	O
1	**Description**
2	Customer complaints of rough running concerns have been traced to numerous problems with the Ignition Coil (Part No. 948 602 104 00). If the ignition coil is not working properly the On-Board Diagnostic (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). Emissions and drivability will both be
3	Customer complaints of rough running concerns have been traced to numerous problems with the Ignition Coil (Part No. 948 602 104 00). If the ignition coil is not working properly the On-Board Diagnostic (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). Emissions and drivability will both be
4	Customer complaints of rough running concerns have been traced to numerous problems with the Ignition Coil (Part No. 948 602 104 00). If the ignition coil is not working properly the On-Board Diagnostic (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). Emissions and drivability will both be
5	Customer complaints of rough running concerns have been traced to numerous problems with the Ignition Coil (Part No. 948 602 104 00). If the ignition coil is not working properly the On-Board Diagnostic (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). Emissions and drivability will both be
6	Malfunction Indicator Lamp (MIL) on associated with engine miss fire may be caused by defective ignition coils. Reported part numbers are 07C 905 115D, 07C 905 115E, 07C 905 115, 07C 905 115F, 07C 905 115J and 07C 905 100. Probable cause of this failure may be related to an internal electrical malfunction. Duri
7	Malfunction Indicator Lamp (MIL) on associated with engine miss fire may be caused by defective ignition coils. Reported part numbers are 07C 905 115D, 07C 905 115E, 07C 905 115, 07C 905 115F, 07C 905 115J and 07C 905 100. Probable cause of this failure may be related to an internal electrical malfunction. Duri
8	Malfunction Indicator Lamp (MIL) on associated with engine miss fire may be caused by defective ignition coils. Reported part numbers are 07C 905 115D, 07C 905 115E, 07C 905 115, 07C 905 115F, 07C 905 115J and 07C 905 100. Probable cause of this failure may be related to an internal electrical malfunction. Duri
9	Malfunction Indicator Lamp (MIL) on associated with engine miss fire may be caused by defective ignition coils. Reported part numbers are 07C 905 115D, 07C 905 115E, 07C 905 115, 07C 905 115F, 07C 905 115J and 07C 905 100. Probable cause of this failure may be related to an internal electrical malfunction. Duri
10	Malfunction Indicator Lamp (MIL) on with the following Diagnostic Trouble Code (DTC) were observed P0300 (Random/Multiple Cylinder Misfire) also any single misfire code may be present (P0301-0304). Analysis of sample parts (part numbers 07K 905 115 C/D and 06B 905 115 A/M/N/Q/L/R) shows that the majority of
11	Malfunction Indicator Lamp (MIL) on with the following Diagnostic Trouble Code (DTC) were observed P0300 (Random/Multiple Cylinder Misfire) also any single misfire code may be present (P0301-0304). Analysis of sample parts (part number 07K 905 115 A/B/C/D) shows that the majority of the complaints were caused
12	Malfunction Indicator Lamp (MIL) illumination, rough running concerns with numerous miss fire codes stored in the Engine Control Units (ECU) memory can be caused by malfunctioning ignition coils. Analysis of sample parts shows that the ignition coils may have internal electrical problems (vendor problem) as well as in
13	Customers have been experiencing rough engine running problems which were traced to the ignition coil (Part # 955 602 101 01, 955 602 101 03, 955 602 101 04, 995 602 101 05 & 955 602 101 02). Following are the types of root causes: a) coils corrode b) coils crack. If the ignition coil is not working properly the
14	Customers have been experiencing rough engine running problems which were traced to the ignition coil (Part # 955 602 101 01, 955 602 101 03, 955 602 101 04, 995 602 101 05 & 955 602 101 02). Following are the types of root causes: a) coils corrode b) coils crack. If the ignition coil is not working properly the
15	Malfunction Indicator Lamp (MIL) on with the following Diagnostic Trouble Code (DTC) were observed P0300 (Random/Multiple Cylinder Misfire) also any single misfire code may be present (P0301-0304). Analysis of sample parts (part number 07K 905 115 A/B/C/D) shows that the majority of the complaints were caused
16	Customer complaints of rough running concerns have been traced to numerous problems with the Ignition Coil (Part No. 948 602 104 00). If the ignition coil is not working properly the On-Board Diagnostic (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). Emissions and drivability will both be
17	Customer complaints of rough running concerns have been traced to numerous problems with the Ignition Coil (Part No. 948 602 104 00). If the ignition coil is not working properly the On-Board Diagnostic (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). Emissions and drivability will both be
18	Customer complaints of rough running concerns have been traced to numerous problems with the Ignition Coil (Part No. 948 602 104 00). If the ignition coil is not working properly the On-Board Diagnostic (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). Emissions and drivability will both be
19	Malfunction Indicator Lamp (MIL) illumination, rough running concerns with numerous miss fire codes stored in the Engine Control Units (ECU) memory can be caused by malfunctioning ignition coils. Analysis of sample parts shows that the ignition coils may have internal electrical problems (vendor problem) as well as in
20	Malfunction Indicator Lamp (MIL) illumination, rough running concerns with numerous miss fire codes stored in the Engine Control Units (ECU) memory can be caused by malfunctioning ignition coils. Analysis of sample parts shows that the ignition coils may have internal electrical problems (vendor problem) as well as in
21	Engine miss fire and Malfunction Indicator Lamp (MIL) illumination may be related to malfunctioning ignition coils. Diagnostic Trouble Codes (DTC) P0300-P0308 have been observed during the diagnosis process. Part numbers 077 905 115 D/G are being replaced by part number 077 905 115 S. During the engine miss
22	Customers have been experiencing rough engine running problems which were traced to the ignition coil (Part # 955 602 101 01, 955 602 101 03, 955 602 101 04, 995 602 101 05 & 955 602 101 02). Following are the types of root causes: a) coils corrode b) coils crack. If the ignition coil is not working properly the
23	Malfunction Indicator Lamp (MIL) illumination with Diagnostic Trouble Code (DTC) P0422 (Main Catalyst Bank 1 efficiency below threshold), is caused by open passages in the catalytic converters expansion matting. This condition allows the exhaust gases to partially bypass the converter monolith. The damage was caus
24	Malfunction Indicator Lamp (MIL) illumination with Diagnostic Trouble Code (DTC) P0422 (Main Catalyst Bank 1 efficiency below threshold), is caused by open passages in the catalytic converters expansion matting. This condition allows the exhaust gases to partially bypass the converter monolith. The damage was caus
25	Malfunction Indicator Lamp (MIL) illumination with Diagnostic Trouble Code (DTC) P0422 (Main Catalyst Bank 1 efficiency below threshold), is caused by open passages in the catalytic converters expansion matting. This condition allows the exhaust gases to partially bypass the converter monolith. The damage was caus
26	Improper engine management diagnostic calibration falsely flags incorrect secondary air pump pressure or check valve operation. This condition illuminates the Malfunction Indicator Lamp (MIL) and stores Diagnostic Trouble Code (DTC) P0411 in the Engine Control Units (ECU) memory. There is no adverse impact on e
27	Malfunction Indicator Lamp (MIL) on with the following Diagnostic Trouble Code (DTC) were observed P0300 (Random/Multiple Cylinder Misfire) also any single misfire code may be present (P0301-0304). Analysis of sample parts (part number 07K 905 115 A/B/C/D) shows that the majority of the complaints were caused
28	Malfunction Indicator Lamp (MIL) on with the following Diagnostic Trouble Code (DTC) were observed P0300 (Random/Multiple Cylinder Misfire) also any single misfire code may be present (P0301-0304). Analysis of sample parts (part number 07K 905 115 A/B/C/D) shows that the majority of the complaints were caused

211	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
212	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
213	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
214	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
215	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
216	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
217	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
218	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
219	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
220	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
221	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
222	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
223	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
224	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
225	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
226	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
227	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
228	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
229	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
230	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
231	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
232	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
233	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
234	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
235	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
236	The OBD system has been incorrectly programmed so the PCM calculation of certain MODE#01 parameters contain minor inaccuracies. As a result, the Mode #01 output percentage may be slightly incorrect, depending on rounding.EDIR 07-005-01 states CARB has agreed with Honda to take no remedy actions as of 6/21
237	Under specific conditions, the OBD system monitoring has been incorrectly programmed so that PCM can not record the correct travel distance after clear command is received from generic scan tool. ARB has agreed with Honda to take no remedy actions on March 9, 2006.
238	Certain 2006 and 2007 E85 capable GM cars and trucks have a condition in which the Engine Control Module (ECM) could miscalculate the ethanol concentration of the fuel after a refueling event. This is due, in large part, to the availability of E85 fuel in the field that may not meet American Society for Testing and Mater
239	Certain 2006 and 2007 E85 capable GM cars and trucks have a condition in which the Engine Control Module (ECM) could miscalculate the ethanol concentration of the fuel after a refueling event. This is due, in large part, to the availability of E85 fuel in the field that may not meet American Society for Testing and Mater
240	Certain 2006 and 2007 E85 capable GM cars and trucks have a condition in which the Engine Control Module (ECM) could miscalculate the ethanol concentration of the fuel after a refueling event. This is due, in large part, to the availability of E85 fuel in the field that may not meet American Society for Testing and Mater
241	Certain 2006 and 2007 E85 capable GM cars and trucks have a condition in which the Engine Control Module (ECM) could miscalculate the ethanol concentration of the fuel after a refueling event. This is due, in large part, to the availability of E85 fuel in the field that may not meet American Society for Testing and Mater
242	Certain 2006 and 2007 E85 capable GM cars and trucks have a condition in which the Engine Control Module (ECM) could miscalculate the ethanol concentration of the fuel after a refueling event. This is due, in large part, to the availability of E85 fuel in the field that may not meet American Society for Testing and Mater
243	Certain 2006 and 2007 E85 capable GM cars and trucks have a condition in which the Engine Control Module (ECM) could miscalculate the ethanol concentration of the fuel after a refueling event. This is due, in large part, to the availability of E85 fuel in the field that may not meet American Society for Testing and Mater
244	Certain 2006 and 2007 E85 capable GM cars and trucks have a condition in which the Engine Control Module (ECM) could miscalculate the ethanol concentration of the fuel after a refueling event. This is due, in large part, to the availability of E85 fuel in the field that may not meet American Society for Testing and Mater
245	Certain 2006 and 2007 E85 capable GM cars and trucks have a condition in which the Engine Control Module (ECM) could miscalculate the ethanol concentration of the fuel after a refueling event. This is due, in large part, to the availability of E85 fuel in the field that may not meet American Society for Testing and Mater
246	Certain vehicles with Sequential Manual Gearshift (SMG) may have the communication between the Transmission Control Unit (TCU) and a generic scan tool interrupted. This means some vehicles will not be able to pass state I/M tests. There is no impact on emissions or drivability. Calibration changes have been made
247	Certain vehicles with Sequential Manual Gearshift (SMG) may have the communication between the Transmission Control Unit (T.C.U.) and a generic scan tool interrupted. This means some vehicles will not be able to pass state I/M tests. There is no impact on emissions or drivability. Calibration changes have been mad
248	Certain vehicles with Sequential Manual Gearshift (SMG) may have the communication between the Transmission Control Unit (T.C.U.) and a generic scan tool interrupted. This means some vehicles will not be able to pass state I/M tests. There is no impact on emissions or drivability. Calibration changes have been mad
249	Certain vehicles with Sequential Manual Gearshift (SMG) may have the communication between the Transmission Control Unit (T.C.U.) and a generic scan tool interrupted. This means some vehicles will not be able to pass state I/M tests. There is no impact on emissions or drivability. Calibration changes have been mad
250	Certain vehicles with Sequential Manual Gearshift (SMG) may have the communication between the Transmission Control Unit (T.C.U.) and a generic scan tool interrupted. This means some vehicles will not be able to pass state I/M tests. There is no impact on emissions or drivability. Calibration changes have been mad
251	Certain vehicles with Sequential Manual Gearshift (SMG) may have the communication between the Transmission Control Unit (T.C.U.) and a generic scan tool interrupted. This means some vehicles will not be able to pass state I/M tests. There is no impact on emissions or drivability. Calibration changes have been mad
252	Certain vehicles with Sequential Manual Gearshift (SMG) may have the communication between the Transmission Control Unit (T.C.U.) and a generic scan tool interrupted. This means some vehicles will not be able to pass state I/M tests. There is no impact on emissions or drivability. Calibration changes have been mad
253	Certain vehicles with Sequential Manual Gearshift (SMG) may have the communication between the Transmission Control Unit (T.C.U.) and a generic scan tool interrupted. This means some vehicles will not be able to pass state I/M tests. There is no impact on emissions or drivability. Calibration changes have been mad
254	The OBD system may falsely detect a malfunction of the secondary oxygen sensor when the engine is stalled. The cause of the failure is inappropriate programing of the OBD system.Remedy: An ECM with a correct programming is made available for repair under Field Fix#W4 for 05-06M CR-V/RSX/TSX/ELEMENT. When
255	The OBD system may falsely detect a malfunction of the secondary oxygen sensor when the engine is stalled. The cause of the failure is inappropriate programing of the OBD system.Remedy: An ECM with a correct programming is made available for repair under Field Fix#W4 for 05-06M CR-V/RSX/TSX/ELEMENT. When
256	The OBD system may falsely detect a malfunction of the secondary oxygen sensor when the engine is stalled. The cause of the failure is inappropriate programing of the OBD system.Remedy: An ECM with a correct programming is made available for repair under Field Fix#W4 for 05-06M CR-V/RSX/TSX/ELEMENT. When
257	The OBD system may falsely detect a malfunction of the secondary oxygen sensor when the engine is stalled. 280	Certain 2003 model year Chevrolet, GMC, Hummer, Cadillac, and Isuzu trucks equipped with V8 engines have been built with a condition in which, in the presence of a malfunctioning or incorrect oxygen sensor where the Powetrain Control Module (PCM) has determined that the sensor's heater element resistance value i
281	Certain 2003 model year Chevrolet, GMC, Hummer, Cadillac, and Isuzu trucks equipped with V8 engines have been built with a condition in which, in the presence of a malfunctioning or incorrect oxygen sensor where the Powetrain Control Module (PCM) has determined that the sensor's heater element resistance value i
282	Certain 2003 model year Chevrolet, GMC, Hummer, Cadillac, and Isuzu trucks equipped with V8 engines have been built with a condition in which, in the presence of a malfunctioning or incorrect oxygen sensor where the Powetrain Control Module (PCM) has determined that the sensor's heater element resistance value i
283	On some vehicles the carbon canister (part # 997 201 221 04) has been replaced due to a minor leak and the setting of the Malfunction Indicator Lamp (MIL). It appears that the carbon canisters in question were damaged in transit from the supplier. An improved method of packaging the carbon canisters has been in
284	Certain 2006 GM and Isuzu vehicles equipped with 2.2L, 4.2L and 4.6L engines and Secondary Air Injection Reaction (SAIR) systems have a condition in which the SAIR system and diagnostics can be disabled without MIL illumination in the presence of a short-to-power fault in the SAIR pump or valve relay driver circuit.R
285	Certain 2006 GM and Isuzu vehicles equipped with 2.2L, 4.2L and 4.6L engines and Secondary Air Injection Reaction (SAIR) systems have a condition in which the SAIR system and diagnostics can be disabled without MIL illumination in the presence of a short-to-power fault in the SAIR pump or valve relay driver circuit.R
286	Certain 2006 GM and Isuzu vehicles equipped with 2.2L, 4.2L and 4.6L engines and Secondary Air Injection Reaction (SAIR) systems have a condition in which the SAIR system and diagnostics can be disabled without MIL illumination in the presence of a short-to-power fault in the SAIR pump or valve relay driver circuit.R
287	Transmission control units (part # 996 618 180 07) are being replaced due to harsh shifting of transmission, or transmission shifting too aggressively complaints from customers. Indication of manufacturer Follow-Up - None.Update 1 dated 11/8/2007 adds 2003 engine family.
