1. INTRODUCTION

This Remedial Action Work Plan (RAWP) has been developed by Loureiro Engineering Associates, Inc. (Loureiro), on behalf of United Technologies Corporation (UTC)/Pratt & Whitney, to present the strategy and approach to remediate soils contaminated with polychlorinated biphenyls (PCBs) at a portion of the Pratt & Whitney Middletown property located on Aircraft Road in Middletown, Connecticut (hereinafter referred to as the "Site"). A portion of the United States Geological Survey (USGS) 7.5-minute series topographic map from the Middle Haddam quadrangle depicting the location of the Site has been included as Figure 1-1. This PCB RAWP is designed to conform with the requirements outlined in Title 40 of the Code of Federal Regulations (CFR) Part 761 Subpart D Section 761.61(a) self-implementing on-site cleanup and (c) risk-based disposal approval of PCB remediation waste (hereinafter referred to as "40 CFR 761.61(c)"). UTC/Pratt & Whitney is seeking United States Environmental Protection Agency (EPA) Regional Administrator approval of the risk-based PCB disposal option presented in this RAWP.

The Site is approximately 1,100 acres in area, although approximately 600 acres on the western half of the Site are undeveloped. At present, there are approximately twenty major buildings and numerous auxiliary buildings located on the eastern half of the Site which are used for manufacturing, assembly, and testing of jet engines and associated support activities. The layout of the Site is provided on Drawing 1-1.

In order to facilitate the investigation of such a large facility, the Site was divided into twelve smaller study areas, which are depicted on Drawing 1-1. The study areas are labeled as follows: the Building 10 Study Area, the Building 110 Study Area, the Building 150 Study Area, the Building 220 Study Area, the Building 330 Study Area, the Building 330 Former Bulk Fuel Farm Study Area, the Building 410 Study Area, the Building 440 Study Area, the Building 450 Study Area, the Waste Treatment Study Area, the Electrochemical Machining (ECM) Landfill Study Area, and the Undeveloped Land Study Area.

Subsurface Investigations (SSIs) conducted within each of the study areas between 2008 and 2012 identified releases of PCBs, volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), total petroleum hydrocarbons (TPH), and/or metals to soil and/or groundwater. Each of the investigations is documented in a Study-Area specific SSI Report. The pertinent investigation findings for each Study Area are also summarized in the *Site-wide Remedial Action Plan* (*Site-wide RAP*), prepared by Loureiro, which was submitted to the Connecticut Department of Energy and Environmental Protection (DEEP) in December 2013. The *Site-wide RAP* also provides a comprehensive proposed approach to remediate soil and

groundwater at the Site to comply with Sections 22a-133k-1 through 22a-131k-3 (commonly referred to as the Remediation Standard Regulations [RSRs]), 22a-449(a), and 22a-449(d)-106(f) of the Regulations of Connecticut State Agencies (RCSAs).

1.1 Purpose and Scope

This RAWP was developed to address a soil release area associated with Former Building 270, which is located within the Building 220 Study Area, as shown on Drawing 1-1. PCBs detected in soil in this area are believed to be related to a material regulated under the Toxic Substances Control Act (TSCA) based on the concentration of total PCBs detected in soil and concrete in this area and the historical presence of transformers and other oil-containing equipment near the area of impacted soil. This RAWP describes the remedial actions that will be applied to this release area.

1.2 Regulatory Framework

The investigation and remediation of the Site is required by Section 22a 449c-105(h) (commonly referred to as the Corrective Action Regulations) of the RCSA. This section of the Connecticut hazardous waste regulations requires that the owner or operator of a Resource Conservation and Recovery Act (RCRA) Land Disposal Facility conduct a site-wide investigation and remediation of releases of hazardous waste or hazardous substances at or from the facility. Notification of the completion of investigation was submitted to the DEEP on April 9, 2013. Public notice for submittal of the *Site-wide RAP* was completed by Pratt & Whitney on December 23, 2013 in accordance with Section 22a-449c-105(h)(7)(A) of the RCSA. The 45-day public notice comment period has expired, and no comments were received.

