the method acceptable ranges.

13. Laboratory Control Sample Analyses

LCS or LCS/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

13.1 Organic Analyses

The LCS or LCS/LCSD contained all compounds of interest or the compounds specified in the method. Most LCS recoveries and RPDs were within the laboratory control limits demonstrating acceptable analytical accuracy and precision. Table 9 presents the sample results that were qualified due to outlying LCS recoveries.

13.2 Inorganic Analyses

The LCS or LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries and RPDs were within the control limits demonstrating acceptable analytical accuracy and precision with the exception of mercury results presented with qualifiers in Table 9.

14. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

If the original sample concentration is significantly greater than the spike concentration (greater than 4 times), the recovery is not assessed.

If only the MS or MSD recovery was outside of control limits, no qualification of the data was performed based on the acceptable recovery of the companion spike and the acceptable RPD.

Due to dilutions of five times and greater that were necessary to successfully analyze the samples, some MS/MSD recoveries were not assessed.

Non-detect sample results were not impacted by high MS/MSD recoveries and/or RPDs. Non-detect sample results that were associated with excessively low MS/MSD recoveries (<10 percent for organics) were rejected in Table 10.

MS/MSD analyses were performed as specified in Table 1.

14.1 Organic Analyses

The MS/MSD samples were spiked with all compounds of interest or the compounds specified in the method. All percent recoveries and RPD values were within the laboratory control limits demonstrating acceptable analytical accuracy and precision with the exception of the sample results presented with qualifiers in Table 10.

14.2 Inorganic Analyses

The MS or MS/MSD samples were spiked with the analytes of interest, and the results were evaluated using the "Guidelines". All percent recoveries and RPD values, if applicable, were within the control limits

demonstrating acceptable analytical accuracy and precision with the exception of the sample results presented with qualifiers in Table 10.

15. Duplicate Sample Analyses – Inorganic Analyses

Analytical precision is evaluated based on the analysis of laboratory duplicate samples. For this study, duplicate samples were prepared and analyzed by the laboratory. The duplicate results were evaluated per the "Guidelines".

All duplicate analyses performed were acceptable, demonstrating acceptable analytical precision.

16. ICP/MS Serial Dilution

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. A minimum of 1 per 20 investigative samples or at least 1 per analytical batch must be analyzed at a five-fold dilution. For samples with sufficient analyte concentrations (>50 times the method detection limit), the serial dilution results must agree within 10 percent of the original results.

A serial dilution was performed on each MS/MSD sample. All results met the criteria above with the exception of the sample results presented with qualifiers in Table 11.

17. ICP Interference Check Sample Analysis (ICS)

To verify that the laboratory has established proper inter-element and background correction factors, ICSs are analyzed. These samples contain high concentrations of aluminum, calcium, magnesium, and iron and are analyzed at the beginning and end of each sample analysis period. The ICSs are evaluated against recovery control limits in the "Guidelines" of 80 to 120 percent.

ICS analysis results were evaluated for all samples using the criteria in the "Guidelines". All ICS recoveries and results were acceptable.

18. Field QA/QC Samples

The field QA/QC consisted of five trip blank samples, five equipment blank samples, and nine field duplicate sample sets.

18.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, five trip blank samples were submitted to the laboratory for VOC analysis. All results were either non-detect for the compounds of interest or were at a level did not impact the associated sample results.

18.2 Equipment Blank Sample Analysis

To assess field decontamination procedures, ambient conditions at the site, and cleanliness of sample containers, five equipment blank sample was submitted for analysis, as identified in Table 1. All results were non-detect for the analytes of interest or were at a level that did not impact the associated sample results.

18.3 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, nine field duplicate sample sets were collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 100 percent for soil samples. If the reported concentration in either the investigative sample or its duplicate is less than five times the reporting limit (RL), the evaluation criterion is two times the RL value for water samples.

Most field duplicate results were within acceptable agreement demonstrating acceptable sampling and analytical precision. Table 12 presents the sample results that were qualified due to variability in the field duplicate results.

19. Analyte Reporting

The laboratory reported detected results down to the laboratory's method detection limit (MDL) for each analyte adjusted for specific sample dilutions, weights, and volumes. Positive analyte detections less than the RL but greater than the sample-specific MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the sample specific MDL in Table 2.

All soil results were reported on a dry weight basis. All results for sample S-38443-053118-JC-119 were qualified as estimated due to low percent solids as the amount of moisture present can introduce analytical variability. See Table 13 for the qualified sample results.