288	Under certain driving conditions, the Onboard Diagnostic (OBD) system may falsely detect a malfunction of the thermostat. The cause of the failure is inappropriate calibration of the OBD system. Remedy: A Powertrain Control Module (PCM) with an improved calibration has been applied to the assembly line and has b
289	Some vehicles have had the exhaust gasket (Part #955 111 113 20) replaced. This part is replaced as a required replacement during major engine or transmission repairs or any time the exhaust system is removed from the engine. They are not being replaced because they are defective.
290	The Onboard Diagnostic (OBD) system may falsely detect a deterioration of the catalyst system efficiency. The cause of the failure is inappropriate programming of the OBD system. When this defect occurs, a Malfunction Indicator Light (MIL) illuminates, and the vehicle will probably be brought to a dealership and diag
291	The On-Board Diagnostic (OBD) system may falsely detect a malfunction of the number 2 engine coolant temperature sensor and the intake air temperature sensor. The cause of the failure is inappropriate calibration of the OBD system system. REMEDY: A Powertrain Control Module (PCM) with an improved calibration
292	During On-Board Diagnostics (OBD) Production Vehicle Evaluation (PVE) testing, required by California Air Resources Board (CARB) regulations. BMW discovered a software error in the Electronic Control Unit (ECU) module. The diagnostics of the thermostat, the Mass-Air Flow (MAF) sensor, radiator outlet temperature sens
293	Because of thermal shock conditions during high performance driving events and due to different material expansions the welding points of the metal monoliths of the affected converters may break causing a rattling noise. If left unattended this could lead to a deformation of the monolith's cell structure. Update dated
294	Because of thermal shock conditions during high performance driving events and due to different material expansions the welding points of the metal monoliths of the affected converters may break causing a rattling noise. If left unattended this could lead to a deformation of the monolith's cell structure. Update dated
295	The affected part number 11727553064 relates to the SAS (Secondary Air System) valve. In June 2005, a new redesigned SAS valve (free from chromium) was introduced into production. This valve tends to jam more because of condensate and may not open sometimes. Which may cause premature wear and cause th
296	The affected part number 11727553064 relates to the SAS (Secondary Air System) valve. In June 2005, a new redesigned SAS valve (free from chromium) was introduced into production. This valve tends to jam more because of condensate and may not open sometimes. Which may cause premature wear and cause th
297	Malfunction Indicator Lamp (MIL) illumination with trouble codes P0116 and P0117 stored in the Engine Control Units (ECU). May be the result of the Engine Coolant Sensor (ECT) failing. Failures are attributed to internal electrical concerns of part number 059 919 501 A. The effect on emissions and drivability is yet to b
298	Malfunction Indicator Lamp (MIL) illumination with trouble codes P0116 and P0117 stored in the Engine Control Units (ECU). May be the result of the Engine Coolant Sensor (ECT) failing. Failures are attributed to internal electrical concerns of part number 059 919 501 A. The effect on emissions and drivability is yet to b
299	Malfunction Indicator Lamp (MIL) illumination with diagnostic trouble code P0420 and rattling noise from underneath can be caused by broken monolith inside the catalytic converter (1J0 254 503 K). Some converters returned for inspection had broken flex pipes. Emissions impact of converters with a broken monolith ex
300	Malfunction Indicator Lamp (MIL) illumination with diagnostic trouble codes P0442 and P0456 may be related to defective fuel caps (part number 3C0 201 550 G). Trouble codes relate to small and very small Evaporative Emissions (EVAP) leaks respectively. Parts analyzed found the majority of the defective components
301	The Vehicle Emissions Control Information (VECI) label with incorrect spark plug information was affixed to some 2005 model year Dodge Dakota trucks equipped with high output 4.7L engines.Remedy: Chrysler will conduct a Voluntary Emission Recall (G46) to replace the VECI label on the affected vehicles.
302	Malfunction Indicator Lamp (MIL) illumination and setting a Diagnostic Trouble Code (DTC) P2181 is related to the sealing ring on the thermostat moving inside the housing. The engine will not reach proper operating temperature. Impact on emissions and drivability was not reported. New thermostat housing with a mo
303	Malfunction Indicator Lamp (MIL) illumination and setting a Diagnostic Trouble Code (DTC) P2181 is related to the sealing ring on the thermostat moving inside the housing. The engine will not reach proper operating temperature. Impact on emissions and drivability was not reported. New thermostat housing with a mo
304	Malfunction Indicator Lamp (MIL) illumination and a Diagnostic Trouble Code (DTC) (not given) set in memory, may be caused by incorrect engine control unit programming. The automatic diagnosis of the evaporative emissions system may detect a leak when there is none. No emission or drivability impacts were given
305	Malfunction Indicator Lamp (MIL) illumination and a Diagnostic Trouble Code (DTC) (not given) set in memory, may be caused by incorrect engine control unit programming. The automatic diagnosis of the evaporative emissions system may detect a leak when there is none. No emission or drivability impacts were given
306	A VECI label with incorrect spark plug information was affixed to some 2007 Dodge Nitro vehicles equipped with 4.0L engines.Remedy: Chrysler will conduct a Voluntary Emissions Recall (G45) to replace the VECI label on the affected vehicles.
307	A VECI label with incorrect spark plug information was affixed to some 2007 Dodge Nitro vehicles equipped with 4.0L engines.Remedy: Chrysler will conduct a Voluntary Emissions Recall (G45) to replace the VECI label on the affected vehicles.
308	Malfunction Indicator Lamp (MIL) illumination and numerous Diagnostic Trouble Codes (DTC) could be caused by an electrical malfunction of the fuel pressure sensor, part number 06E 906 051 E. DTC codes noted were P2539, 2540, 2541, 2543, 310B and 129F all related to low fuel pressure caused by intermittent, weal
309	Malfunction Indicator Lamp (MIL) illumination and numerous Diagnostic Trouble Codes (DTC) could be caused by an electrical malfunction of the fuel pressure sensor, part number 06E 906 051 E. DTC codes noted were P2539, 2540, 2541, 2543, 310B and 129F all related to low fuel pressure caused by intermittent, weal
310	Malfunction Indicator Lamp (MIL) illumination and numerous Diagnostic Trouble Codes (DTC) could be caused by an electrical malfunction of the fuel pressure sensor, part number 06E 906 051 E. DTC codes noted were P2539, 2540, 2541, 2543, 310B and 129F all related to low fuel pressure caused by intermittent, weal
311	Malfunction Indicator Lamp (MIL) illumination and numerous Diagnostic Trouble Codes (DTC) could be caused by an electrical malfunction of the fuel pressure sensor, part number 06E 906 051 E. DTC codes noted were P2539, 2540, 2541, 2543, 310B and 129F all related to low fuel pressure caused by intermittent, weal
312	Malfunction Indicator Lamp (MIL) illumination and numerous Diagnostic Trouble Codes (DTC) could be caused by an electrical malfunction of the fuel pressure sensor, part number 06E 906 051 E. DTC codes noted were P2539, 2540, 2541, 2543, 310B and 129F all related to low fuel pressure caused by intermittent, weal
313	An inapplicable Vehicle Emissions Control Information (VECI) label was installed on some early 2008 model year Dodge Ram 3500 vehicles. Some 50 state certified 2008 model year D1 vehicles were built with VECI labels that incorrectly state "Not for sale in states with California emissions standards".Remedy: Chrysler
314	Vehicles produced before August 14, 2007 have an issue with the oxygen sensor diagnostics that may not detect a failed O2 sensor and therefore may not illuminate the MIL. Cummins also determined that there is a problem with the O2 Auto Zero routine. O2 sensor Auto Zero is used to compensate for sensor drift wit

397	At engine start under very cold ambient conditions, the element of the air fuel ratio sensor may crack due to the thermal shock by water condensed on the sensor element. A Power train Control Module with a improved calibration has been applied to the assembly line and is made available for repair under Running Ch
398	At engine start under very cold ambient conditions, the element of the air fuel ratio sensor may crack due to the thermal shock by water condensed on the sensor element. A Power train Control Module with a improved calibration has been applied to the assembly line and is made available for repair under Running Ch
399	At engine start under very cold ambient conditions, the element of the air fuel ratio sensor may crack due to the thermal shock by water condensed on the sensor element. A Power train Control Module with a improved calibration has been applied to the assembly line and is made available for repair under Running Ch
400	At engine start under very cold ambient conditions, the element of the air fuel ratio sensor may crack due to the thermal shock by water condensed on the sensor element. A Power train Control Module with a improved calibration has been applied to the assembly line and is made available for repair under Running Ch
401	At engine start under very cold ambient conditions, the element of the air fuel ratio sensor may crack due to the thermal shock by water condensed on the sensor element. A Power train Control Module with a improved calibration has been applied to the assembly line and is made available for repair under Running Ch
402	At engine start under very cold ambient conditions, the element of the air fuel ratio sensor may crack due to the thermal shock by water condensed on the sensor element. A Power train Control Module with a improved calibration has been applied to the assembly line and is made available for repair under Running Ch
403	At engine start under very cold ambient conditions, the element of the air fuel ratio sensor may crack due to the thermal shock by water condensed on the sensor element. A Power train Control Module with a improved calibration has been applied to the assembly line and is made available for repair under Running Ch
404	At engine start under very cold ambient conditions, the element of the air fuel ratio sensor may crack due to the thermal shock by water condensed on the sensor element. A Power train Control Module with a improved calibration has been applied to the assembly line and is made available for repair under Running Ch
405	At engine start under very cold ambient conditions, the element of the air fuel ratio sensor may crack due to the thermal shock by water condensed on the sensor element. A Power train Control Module with a improved calibration has been applied to the assembly line and is made available for repair under Running Ch
406	At engine start under very cold ambient conditions, the element of the air fuel ratio sensor may crack due to the thermal shock by water condensed on the sensor element. A Power train Control Module with a improved calibration has been applied to the assembly line and is made available for repair under Running Ch
407	Under certain conditions it is possible that the On-Board Diagnosis (OBD) System stores a fault code entry for the Oxygen Sensor (Part No. 996 606 178 01) even if the sensor is not defective. This fault code entry relates to a problem in the Oxygen Sensor heating and will illuminate the Malfunction Indicator Lamp (MIL
408	Under certain conditions it is possible that the On-Board Diagnosis (OBD) System stores a fault code entry for the Oxygen Sensor (Part No. 996 606 178 01) even if the sensor is not defective. This fault code entry relates to a problem in the Oxygen Sensor heating and will illuminate the Malfunction Indicator Lamp (MIL
409	Under certain conditions it is possible that the On-Board Diagnosis (OBD) System stores a fault code entry for the Oxygen Sensor (Part No. 996 606 178 01) even if the sensor is not defective. This fault code entry relates to a problem in the Oxygen Sensor heating and will illuminate the Malfunction Indicator Lamp (MIL
410	Under certain conditions it is possible that the On-Board Diagnosis (OBD) System stores a fault code entry for the Oxygen Sensor (Part No. 996 606 178 01) even if the sensor is not defective. This fault code entry relates to a problem in the Oxygen Sensor heating and will illuminate the Malfunction Indicator Lamp (MIL
411	The On Board Diagnostic system may falsely detect a deterioration of the Catalyst System efficiency. The cause of the failure is inappropriate calibration of the On Board Diagnostic system. An engine control module with an improved calibration is made available for repair under Field Fix#Z3. When this defect occurs, th
412	The On Board Diagnostic system may falsely detect a deterioration of the Catalyst System efficiency. The cause of the failure is inappropriate calibration of the On Board Diagnostic system. An engine control module with an improved calibration is made available for repair under Field Fix#Z3. When this defect occurs, th
413	The breather hose material may degrade due to heat and chemical exposure. Owners are alerted to this defect by illumination of the MIL, engine hesitation & surging and oil leakage. Tailpipe emissions may increase and crankcase gasses may be emitted due to this defect. Land Rover feels that the illumination of th
414	On some 2008 model year vehicles equipped with a 5.7L Hemi engine, the On-Board Diagnostic (OBD) software for the Incorrect Engine Oil Diagnostic will erroneously set a fault for Low Engine Oil Pressure and cause them Malfunction Indicator Light (MIL) to illuminate. Using an oil with the wrong viscosity will not disable
415	On some 2008 model year vehicles equipped with a 5.7L Hemi engine, the On-Board Diagnostic (OBD) software for the Incorrect Engine Oil Diagnostic will erroneously set a fault for Low Engine Oil Pressure and cause them Malfunction Indicator Light (MIL) to illuminate. Using an oil with the wrong viscosity will not disable
416	On some 2008 model year vehicles equipped with a 5.7L Hemi engine, the On-Board Diagnostic (OBD) software for the Incorrect Engine Oil Diagnostic will erroneously set a fault for Low Engine Oil Pressure and cause them Malfunction Indicator Light (MIL) to illuminate. Using an oil with the wrong viscosity will not disable
417	On some 2008 model year vehicles equipped with a 5.7L Hemi engine, the On-Board Diagnostic (OBD) software for the Incorrect Engine Oil Diagnostic will erroneously set a fault for Low Engine Oil Pressure and cause them Malfunction Indicator Light (MIL) to illuminate. Using an oil with the wrong viscosity will not disable
418	On some 2008 model year vehicles equipped with 4.0L engine, the OBD calibration for the ignition coil-insufficient ionization diagnostics can false fail. During a deceleration fuel shutoff event, the ignition coil ionization current can fall below the failure threshold and cause MIL illumination for diagnostic trouble codes P2
419	On some 2008 model year vehicles equipped with 4.0L engine, the OBD calibration for the ignition coil-insufficient ionization diagnostics can false fail. During a deceleration fuel shutoff event, the ignition coil ionization current can fall below the failure threshold and cause MIL illumination for diagnostic trouble codes P2
420	MIL illumination with DTC's P0171 and P0174 may be caused by cracks in the Throttle Body Inlet (TBI) air supply hose. The hose becomes brittle after time and will crack, part # MLH000020 is being replaced by part# MLH500200. There is no effect on drivability and no adverse effect on emissions if the owner returns to
421	MIL illumination with DTC's P0171 and P0174 may be caused by cracks in the Throttle Body Inlet (TBI) air supply hose. The hose becomes brittle after time and will crack, part # MLH000020 is being replaced by part# MLH500200. There is no effect on drivability and no adverse effect on emissions if the owner returns to
422	MIL illumination with DTC's P0171 and P0174 may be caused by cracks in the Throttle Body Inlet (TBI) air supply hose. 	O
793	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
794	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
795	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
796	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
797	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
798	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
799	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
800	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
801	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