This RAWP describes the measures that will be taken to remediate contamination resulting from the Former Building 270 PCB release that is subject to TSCA regulations under EPA guidance. UTC proposes to address soil and concrete impacted by that release under 40 CFR 761.61(a) and 40 CFR 761.61(c), using an existing building as the cap that meets the requirements under 40 CFR 761.61(a)(7), for capping of bulk PCB waste in a low occupancy area.

1.3 Report Scope and Organization

The following is a general description of the contents of each of the following sections of the report.

- Section 2 presents a description of the Site and a summary of the Site history and previous investigations conducted on the Site.

- Section 3 provides a discussion of the distribution of PCBs in soil in the Former Building 270 release area for which remediation of TSCA PCB remediation waste is warranted.
- Section 4 presents a discussion of the proposed remedial approach for regulatory compliance.
- Section 5 details the work to be completed during the project, including post-construction activities.

2. FACILITY DESCRIPTION AND HISTORY

Section 2 provides background information relating to the Site and a summary of the previous environmental investigations conducted at the Site.

2.1 Site Description

The 1,100-acre Site located on Aircraft Road in Middletown, Connecticut in Middlesex County is owned by UTC/Pratt & Whitney Aircraft Division. Approximately half the Site is developed for industrial purposes. Figure 1-1 depicts the topographic contours, major access routes, watercourses, and other relevant features in the vicinity of the Site. The Site layout is depicted on Drawing 2-1. As shown on Figure 1-1, the Site is located on the western bank of the Connecticut River in Middletown. The Connecticut River makes a broad bend to the east-northeast in the vicinity of the Site and forms the northern and eastern boundaries of the Site.

The topography on the Site rises steeply from a low terrace adjacent to the Connecticut River at an elevation of approximately seven feet above mean sea level (AMSL) to a broad flat high terrace at an elevation of approximately 140 feet AMSL. To the west of the high terrace and west of facility Road A, the Site landscape is hilly and wooded and the elevation rises to approximately 450 feet AMSL.

There are three major ravines that cut the slope from the upper terrace to the lower terrace. One is located adjacent to the ECM Landfill, in the southern portion of the Site. Dart Brook, a small tributary to the Connecticut River, originates in the central portion of the Site and flows north and then east in a ravine on the side north side of the former waste disposal area north of Building 330 in the Building 410 Study Area. The third ravine is located along Road C, between the Waste Treatment and Building 330 Study Areas.

2.2 Site History

The Site was initially developed by the United States Government as a research facility for the Air Force Aircraft Nuclear Propulsion Program (ANP). The land was acquired between 1955 and 1957, and the Connecticut Advanced Nuclear Engine Laboratory (CANEL) facility was constructed under direction of the Army Corps of Engineers in 1956. The CANEL facility was designed primarily to support the ANP program of experimental research directed towards the development and testing of high-temperature nuclear power systems for aircraft and was administered by the Air Force until 1963 when the ANP was cancelled. The Atomic Energy Commission then maintained the Site until it was transferred to United Aircraft Corporation (the parent company of Pratt & Whitney) in 1966. Since 1966, Pratt & Whitney has used the Site for

manufacturing, assembly, and testing of jet engines; steam and compressed air generation; jet engine fuel storage and distribution; industrial wastewater treatment; potable and process water supply; and facility maintenance.

2.3 Physical Setting

The following descriptions of geologic and hydrogeologic conditions at the Site are derived from observations made during on-going subsurface investigation activities and/or directly from the information provided in previous environmental reports.

2.3.1 Surficial Geology

Surficial geologic materials at the Site consist of glacial till, a dense unstratified mixture of sand and gravel interspersed with varying amounts of silt, clay, and boulders which discontinuously overlies bedrock at the Site. Till deposits are exposed extensively in the upland undeveloped portion of the Site and range in thickness up to 15 feet. Glacial outwash deposits overlie the till on the eastern developed portion of the Site and form a broad high terrace. These deposits are derived from local glacial melt waters which carried gravel, sand, silt and clay in streams discharging from the base of the glacier. The outwash deposits are typically stratified coarse to fine sands with inter-bedded layers of silt and silty sands. The thickness of the outwash deposits ranges from zero feet in the hilly western portion of the Site to more than 145 feet on the eastern edge of the high terrace. Near the Connecticut River, the outwash deposits are typically coarse-grained sands and gravels at depth. These deposits are possibly associated with the glacial channel of the Connecticut River.

