Subject: Passaic River Sampling Results Are In: River Mile 10.9 (Lyndhurst)

Sample results from Riverside Park in Lyndhurst have been analyzed, validated and a report prepared. That report is now available at http://www.epa.gov/region02/superfund/npl/diamondalkali/relateddocs.htm A one page summary fact sheet is also available there. Please call or email with any questions. EPA will do a report out this evening at the Passaic River Community Advisory Group meeting in Newark.

Summary points are as follows:

Recreational Fields Sampling Results: Township of Lyndhurst, NJ, March 2012

- The Passaic River flooded in the fall of 2011 following Hurricane Irene and Tropical Storm Lee. Flood waters covered much of Riverside Park in North Arlington and Lyndhurst and other stretches of the Passaic.

- A study of contaminated sediments in the Lower Passaic River is presently being conducted by a group of potentially responsible parties (the Cooperating Parties Group) under U.S. Environmental Protection Agency oversight. A part of that study led to a detailed characterization of tidal mud flats in Lyndhurst in the fall of 2011.

- Relatively high concentrations of contaminants, including dioxins/furans, PCBs and mercury were detected in the tidal mud flats adjacent to Riverside County Park in Lyndhurst.

- EPA proactively collected samples of surface soil from Riverside Park, at approximately river mile 10.9, on January 30 and 31, 2012. The concern motivating the park sampling effort was that the public use areas in Riverside Park were potentially impacted by sediment that migrated from the Passaic River during recent flooding events and that over time the deposited sediment integrate with the soils.

- The objective of the January 2012 soil sampling was to provide a preliminary investigation of whether PCBs, dioxins and mercury may have impacted public use areas due to the potential migration of contaminated sediments and their potential deposition on the soil surface as a result of episodic flooding.

- Soil samples were collected from public use areas to screen for the presence of mercury, dioxins, furans and dioxin-like PCBs.

- Various risk scenarios were evaluated, including a young child's exposure, an adolescent's exposure and an adult outdoor worker's exposure over time.

- The study assessed the cancer risks and non-cancer hazards associated with potential exposure to dioxins, PCBs and mercury accounting for skin contact, incidental ingestion and incidental inhalation.

- The results show that the measured concentrations of dioxins, PCBs and mercury are present in

soil but are well below levels of concern.

- Based on its analysis, EPA does not plan on further sampling of the recreational areas in the park and deems that park soil cleanup actions are not warranted in this instance.

- The sampling report is posted on the Agency's Diamond Alkali web site at http://www.epa.gov/region02/superfund/npl/diamondalkali/.