802	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
803	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
804	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
805	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
806	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
807	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
808	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
809	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
810	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
811	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
812	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
813	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
814	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
815	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
816	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
817	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
818	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
819	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
820	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
821	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
822	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
823	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
824	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
825	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
826	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
827	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
828	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
829	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
830	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
831	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
832	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
833	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
834	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
835	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
836	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
837	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
838	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
839	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
840	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
841	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
842	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
843	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
844	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
845	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
846	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
847	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
848	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
849	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
850	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
851	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
852	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
853	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
854	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
855	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
856	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
857	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
858	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
859	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
860	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
861	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
862	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
863	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
864	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
865	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
866	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
867	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
868	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
869	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
870	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
871	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
872	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
873	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
874	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
875	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
876	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
877	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
878	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
879	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
880	
881	Some trucks with 7.5L engines may have inoperative HEGO sensors.
882	Some trucks with 7.5L engines may have inoperative HEGO sensors.
883	Some cars may have throttle position sensors that wear out prematurely.
884	
885	
886	
887	The catalytic converter will be replaced with a redesigned part.
888	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
889	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
890	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
891	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
892	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
893	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
894	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
895	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
896	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
897	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
898	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
899	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
900	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
901	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
902	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
903	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.
904	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.
905	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.
906	Positive Crankcase Ventilation hoses exhibit a deterioration of the material, which causes cracking, resulting in crankcase vent system leaks and vacuum leaks.
907	Positive Crankcase Ventilation hoses exhibit a deterioration of the material, which causes cracking, resulting in crankcase vent system leaks and vacuum leaks.
908	An engine may experience starting difficulty when vehicles are soaked for a long time in an extremely cold area. This situation is caused by incorrect vacuum signal into the MAP sensor due to frozen moisture which clogs the vacuum line between the MAP sensor and the intake manifold.
909	An engine may experience starting difficulty when vehicles are soaked for a long time in an extremely cold area. This situation is caused by incorrect vacuum signal into the MAP sensor due to frozen moisture which clogs the vacuum line between the MAP sensor and the intake manifold.
910	Oxygen sensors deteriorate and result in poor fuel/air control, reduced catalyst efficiency, and high emission levels.
911	Oxygen sensors deteriorate and result in poor fuel/air control, reduced catalyst efficiency, and high emission levels.
912	A processing error in the DME engine control module of the initial production phase can lead to an erroneous setting of the check engine light and erroneous fault code storage.
913	The check engine light may become illuminated for a short period of time and fault code 41 set in the engine control module. The problem is caused by an onboard diagnostic system threshold adaption error. It is corrected by reprogramming the ECM EPROM with an updated software program.
914	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
915	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
916	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
917	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
918	Some cars have a rattling noise underneath the vehicle since the monolith has been abraded by mat erosion.
919	Illumination of the malfunction indicator light results from unstable signal output from the oxygen sensor.
920	This engine family is equipped with a secondary air injection system, delivering air into the exhaust manifold. Part of this system is a non-return or check valve, which prevents hot exhaust gases from entering the pump. Some vehicles may have been equipped with a warped sealing disk which could allow flow back to
921	Due to a logistical error incorrect coolant temperature sensors (NTCs) may have been installed on M5 vehicles during a specified production period.
922	Due to a logistical error incorrect coolant temperature sensors (NTCs) may have been installed on M5 vehicles during a specified production period.
923	Engines were assembled with the incorrect Positive Crankcase Ventilation (PCV) valve.The affected vehicles will be recalled to replace the incorrect valve with the released valve.
924	It is possible that some of the affected vehicles do not comply with OBD2 access requirements as outlined in the SAE J1962 standardization. The problem consists of difficulty with the connection of a diagnosis unit, other than the VAG 1551, because of some extremely close adapter plug tolerances.
925	It is possible that some of the affected vehicles do not comply with OBD2 access requirements as outlined in the SAE J1962 standardization. The problem consists of difficulty with the connection of a diagnosis unit, other than the VAG 1551, because of some extremely close adapter plug tolerances.
926	The supplier of spark plug wires for the affected vehicles began using a new vendor for the PBT resin used in making the wires. The spark plug wires made using the PBT from the new vendor have been found to exhibit ignition leak problems under high temperature and high humidity conditions.
927	The supplier of spark plug wires for the affected vehicles began using a new vendor for the PBT resin used in making the wires. The spark plug wires made using the PBT from the new vendor have been found to exhibit ignition leak problems under high temperature and high humidity conditions.
928	Signal wires for the oxygen sensors located after the catalytic converters are potentially incorrectly positioned in the ECM wiring harness connector.
929	Some Vehicle Control Modules (VCM) may have been incorrectly programmed with an engine calibration intended for Canadian usage. The Canadian calibration would not allow certain OBD2 malfunction lights to illuminate.
930	Secondary Air Pump Wire Connection-During the initial production period of 3-series vehicles with 2.8L engines, the two wires supplying power to the air pump may have been reversed in the connecting plug, causing the pump to run backwards. ECM Programming Error-During above production period, software was used
931	Secondary Air Pump Wire Connection-During the initial production period of 3-series vehicles with 2.8L engines, the two wires supplying power to the air pump may have been reversed in the connecting plug, causing the pump to run backwards. ECM Programming Error-During above production period, software was used
932	Multec Bottom Feed Injectors with D195A and D195B build date codes may have abnormal stresses in the plastic encapsulant resulting in leakage of fuel vapor to the atmosphere.A voluntary Emission Recall will be conducted to replace all the injectors with the suspect build date.
933	Multec Bottom Feed Injectors with D195A and D195B build date codes may have abnormal stresses in the plastic encapsulant resulting in leakage of fuel vapor to the atmosphere.A voluntary Emission Recall will be conducted to replace all the injectors with the suspect build date.
934	Multec Bottom Feed Injectors with D195A and D195B build date codes may have abnormal stresses in the plastic encapsulant resulting in leakage of fuel vapor to the atmosphere.A voluntary Emission Recall will be conducted to replace all the injectors with the suspect build date.
935	The emission control information label affixed to certain 1996 model year V8 and V12 models may contain an error. An incorrect barcode is indicated on the label.
936	The emission control information label affixed to certain 1996 model year V8 and V12 models may contain an error. An incorrect barcode is indicated on the label.
937	The Emission Control Information label affixed to certain 1995 model year V8 models may contain an error. An incorrect EVAP family is indicated on the label.
938	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
939	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
940	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
941	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
942	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
943	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
944	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
945	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
946	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
947	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
948	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
949	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
950	Ignition coils are being replaced on engines due to a failure of the secondary magnet wire. The failures are caused by the difference in the coefficient of thermal expansion of the fine secondary wire and bobbin.
951	Ignition coils are being replaced on engines due to a failure of the secondary magnet wire. The failures are caused by the difference in the coefficient of thermal expansion of the fine secondary wire and bobbin.
952	Ignition coils are being replaced on engines due to a failure of the secondary magnet wire. The failures are caused by the difference in the coefficient of thermal expansion of the fine secondary wire and bobbin.
953	Ignition coils are being replaced on engines due to a failure of the secondary magnet wire. The failures are caused by the difference in the coefficient of thermal expansion of the fine secondary wire and bobbin.
954	Failed fuel pump due to worn out commutator.
955	Some cars may have been shipped with incorrect Electric Air Pumps installed.
956	Some cars may have been shipped with incorrect Electric Air Pumps installed.
957	Some trucks may have been built with incorrect Mass Airflow Sensors.
958	Some trucks may have been built with incorrect Mass Airflow Sensors.
959	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
960	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
961	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
962	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
963	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
964	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
965	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
966	Cracking of the spark plug wire insulation may occur on some Federal 1994-95 Chevrolet Geo Tracker vehicles with 1.6L L4 (RPO L01) engine. This condition can manifest itself as a driveability problem.
967	Cracking of the spark plug wire insulation may occur on some Federal 1994-95 Chevrolet Geo Tracker vehicles with 1.6L L4 (RPO L01) engine. This condition can manifest itself as a driveability problem.
968	Freeze frame (Mode 2) values for the "lambda control factor" and the "lambda control adaption factor" for cylinder bank 2 are not stored and available on the scan tool. The values are available real-time (Mode 1) and are available for cylinder bank 1 in both freeze frame and real time. This is not according to SAE J19
969	Freeze frame (Mode 2) values for the "lambda control factor" and the "lambda control adaption factor" for cylinder bank 2 are not stored and available on the scan tool. The values are available real-time (Mode 1) and are available for cylinder bank 1 in both freeze frame and real time. This is not according to SAE J19
970	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
971	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
972	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
973	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
974	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
975	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
976	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
977	Vacuum hose routing diagram has been printed incorrectly. The hose routing between throttle body, EGR vacuum modulator and pulse width modulated vacuum switching valve was incorrect
978	Vacuum hose routing diagram has been printed incorrectly. The hose routing between throttle body, EGR vacuum modulator and pulse width modulated vacuum switching valve was incorrect
979	Some cars may have inoperative HEGO sensors caused by a cracked sensing element.
980	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
981	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
982	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
983	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
984	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
985	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
986	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
987	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
988	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
989	Some

	P
920	the pump causing condensation to form and ultimately leading to pump failure.