Alluvium deposited by the Connecticut River is the most recent unconsolidated material on the Site. Much of the alluvium is outwash material that the modern Connecticut River has reworked; however, finer sands and silt layers are present in the upper part of the alluvium as a result of the deposition of floodplain sediment and accumulation in wetlands associated with the river. The thickness of surficial unconsolidated material including the thin till, the outwash and the modern alluvium ranges from a few feet or less on the western side of the Site to more than 170 feet near the Connecticut River.

2.3.2 Bedrock Geology

The bedrock beneath the majority of Site consists primarily of the Paleozoic Maromas Granite Gneiss, which is exposed or overlain by thin till in the western undeveloped portion of the Site and in the western portions of the Building 220 and Building 410 Study Areas. The granite gneiss is described as a foliated light gray to buff, medium- to fine-grained granitic gneiss

(USGS, 1965). The foliation in the granite gneiss trends in a northwest/southeast direction with the foliation plane dipping 20 to 40 degrees to the east. The bedrock beneath the eastern portion of the Site is mapped as the Collins Hill Formation which consists of medium to coarse-grained schist and interbedded amphibolites.

2.3.3 Hydrogeology

There are two primary saturated hydrogeologic units in the shallow subsurface at the Site: (1) glaciofluvial outwash and post-glacial alluvial deposits and (2) fractured and foliated metamorphic bedrock. The relatively thin till unit which occurs discontinuously across the Site is not a significant saturated unit. The outwash and alluvial deposits overlying bedrock are generally unconfined aquifers with significant groundwater yields. The facility's on-site potable and process water supply wells draw from these unconsolidated units.

Groundwater in the fractured metamorphic bedrock generally flows along joints and foliation planes. While the Maromas granite gneiss and the Collins Hill schist formations have generally much lower yields than the glaciofluvial overburden, they do yield enough water to serve the needs of most single-family residences. The residential properties in the area west (upgradient) of the Site rely on private wells drilled into the bedrock since public water is not available.

The Site hydrogeology is strongly influenced by the topography of the ground surface as well as the topography of the local bedrock surface, the Connecticut River, and local pumping influences associated with the on-site production wells. The regional flow direction of groundwater in the overburden sediments is generally toward the Connecticut River.

Depth to water ranges significantly across the Site. Depth to water is less than 10 feet below grade (fbg) on some western portions of the Site and greater than 130 fbg on the eastern edge of the high terrace. The thickness of the saturated portion of the overburden also varies across the Site. In the south central and south eastern portions of the Building 220 Study Area, groundwater is not present above bedrock. In the remainder of the Building 220 Study Area, the saturated thickness of the overburden ranges from less than one foot to about 10 feet. The overburden saturated thickness is also less than 10 feet across portions of the high terrace in the vicinity of Building 450, Building 440, Building 400, Building 310, northeast of Building 170 and west of Building 110.

2.4 **Ecological Setting**

The ecological setting of the Site is varied. The majority of the broad high terrace is covered by structures, paved parking areas and roads. Slopes descending from the terrace consist of mature

forest with scattered roads and clearings associated with the facility. Floodplain areas are divided between young to mature forest, and open, early successional areas associated with the former sand and gravel extraction activities and subsequent filling and grading. Several small areas of the floodplain have been cleared for pumping facilities and access roads. In addition, a large grassy area which was the location of the former jet fuel tank farm is located in the central portion of the Site. The banks of the Connecticut River are wooded throughout the Site.

Wetlands at the Site constitute four major habitat categories: Riverine Shore, Floodplain Wetlands, Impounded Wetlands, and Uplands. The Site is bounded to the north and the east by the Riverine Shore habitat communities, following the banks of the Connecticut River. Wetlands at the Site exist predominantly at the southern end of the property and also in small areas along the floodplain east of the main facility buildings and in the area around Dart Brook. Other drainages on the Site are generally ephemeral and strongly influenced by stormwater discharges.

