REPORT ON ALDEHYDE AND KETONE TESTING

Performed for:
SOLVAY MINERALS, INC.
CA-3 & CA 1 & 2 CALCINER STACKS
GREEN RIVER, WYOMING

Client Reference No: CO2863
CAE Project No: 7747-3
Revision 0: January 7, 1996

To the best of our knowledge, the data presented in this report are accurate and complete.

Project Overview

SOLVAY2016_6_001612

PROJECT OVERVIEW

Solvay Minerals contracted Clean Air Engineering to perform an air emissions test program for gas fired calciners CA 1 & 2 and for gas fired calciner CA-3. The purpose of the test program was to quantify aldehydes and ketones in the exhaust gas of the calciners. The testing took place at the CA-3 Calciner Stack on July 24, 1996 and at the CA 1 & 2 Calciner Stack on July 26, 1996. EPA Method performed was BIF (Boilers and Industrial Furnaces) Method 0011 and associated Methods 1-4.

BIF 0011 results show acrolein was biased high by contribution from acetone at both CA-3 and CA 1&2 Calciners. Acetone could not be resolved from the major acrolein peak. To determine acrolein concentration the estimated concentration of acetone was subtracted from the acrolein mass.

Test run one on CA 1 & 2 Calciner Stack was aborted due to process upset. Test runs 2 through 4 are reported.

Test run one on CA-3 Calciner was non-isokinetic. The calculated isokinetic value was 89.9 percent. Isokinetic limits are 100% ± 10%.

Coordinating the field testing were:

D. Potter - Solvay Minerals, Inc.
T. Brown - Solvay Minerals, Inc.
S. Cook - Solvay Minerals, Inc.
S. Ferguson - Clean Air Engineering

Source identifications are shown in Table 1-1 and Table 1-2.

SOLVAY2016_6_001613

PROJECT OVERVIEW

Table 1-1:
CA 3 Calciner Profile

Unit Identification Number	AQD No. 48, CA-3
Process	Calciner
Fuel	Natural Gas
Heat Content	1080 Btu/ft^3.
Stack Height	180 feet
Stack Diameter	125.5 inches
Diameters to Upstream Disturbance	Approximately 9.0
Diameters to Downstream Disturbance	Approximately 5.5
Primary Control Equipment	Flakt ESP

Table 1-2:
CA 1 & 2 Calciner Profile

Unit Identification Number	AQD No. 17, CA 1 & 2
Process	Calciner
Fuel	Natural Gas
Heat Content	1080 Btu/ft^3
Stack Height	180.5 feet
Stack Diameter	144 inches
Diameters to Upstream Disturbance	Approximately 3.6
Diameters to Downstream Disturbance	Approximately 4.4
Primary Control Equipment	2-Buell ESP

Chemical abstract service (CAS) numbers and molecular weights are listed in Table 1-3

Table 1-3:
Compound (CAS) Numbers

Compound Name	Molecular Weight	CAS No.
Acetaldehyde	44.05	75-07-0 ✓
Acetone	58.08	67-64-1
Acrolein	56.06	107-02-8 ✓
Formaldehyde	30.03	50-00-0 ✓
Propionaldehyde	58.08	123-38-6 ✓
2-Butanone (MEK)	72.10	78-93-3 ✓

A summary of test results is shown in Table 1-4.

Description of Installation

SOLVAY2016_6_001619

DESCRIPTION OF INSTALLATION

Solvay Minerals, Inc., located near Green River, Wyoming, is a mine and refinery with corporate offices in Houston, Texas. Soda ash operations at the Green River, Wyoming facility began initial production in May of 1982. On May 27, 1992 Solvay S.A. of Belgium purchased the Green River facilities from Tenneco, Inc. and changed the name to Solvay Minerals, Inc.

The primary raw material for the Green River facility is sodium sesquicarbonate which is commonly referred to as trona. The trona is mined at the plant site from an ore bed located 1,500 feet below the surface. The trona is hoisted to the surface before refining into soda ash and other sodium-based products.

The caustic/sulfite system is fed unfiltered saturated sodium carbonate solution from the soda ash process. Insolubles are separated by settling and filtration. At this point the caustic carbonate liquor is reacted with lime forming caustic soda. The remaining sodium carbonate liquor is reacted with sulfur dioxide forming sodium sulfite. At the completion of the refining process the caustic soda and the sodium sulfite are stored pending shipment.