923	Aurora model has 4.0L displacement.

	O
991	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
992	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
993	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
994	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
995	Some trucks may have bolts that lose torque due to incompatible expansion characteristics with the improved exhaust manifold material. (Covers FED and CA, =50S)
996	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
997	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
998	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
999	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
1000	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
1001	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
1002	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
1003	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
1004	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
1005	Some cars may have Fuel Pressure Regulators with diaphragms that can rupture.
1006	Some cars may have Fuel Pressure Regulators with diaphragms that can rupture.
1007	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1008	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1009	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1010	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1011	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1012	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1013	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1014	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1015	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1016	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1017	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1018	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1019	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1020	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1021	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1022	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1023	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1024	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1025	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1026	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1027	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1028	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1029	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1030	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1031	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1032	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1033	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1034	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1035	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1036	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1037	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1038	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1039	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1040	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1041	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1042	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1043	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1044	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1045	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1046	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1047	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1048	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1049	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1050	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1051	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1052	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1053	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1054	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1055	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1056	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1057	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1058	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1059	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1060	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1061	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1062	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1063	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.

1072	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
1073	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
1074	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
1075	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
1076	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1077	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1078	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1079	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1080	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1081	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1082	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1083	Some cars equipped with EGR may experience a difficult starting condition. Water vapor and cold temperature may result in ice build up at the tip of the fuel injector.
1084	Some cars equipped with EGR may experience a difficult starting condition. Water vapor and cold temperature may result in ice build up at the tip of the fuel injector.
1085	Some trucks were built with an engine calibration certified for E-250 standard vans.
1086	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
1087	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
1088	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
1089	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
1090	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
1091	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
1092	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1093	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1094	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1095	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1096	The pressure transducer may experience binding at low temperatures potentially causing the MIL to illuminate. The binding has been attributed to out of tolerance conditions within the transducer.
1097	Grease comes out from a bearing in an idle air control valve and attaches to the surface of the valve seat. Carbon in exhaust gas clings to the attaching grease and is pressed by the valve surface. This occurs due to some valve axle clearance of the bearing which moves from the manifold vacuum pressure. This resu
1098	Secondary air injection pump relay may be contaminated by materials present in the underhood atmosphere. This prevents the air pump from operating correctly.
1099	Secondary air injection pump relay may be contaminated by materials present in the underhood atmosphere. This prevents the air pump from operating correctly.
1100	Some cars may have inoperative Idle Air Bypass valves caused by resonance in the air supply tube inducing mechanical damage to the valve and valve seat.
1101	Some cars may have inoperative Mass Airflow sensors caused by silicone contamination of the sensing element during the manufacturing process.
1102	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1103	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1104	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1105	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1106	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1107	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1108	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1109	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1110	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1111	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1112	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1113	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1114	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1115	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1116	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1117	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1118	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1119	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1120	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1121	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1122	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1123	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1124	Some 1997 4.6L Federal Continental passenger cars may have been built with California Powertrain Control Modules (PCM).
1125	Some cars equipped with the 2.4L (RPO LD9) VIN Engine Code "T" engine may have been built with an incorrect Evaporative Emission (EVAP) Canister Purge Solenoid.
1126	Some cars equipped with the 2.4L (RPO LD9) VIN Engine Code "T" engine may have been built with an incorrect Evaporative Emission (EVAP) Canister Purge Solenoid.
1127	Based on the results of our supplier's analyses, the principal failure mode is a slowed or absence of switching of the oxygen sensor due to the cracking of the ceramic substrate.
1128	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1129	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1130	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1131	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1132	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1133	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1134	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1135	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1136	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1137	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1138	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1139	The Engine Control Module (ECM) installed in some 1997 Sportage models produced before 2/19/97 may have software errors that affects the readiness function for Evaporative Emissions System leakage monitoring. The result of this malfunction is loss of evaporative emissions diagnostic function and non-compliance
1140	The Engine Control Module (ECM) installed in some 1997 Sportage models produced before 2/19/97 may have software errors that affects the readiness function for Evaporative Emissions System leakage monitoring. The result of this malfunction is loss of evaporative emissions diagnostic function and non-compliance
1141	Carbon tracking may occur on the inner surface of the distributor cap as a result of moisture settling on the rib pattern. If moisture settles on the rib pattern, a reduced path of resistance is created and a high voltage short may result when the coil fires.
1142	Carbon tracking may occur on the inner surface of the distributor cap as a result of moisture settling on the rib pattern. If moisture settles on the rib pattern, a reduced path of resistance is created and a high voltage short may result when the coil fires.
1143	Carbon tracking may occur on the inner surface of the distributor cap as a result of moisture settling on the rib pattern. If moisture settles on the rib pattern, a reduced path of resistance is created and a high voltage short may result when the coil fires.
1144	Some trucks may have jumper hoses to the fuel tank that can develop cracks due to being overheated during the manufacturing process.
1145	Some trucks may have jumper hoses to the fuel tank that can develop cracks due to being overheated during the manufacturing process.
1146	Some cars may have been built with 400 cpi catalytic converter substrates in place of 350 cpi substrates.
1147	The Vehicle Emissions Control Information (VECI) labels on certain California 2.4L minivan models contain an error in the emission configuration code and the bar code.
1148	The Vehicle Emission Control Information (VECI) labels on some Dakota models with GVWRs less than 6000 lbs incorrectly identify the vehicle as certified to California emissions.
1149	The rear O2 sensor wiring may be reversed, with the left sensor connected to the right side wiring and vice-versa.Campaign #725 represents FEDERAL vehicles in this EF.Campaign #726 represents CALIFORNIA vehicles in this EF.
1150	The owners manual for the 1996 Plymouth Breeze model, does not contain the recommended shift speeds used for emission certification and fuel economy testing of the vehicle as required by the regulations.Chrysler will conduct a recall to provide customers with an owners manual addendum giving the shift speeds.
1151	The owners manual for the 1996 Plymouth Breeze model, does not contain the recommended shift speeds used for emission certification and fuel economy testing of the vehicle as required by the regulations.Chrysler will conduct a recall to provide customers with an owners manual addendum giving the shift speeds.
1152	Federal Vehicle Emission Control Information (VECI) labels were mistakenly installed on certain California 5.2L trucks.A correct label for each affected vehicle will be enclosed with the recall notification mailed to owners and dealers.
1153	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by fatigue failure of the wire.
1154	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
1155	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
1156	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
1157	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
1158	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1159	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1160	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1161	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1162	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1163	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1164	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1165	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1166	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1167	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1168	The catalytic converter in some cases fails to last the useful life of the vehicle. This is caused by the thermal expansion of the catalyst can, and the subsequent erosion of the mat surrounding the biscuits. Also, the carburetor accelerator pump will be replaced, a throttle return dashpot will be added, and the vacuum adv

1189	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1190	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1191	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1192	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1193	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1194	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1195	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1196	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1197	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1198	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1199	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1200	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1201	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1202	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1203	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1204	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1205	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1206	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1207	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1208	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1209	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1210	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1211	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1212	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1213	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1214	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1215	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1216	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1217	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1218	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
1219	The valve lash specifications are incorrect on the under-hood Vehicle Emissions Control Information label.
1220	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
1221	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
1222	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
1223	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
1224	Some vehicles may experience corrosion of an oxygen sensor wiring harness connector. The cause is due to water drainage from a hood scoop onto the affected connector.
1225	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1226	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1227	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1228	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1229	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1230	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1231	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1232	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1233	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1234	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1235	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1236	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1237	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1238	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1239	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1240	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1241	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1242	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1243	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1244	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1245	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1246	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1247	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1248	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1249	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1250	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1251	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1252	Some trucks may have inoperative HEGO sensors due to weak gas seal rings or contamination by carbon, lead, oil, or silicone.
1253	Some trucks may have inoperative Idle Air Bypass valves caused by engine sludging.
1254	Corrupted data communication between the (PCM) and Instrument Panel Cluster (IPC) and (HVAC) processors may cause a PCM reset to occur and/or the setting of DTC P1518 (Reduced Engine Power).The correction to be made is to recall all potentially affected vehicles and reflash the PCM calibration to make the syst
1255	Corrupted data communication between the (PCM) and Instrument Panel Cluster (IPC) and (HVAC) processors may cause a PCM reset to occur and/or the setting of DTC P1518 (Reduced Engine Power).The correction to be made is to recall all potentially affected vehicles and reflash the PCM calibration to make the syst
1256	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
1257	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
1258	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
1259	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
1260	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1261	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1262	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1263	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1264	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1265	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1266	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1267	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1268	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1269	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1270	It may be possible that the connector of the ignition coil may intermittently lose contact with the electronic ignition control unit.
1271	825 warranty claims related to the ignition coil. The warranty claims were prompted by complaints of rough idling, engine stumbling, or poor performance.
1272	825 warranty claims related to the ignition coil. The warranty claims were prompted by complaints of rough idling, engine stumbling, or poor performance.
1273	ISC Servo Kit failures caused by water intrusion into the ISC Servo Kit.
1274	The turbine wheel may brush the housing, caused by the narrow clearance.
1275	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1276	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1277	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1278	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1279	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1280	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1281	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1282	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
1283	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
1284	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
1285	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
1286	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
1287	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1288	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1289	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1290	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1291	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
1292	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
1293	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
1294	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
1295	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1296	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1297	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1298	An intermittent connector leads to a check engine light on condition in some vehicles. The sensor was replaced as indicated by the fault code. The check engine light condition could not be corrected with the new sensor. The connector was subsequently modified to improve the connection with the knock sensor.
1299	An intermittent connector leads to a check engine light on condition in some vehicles. The sensor was replaced as indicated by the fault code. The check engine light condition could not be corrected with the new sensor. The connector was subsequently modified to improve the connection with the knock sensor.
1300	The container holding the left side catalytic converter may have been manufactured with variances in tolerance which could allow the substrate to come loose within the converter housing. Loose subsrates tend to generate a loud "rattling" noise which is audible inside the vehicle.
1301	The container holding the left side catalytic converter may have been manufactured with variances in tolerance which could allow the substrate to come loose within the converter housing. Loose subsrates tend to generate a loud "rattling" noise which is audible inside the vehicle.
1302	The container holding the left side catalytic converter may have been manufactured with variances in tolerance which could allow the substrate to come loose within the converter housing. Loose subsrates tend to generate a loud "rattling" noise which is audible inside the vehicle.
1303	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1304	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1305	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1306	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1307	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1308	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1309	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1310	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1311	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1312	Some cases of water intrusion into ISC Servo Kit have been found. Hyundai believes that most ISC replacements are improper diagnosis and repair.
1313	Some cases of carbon deposits inside the Idle Speed Actuator (ISA) have caused complaints of rough idling and engine stumbling.
1314	Some cases of carbon deposits inside the Idle Speed Actuator (ISA) have caused complaints of rough idling and engine stumbling.
1315	Poor engine starting may result from a failed purge control valve. The valve failed as a result of contamination with dust or oil used to insert the PCV hose onto the valve nipple.
1316	Poor engine starting may result from a failed purge control valve. The valve failed as a result of contamination with dust or oil used to insert the PCV hose onto the valve nipple.
1317	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. Some parts failed as a result of intrusion of water into the sensor body; however, the main cause of failure was a short circuit at the soldering spot between the terminal and the thermistor wire. Hyundai belie
1318	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. Some parts failed as a result of intrusion of water into the sensor body; however, the main cause of failure was a short circuit at the soldering spot between the terminal and the thermistor wire. Hyundai belie
1319	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. Some parts failed as a result of intrusion of water into the sensor body; however, the main cause of failure was a short circuit at the soldering spot between the terminal and the thermistor wire. Hyundai belie
1320	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. The main cause of failure was an intermittent short circuit at the soldering spot between the terminal and the thermistor wire, although there were some cases of water intrusion into the sensor body.
1321	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. The main cause of failure was an intermittent short circuit at the soldering spot between the terminal and the thermistor wire, although there were some cases of water intrusion into the sensor body.
1322	Outflow of charcoal from the canister may result in difficulty in starting the engine.
1323	Outflow of charcoal from the canister may hinder operation of the purge solenoid valve resulting in difficulty in starting the engine.
1324	Illumination of the MIL caused by oxygen sensor failure. The main cause of oxygen sensor failure was internal electrode damage, resulting from unsatisfactory reproducibility of Pt Powder grain size and surface area.
1325	Illumination of the MIL caused by oxygen sensor failure. The main cause of oxygen sensor failure was internal electrode damage, resulting from unsatisfactory reproducibility of Pt Powder grain size and surface area.
1326	Illumination of the MIL caused by oxygen sensor failure. The main cause of oxygen sensor failure was internal electrode damage, resulting from unsatisfactory reproducibility of Pt Powder grain size and surface area.
1327	The charcoal canister check ball sticks to the aluminum seat due to thermal expansion difference of the ball and the seat. This causes MIL illumination.
1328	One of the following problems may have been present:Intake manifold plug cap on the left rear side of the crankcase ventilation valve may be torn or missing.Intake manifold gaskets may be leaking.
1329	One of the following problems may have been present:Intake manifold plug cap on the left rear side of the crankcase ventilation valve may be torn or missing.Intake manifold gaskets may be leaking.