2.5 Summary of Soil Investigations

This section presents a summary of previous investigation activities conducted at the Site. Appendix B includes a list of all previous reports from which data were used to develop this RAWP.

Multiple investigations have been conducted at the Site since the mid-1990s. The first site-wide investigation, a RCRA Facility Investigation (RFI), was completed by Loureiro between August 1993 and November 1994. Additionally, Phase II/III SSI reports for each of the twelve study areas were prepared by Loureiro between November 2008 and November 2012. Finally, both a *Screening Level Ecological Risk Assessment Report* (SLERA) and a *Site-wide Groundwater Investigation Report* were issued for the Site by Loureiro in October 2012 and April 2013, respectively.

Loureiro completed a RFI for Pratt & Whitney between August 1993 and November 1994, as required by the since-expired RCRA permit issued in November 1988 and documented in the report titled *RCRA Facility Investigation Report* (Loureiro, April 1995). The RFI included an investigation of five areas of groundwater contamination that were identified as Areas of Concern (AOCs) and eleven Solid Waste Management Units (SWMUs), areas where known wastes, spills of hazardous waste, or spills of hazardous substances had been disposed. During the course of the RFI over 3,000 soil samples and over 700 groundwater samples were collected and analyzed. The results of the RFI were incorporated into the subsequent SSIs that were conducted under the Corrective Action program.

Between 2008 and 2012 separate Phase II/III SSIs were conducted for each of the twelve study areas. The SSIs discussed each potential release area (PRA) where evidence of a release was identified, as well as the extent and nature of contamination that resulted from each release. The SSI reports also identified which of the release areas would require remediation to address exceedances of the RSRs. A supplemental soil investigation was conducted in 2014 to refine the extent of contamination in one study area. The SSIs involved the evaluation of 282 PRAs across the Site through the advancement of over 1,900 soil borings and the collection and analysis of over 5,600 soil samples, as well as the collection and analysis of numerous soil, soil vapor, and groundwater samples.

The nature and extent of groundwater contamination resulting from releases identified in the RFI and the Phase II/III SSIs was characterized in a site-wide groundwater investigation conducted in 2012. The scope of the investigation involved the collection and analysis of two rounds of groundwater samples. Approximately 250 groundwater samples were collected and analyzed during the site-wide groundwater investigation. In addition, two rounds of comprehensive water level gauging were completed to assess hydraulic gradients. The site-wide groundwater investigation also took into consideration the results of three on-going groundwater monitoring programs.

A SLERA was conducted in 2012 to evaluate whether contaminants released at the Site, including those contaminants that had affected sediment in the streams and wetlands on the Site, posed an unacceptable ecological risk. Thirty soil and sediment samples were collected and analyzed during the SLERA.

Of the 282 PRAs identified on the Site, the following PRA involved a release of PCBs that is the subject of this RAWP:

- **Former Building 270**, labeled as B220-PRA-40 (located in the Building 220 Study Area).

The location of the Former Building 270 PCB release area on the Site is included on Drawing 2-1.

3. NATURE AND EXTENT OF PCB CONTAMINATION IN SOILS

This section provides a conceptual site model (CSM) for the Former Building 270 PCB release areas. The CSM includes a description of the release area, a discussion regarding the release mechanisms, a summary of investigation activities that were conducted, and a discussion regarding the nature and extent of PCB contamination in soil. The subsurface investigation activities support an assessment of areas that will require remediation to comply with the EPA regulations and the requirements of the RSRs.

3.1 Building Descriptions

Former Building 270 was constructed in 1958 and operated as a radiator laboratory during the CANEL-era operations at the Site. The radiator laboratory was constructed to conduct experiments involving the heat transfer of liquid metals; however it is not clear whether any liquid metal experiments were actually conducted before the CANEL project was canceled.

Based on historical facility drawings, Former Building 270 covered an area of approximately 23,400 square feet and was constructed with an approximately 4,200 square-foot partial basement and an approximately 9,900 square-foot partial sub-basement. The partial basement extended to a depth of approximately 14 fbg (6 feet below current grade) and the partial sub-basement extended to a depth of approximately 25 fbg (17 feet below current grade). In addition, historical facility drawings depicted several pits within the main floor of Building 270, although the depths of the pits are not known. After cancellation of the CANEL project and transfer of the Site to UTC (circa 1966), Former Building 270 was used for general storage until it was demolished in 1995. The historical layout of Building 270 is depicted on Drawing 3-1.