20. Target Compound Identification

To minimize erroneous compound identification during organic analyses, qualitative criteria including compound retention time and mass spectra (if applicable) were evaluated according to the identification criteria established by the methods. The samples identified in Table 1 were reviewed. The organic compounds reported adhered to the specified identification criteria.

Pesticide and PCB analyses were performed using dual column analyses. In general, the results showed good correlation between the two columns (<40 RPD). Variability was observed between some of the results. The associated data were qualified in Table 14 as estimated (J) or presumptively identified and estimated (NJ) where RPD > 80 to reflect the indicated variability.

Table 15 presents the qualified samples results for dioxin/furans due to outlying identification criteria.

Matrix interferences were present for some dioxin/furan sample results that affected identification and/or accurate determination of detection limits. The qualified results are as shown in Table 16.

21. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are acceptable with the specific exceptions and qualifications noted herein.

Subject: **Analytical Results and Full/Innovative Validation**
Soil Sampling
ITW Corporate-South Dayton Dump and Landfill
Moraine, Ohio
October-December 2018

1. Introduction

This document details a validation of analytical results for soil samples collected in support of the Soil Sampling Program at the Moraine, Ohio site during October through December 2018. Samples were submitted to TestAmerica Laboratories, Inc. (TA) located in North Canton, Ohio and Knoxville, Tennessee. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2. A summary of the analytical methodology is presented in Table 3.

Full Contract Laboratory Program (CLP) equivalent raw data deliverables were provided by the laboratory. Evaluation of the data was based on information obtained from the finished data sheets, raw data, chain of custody forms, calibration data, blank data, duplicate data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spike (MS) samples and field quality assurance/quality (QA/QC) samples. The assessment of analytical and in-house data included checks for data consistency (by observing comparability of duplicate analyses), adherence to accuracy and precision criteria, and transmittal errors.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "Remedial Investigation/Feasibility Study (RI/FS) Work Plan for Operable Units 1 and 2, Appendix E-Quality Assurance Project Plan", September 20, 2017

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review", USEPA 540-R-10-011, January 2010

iii) "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008

iv) "National Functional Guidelines for High Resolution Superfund Methods Data Review", United States Environmental Protection Agency (USEPA) 542-B-16-001, April 2016.

Items ii), iii), and iv) will subsequently be referred to as the "Guidelines" in this Memorandum.

This memo was revised to correct the total lead result for fractionated lead analysis for sample SS-38443-103018-JC-059 in Table 2.

2. Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 3. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times with the exception of one sample for volatile organic compounds (VOC) analysis. Table 4 presents the qualified sample results.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Gas Chromatography/Mass Spectrometer (GC/MS) – Tuning and Mass Calibration (Instrument Performance Check) and Inductively Coupled Plasma/Mass Spectrometer (ICP/MS)

3.1 Organic Analyses

Prior to VOC and semi-volatile organic compound (SVOC) analysis, GC/MS instrumentation is tuned to ensure optimization over the mass range of interest. To evaluate instrument tuning, methods require the analysis of specific tuning compounds bromofluorobenzene (BFB) and decafluorotriphenylphosphine (DFTPP), respectively. The resulting spectra must meet the criteria cited in the methods before analysis is initiated. Analysis of the tuning compound must then be repeated every 12 hours throughout sample analysis to ensure the continued optimization of the instrument.

Tuning compounds were analyzed at the required frequency throughout VOC and SVOC analysis periods. All tuning criteria were met indicating that proper optimization of the instrumentation was achieved.

3.2 High Resolution GC/MS Analyses

GC/MS system performance checks are performed to ensure mass resolution, identification, and calibration. The following criteria must be met before sample analysis can begin:

i) For the PFK (perfluorokerosene) molecular leak, the resolution must be greater than or equal to 10,000. The deviation between the exact mass and the theoretical mass for each of the three to five ions monitored must be less than 5 parts per million (ppm).

ii) The Window Defining Mix (WDM) should be analyzed after the PFK, prior to calibration and every 12 hours during sample analysis.

iii) The Isomer Specificity Check standard should be analyzed after the WMD, prior to calibration and every 12 hours during sample analysis.

All GC/MS performance checks were performed and all criteria were met.

3.3 Inorganic Analyses

To ensure adequate mass resolution, identification, and to some degree, sensitivity, the performance of each ICP/MS instrument used for metals analyses is checked prior to calibration and initiating an analysis sequence through the analysis of a tuning solution.