1330	A ceramic spacer is fixed between both monoliths of the catalytic converter. Due to faulty packaging, the ceramic ring becomes loose and causes a rattling noise.
1331	A ceramic spacer is fixed between both monoliths of the catalytic converter. Due to faulty packaging, the ceramic ring becomes loose and causes a rattling noise.
1332	The affected part is the oxygen sensor. The sensors showed signs of a decreased control frequency. Analysis of the affected oxygen sensors has found exhaust-carried deposits on the ceramic sensing element.The corrective measure consists of reprogramming the Engine Control Module with new updated software.
1333	The affected part is the oxygen sensor. The sensors showed signs of a decreased control frequency. Analysis of the affected oxygen sensors has found exhaust-carried deposits on the ceramic sensing element.The corrective measure consists of reprogramming the Engine Control Module with new updated software.
1334	The affected part is the oxygen sensor. The sensors showed signs of a decreased control frequency. Analysis of the affected oxygen sensors has found exhaust-carried deposits on the ceramic sensing element.The corrective measure consists of reprogramming the Engine Control Module with new updated software.
1335	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
1336	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
1337	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
1338	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
1339	Some cars may have inoperative Idle Air Control Valves caused by the rubber orifice seat sticking closed.
1340	Some vans may have HEGO sensors with reference cavities that may become contaminated by exhaust gas under certain conditions. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1341	Some cars may have inoperative HEGO sensors caused by oil absorption through the wire connector.
1342	Due to an error in the OBD computer logic, the evaporative system readiness codes remains incomplete even after the computer confirms that the system operates correctly. However, a malfunction will be correctly detected and the MIL will be illuminated according to Toyota.
1343	Illumination of the MIL caused by oxygen sensor malfunction. The oxygen sensor lead wire can come under excessive tension leading to the potential of malfunction. The excessive tension can cause intermittent unstable signal voltage.
1344	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1345	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1346	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1347	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1348	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
1349	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
1350	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
1351	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
1352	Some cars may have fuel line jumpers that can rub on the floorpan.
1353	Some cars may have fuel line jumpers that can rub on the floorpan.
1354	Some cars may have fuel line jumpers that can rub on the floorpan.
1355	Some cars may have fuel line jumpers that can rub on the floorpan.
1356	Some cars may have fatigue cracks in the fuel tank at the heat shield attachment point.
1357	Some cars may have fatigue cracks in the fuel tank at the heat shield attachment point.
1358	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
1359	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
1360	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
1361	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
1362	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
1363	The elbow containing the crankcase ventilation orifice was installed on the wrong valve cover during reconditioning of the engine.
1364	The elbow containing the crankcase ventilation orifice was installed on the wrong valve cover during reconditioning of the engine.
1365	Spark plug wire boots may become cracked on some cylinders, allowing secondary ignition voltage to arc through the crack(s) to heat shields around the boots, and then to ground, under certain operating conditions.
1366	Spark plug wire boots may become cracked on some cylinders, allowing secondary ignition voltage to arc through the crack(s) to heat shields around the boots, and then to ground, under certain operating conditions.
1367	Spark plug wire boots may become cracked on some cylinders, allowing secondary ignition voltage to arc through the crack(s) to heat shields around the boots, and then to ground, under certain operating conditions.
1368	The failing component is the AIR injection reactor (AIR) system fuse. The failure that has been ocurring is blown AIR fuses. The probable cause is high in-rush current from repeated on-off cycles of the AIR pump when the manual transmission vehicles are driven agressively, with heavy throttle acceleration or high RPM
1369	The failing component is the AIR injection reactor (AIR) system fuse. The failure that has been ocurring is blown AIR fuses. The probable cause is high in-rush current from repeated on-off cycles of the AIR pump when the manual transmission vehicles are driven agressively, with heavy throttle acceleration or high RPM
1370	The calibration of the Powertrain Control Module (PCM) may fail to adequately control CO emissions during certain Inspection and Maintenance (IM) tests, such as the steady state Acceleration Simulation Mode (ASM) test.
1371	The calibration of the Powertrain Control Module (PCM) may fail to adequately control CO emissions during certain Inspection and Maintenance (IM) tests, such as the steady state Acceleration Simulation Mode (ASM) test.
1372	The VECI labels on certain Federal and California AWD minivan models were reversed, with the Federal label installed on the California and vice versa,
1373	Chrysler is conducting a recall of trucks equipped with 5.9L engines certified to the California Transitional Low Emission Vehicle (TLEV) emission standards. These vehicles were found to possibly emit high NOx emissions during the 2% audit of production vehicles required by CARB.
1374	Chrysler is conducting a recall of trucks equipped with 5.9L engines certified to the California Transitional Low Emission Vehicle (TLEV) emission standards. These vehicles were found to possibly emit high NOx emissions during the 2% audit of production vehicles required by CARB.
1375	The VECI labels on certain 1998 MY HD trucks mistakenly indicated that the trucks were 1997 MY vehicles.
1376	The VECI labels on certain 1998 MY HD trucks mistakenly indicated that the trucks were 1997 MY vehicles.
1377	The VECI labels on certain 1998 MY 2.4L Sebring convertibles contained an error involving the purge control valve hose routing.
1378	The VECI labels on certain 1998 MY 2.4L Sebring convertibles contained an error involving the purge control valve hose routing.
1379	Due to a programming error, the Powertrain Control Module (PCM) installed in the affected vehicles may, under certain driving conditions, trigger a shift in air-fuel ratio to an over-lean condition, resulting in an engine stall. An engine stall may lead to a loss of vehicle control and/or a vehicle crash. This DR is actually a
1380	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1381	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1382	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1383	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1384	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1385	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1386	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.

	P
1189	Note: Jane Armstrong's letter dated 5-2-1997 to all manufacturers using the Mazda OBD misfire strategy for their misfire counter requested that information about this strategy be submitted to EPA. 	O
1387	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1388	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1389	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1390	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1391	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1392	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
1393	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
1394	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
1395	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
1396	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
1397	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
1398	The main under-floor catalytic converter assemblies on certain 1998 Model Year ML320 models may have been assembled incorrectly by the supplier. The right side converter may be installed on the left side in the reverse orientation and the left side converter may be installed on the right side in the reverse orientatio
1399	The misfire detection strategy does not fully meet the requirements of CARB OBD2 in that monitoring for misfire during positive torque engine operation is not continuous. CARB confirmed their concerns to Jaguar in a letter dated 23 April, received 24 April, 1997.
1400	The misfire detection strategy does not fully meet the requirements of CARB OBD2 in that monitoring for misfire during positive torque engine operation is not continuous. CARB confirmed their concerns to Jaguar in a letter dated 23 April, received 24 April, 1997.
1401	The misfire detection strategy does not fully meet the requirements of CARB OBD2 in that monitoring for misfire during positive torque engine operation is not continuous. CARB confirmed their concerns to Jaguar in a letter dated 23 April, received 24 April, 1997.
1402	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1403	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1404	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1405	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1406	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1407	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1408	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1409	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1410	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1411	Malfunction Indicator Light (MIL) falsely illuminates as a malfunction of automatic transmission (A/T) input speed sensor under the limited condition after A/T gear is shifted from 5th to 4th during coast down deceleration.
1412	The emission tune-up label states the engine family had EGR; the family was certified without EGR.
1413	Some vehicles are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock detection routine so as not to permit this condition.
1414	Some vehicles are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock detection routine so as not to permit this condition.
1415	Some vans may draw water into the evaporative emission canister when driven in slushy-snow conditions. This can result in setting a MIL, misfire, rough idle, lack of power and eventually, an engine stall if driveability symptoms and MIL are ignored.
1416	Some vans may draw water into the evaporative emission canister when driven in slushy-snow conditions. This can result in setting a MIL, misfire, rough idle, lack of power and eventually, an engine stall if driveability symptoms and MIL are ignored.
1417	The secondary air injection valve with built-in check valve prevents exhaust gases from being forced into the secondary air injection pump. The failed valves were inoperable, i.e. stuck in the open or closed position.
1418	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1419	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1420	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1421	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1422	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1423	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1424	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1425	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1426	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1427	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1428	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1429	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1430	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1431	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
1432	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
1433	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
1434	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
1435	The throttle shaft ball bearing on the sensor side of the throttle body assembly of the subject vehicles may not have been installed in certain throttle bodies produced.
1436	The throttle shaft ball bearing on the sensor side of the throttle body assembly of the subject vehicles may not have been installed in certain throttle bodies produced.
1437	The throttle shaft ball bearing on the sensor side of the throttle body assembly of the subject vehicles may not have been installed in certain throttle bodies produced.
1438	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. The main cause of failure was an intermittent short circuit at the soldering spot between the terminal and the thermistor wire, and an intermittent connection caused by engine vibration.
1439	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
1440	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
1441	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
1442	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
1443	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
1444	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
1445	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
1446	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
1447	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
1448	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1449	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1450	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1451	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1452	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1453	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1454	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1455	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1456	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1457	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1458	Some cars may have a misfire monitor strategy that can cause unintended Malfunction Indicator Light (MIL) illumination.
1459	Some cars may have a misfire monitor strategy that can cause unintended Malfunction Indicator Light (MIL) illumination.
1460	Some cars are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock calibration routine so as not to permit this condition.
1461	Some cars are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock calibration routine so as not to permit this condition.
1462	As the consequence of variations in the length and routing of the injector harness, it may contact the manifold at the EGR pipe. If the harness is damaged, a short circuit may occur, blowing the fuse for the fuel injector, resulting in the engine stalling. It may also cause the injector to continue fueling if a short circuit oc
1463	As the consequence of variations in the length and routing of the injector harness, it may contact the manifold at the EGR pipe. If the harness is damaged, a short circuit may occur, blowing the fuse for the fuel injector, resulting in the engine stalling. It may also cause the injector to continue fueling if a short circuit oc
1464	The Aspirator System installed on the subject vehicles may fail, resulting in the creation of NOx emissions which could exceed the allowable standards. The presence of the Aspirator System also allows moisture to contact the fuel pressure regulator causing corrosion and jeopardizing its integrity.
1465	Some cars may have inoperative Mass Airflow sensors caused by silicone contamination of the sensing element during the manufacturing process.
1466	Some cars may have inoperative Mass Airflow sensors caused by silicone contamination of the sensing element during the manufacturing process.
1467	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings, exhaust contamination, or broken heaters.
1468	Some cars may have Spark Plug Wires which have experienced dielectric failure.
1469	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings, exhaust contamination, or broken heaters.
1470	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings, exhaust contamination, or broken heaters.
1471	An engine calibration released for vehicles intended to meet California Low Emission Vehicle standards was incorrectly programmed into vehicles intended to meet Federal Tier 1 standards.
1472	Some of the affected vehicles were built with a kinked vacuum purge harness to the distributor. The harness was kinked during the vehicle assembly process and results in no ventilation from the distributor housing. Excessive NOx gas is trapped in the distributor.
1473	Some of the affected vehicles were built with a kinked vacuum purge harness to the distributor. The harness was kinked during the vehicle assembly process and results in no ventilation from the distributor housing. Excessive NOx gas is trapped in the distributor.
1474	Elboe fittings connecting the EVAP canister to the OBD2 valve on certain fuel tank assemblies may be abraded or cracked. The abrasions or cracks stem from an improper handling procedure during early production. This procedure was corrected during September production.
1475	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1476	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1477	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1478	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1479	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1480	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1481	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1482	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1483	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1484	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1485	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1486	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1487	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1488	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1489	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1490	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1491	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1492	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1493	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1494	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1495	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1496	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1497	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1498	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1499	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1500	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1501	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1502	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1503	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1504	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1505	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1506	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1507	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1508	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1509	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1510	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1511	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1512	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1513	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1514	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1515	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1516	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1517	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1518	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1519	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1520	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1521	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1522	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1523	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1524	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1525	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1526	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1527	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1528	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1529	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1530	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1531	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1532	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1533	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1534	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1535	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1536	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1537	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1538	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1539	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1540	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1541	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1542	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1543	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1544	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1545	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1546	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1547	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1548	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1549	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1550	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1551	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1552	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1553	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1554	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1555	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1556	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1557	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1558	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1559	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1560	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1561	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1562	Some trucks may have Thermactor Air Injection Manifolds that leak Thermactor air or exhaust gas.
1563	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1564	Some cars may have inoperative heated exhaust gas oxygen sensors due to broken sensing elements.
1565	Some cars may have inoperative heated exhaust gas oxygen sensors due to broken sensing elements.
1566	Some cars may have inoperative heated exhaust gas oxygen sensors due to broken sensing elements.
1567	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
1568	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
1569	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
1570	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
1571	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
1572	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
1573	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
1574	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
1575	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
1576	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
1577	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
1578	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1579	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1580	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1581	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1582	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1583	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1584	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.

	O
1585	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1586	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1587	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1588	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1589	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1590	Some cars may have been built with incorrect catalytic converters. Six brick converters were installed in place of four brick converters used in this application.