Building 250, which houses roll-off dumpsters for recyclable materials, was constructed over the southern portion of the Building 270 footprint in early 1996. The layout of Building 250 consists of six bays for dumpsters; each bay is surrounded on three sides (generally west, north, and east) by a raised concrete platform (approximately four feet above surrounding grade) for fork trucks. A concrete apron extends south of the roll-off bays. The current layout of Building 250 is depicted on Drawing 3-1.

3.2 Subsurface Investigation Activities

Investigation activities were conducted in this area during 2012, 2013, 2014, and 2016. A total of 69 soil borings were completed in the vicinity of Former Building 270, 52 of which were completed within the footprint of the former building. Direct-push drilling methods were used during initial investigation activities in this area; hollow-stem auger and rotosonic drilling

methods were used during later investigation activities due to direct-push refusals at several locations. Concrete was encountered in several of the soil borings completed within the footprint of the sub-basement portion of the former building. Numerous soil and several concrete samples were collected from the area and analyzed for PCBs, as summarized in the table below:

Building Area	Number of		Total Soil Samples	Number of		Total Concrete Samples
	Soil Samples	Field Duplicates		Concrete Samples	Field Duplicates	
First Floor	60	3	63	-	-	-
Basement	11	3	14	-	-	-
Sub-Basement	93	2	95	11	2	13
Pits	3	-	3	-	-	-
Exterior	41	4	45	-	-	-
TOTAL	**208**	**12**	**220**	**11**	**2**	**13**

Samples collected during the initial investigation activities in 2012 were analyzed in accordance with EPA Method 8082, following either pressurized fluid extraction (EPA Method 3545) or microwave extraction (EPA Method 3546). Samples collected during follow-up investigation activities in 2013, 2014, and 2016 were analyzed in accordance with EPA Method 8082, following Soxhlet extraction (EPA Method 3540C).

Extraction Method	Number of Samples	
	Soil	Concrete
Pressurized Fluid Extraction	91	-
Microwave Extraction	17	13
Soxhlet Extraction	112	-
TOTAL	**220**	**13**

A summary of sample identifications, sample dates, sample intervals, sample types, and constituents analyzed for soil and concrete characterization samples collected from this release area is provided in Table 3-1. Laboratory data sheets documenting the PCB analytical results for these samples are provided on compact disc (CD) in Appendix C. Table 3-2 provides a summary of total PCBs detected in soil and concrete at concentrations above laboratory reporting limits.

Of the 175 soil samples (including field duplicates) collected from within the footprint of Former Building 270, PCBs were detected in 83 of the samples. PCBs were detected in 21 soil samples and 3 concrete samples at concentrations greater than 1 mg/kg, and at concentrations greater than 10 mg/kg in three of the soil samples and one of the concrete samples.

PCBs at concentrations greater than 1 mg/kg were identified in two main areas of the former building. The highest concentrations, up to 48.18 mg/kg in soil and up to 34.9 mg/kg in

concrete, were generally found in samples collected more than 15 fbg in the southern portion of Former Building 270, within the sub-basement area. The second area with PCB-impacted soils, with concentrations up to 10.4 mg/kg, was generally found in near-surface soils in the western and northwestern portions of the former building. The PCB-impacted soil samples collected within the sub-basement area are also characterized by the presence of PAHs at concentrations up to 976,940 ug/kg and ETPH at concentration up to 3,070 mg/kg. The PCB-impacted soil samples collected from near the surface in the western and northwestern portions of the former building exhibited PAHs and ETPH at concentrations several orders of magnitude below the concentrations detected in samples collected more than 15 fbg in the sub-basement area. These data indicate that the near-surface soils with PCB concentrations up to 10.4 mg/kg are not related to the TSCA release, described in Section 3.3 below.

The soil sample with the maximum detected PCB concentration (from boring B220-SB-100) was also analyzed for PCBs following synthetic precipitation leaching procedure extraction. PCBs were detected in the extract at a concentration of 0.28 micrograms per liter (µg/l).