The trona that is fed to the soda ash calciners is heated, resulting in thermal calcination of the sodium sesquicarbonate forming a crude soda ash. The crude soda ash is dissolved in water and the insolubles are separated from the solution by settling and filtration. The insolubles are disposed of in the mine void. The high-purity saturated solution of sodium carbonate is then fed to crystallizers where a large amount of water is removed and a slurry of sodium carbonate monohydrate crystals is formed. This slurry is then further dewatered and washed by a series of cyclones and centrifuges. The resulting monohydrate crystals are fed through dryers forming a high quality soda ash, which then is ready for storage and shipment.

The facility is equipped with baghouses, scrubbers and electrostatic precipitators (ESP) to control emissions.

A schematic of the process shown in Figure 3-1.

SOLVAY2016_6_001621

Methodology

METHODOLOGY

The sampling followed procedures as detailed in U.S. Environmental Protection Agency (EPA) Methods 1, 2, 3, 4 and BIF 0011. The following table summarizes the methods and their respective sources.

Table 4-1:
Summary of Sampling Procedures

Title 40 CFR Part 60 Appendix A	
Method 1	"Sample and Velocity Traverses for Stationary Sources"
Method 2	"Determination of Stack Gas Velocity and Volumetric Flow Rate (Type S Pitot Tube)"
Method 3	"Gas Analysis for the Determination of Dry Molecular Weight"
Method 4	"Determination of Moisture Content in Stack Gases"
Title 40 CFR Part 266 Appendix IX	
Method 0011	"Sampling for Aldehyde and Ketone Emissions from Stationary Sources"

These methods appear in detail in Title 40 of the Code of Federal Regulations (CFR).

These sampling, recovery and analytical procedures are summarized on pages 4-2 through 4-7.

All equipment was calibrated at the Clean Air Engineering laboratory prior to shipment to the job site. A post calibration was performed on each meter box at the conclusion of testing to verify that calibration was maintained throughout the test program. Calibration sheets can be found in Appendix Section C.

SOLVAY2016_6_001623

METHODOLOGY

SAMPLING POINT DETERMINATION

Sampling point locations were determined according to EPA Method 1.

Table 4-2 outlines the sampling point configurations. Figure 4-1 through 4-2 illustrate the sampling points and orientation of sampling ports for each of the sources tested in the program.

Table 4-2:
Sampling Points

SOLVAY2016_6_001626

METHODOLOGY

VELOCITY AND VOLUMETRIC FLOW RATE - EPA METHOD 2

EPA Method 2 was used, in conjunction with aldehydes and ketones testing, to determine the gas velocity and flow rate at the test locations. Figure 4-3 includes the components of the EPA Method 2 sampling apparatus.

Each set of velocity determinations included the measurement of gas velocity pressure and gas temperature at each of the EPA Method 1 traverse points. The velocity pressures were measured with a Type S pitot tube. Gas temperature measurements were made using a Type K thermocouple and digital pyrometer.

GAS COMPOSITION AND MOLECULAR WEIGHT - EPA METHOD 3

In order to determine the oxygen (O_2) concentration, carbon dioxide (CO_2) concentration and gas molecular weight, a time-integrated sample of the gas was obtained and analyzed in accordance with EPA Method 3. The gas sample was collected into a vinyl sample bag from the aldehydes and ketones testing. The contents of the bag were analyzed for O_2 and CO_2 concentrations using an Orsat gas analyzer.

MOISTURE CONTENT - EPA METHOD 4

The flue gas moisture content at the test locations was determined in accordance with EPA Method 4, in conjunction with aldehydes and ketones testing. Figure 4-3 includes the components of the EPA Method 4 sampling apparatus. The gas moisture was determined by quantitatively condensing the water in chilled impingers. The amount of moisture condensed was determined gravimetrically. A dry gas meter was used to measure the volume of gas sampled. The amount of water condensed and the volume of gas sampled were used to calculate the gas moisture content in accordance with EPA Method 4.

SOLVAY2016_6_001627

METHODOLOGY

ALDEHYDE AND KETONE EMISSIONS - BIF METHOD 0011

BIF Method 0011 was used to measure aldehydes and ketones at the CA-3 Calciner Stack and at the CA 1 & 2 Calciner Stack. The method utilizes the reaction of formaldehyde with 2,4-dinitrophenylhydrazine (DNPH) to form the stable formaldehyde dinitrophenylhydrazone derivative. The derivative is extracted, solvent-exchanged, concentrated, and then analyzed by high performance liquid chromatography (HPLC).