Instrument performance check data were reviewed. The tuning solution was analyzed at the required frequency throughout the analyses. The results of all instrument performance checks were within the method acceptance criteria, indicating that proper optimization of the instrumentation was achieved.

4. Initial Calibration - Organic Analyses

4.1 GC/MS

To quantify VOCs and SVOCs of interest in samples, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds of interest is analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity of the calibration curve and instrument sensitivity are evaluated against the following criteria:

i) All relative response factors (RRFs) must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) The percent relative standard deviation (%RSD) values must not exceed 20.0 percent (40.0 percent for compounds that exhibit poor response) or a minimum correlation coefficient (R) and minimum coefficient of determination (R^2) of 0.995 and 0.99, respectively, if linear and quadratic equation calibration curves are used

The initial calibration data for VOCs and SVOCs were reviewed. All compounds met the above criteria for sensitivity and linearity.

4.2 High Resolution GC/MS

To quantify dioxins/furans of interest, calibration of the GC/MS over a specific concentration range must be performed. Initially, a five-point calibration curve containing all compounds required by the method is analyzed to characterize instrument response for each analyte over a specific concentration range. Linearity and sensitivity of the calibration curve are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) for the relative response (RR) of congeners calibrated by isotope dilution must not exceed 20.0 percent or a minimum correlation coefficient (R) of 0.99 if linear calibration curves are used

ii) The percent relative standard deviation (%RSD) for the relative response factor (RRF) of congeners calibrated by internal standard must not exceed 35.0 percent or a minimum correlation coefficient (R) of 0.99 if linear calibration curves are used

iii) The signal to noise ratio (S/N) must be ≥ 10 percent for all analytes and the ion abundance ratios must be within the method required window

The initial calibration data were reviewed. All compounds met the above criteria for linearity and sensitivity.

4.3 GC

To quantify pesticides, the performance evaluation mixture (PEM) is analyzed at the beginning and end of the initial calibration sequence and throughout the analytical sequence. The results of these analyses are used to evaluate dichlorodiphenyltrichloroethane (DDT)/endrin breakdown, using the method degradation criteria of <15 percent. PEM standards were analyzed at the required frequency throughout sample analysis and all method performance criteria were met.

4.3.1 Internal Standard Calibration – PCBs and Organochlorine Pesticides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Polychlorinated biphenyls (PCBs) and organochlorine pesticides were calibrated with a dual column analysis using internal standardization. Five peaks, representing five congeners, were used for the analysis of each Aroclor with a separate curve fitted to the calibration data for each congener. A calibration curve consisting of a minimum of five concentration levels was analyzed for all single component compounds of interest. Linearity of the calibration curves are evaluated against the following criteria:

i) The percent relative standard deviation (%RSD) values for the response factors (RF) must not exceed 20.0 percent

ii) A minimum correlation coefficient (R) or minimum coefficient of determination (R^2) of 0.99 if linear or quadratic equation calibration curves are used

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the methods.

4.3.2 External Standard Calibration – Herbicides

In order to quantify organic compounds of interest by GC, calibration of the gas chromatograph over a specific concentration range must be performed. Initially, a calibration curve consisting of a minimum of five concentration levels is analyzed for all single component compounds of interest. Linearity of the calibration curve is acceptable if all RSD values are less than or equal to 20.0 percent or if the correlation coefficient (R) is 0.995 or greater for linear regression curves.

Retention time windows are also calculated from the initial calibration analyses. These windows are then used to identify all compounds of interest in subsequent analyses.

All initial calibration standards were analyzed at the required frequencies. All retention time, peak resolution, and linearity criteria were satisfied as specified in the methods.

5. Initial Calibration – Inorganic Analyses

Initial calibration of the instruments ensures that they are capable of producing satisfactory quantitative data at the beginning of a series of analyses. For ICP/MS analysis, a calibration blank and at least one standard must be analyzed at each wavelength to establish the analytical curve. For mercury atomic absorption (AA) analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater. For instrumental general chemistry analyses, a calibration blank and a minimum of five standards must be analyzed to establish the analytical curve, and resulting correlation coefficients (R) must be 0.995 or greater.