1591	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1592	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1593	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1594	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1595	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1596	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1597	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1598	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1599	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1600	Wall thickness of production fuel tanks is greater than the wall thickness of developmental vehicles. This difference results in a tank with greater stiffness. A stiffer tank with decreased elasticity may result in a reduced pressure compensation during the OBD EVAP system leak check process. The pressure peak could e
1601	During extremly low temperature start-up conditions, the Transfer Case control module may not communicate with the remainder of the vehicle (CAN).
1602	Vehicles were manufactured with an incorrect Vehicle Emission Control Information (VECI) label. These carryover vehicles were equipped with an underhood VECI label, which identifies the vehicles as compling with 1998 model year LDV standards.
1603	Vehicles were manufactured with an incorrect Vehicle Emission Control Information (VECI) label. These carryover vehicles were equipped with an underhood VECI label, which identifies the vehicles as compling with 1998 model year LDV standards.
1604	Rear oxygen sensor failure caused by corrosion and breakaway of the outer electrode conductive strip of the sensor ceramic body.
1605	This defect involves the rear oxygen sensor. In this case, Nissan has determined from the diagnostic trouble code and investigation of replaced oxygen sensors that the sensor is malfunctioning. In most cases this has been determined to be due to corrosion of the sensor from moisture in the exhaust gas. Some ma
1606	This defect involves the front oxygen sensor. Unexpected deterioration of the oxygen sensor is occurring as a result of contamination possibly from fuel, oil or other unknown sources and causing the MIL to illuminate.
1607	This defect involves the fuel temperature sensor. One of the electrical leads to the temperature sensor which is located in the fuel tank can fatigue and break off of the sensor over a period of time due to vibration. This results in illumination of the MIL.
1608	This defect involves the auxiliary air control valve. As a result of deposits on the valve, it may intermittently stick and not open or close smoothly. During the OBD system self-test of the auxiliary air control valve, the MIL may be illuminated as a result of the valve intermittently sticking.
1609	This defect involves the throttle valve switch. Degradation/wear of the resistance material in the switch can affect the resistance of the variable resistor which can cause the MIL to illuminate.
1610	This defect involves the vent control valve for the evaporative emission control system. On some vehicles the valve is sticking in the open position due to corrosion so that when the OBD system attempts to do a check for leaks in the evaporative control system, the MIL illuminates because the system is not sealed.
1611	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
1612	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
1613	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
1614	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
1615	Secondary Air Changeover Valve becomes non-functional due to internal contamination, which comes from an outside source.
1616	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1617	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1618	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1619	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1620	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1621	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1622	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1623	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1624	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1625	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1626	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1627	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1628	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1629	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1630	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1631	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1632	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1633	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1634	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1635	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1636	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1637	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1638	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1639	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1640	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1641	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1642	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1643	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1644	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1645	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1646	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1647	The fuel tank rollover valve may allow liquid fuel to pass through and fill the evaporative canister.
1648	The oxygen sensor harness may have been mistakenly secured with clips to the exhaust heat shield and/or to a bracket on the transmission housing. Due to the movement between the vehide body, transmission and exhaust system, the oxygen sensor harness may stretch and break over time causing the check eng
1649	There may be condensation in the exhaust system causing thermal shock condition to the outer shell of the oxygen sensor. There may also be a loosening of the conductive strip from the protective layer of the sensor element due to production failure, interrupting the signal from the outer electrode.
1650	There may be condensation in the exhaust system causing thermal shock condition to the outer shell of the oxygen sensor. There may also be a loosening of the conductive strip from the protective layer of the sensor element due to production failure, interrupting the signal from the outer electrode.
1651	Oxygen sensors cause DTC fault codes within the vehicles OBD2 diagnostic system.
1652	The On-board Diagnostic II (OBDII) evaporative system monitor on 1997 and 1998 model year vehicles certified to the enhanced evaporative emission requirements may allow pending diagnostic trouble codes to be erased under limited conditions.Ford amended this DR on 4/4/2001.
1653	The On-board Diagnostic II (OBDII) evaporative system monitor on 1997 and 1998 model year vehicles certified to the enhanced evaporative emission requirements may allow pending diagnostic trouble codes to be erased under limited conditions.Ford amended this DR on 4/4/2001.
1654	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
1655	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
1656	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
1657	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
1658	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
1659	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
1660	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1661	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1662	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1663	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1664	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1665	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1666	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1667	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1668	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1669	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1670	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1671	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1672	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1673	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1674	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1675	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1676	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1677	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1678	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1679	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1680	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1681	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1682	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1683	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1684	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1685	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1686	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1687	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1688	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1689	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1690	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1691	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1692	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1693	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1694	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1695	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1696	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1697	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1698	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1699	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1700	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1701	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1702	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1703	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1704	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1705	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1706	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1707	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1708	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1709	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1710	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1711	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1712	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1713	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1714	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1715	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1716	The wrong Vehicle Emission Control Information (VECI) label may have been installed on the subject vehicles.
1717	The Fuel tank level sending unit may display an inaccurate level.
1718	The main cause of failure was abrasion of the monolith caused by mat erosion and thermal cracking of the front face of the monolith.
1719	Rear oxygen sensor failure caused by corrosion and breakaway of the outer electrode conductive strip of the sensor ceramic body.
1720	The Onboard Diagnostic System on the subject vehicles may have been disabled in the area of purge flow detection.
1721	The component that failed is the spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires.
1722	The component that failed is the spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires.
1723	The component that failed is the spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires.
1724	A faulty ground causes electrical noise to be transmitted to the rear oxygen sensor when the heater of the air fuel ratio sensor switches on and off. As a result, the readiness code on the catalyst monitor remains incomplete and does not make a pass determination. The "noise" does not interfere with monitor's ability
1725	Visible smoke from exhaust on acceleration, after prolonged idle period.
1726	Internal corrosion of the Exhaust Gas Recirculation (EGR) valve. A design change to the valve had been made for this 98' F car application to make it more robust against water splash intrusion.Part of the design change has resulted in moist gases feeding into the center body of the valve, causing corrosion of the arme
1727	Internal corrosion of the Exhaust Gas Recirculation (EGR) valve. A design change to the valve had been made for this 98' F car application to make it more robust against water splash intrusion.Part of the design change has resulted in moist gases feeding into the center body of the valve, causing corrosion of the arme
1728	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
1729	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
1730	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
1731	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
1732	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1733	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1734	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1735	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1736	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1737	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1738	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1739	Some vans may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings.
1740	Spark plug wires #2 and #8 were cut by contact with the accessory drive belt or pulley. There was a stack-up tolerance problem as well as lead length dimensional issue that allowed potential interference with the accessory drive system for the #2 or #8 spark plug wire.
1741	Spark plug wires #2 and #8 were cut by contact with the accessory drive belt or pulley. There was a stack-up tolerance problem as well as lead length dimensional issue that allowed potential interference with the accessory drive system for the #2 or #8 spark plug wire.
1742	Failures are occurring to the ignition coil and the coil to distributor wire due to corrosion and erosion of the coil wire terminal and the coil terminal post.
1743	Failures are occurring to the ignition coil and the coil to distributor wire due to corrosion and erosion of the coil wire terminal and the coil terminal post.
1744	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1745	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1746	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1747	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1748	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1749	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1750	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1751	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1752	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1753	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1754	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1755	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1756	The wrong VECI label may have been installed on the subject vehicles.
1757	The wrong VECI label may have been installed on the subject vehicles.
1758	The wrong Vehicle Emission Control Information label may have been installed on the subject vehicles.
1759	Spark plugs may fail due to loose center electrodes.
1760	Some cars experience engine stumble during driving above 2000 rpm. Generally, this has occurred at approximately 50 mph, in 4th gear, and during slightly uphill driving.Hyundai will publish a TSB providing a description of this problem, and will issue a running change and field fix to replace the affected ECM's as nece
1761	Some cars experience engine stumble during driving above 2000 rpm. Generally, this has occurred at approximately 50 mph, in 4th gear, and during slightly uphill driving.Hyundai will publish a TSB providing a description of this problem, and will issue a running change and field fix to replace the affected ECM's as nece
1762	Some cars experience engine stumble during driving above 2000 rpm. Generally, this has occurred at approximately 50 mph, in 4th gear, and during slightly uphill driving.Hyundai will publish a TSB providing a description of this problem, and will issue a running change and field fix to replace the affected ECM's as nece
1763	Oxygen sensor problem as follows: Loosening of the conductive strip from the protective layer of the sensor element due to production failure, interrupting the signal from the outer electrode OR the ceramic seals of the O2 sensor may over time develop porosity. This may lead to an electrical short or interruptions of th
1764	Oxygen sensor problem as follows: Loosening of the conductive strip from the protective layer of the sensor element due to production failure, interrupting the signal from the outer electrode OR the ceramic seals of the O2 sensor may over time develop porosity. 1818	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1819	Some cars may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1820	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1821	Some cars may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1822	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1823	Some cars may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1824	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1825	Some cars may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1826	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1827	Some cars may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1828	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1829	Some cars may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1830	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1831	Some trucks may have an On-Board Diagnostic (OBD) strategy that can illuminate the MIL due to circuit integrity or current imbalance.
1832	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1833	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1834	Some cars may have Spark Plug Wires which have experienced thermal deterioration of the insulation material.
1835	Some cars may have Spark Plug Wires which have experienced thermal deterioration of the insulation material.
1836	Some cars may have Spark Plug Wires which have experienced thermal deterioration of the insulation material.
1837	Some vans may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings.
1838	Some vans may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings or contamination of the sensing element. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1839	Some vans may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings or contamination of the sensing element. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1840	Some vans may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings or contamination of the sensing element. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1841	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings.
1842	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings.
1843	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings.
1844	Some trucks may have inoperative Catalyst Monitor sensors due to exhaust contamination of the sensing element. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1845	Some trucks may have inoperative Idle Air Control valves caused by the rubber orifice seat sticking closed.
1846	Some vans may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1847	Some vans may have inoperative Throttle Position sensors caused by abrasion of the variable resistor.
1848	Some vans may have inoperative Throttle Position sensors caused by abrasion of the variable resistor.
1849	Some vans may have inoperative Throttle Position sensors caused by abrasion of the variable resistor.
1850	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors dut to weak gas seal rings.
1851	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors dut to weak gas seal rings.
1852	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors dut to weak gas seal rings.
1853	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors dut to weak gas seal rings.
1854	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors dut to weak gas seal rings.
1855	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors dut to weak gas seal rings.
1856	The O2 sensor causes DTC fault codes within the vehicles OBD2 diagnostic system. The following DTC fault codes are evident:-oxygen sensor circuit, no activity-oxygen sensor, slow response-oxygen sensor, long term fuel trim (system lean)-oxygen sensor, heater circuit - malfunction
1857	The O2 sensor causes DTC fault codes within the vehicles OBD2 diagnostic system. The following DTC fault codes are evident:-oxygen sensor circuit, no activity-oxygen sensor, slow response-oxygen sensor, long term fuel trim (system lean)-oxygen sensor, heater circuit - malfunction
1858	The O2 sensor causes DTC fault codes within the vehicles OBD2 diagnostic system. The following DTC fault codes are evident:-oxygen sensor circuit, no activity-oxygen sensor, slow response-oxygen sensor, long term fuel trim (system lean)-oxygen sensor, heater circuit - malfunction
1859	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1860	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1861	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1862	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1863	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1864	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1865	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1866	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1867	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1868	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1869	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1870	Failures have been occuring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets.
1871	Failures have been occuring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets.
1872	Failures have been occuring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets.
1873	Failures have been occuring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets.
1874	There have been secondary failures of the catalytic converter due to extreme misfire caused by an ignition coil wire burn through condition (ref. GM letter FE-6209 dated 2/19/98). Although the converters are not defective in design, materials, or workmanship, the failures are being reported. The extreme misfire cause
1875	There have been secondary failures of the catalytic converter due to extreme misfire caused by an ignition coil wire burn through condition (ref. GM letter FE-6209 dated 2/19/98). Although the converters are not defective in design, materials, or workmanship, the failures are being reported. The extreme misfire cause
1876	There have been secondary failures of the catalytic converter due to extreme misfire caused by an ignition coil wire burn through condition (ref. GM letter FE-6209 dated 2/19/98). Although the converters are not defective in design, materials, or workmanship, the failures are being reported. The extreme misfire cause
1877	The corrective measure consists of installation of a new EPROM into the engine control module and reprogramming same with new software. The revised software is trimming the air/fuel mixture, correcting a lean bias caused by excessive oxygen sensor deposits.
1878	The corrective measure consists of installation of a new EPROM into the engine control module and reprogramming same with new software. The revised software is trimming the air/fuel mixture, correcting a lean bias caused by excessive oxygen sensor deposits.
1879	Some trucks may have Thermactor Check valves with cracked leaf springs.
1880	Some trucks may have Thermactor Check valves with cracked leaf springs.
1881	Some trucks may have Thermactor Check valves with cracked leaf springs.
1882	Some trucks may have Thermactor Check valves with cracked leaf springs.
1883	Some trucks may have Thermactor Check valves with cracked leaf springs.
1884	Some trucks may have Thermactor Check valves with cracked leaf springs.
1885	Some trucks may have Thermactor Check valves with cracked leaf springs.
1886	Some trucks may have Thermactor Check valves with cracked leaf springs.
1887	Some trucks may have Thermactor Check valves with cracked leaf springs.
1888	The On-Board Diagnostic (OBD) evaporative purge monitor will not detect a plugged purge line.
1889	The On-Board Diagnostic (OBD) evaporative purge monitor will not detect a plugged purge line.
1890	The intumescent mat used to retain the catalyst monolith may fail allowing the "brick" to move within the can and eventually erode to the point of disappearance.