Figure 4-3 shows the major components of the BIF 0011 sampling train. The sampling train contained a glass-lined temperature-controlled probe equipped with a pitot tube (for measuring stack gas flow rate) and a sharp-edged glass button-hook nozzle. The exit of the probe was connected directly to a series of four full size impingers. The first two impingers each contained 100 milliliters of 2, 4-DNPH. The third impinger was dry, and the fourth contained 300 grams of silica gel. The impingers were immersed in an ice bath for the duration of each test.

Procedures for selecting sampling locations and for operation of the train were derived from EPA Method 5 and associated Methods 1 through 4. The sampling train was leak-checked before and after each test run. Sampling was performed isokinetically (within ±10%) at each traverse point.

At the conclusion of each test run, the probe and nozzle were rinsed and brushed with methylene chloride, which was collected into a glass sample container. The volumes of the first three impinger solutions were measured, and the solutions transferred to a glass container. The impingers were quantitatively rinsed with methylene chloride and HPLC water. These rinses were collected along with the impinger solutions.

Analysis of the collected samples was performed by Zenon Environmental Laboratories located in Burlington Ontario. The impinger contents and rinses from the sampling trains were analyzed for aldehydes and ketones in accordance with BIF 0011 procedures. The solutions were extracted with methylene chloride, and the DNPH-formaldehyde derivative was determined using reverse phase high performance liquid chromatography with an ultraviolet (UV) absorption detector operating at 360 nanometers. Identification and quantification of compounds in the samples were done by comparison of retention times and area counts, respectively, with those of standard samples.

SAMPLE CALCULATIONS (CONTINUED)

3. Sample gas pressure (in. Hg)

$$P_s = P_{bar} + \left(\frac{P_g}{13.6}\right)$$

$$= 23.75 + \left(\frac{-0.3}{13.6}\right)$$

$$= 23.73 \text{ in. Hg}$$

Where:

P_{bar}	barometric pressure (in. Hg)
P_g	sample gas static pressure (in. H_2O)
P_s	absolute sample gas pressure (in. Hg)
13.6	conversion factor (in. H_2O/in. Hg)

4. Actual vapor pressure (in. Hg)[1]

$$P_v = P_s$$

$$= 23.73 \text{ in. Hg}$$

Where:

P_v	vapor pressure, actual (in. Hg)
P_s	absolute sample gas pressure (in. Hg)

5. Moisture content (%)

$$B_{wo} = \frac{V_{wstd}}{V_{mstd} + V_{wstd}}$$

$$= \frac{17.15}{50.32 + 17.15}$$

$$= 0.2542$$

$$\times 100\% = 25.42\ \%$$

Where:

B_{wo}	proportion of water vapor in the gas stream by volume (%)
V_{mstd}	volume of gas sample through the dry gas meter at standard conditions (ft^3)
V_{wstd}	volume of water collected at standard conditions (ft^3)

SAMPLE CALCULATIONS (CONTINUED)

6. Saturated moisture content (%)

$$B_{ws} = \frac{(P_v)}{(P_s)}$$

$$= \frac{(23.73)}{(23.73)}$$

$$= 1.0$$

$$\times 100\% = 100.0\ \%$$

Where:

B_{ws}	proportion of water vapor in the gas stream by volume at saturated conditions (%)
P_s	absolute sample gas pressure (in. Hg)
P_v	vapor pressure, actual (in. Hg)

Whichever moisture value is smaller is used for B_{wo} in the following calculations.

7. Molecular weight of dry gas stream (lb/lb·mole)

$$M_d = M_{CO_2}\frac{(CO_2)}{(100)} + M_{O_2}\frac{(O_2)}{(100)} + M_{CO+N_2}\frac{(CO+N_2)}{(100)}$$

$$= 44.0\frac{(7.1)}{(100)} + 32.0\frac{(14.2)}{(100)} + 28.0\frac{(78.7)}{(100)}$$

$$= 29.70\ \frac{lb}{lb \cdot mole}$$

Where:

M_d	dry molecular weight of sample gas (lb/lb·mole)
M_{CO_2}	molecular weight of carbon dioxide (lb/lb·mole)
M_{O_2}	molecular weight of oxygen (lb/lb·mole)
$M_{CO}+N_2$	molecular weight of carbon monoxide and nitrogen (lb/lb·mole)
CO_2	proportion of carbon dioxide in the gas stream by volume (%)
O_2	proportion of oxygen in the gas stream by volume (%)
$CO+N_2$	proportion of carbon monoxide and nitrogen in the gas stream by volume (%)
100	conversion factor (%)

SAMPLE CALCULATIONS (CONTINUED)

8. Molecular weight of sample gas (lb/lb·mole)

$$M_s = (M_d)(1 - B_{wo}) + (M_{H_2O})(B_{wo})$$
$$= (29.70)(1 - 0.2542) + (18.0)(0.2542)$$
$$= 26.73 \frac{\text{lb}}{\text{lb} \cdot \text{mole}}$$

Where:

B_{wo}	proportion of water vapor in the gas stream by volume
M_d	dry molecular weight of sample gas (lb/lb·mole)
M_{H_2O}	molecular weight of water (lb/lb·mole)
M_s	molecular weight of sample gas, wet basis (lb/lb·mole)

9. Velocity of sample gas (ft/sec)

$$V_s = (K_p)(C_P)\left(\overline{\sqrt{\Delta P}}\right)\left(\sqrt{\frac{(\overline{T_s} + 460)}{(M_s)(P_s)}}\right)$$
$$= (85.49)(0.84)(0.717)\left(\sqrt{\frac{(372 + 460)}{(26.73)(23.73)}}\right)$$
$$= 59.0 \frac{\text{ft}}{\text{sec}}$$

Where:

K_p	velocity pressure coefficient (dimensionless)
C_p	pitot tube constant
M_s	molecular weight of sample gas, wet basis (lb/lb·mole)
P_s	absolute sample gas pressure (in. Hg)
T_s	average sample gas temperature (°F)
V_s	sample gas velocity (ft/sec)
$\sqrt{\Delta P}$	average square roots of velocity heads of sample gas (in. H_2O)
460	°F to °R conversion constant

10. Total flow of sample gas (acfm)

$$Q_a = (60)(A_s)(V_s)$$
$$= (60)(113.10)(59.0)$$
$$= 400{,}100 \text{ acfm}$$

Where:

A_s	cross sectional area of sampling location (ft^2)
Q_a	volumetric flow rate at actual conditions (acfm)
V_s	sample gas velocity (ft/sec)
60	conversion factor (sec/min)

SAMPLE CALCULATIONS (CONTINUED)

11. Total flow of sample gas (dscfm)

$$Q_{std} = \frac{(Q_a)(P_s)(17.64)(1-B_{wo})}{(\overline{T_s}+460)}$$

$$= \frac{(400{,}100)(23.73)(17.64)(1-0.2542)}{(372+460)}$$

$$= 150{,}100 \text{ dscfm}$$

Where:

B_{wo}	proportion of water vapor in the gas stream by volume
P_s	absolute sample gas pressure (in. Hg)
Q_a	volumetric flow rate at actual conditions (acfm)
Q_{std}	volumetric flow rate at standard conditions, dry basis (dscfm)
T_s	average sample gas temperature (°F)
17.64	conversion factor (°R/in. Hg)
460	°F to °R conversion constant

12. Formaldehyde concentration (µg/dscm)[1]

$$C_{\mu g/dscm} = \frac{(m_n)}{(V_{mstd})}(35.31)$$

$$= \frac{(530)}{50.32}(35.31)$$

$$= 3.72E^{+02}\ \frac{\mu g}{dscm}$$

Where:

$C_{\mu g/dscm}$	concentration (µg/dscm)
m_n	net mass of formadehyde collected (µg)
V_{mstd}	volume of gas sample through the dry gas meter at standard conditions (ft^3)
35.31	conversion factor (ft^3/m^3)

[1] The calculations for other aldehydes and ketones are performed in a similar manner.