After the analyses of the calibration curves, an initial calibration verification (ICV) standard must be analyzed to verify the analytical accuracy of the calibration curves. All analyte recoveries from the analyses of the ICVs must be within the following control limits:

Analytical Method	Parameter	Control Limits
ICP/MS	Metals	90 - 110%
Cold Vapor AA	Mercury	80 - 120%
Instrumental General Chemistry	Cyanide, Total Organic Carbon	85 - 115% or laboratory acceptance criteria

Upon review of the data, it was determined that the calibration curves and ICVs were analyzed at the proper frequencies and that all of the above-specified criteria were met. The laboratory effectively demonstrated that the instrumentation used for metals and general chemistry analyses were properly calibrated prior to sample analysis.

6. Continuing Calibration - Organic Analyses

6.1 GC/MS

To ensure that instrument calibration for VOC and SVOC analyses is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) All RRF values must be greater than or equal to 0.050 (greater than or equal to 0.010 for compounds that exhibit poor response)

ii) Percent difference (%D) values must not exceed 25.0 percent (40.0 percent for compounds that exhibit poor response)

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability with the exception of the sample results presented with qualifiers in Table 5.

6.2 High Resolution GC/MS

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration standards must be analyzed and compared to the initial calibration curve every 12 hours.

The following criteria were employed to evaluate continuing calibration data:

i) The percent difference (%D) for the relative response (RR) of congeners calibrated by isotope dilution must not exceed 25.0 percent

ii) The percent difference (%D) for the relative response factor (RRF) of congeners calibrated by internal standard must not exceed 35.0 percent

iii) The signal to noise ratio (S/N) must be ≥ 10 percent for all analytes and the ion abundance ratios must be within the method required window

Calibration standards were analyzed at the required frequency, and the results met the above criteria for instrument sensitivity and stability

6.3 GC

To ensure that the calibration of the instrument for organic analyses by GC is valid throughout the sample analysis period, continuing calibration standards are analyzed and evaluated on a regular basis. To evaluate the continued linearity of the calibration, %D values are calculated for each compound. As specified in the methods, all %D values should not exceed 15 percent. To ensure that compound retention times do not vary over the analysis period, all retention times for continuing calibration compounds must fall within the established retention time windows.

All continuing calibration standards were analyzed at the required frequency. All %D values and compound retention times met the above criteria indicating acceptable instrument calibration throughout the analysis period with the exception of the results presented with qualifiers in Table 5.

7. Continuing Calibration - Inorganic Analyses

To ensure that instrument calibration is acceptable throughout the sample analysis period, continuing calibration verification (CCV) standards are analyzed on a regular basis. Each CCV is deemed acceptable if all analyte recoveries are within the control limits specified above for the ICVs. If some of the CCV analyte recoveries are outside the control limits, samples analyzed before and after the CCV, up until the previous and proceeding CCV analyses, are affected.

For this study, CCVs were analyzed at the proper frequency. All analyte recoveries reported for the CCVs were within the specified limits.

8. Laboratory Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. Additionally, initial and continuing calibration blanks (ICBs/CCBs) are routinely analyzed after each ICV/CCV for the inorganic parameters.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

8.1 Organic Analyses

Most method blank results were non-detect. Table 6 presents the sample results that were qualified as non-detect due to analyte concentrations in the method blanks.

8.2 Inorganic Analyses

ICBs, CCBs, and method blanks were reviewed. All results were either non-detect or were at a level that did not impact the associated sample results. Qualification of the sample data was not necessary on this basis.

9. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for organic determinations were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. Due to dilutions equal to or greater than 5 times that were necessary to successfully analyze the samples, numerous surrogate recoveries in investigative samples analyzed for pesticides, PCBs, and SVOCs were not assessed. Most remaining surrogate recoveries were within the laboratory criteria. Where surrogate recoveries were above the control limits, non-detect sample results were not impacted by the implied high bias and were not qualified. Detected sample results were qualified as estimated. Where surrogate recoveries were less than 10 percent, the associated non-detect sample results were rejected and the detected results were qualified as estimated. Table 7 presents the sample results that were qualified or rejected due to outlying surrogate recoveries.

10. Spiked C-13 Labeled PCDD/PCDF

In accordance with the method employed, all samples, blanks, and QC samples analyzed for PCDD/PCDF are spiked with labeled congeners prior to extraction to be an internal standard for the quantitation of native congeners, and to serve as surrogates for the assessment of method performance in the sample matrix.

All samples submitted for PCDD/PCDF determinations were spiked with the appropriate number of labeled compounds prior to sample extraction analysis.