1891	The intumescent mat used to retain the catalyst monolith may fail allowing the "brick" to move within the can and eventually erode to the point of disappearance.
1892	The intumescent mat used to retain the catalyst monolith may fail allowing the "brick" to move within the can and eventually erode to the point of disappearance.
1893	The intumescent mat used to retain the catalyst monolith may fail allowing the "brick" to move within the can and eventually erode to the point of disappearance.
1894	The welds on the catalytic converter were made using mild steel weld wire. In combination with the stainless steel converter shell, the welds may rust causing premature failure of the assembly.
1895	The Powertrain Control Module (PCM) will be re-flashed with the proper On-Board Diagnostic (OBD) purge monitor calibration.
1896	On-Board Diagnostic (OBD) readiness codes are cleared during a "key on/Key off" sequence. The codes indicate that the OBD checks have been performed by the diagnostic software. This violates a California Air Resources Board regulation on the performance of OBD systems.
1897	The affected part is the crankshaft position/RPM sensor. The reason for the defect is a thermal mismatch of the materials used in the sensor. Due to different coefficients of thermal expansion of these materials, alternating thermal stress could cause a breakage of internal solder connections. Under certain condition
1898	The affected part is the crankshaft position/RPM sensor. The reason for the defect is a thermal mismatch of the materials used in the sensor. Due to different coefficients of thermal expansion of these materials, alternating thermal stress could cause a breakage of internal solder connections. Under certain condition
1899	The affected part is the crankshaft position/RPM sensor. The reason for the defect is a thermal mismatch of the materials used in the sensor. Due to different coefficients of thermal expansion of these materials, alternating thermal stress could cause a breakage of internal solder connections. Under certain condition
1900	The affected part is the crankshaft position/RPM sensor. The reason for the defect is a thermal mismatch of the materials used in the sensor. Due to different coefficients of thermal expansion of these materials, alternating thermal stress could cause a breakage of internal solder connections. Under certain condition
1901	The affected part is the crankshaft position/RPM sensor. The reason for the defect is a thermal mismatch of the materials used in the sensor. Due to different coefficients of thermal expansion of these materials, alternating thermal stress could cause a breakage of internal solder connections. Under certain condition
1902	An incorrect fuel filler pipe assembly was installed in certain 1998 heavy-duty vehicles. The incorrect assembly does not incorporate a one-way valve to reduce fuel-dispensing spitback. When a vehicle with the incorrect fuel filler pipe assembly is refueled, a small amount of excess fuel can be ejected from the fuel filler
1903	Some cars may experience fuel seepage at the interface of the metal fuel line with the nylon jumper, due to manufacturing problems at the part supplier.The interfacing joint of a metal fuel line and nylon jumper tube will be inspected and, if necessary, a fuel line clamp kit will be installed.
1904	Some cars may experience fuel seepage at the interface of the metal fuel line with the nylon jumper, due to manufacturing problems at the part supplier.The interfacing joint of a metal fuel line and nylon jumper tube will be inspected and, if necessary, a fuel line clamp kit will be installed.
1905	Some cars may experience fuel seepage at the interface of the metal fuel line with the nylon jumper, due to manufacturing problems at the part supplier.The interfacing joint of a metal fuel line and nylon jumper tube will be inspected and, if necessary, a fuel line clamp kit will be installed.
1906	Some cars may experience fuel seepage at the interface of the metal fuel line with the nylon jumper, due to manufacturing problems at the part supplier.The interfacing joint of a metal fuel line and nylon jumper tube will be inspected and, if necessary, a fuel line clamp kit will be installed.
1907	Some vehicles may experience carbon deposit buildup on the LEGR valve pintle shaft causing the shaft to stick in the open or closed position.
1908	Some vehicles may experience carbon deposit buildup on the LEGR valve pintle shaft causing the shaft to stick in the open or closed position.
1909	Some vehicles may experience carbon deposit buildup on the LEGR valve pintle shaft causing the shaft to stick in the open or closed position.
1910	Some vehicles may experience carbon deposit buildup on the LEGR valve pintle shaft causing the shaft to stick in the open or closed position.
1911	Some vehicles may experience carbon deposit buildup on the LEGR valve pintle shaft causing the shaft to stick in the open or closed position.
1912	Some vehicles may experience carbon deposit buildup on the LEGR valve pintle shaft causing the shaft to stick in the open or closed position.
1913	Some cars may have a wiring harness that can chafe on a power steering hose, which can interrupt the camshaft position sensor signal.
1914	Engine stalling, rough idling or MIL illuminating due to the deterioration on the output voltage of the throttle position sensor (sensor output noise).
1915	Engine stalling, rough idling or MIL illuminating due to the deterioration on the output voltage of the throttle position sensor (sensor output noise).
1916	Fuel vapor may leak through the fuel cap due to improper sealing between o-ring of fuel cap and the fuel pipe. The root cause is under investigation.
1917	Fuel vapor may leak through the fuel cap due to improper sealing between o-ring of fuel cap and the fuel pipe. The root cause is under investigation.
1918	Fuel vapor may leak through the fuel cap due to improper sealing between o-ring of fuel cap and the fuel pipe. The root cause is under investigation.
1919	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1920	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1921	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1922	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1923	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1924	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1925	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1926	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1927	The wrong VECI label may have been installed on the subject vehicles.
1928	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1929	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1930	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1931	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1932	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1933	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1934	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1935	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1936	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1937	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1938	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors due to weak gas seal rings.
1939	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors due to weak gas seal rings.
1940	Some cars may have the MIL illuminated for random misfire without any misfire occuring. The illumination is attributed to background crankshaft acceleration noise.
1941	Some cars may have the MIL illuminated for random misfire without any misfire occuring. The illumination is attributed to background crankshaft acceleration noise.
1942	Some cars may have the MIL illuminated for random misfire without any misfire occuring. The illumination is attributed to background crankshaft acceleration noise.
1943	Some trucks may have faulty Mass Airflow sensors due to corrosion of the electronic circuit.
1944	Some trucks may have faulty Mass Airflow sensors due to corrosion of the electronic circuit.
1945	Some trucks may have faulty Mass Airflow sensors due to corrosion of the electronic circuit.
1946	Some trucks may have faulty Mass Airflow sensors due to corrosion of the electronic circuit.
1947	Some trucks may have faulty Mass Airflow sensors due to corrosion of the electronic circuit.
1948	Some trucks may have faulty Mass Airflow sensors due to corrosion of the electronic circuit.
1949	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
1950	During engine warm up (coolant temperature 40 - 60C) when accelerating with small throttle openings there may be a hesitation or engine stall. When the throttle is opened slowly and slightly, the idle air control changes from the idle mode to the off idle mode. This change is made to quickly and is too large and eng
1951	A Vehicle Emission Control Information (VECI) label with an inaccurate evaporative emission control hose routing sketch was installed on the vehicle.
1952	Some cars may have inoperative Mass Airflow sensors due to contamination of the sensing element.
1953	Some cars may have inoperative Vehicle Speed sensors due to broken sensor shafts.
1954	Some cars may have inoperative Vehicle Speed sensors due to broken sensor shafts.
1955	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to oil contamination.
1956	Some cars may have inoperative Purge Control valves due to faulty electrical terminal insertion during the manufacturing process, or wire chafing.
1957	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors due to weak gas seal rings.
1958	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to contamination of the reference cavity. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1959	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to contamination of the reference cavity. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1960	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to contamination of the reference cavity. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1961	Exhaust manifold on certain Honda vehicles may crack due to repeated exposure to severe thermal stress.
1962	The exhaust manifold may crack due to repeated exposure to severe thermal stress.
1963	The exhaust manifold may crack due to repeated exposure to severe thermal stress.
1964	Some vehicles may not start at cold ambient temperature (+5F) or below, due to a rich fuel mixture.A VERR will be conducted on affected vehicles to install a new Powertrain Control Module (PCM). If the vehicle has a history of no start, spark plugs will also be replaced.
1965	Some vehicles may not start at cold ambient temperature (+5F) or below, due to a rich fuel mixture.A VERR will be conducted on affected vehicles to install a new Powertrain Control Module (PCM). If the vehicle has a history of no start, spark plugs will also be replaced.
1966	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
1967	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
1968	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
1969	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
1970	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
1971	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
1972	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
1973	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
1974	Some trucks may have the MIL illuminated for an ignition system malfunction without a malfunction being present.
1975	Some trucks may have the MIL illuminated for an ignition system malfunction without a malfunction being present.
1976	Some trucks may have the MIL illuminated for an ignition system malfunction without a malfunction being present.
1977	Some trucks may have the MIL illuminated for an ignition system malfunction without a malfunction being present.
1978	Some trucks may have the MIL illuminated for an ignition system malfunction without a malfunction being present.
1979	Some trucks may have the MIL illuminated for an ignition system malfunction without a malfunction being present.
1980	The affected part is the idle speed control valve. The engine may not start or may only start with the accelerator pedal depressed due to a binding idle control valve.

	O
1981	The affected part is the idle speed control valve. The engine may not start or may only start with the accelerator pedal depressed due to a binding idle control valve.
1982	The affected part is the idle speed control valve. The engine may not start or may only start with the accelerator pedal depressed due to a binding idle control valve.
1983	During initial production start-up an incorrect US exhaust emission control information label may have been placed in the engine compartment.
1984	Vehicles may experience poor driveability and/or MIL illumination due to O2 sensor failure. Analysis of returned sensors show the major failure as the loss of the electrical signal from the sensor to the controller due to abrasion of the sensor element inner conductive strip.
1985	The exhaust downpipe seal is being replaced due to premature deterioration of the seal, which results in audible exhaust noise.
1986	Improper software coding of the "torque converter lock-up program", in the automatic transmission control module, may result in the variable camshaft timing device to incorrectly identify the cam position when in fact it is correct.
1987	Defective solder joints in the fuel injection pump may sporadically interrupt proper electrical contact to the engine control module, signaling the pump to shut off. The presence of OBD codes PO 1220 and / or PO 1223 indicate that this has occurred.
1988	Defective solder joints in the fuel injection pump may sporadically interrupt proper electrical contact to the engine control module, signaling the pump to shut off. The presence of OBD codes PO 1220 and / or PO 1223 indicate that this has occurred.
1989	Defective solder joints in the fuel injection pump may sporadically interrupt proper electrical contact to the engine control module, signaling the pump to shut off. The presence of OBD codes PO 1220 and / or PO 1223 indicate that this has occurred.
1990	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.

2007	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.Field Campaign 99E02 will be conducted to correct vehicles in the field.
2008	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.
2009	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.Field Campaign 99E02 will be conducted to correct vehicles in the field.
2010	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.
2011	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.Field Campaign 99E02 will be conducted to correct vehicles in the field.
2012	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.
2013	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.Field Campaign 99E02 will be conducted to correct vehicles in the field.
2014	After a rapid sucession of repeated cold starts, the air injection pump contacts may stick causing the pump to run for an extended period of time. Extended air pump operation may result in an "over-current condition", causing damage to the air injection pump. The vehicle's check engine light will illuminate under such
2015	After a rapid sucession of repeated cold starts, the air injection pump contacts may stick causing the pump to run for an extended period of time. Extended air pump operation may result in an "over-current condition", causing damage to the air injection pump. The vehicle's check engine light will illuminate under such
2016	The oxygen sensor lead wire may become damaged if placed in excessive tension. A short circuit can result and cause the MIL to illuminate.
2017	The oxygen sensor lead wire may become damaged if placed in excessive tension. A short circuit can result and cause the MIL to illuminate.
2018	When the traction control system is operating to control engine output the manifold vacuum will increase. Under certain conditions the OBD system will mistakenly judge that the Barometric Pressure Sensor (BPS) has failed when the difference between the BPS and the MAP sensor signals exceeds the malfunction criteria
2019	This system incorrectly detects the deterioration of the primary oxygen sensor due to an unexpected primary oxygen sensor signal which occurs under certain conditions.
2020	This system incorrectly detects the deterioration of the primary oxygen sensor due to an unexpected primary oxygen sensor signal which occurs under certain conditions.
2021	This system incorrectly detects the deterioration of the primary oxygen sensor due to an unexpected primary oxygen sensor signal which occurs under certain conditions.
2022	This system incorrectly detects the deterioration of the primary oxygen sensor due to an unexpected primary oxygen sensor signal which occurs under certain conditions.
2023	This system incorrectly detects the deterioration of the primary oxygen sensor due to an unexpected primary oxygen sensor signal which occurs under certain conditions.
2024	The malfunction detection threshold for torque converter lock-up operation is wrong causing the MIL to be illuminated under certain operating conditions.
2025	The engine wire harness is chafed and rubbing on the intake manifold stay bracket. Fuse number 15 is blown and the MIL is illuminated.
2026	The engine wire harness is chafed and rubbing on the intake manifold stay bracket. Fuse number 15 is blown and the MIL is illuminated.