SAMPLE CALCULATIONS (CONTINUED)

13. Formaldehyde concentration (lb/dscf)[1]

$$C_{lb/dscf} = \frac{(m_n)}{(V_{mstd})(4.5359E^{+08})}$$

$$= \frac{(530)}{(50.32)(4.5359E^{+08})}$$

$$= 2.32E^{-08}\ \frac{lb}{dscf}$$

Where:

$C_{lb/dscf}$	concentration (lb/dscf)
m_n	net mass of formadehyde collected (µg)
V_{mstd}	volume of gas sample through the dry gas meter at standard conditions (ft^3)
$4.5359E^{+08}$	conversion factor (µg/lb)

14. Formaldehyde emission (lb/hr)

$$E_{lb/hr} = (C_{lb/dscf})(Q_{std})(60)$$

$$= (2.32E^{-08})(150,100)(60)$$

$$= 0.209\ \frac{lb}{hr}$$

Where:

$C_{lb/dscf}$	concentration (lb/dscf)
Q_{std}	volumetric flow rate at standard conditions, dry basis (dscfm)
$E_{lb/hr}$	emission rate (lb/hr)
60	conversion factor (min/hr)

15. Formaldehyde concentration (ppmdv)[2]

$$C_{ppmdv} = (C_{lb/dscf})\left(\frac{(385.3)(10^6)}{M_{CHCO}}\right)$$

$$= (2.32E^{-08})\left(\frac{(385.3)(10^6)}{30.03}\right)$$

$$= 0.298\ \text{ppmdv}$$

Where:

$C_{lb/dscf}$	concentration (lb/dscf)
10^6	conversion factor (ppm)
385.3	conversion factor (ft^3/lb·mole)
M_{CHCO}	molecular weight of formaldehyde

[1] The calculations for other aldehydes and ketones are performed in a similar manner.

[2] The calculations for other aldehydes and ketones are performed in a similar manner using the appropriate molecular weight.

PROJECT NARRATIVE
ZENON Laboratories
Zenon Project: AN960722
Zenon Submission #:6G0799
Client: Clean Air Engineering
Client Project: 7747

I. SAMPLE RECEIPT/ANALYSIS

a) Sample Listing

Zenon ID	Client Sample ID	Date Sampled	Date Received	Run Date
Aldehydes and Ketones via HPLC				
029005 96	Field Blank	96/07/24	96/07/27	96/08/09
029006 96	Reagent Blank	96/07/24	96/07/27	96/08/09
029007 96	Run #1 EP-5 Stack	96/07/24	96/07/27	96/08/09
029008 96	Run #2 EP-5 Stack	96/07/24	96/07/27	96/08/09
029009 96	Run #3 EP-5 Stack	96/07/24	96/07/27	96/08/09

b) Shipping Problems: none encountered

c) Documentation Problems: none encountered

II. SAMPLE PREP:

No problems encountered

III. SAMPLE ANALYSIS:

a) Surrogate/Internal Recoveries: all within control limits

b) Hold Times: method 0011 recommended hold times are 30 days for the extraction and 30 days for extract prior to analysis. Both of these steps were achieved well within recommended hold times.

c) Instrument Calibration: all within control limits

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above.
In addition, I certify, that to the best of my knowledge and belief, the data as reported are true and accurate.
Release of the data contained in this data package has been authorized by the cognizant laboratory official or his/her designee, as verified by this signature.

Fax Number: 303-650-9747
Phone Number: 303-650-9745

LABORATORY INFORMATION

Contact: Ron McLeod
Project: AN960722
Date Received: 96/07/27
Date Reported: 96/08/12

Submission No.: 6G0827
Sample No.: 029005-029225

NOTES: *"-" = not analysed '<' = less than Method Detection Limit (MDL) 'NA' = no data available*
LOQ can by determined for all analytes by multiplying the appropriate MDL X 3.33
Solids data is based on dry weight except for biota analyses.
Organic analyses are not corrected for extraction recovery standards except for isotope dilution methods, (i.e. CARB 429 PAH, all PCDD/F and DBD/DBF analyses)

Methods used by Zenon are based upon those found in 'Standard Methods for the Examination of Water and Wastewater', Seventeenth Edition. Other methods are based on the principles of MISA or EPA methodologies.

All work recorded herein has been done in accordance with normal professional standards using accepted testing methodologies, quality assurance and quality control procedures except where otherwise agreed to by the client and testing company in writing. Any and all use of these test results shall be limited to the actual cost of the pertinent analysis done. There is no other warranty expressed or implied. Your samples will be retained at Zenon for a period of three weeks from receipt of data or as per contract.

COMMENTS:

* Acrolein and acetone peaks unresolved. Acrolein is the major contributor. Reported value is based on the total response for acrolein and acetone relative to instrument response to the acrolein-DNP derivative.