Labeled congener recoveries were assessed against method control limits. All recoveries met the method criteria with the exception of the qualified sample results in Table 7.

11. Internal Standards (IS) Analyses

IS data were evaluated for all VOC, SVOC, PCB, Pesticide, and ICP/MS metals sample analyses.

11.1 Organics Analyses

To ensure that changes in the GC/MS and GC sensitivity and response do not affect sample analysis results IS compounds are added to each sample prior to analysis. All results are then calculated as a ratio of the IS responses.

The sample IS results were evaluated against the following criteria:

i) The retention time of the IS must not vary more than ±30 seconds from the associated calibration standard

ii) IS area counts must not vary by more than a factor of two (-50 percent to +100 percent) from the associated calibration standard

Most organic IS recoveries and retention times met the above criteria. Table 8 presents the sample results that were qualified or rejected due to outlying IS recoveries.

11.2 Inorganic Analyses

IS elements were added to all samples prior to metals analysis by ICP/MS. Overall instrument stability and performance for metals analyses were monitored using the IS intensity data. IS recoveries were assessed using control limits of 60-125 percent.

All inorganic IS recoveries were within the acceptance limits.

12. Cleanup Standard Recoveries-High Resolution GC/MS-PCDD/PCDF

Two C-13 labeled cleanup standards are added to all samples, blanks, and blank spike samples subsequent to extraction, but prior to the cleanup procedures to assess the efficiency of the cleanup procedures.

Cleanup standards were added to all samples and blanks prior to cleanup. All recoveries were within the method acceptable ranges.

13. Laboratory Control Sample Analyses

LCS or LCS/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

13.1 Organic Analyses

The LCS or LCS/LCSD contained all compounds of interest or the compounds specified in the method. Most LCS recoveries and RPDs were within the laboratory control limits demonstrating acceptable analytical accuracy and precision. Several VOC LCS recoveries were outside of the control limits. Table 9 presents the sample results that were qualified or rejected (<10 percent recovery) due to outlying LCS recoveries.

13.2 Inorganic Analyses

The LCS or LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS recoveries and RPDs were within the control limits demonstrating acceptable analytical accuracy and precision.

14. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

If the original sample concentration is significantly greater than the spike concentration, the recovery is not assessed.

If only the MS or MSD recovery was outside of control limits, no qualification of the data was performed based on the acceptable recovery of the companion spike and the acceptable RPD with the exception of any recoveries of <10 percent. All associated non-detect sample results were rejected and all positive results were qualified as estimated.

Due to dilutions that were necessary to successfully analyze the samples, some MS/MSD recoveries were not assessed.

MS/MSD analyses were performed as specified in Table 1.

14.1 Organic Analyses

The MS/MSD samples were spiked with all compounds of interest or the compounds specified in the method. Most percent recoveries and RPD values were within the laboratory control limits demonstrating acceptable analytical accuracy and precision. Table 10 presents the sample results that were qualified or rejected due to outlying MS/MSD recoveries and/or RPDs.

14.2 Inorganic Analyses

The MS or MS/MSD samples were spiked with the analytes of interest, and the results were evaluated using the "Guidelines". All percent recoveries and RPD values, if applicable, were within the control limits, demonstrating acceptable analytical accuracy and precision with the exception of the sample results that were rejected or qualified in Table 10.

15. Duplicate Sample Analyses – Inorganic Analyses

Analytical precision is evaluated based on the analysis of laboratory duplicate samples. For this study, duplicate samples were prepared and analyzed by the laboratory as specified in Table 1. The duplicate results were evaluated per the "Guidelines".

All duplicate analyses performed were acceptable, demonstrating acceptable analytical precision.

16. ICP/MS Serial Dilution

The serial dilution determines whether significant physical or chemical interferences exist due to sample matrix. A minimum of 1 per 20 investigative samples or at least 1 per analytical batch must be analyzed at a five-fold dilution. For samples with sufficient analyte concentrations (>50 times the method detection limit), the serial dilution results must agree within 10 percent of the original results.

A serial dilution was performed on each MS/MSD sample. Most results met the criteria above. Table 11 presents the qualified sample results.

17. ICP Interference Check Sample Analysis (ICS)

To verify that the laboratory has established proper inter-element and background correction factors, ICSs are analyzed. These samples contain high concentrations of aluminum, calcium, magnesium, and iron and are analyzed at the beginning and end of each sample analysis period. The ICSs are evaluated against recovery control limits in the "Guidelines" of 80 to 120 percent.

