---

Brooks,

Attached are two tables:

- The "Residential Action Levels…" table lists the main constituents found thus far (based on HAPSITE data from (b) (6) [redacted]), and displays the EPA RSLs (displayed in ug/m3), and converts those values to ppm/ppb (which is what the MultiRAE and UltraRAE instruments display). Additionally, the second to last column displays each analyte if present as 1 ppm in the equivalent values of each compound in ug/m3.
- The "40 ppm compare 5 ppm…" table lists the HAPSITE reported values for (b) (6) [redacted], in the blue columns, displayed in ppm, and ug/m3. This table also shows the values based on assuming values of similar ratios of the contaminants present at 40 ppm (which was the MultiRAE reading present at (b) (6) [redacted]), and broke it down to concentrations present to a ratio at 5 ppm, 1 ppm, etc. if read on the MultiRAE.

Thanks