A groundwater monitoring well (B220-MW-05) was installed approximately 30 feet downgradient from the area with the maximum detected PCB concentrations in soil (B220-SB-100) and concrete (B220-SB-100A). The monitoring well was installed with a 10-foot screen extending beneath the concrete slab of the former sub-basement, which was encountered at approximately 22.5 fbg during drilling. In 2012, depth to water in the monitoring well ranged from approximately 27 to 28 fbg. Groundwater samples were collected from the monitoring well in June, October, and December of 2012 and analyzed for PCBs, which were not detected in any of the samples. A summary of sample identifications, sample dates, and constituents analyzed for groundwater samples collected from this release area is provided in Table 3-3. Laboratory data sheets documenting the PCB analytical results for these samples are provided on CD in Appendix C.

3.3 Description of Release and Conceptual Model

The higher concentrations of PCBs at depth in a portion of the sub-basement area of Former Building 270 are believed to be the result of PCB-containing oils being released to the former building basement and/or sub-basement concrete slabs and subsequently affecting the fill material used to backfill the sub-basement. Because total PCBs were detected at depth at concentrations close to 50 mg/kg, and historical facility drawings indicate the presence of a transformer and other potentially oil-containing equipment positioned in this area of the basement, soils impacted with PCBs in this release area are likely the result of a release of material regulated under TSCA. The concrete encountered in several borings in this area is

believed to be remnants of the basement and sub-basement concrete slabs of the former building, which were left in place after being broken apart to prevent accumulation of precipitation within the former basement and sub-basement areas. Lower concentrations of PCBs, generally less than 0.5 mg/kg, located throughout this area are believed to be associated with the fill material that was used to backfill the basement and sub-basement areas.

Soil and concrete impacted with PCBs as a result of a release of material regulated under TSCA have been delineated in this area to concentrations of total PCBs less than 10 mg/kg, and in most areas to less than 1 mg/kg. Delineation sample locations were determined based on the requirements set forth in 40 CFR 761 Subpart N. Sample locations were selected using a grid format. Sampling locations were placed on each node of the grid, and grid nodes were not more than 10 feet apart from one another. The presence of PCBs in soil has been delineated vertically in all delineation sample locations, and impacted soil and concrete have not been detected below 22 fbg.

4. PROPOSED REMEDIAL APPROACH

This section summarizes the proposed remedial approach for regulatory compliance at the Former Building 270 PCB-release area. This area is related to PCB-impacted soil and concrete at depth within the sub-basement area of Former Building 270.

4.1 Risk-Based Disposal

UTC proposes to address soil and concrete impacted with PCBs at depth in the southern portion of Former Building 270 under 40 CFR 761.61(c), risk-based disposal of PCB remediation waste.

The selected remedial approach involves the use of an existing building (Building 250) as the cap under 40 CFR 761(a)(7) to prevent exposure to subsurface soil and concrete impacted with PCBs in this area. Building 250 consists of six adjacent roll-off bays underlain by concrete. The roll-off bays are surrounded and separated by one contiguous concrete structure, running the length of the building, rising approximately four feet above grade. The building roof and back wall (north side) consist of corrugated metal, while the three front-facing sides (south, east, and west sides) of the building are open to the environment. A concrete apron extends approximately 30 feet south of the front of Building 250. Building 250 meets the definition of a low occupancy area, as identified in 40 CFR 761.3.

This remedial approach generally follows the cleanup requirements set forth under 40 CFR 761.61(a)(4)(i)(B)(3), under which bulk PCB remediation waste with concentrations of up to 100 mg/kg may remain onsite, so long as they are covered with a cap meeting the requirements set forth in 40 CFR 761.61(a)(7) and 40 CFR 761.61(a)(8). The construction of Building 250 substantially complies with the cap requirements set forth under 40 CFR 761.61(a)(7), with the exception that the concrete is not of uniform thickness. The concrete slab thickness ranges between 5 and 16 inches across the area on top of a process gravel subbase. The areas of thicker concrete are generally located within the roll-off bays, while the areas of thinner concrete are generally located on the raised fork-truck platforms. Because the minimum thickness of the concrete does not conform with the minimum 6-inch requirement identified in 40 CFR 761.61(a)(7), UTC is referring to the concrete slab and the underlying process gravel subbase as the cap and we are requesting approval of this remedial approach under 40 CFR 761.61(c), risk-based disposal of PCB remediation waste.

