A Report on Non-Ionizing Radiation

"More Than a Coincidence"

Major New Animal Study, Like NTP's, Links RF to Schwannomas

It's happened again.

A second large study has found tumors in the Schwann cells —schwannomas— in the hearts of male rats exposed to cell phone radiation.

The new finding comes from the Ramazzini Institute in Bologna, Italy.

The malignant schwannomas of the heart seen in the Italian study are the same as those described by the U.S. National Toxicology Program (NTP) earlier this month as the basis for their concern that cell phone radiation can lead to cancer.

The Ramazzini paper is expected to be published within a week.

Read about this important new study and its implications here.
