Katie,

Thanks for the follow-up, and that's useful historical context. We'll keep it in the mix as we discuss options, since there may be different recommendations. Kaitlyn found today that FDOH recommends 8-12 ounces per week, which would translate to 32.4 grams /day at the low end. I have not checked back on proposed FL consumption to see how that compares. Definitely a contentious topic.

Nia

Hi Nia –

I followed up with Joel on your question about picking fish consumption numbers based on recommended consumption amounts in the public health arena. Joel indicated that FL has proposed this in the past and EPA dissuaded them because the recommendation (maybe by American Heart Association) was significantly less than the actual fish consumption rate in FL. Of course, we can have more detailed discussions on that to understand the history there, if needed.

Katie