The maximum concentrations of PCBs in soil (48.18 mg/kg) and concrete (34.9 mg/kg) detected in this area were below 50 mg/kg, and the area where these concentrations were found was limited in areal extent and approximately 14 feet below the surrounding grade (and 18 feet below

the fork truck platform). Although PCBs were detected in the SPLP extract from the soil sample with the maximum detected PCB concentration, PCBs were not detected in groundwater downgradient of that soil boring.

The layout of Building 250 and extents of the remedial area that will be addressed by the Building 250 cap are depicted on Drawing 3-3. The limits of a planned engineered control to be constructed to the north of the cap to address shallow soils impacted by non-TSCA PCBs and other constituents is also depicted on Drawing 3-3 for reference.

In accordance with 40 CFR 761.61(a)(8), a notice will be recorded on the property deed that identifies:

- that the area has been used for PCB remediation waste disposal and is restricted to use as a low occupancy area;
- the location and description of the cap and the cap-maintenance requirements; and
- that PCBs in soil and concrete up to 50 mg/kg are present beneath the cap.

The deed notice will be in the form of a Connecticut environmental land use restriction (ELUR), which is equal to or more stringent than the deed notice requirement identified in 40 CFR 761.61(a)(8). The Owner of the property will prepare and submit the ELUR for approval by the DEEP subsequent to the completion of the Site-wide remediation and in accordance with the RCRA Corrective Action schedule submitted to DEEP.

5. STATEMENT OF WORK

This section details the work to be completed as part of the RAWP. This work includes inspections and maintenance of the Building 250 cap and the preparation of an ELUR for recording on the land records for the Former Building 270 PCB release area.

5.1 Maintenance of Cap

The key components of the maintenance program for the Building 250 cap include the following elements:

- An inspection program, accompanied by corrective action within 72 hours (or as soon as allowed by weather conditions) of the observation of any breaches which would impair the integrity of the cap.

The inspection program will include semi-annual inspections of the cap, concurrent with the inspection of the various engineered controls installed at the Site to address exceedances of RSR criteria. Copies of the inspection forms and documentation of the corrective actions will be provided to DEEP on an annual basis. The maintenance and monitoring plan will continue for the life of the cap.

5.2 Environmental Land Use Restriction

UTC will prepare and submit a *Declaration of Environmental Land Use Restriction* to the DEEP for approval. The ELUR Decision Document (Exhibit B of the *Declaration of Environmental Land Use Restriction*) will include the information required in 40 CFR 761.61(a)(8)(i)(A), specifically:

- That the land has been used for PCB remediation waste disposal and is restricted to use as a low occupancy area defined in 40 CFR 761.3;
- The existence of the cap and the requirement to maintain the cap; and
- The applicable cleanup levels left at the Site and under the cap.

In addition, the ELUR Decision Document will restrict the use of the entire property to industrial/commercial use. The *Declaration of Environmental Land Use Restriction* will be filed with the City of Middletown within 60 days of approval by DEEP.

PCB Characterization Data Repository Certification

APPENDIX A

Certification Statement in Accordance with 40CFR 761.61(a)(3)(E)

Owner: United Technologies Corporation (UTC)
Party Conducting Cleanup: UTC
Project: United Technologies Corporation/Pratt & Whitney Middletown Facility – Middletown, Connecticut

I, Renee Welsh, hereby certify, that all sampling plans, sample collection procedures, sample preparation procedures, extraction procedures, and instrumental/chemical analysis procedures used to assess or characterize the presence, concentrations, and extent of polychlorinated biphenyl-impacted media at the Pratt & Whitney Middletown Property located on Aircraft Road in Middletown, Connecticut are on file and available for United States Environmental Protection Agency review at the following location:

Loureiro Engineering Associates, Inc.
100 Northwest Drive
Plainville, Connecticut 06062
Tel: 860-747-6181
Project Officer: David Fiereck, P.E., L.E.P.