ICS analysis results were evaluated for all samples using the criteria in the "Guidelines". All ICS recoveries and results were acceptable.

18. Field QA/QC Samples

The field QA/QC consisted of 8 trip blank samples, 11 rinse blank samples, and 11 field duplicate sample sets.

18.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, 8 trip blank samples were submitted to the laboratory for VOC analysis. All results were non-detect for the compounds of interest or were at a level that did not impact the associated sample results.

18.2 Rinse Blank Sample Analysis

To assess field decontamination procedures, ambient conditions at the site, and cleanliness of sample containers, 11 rinse blank samples were submitted for analysis, as identified in Table 1. Most results were non-detect for the analytes of interest. Table 12 presents the sample results that were qualified as non-detect due to results that were similar to the rinse blank sample.

18.3 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, 11 field duplicate sample sets were collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 100 percent for soil samples. If the reported concentration in either the investigative sample or its duplicate is less than five times the reporting limit (RL), the evaluation criterion is two times the RL value for soil samples.

Most field duplicate results were within acceptable agreement, demonstrating acceptable sampling and analytical precision. Table 13 presents the sample results that were qualified due to variability in the field duplicate results.

19. Analyte Reporting

The laboratory reported detected results down to the laboratory's method detection limit (MDL) for each analyte adjusted for specific sample dilutions, weights, and volumes. Positive analyte detections less than the RL but greater than the sample-specific MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the sample specific MDL in Table 2.

All soil results were reported on a dry weight basis. All sample percent solids were greater than 50% with the exception of sample SS-38443-102618-JC-034. All associated sample results were qualified as estimated as the amount of moisture present can introduce analytical variability. (See Table 14).

20. Miscellaneous

20.1 Dual Column Reporting

GC analyses were performed using dual column analyses. In general, the results showed good correlation between the two columns (<40 RPD). Variability was observed between some of the results (see Table 15). The associated data were qualified as estimated (J) or presumptively identified and estimated (NJ) where RPD > 80 to reflect the indicated variability.

20.2 Identification of Dioxin/Furans

Numerous sample results for several samples for dioxin/furan analysis did not meet the identification criteria of the analytical method. Table 16 presents the qualified sample results.

20.3 Exceedance of Calibration Range

The 1,2,3,4,6,7,8,9-Octachlorodibenzo-p-dioxin (OCDD) result for sample SS-38443-102618-JC-033 was qualified as estimated in Table 17 due to a response which exceeded the linear calibration for that compound. Based on the nature of the analytical method, sample dilutions are typically not performed.

21. Target Compound Identification

To minimize erroneous compound identification during organic analyses, qualitative criteria including compound retention time and mass spectra (if applicable) were evaluated according to the identification criteria established by the methods. The samples identified in Table 1 were reviewed. The organic compounds reported adhered to the specified identification criteria.

22. Conclusion

Based on the assessment detailed in the foregoing, the data summarized in Table 2 are acceptable with the specific exceptions and qualifications noted herein.

Parameters	**Unit**			
Metals				
Copper	mg/kg	19	--	30 J
Iron	mg/kg	9200	--	15000
Lead	mg/kg	26	--	25 J
Lead - coarse fraction	mg/kg	--	--	24
Lead - fine fraction	mg/kg	--	--	48
Lead - total (calculated by fine/coarse fraction)	mg/kg	--	--	26
Magnesium	mg/kg	30000	--	30000
Manganese	mg/kg	320	--	530 J
Mercury	mg/kg	0.094 J	--	0.050 J
Nickel	mg/kg	11	--	15 J
Potassium	mg/kg	590	--	740 J
Selenium	mg/kg	0.78 J	--	0.86 J
Silver	mg/kg	0.061 J	--	0.048 J
Sodium	mg/kg	98 J	--	90 J
Thallium	mg/kg	0.14 J	--	0.20
Vanadium	mg/kg	13	--	22
Zinc	mg/kg	61	--	58 J
General Chemistry				
Cyanide (total)	mg/kg	0.23 U	--	0.21 U
Soot carbon	mg/kg	--	--	--
Total organic carbon (TOC)	mg/kg	--	--	--

Notes:

R - Rejected
J - Estimated concentration
U - Not detected at the associated reporting limit
-- - Not applicable
UJ - Not detected; associated reporting limit is detected
PCBs - Polychlorinated Biphenyls