2027	The engine wire harness is chafed and rubbing on the intake manifold stay bracket. Fuse number 15 is blown and the MIL is illuminated.
2028	The engine wire harness is chafed and rubbing on the intake manifold stay bracket. Fuse number 15 is blown and the MIL is illuminated.
2029	The engine wire harness is chafed and rubbing on the intake manifold stay bracket. Fuse number 15 is blown and the MIL is illuminated.
2030	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2031	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2032	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2033	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2034	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2035	Fuel vapor may leak through the fuel cap due to improper sealing between o-ring of fuel cap and fuel pipe. The root cause is under investigation.
2036	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2037	Fuel vapor may leak through the fuel cap due to improper sealing between o-ring of fuel cap and fuel pipe. The root cause is under investigation.
2038	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2039	Fuel vapor may leak through the fuel cap due to improper sealing between o-ring of fuel cap and fuel pipe. The root cause is under investigation.
2040	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2041	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2042	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2043	An over-rich mixture caused by exhaust gas in the intake manifold results in hard starting.
2044	An over-rich mixture caused by exhaust gas in the intake manifold results in hard starting.
2045	Water may leak into the Spark-Plug Voltage Detection Module, causing a short circuit. The MIL is illuminated
2046	Water may leak into the Spark-Plug Voltage Detection Module, causing a short circuit. The MIL is illuminated
2047	A short circuit of the knock sensor out-put line causes the MIL to illuminate.
2048	A short circuit of the knock sensor out-put line causes the MIL to illuminate.
2049	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2050	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2051	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2052	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2053	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2054	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2055	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2056	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2057	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2058	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2059	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2060	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2061	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2062	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2063	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2064	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2065	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2066	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2067	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2068	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2069	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2070	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2071	The poor connection between the high tension lead and the ignition coil causes radio noise.
2072	The poor connection between the high tension lead and the ignition coil causes radio noise.
2073	The poor connection between the high tension lead and the ignition coil causes radio noise.
2074	The poor connection between the high tension lead and the ignition coil causes radio noise.
2075	The poor connection between the high tension lead and the ignition coil causes radio noise.
2076	The poor connection between the high tension lead and the ignition coil causes radio noise.
2077	When the ignition key is released after engine starting, power to the Transmission Control Module may be interrupted causing the MIL to illuminate.
2078	When the ignition key is released after engine starting, power to the Transmission Control Module may be interrupted causing the MIL to illuminate.
2079	When the ignition key is released after engine starting, power to the Transmission Control Module may be interrupted causing the MIL to illuminate.
2080	When the ignition key is released after engine starting, power to the Transmission Control Module may be interrupted causing the MIL to illuminate.
2081	The exhaust manifold with close-coupled catalyst on certain Honda vehicles may crack due to repeated exposure to severe thermal stress.
2082	The exhaust manifold with close-coupled catalyst on certain Honda vehicles may crack due to repeated exposure to severe thermal stress.
2083	The exhaust manifold with close-coupled catalyst on certain Honda vehicles may crack due to repeated exposure to severe thermal stress.
2084	The exhaust manifold with close-coupled catalyst on certain Honda vehicles may crack due to repeated exposure to severe thermal stress.
2085	Misdetection of automatic transmission shift position switch malfunction causing MIL illumination.
2086	When the ignition key is turned on to start the engine, voltage to the ECU can drop. This affects the oscillation of the ECU clock and as a result the ECU works in the back-up mode. This causes the engine idle speed to increase to 1500 rpm and limits maximum engine speed to 2500 rpm. The MIL is always illuminate
2087	Software mistake causing engine surge on dosing throttle at high rpm.
2088	Some trucks may have rolled or twisted Intake Manifold gaskets, which can cause a vacuum leak.
2089	Some trucks may have rolled or twisted Intake Manifold gaskets, which can cause a vacuum leak.
2090	Some trucks may have rolled or twisted Intake Manifold gaskets, which can cause a vacuum leak.
2091	Some trucks may have rolled or twisted Intake Manifold gaskets, which can cause a vacuum leak.
2092	Some vehicles may have the wrong EGR enable and disable temperatures due to an input error. The errant calibration causes the EGR to be turned on-off every 50 msec. The EGR pintle cannot keep up with the rapidly cycling commanded position and may cause diagnostic P-codes to be set.
2093	Some vehicles may have the wrong EGR enable and disable temperatures due to an input error. The errant calibration causes the EGR to be turned on-off every 50 msec. The EGR pintle cannot keep up with the rapidly cycling commanded position and may cause diagnostic P-codes to be set.
2094	Some vehicles may have the wrong EGR enable and disable temperatures due to an input error. The errant calibration causes the EGR to be turned on-off every 50 msec. The EGR pintle cannot keep up with the rapidly cycling commanded position and may cause diagnostic P-codes to be set.
2095	Some vehicles may have the wrong EGR enable and disable temperatures due to an input error. The errant calibration causes the EGR to be turned on-off every 50 msec. The EGR pintle cannot keep up with the rapidly cycling commanded position and may cause diagnostic P-codes to be set.
2096	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2097	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2098	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2099	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2100	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2101	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2102	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2103	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2104	The spark plug wire design for the affected engine families utilizes a three piece 90 degree boot that has a plastic extender and a rubber plug seal. The wires have been failing due to a dielectric breakdown of the plastic extender or between the extender and the rubber plug seal.
2105	The spark plug wire design for the affected engine families utilizes a three piece 90 degree boot that has a plastic extender and a rubber plug seal. The wires have been failing due to a dielectric breakdown of the plastic extender or between the extender and the rubber plug seal.
2106	The spark plug wire design for the affected engine families utilizes a three piece 90 degree boot that has a plastic extender and a rubber plug seal. The wires have been failing due to a dielectric breakdown of the plastic extender or between the extender and the rubber plug seal.
2107	The engine wire harness is chafed by rubbing on the brake light switch bracket. Fuse number 15 is blown and the MIL is illuminated.
2108	The engine wire harness is chafed by rubbing on the brake light switch bracket. Fuse number 15 is blown and the MIL is illuminated.
2109	The engine wire harness is chafed by rubbing on the brake light switch bracket. Fuse number 15 is blown and the MIL is illuminated.
2110	Rough idling and rough running during cold starting.
2111	Failures of the fuel pressure regulators have been occuring due to chemical degradation of the regulator diaphragms.
2112	Failures of the fuel pressure regulators have been occuring due to chemical degradation of the regulator diaphragms.
2113	Failures of the fuel pressure regulators have been occuring due to chemical degradation of the regulator diaphragms.
2114	Failures of the fuel pressure regulators have been occuring due to chemical degradation of the regulator diaphragms.
2115	Some cars may have inoperative EGR pressure sensors due to leaking fill plugs.
2116	Some cars may have inoperative HEGO sensors due to degraded gas seal rings.
2117	Some cars may have inoperative Purge Flow sensors due to an electronic open circuit.
2118	Some cars may have inoperative Purge Flow sensors due to an electronic open circuit.
2119	Some cars may have inoperative Purge Flow sensors due to an electronic open circuit.
2120	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2121	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2122	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2123	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2124	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2125	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2126	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2127	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2128	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2129	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2130	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2131	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2132	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2133	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2134	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2135	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2136	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2137	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2138	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2139	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2140	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2141	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2142	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2143	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2144	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2145	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2146	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2147	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2148	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2149	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2150	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2151	The wiring for the secondary air circuit is reversed at the Engine Control Modules (ECM/DME) which may lead to the illumination of the Check Engine light and set a fault code.
2152	An erratic signal from the fuel tank pressure sensor causes the MIL to illuminate.
2153	Due to inappropriate programming in the PCM the, MIL may not illuminate even if the solenoid valve in the automatic transmission fails.
2154	Due to inappropriate programming in the PCM the, MIL may not illuminate even if the solenoid valve in the automatic transmission fails.
2155	Due to inappropriate programming in the PCM the, MIL may not illuminate even if the solenoid valve in the automatic transmission fails.
2156	Due to inappropriate programming in the PCM the, MIL may not illuminate even if the solenoid valve in the automatic transmission fails.
2157	Some vehicles have experienced false MIL illumination because the OBD logic related to the rationality check of the oxygen sensor system included thresholds that were too severe for normal operation.
2158	Some vehicles equipped with the 2.5L engine and automatic transmissions have experienced ECU communication errors with generic scan tools. This results from a protocol difference between the Engine Control Units (ECU) and Transmission Control Units (TCU). The Sonata 2.5L V6 ECU protocol is KWP 2000 and the T
2159	Some vehicles equipped with the 2.5L engine and automatic transmissions have experienced ECU communication errors with generic scan tools. This results from a protocol difference between the Engine Control Units (ECU) and Transmission Control Units (TCU). The Sonata 2.5L V6 ECU protocol is KWP 2000 and the T
2160	Confirmed failures are the result of catalytic converter mat damage due to over temperature exposure or mechanical failure. Damage to the mat support material may allow one or both of the catalytic converter bricks to become loose inside the converter housing causing the rattling noise and/or performance degradati
2161	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2162	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2163	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2164	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2165	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2166	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2167	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2168	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2169	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2170	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2171	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2172	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2173	The Powertrain Control Module (PCM) will be reflashed with an emissions compliant calibration.
2174	The vehicles while certified for sale in California were equipped with Vehicle Emission Control Information (VECI) labels intended for sale in the Northeast Trading Region (NLEV).
2175	The mini-catalyst which should have been installed on the 2.5L Dakota Pick-up certified for the 1999 model year in California was omitted.
2176	When the AIR valve is open, it is designed to function as a check valve to prevent the flow of exhaust gases from the engine into the AIR pump. The failures noted to date are that the valve is inoperable; typically the valve is stuck in the closed position.
2177	The On Board Diagnostic (OBD) system calibration will not illuminate the Malfunction Indicator Light (MIL) if one of the dual close-coupled mini-catalysts should fail.DaimlerChrysler will conduct a recall of the affected vehicles to install (flash) the required OBD calibration in the affected vehicles.
2178	The On Board Diagnostic (OBD) system calibration will not illuminate the Malfunction Indicator Light (MIL) if one of the dual close-coupled mini-catalysts should fail.DaimlerChrysler will conduct a recall of the affected vehicles to install (flash) the required OBD calibration in the affected vehicles.

2179	Some vehicles may be found with evaporative hoses exhibiting signs of premature deterioration.Replacement of fuel tank vapor hoses.
2180	Some vehicles may be found with evaporative hoses exhibiting signs of premature deterioration.Replacement of fuel tank vapor hoses.
2181	Some cars may be found with a defective EGR pressure sensor due to a cracked hose nipple.
2182	Some vehicles may be found with defective oxygen sensors due to corrosion and breakway of the outer surface of the electrode.
2183	Some vehicles may be found with defective oxygen sensors due to corrosion and breakway of the outer surface of the electrode.
2184	Underbody noise caused by loose catalytic converter material caused by mat erosion and monolith cracking.Some 1995 MY Sportages equipped with DOHC engines may have catalytic converters that have deteriorated internally.To correct these potential problems, Kia is recalling all affected 1995 Sportage DOHC models
2185	Underbody noise caused by loose catalytic converter material caused by mat erosion and monolith cracking.Some 1995 MY Sportages equipped with DOHC engines may have catalytic converters that have deteriorated internally.To correct these potential problems, Kia is recalling all affected 1995 Sportage DOHC models
2186	Underbody noise caused by loose catalytic converter material caused by mat erosion and monolith cracking.
2187	Underbody noise caused by loose catalytic converter material caused by mat erosion and monolith cracking.
2188	Due to defective programming, the ECU is unable to access output functions such as error codes.VER states that a special label will be mailed to vehicle owners that will inform technicians of the necessity to have the engine running in order to read OBD II diagnostic trouble codes.
2189	Due to defective programming, the ECU is unable to access output functions such as error codes.VER states that a special label will be mailed to vehicle owners that will inform technicians of the necessity to have the engine running in order to read OBD II diagnostic trouble codes.
2190	Due to defective programming, the ECU is unable to access output functions such as error codes.VER states that a special label will be mailed to vehicle owners that will inform technicians of the necessity to have the engine running in order to read OBD II diagnostic trouble codes.
2191	Due to defective programming, the ECU is unable to access output functions such as error codes.VER states that a special label will be mailed to vehicle owners that will inform technicians of the necessity to have the engine running in order to read OBD II diagnostic trouble codes.
2192	Due to defective programming, the ECU is unable to access output functions such as error codes.
2193	Due to defective programming, the ECU is unable to access output functions such as error codes.
2194	Daimler/Chrysler will conduct a recall of the affected vehicles to reflash the Powertrain Control Module to illuminate the EMR light at the appropriate mileages.
2195	Daimler/Chrysler will conduct a recall of the affected vehicles to reflash the Powertrain Control Module to illuminate the EMR light at the appropriate mileages.
2196	Due to a lack of inspection and correction during the assembly process, a small percentage of vehicles may have insufficient evaporative emission purge hose clearance. The hose may be installed in a position close to a heat protector for the exhaust pipe. Despite the use of heat resistant material in the hose, the ho
2197	Due to a lack of inspection and correction during the assembly process, a small percentage of vehicles may have insufficient evaporative emission purge hose clearance. The hose may be installed in a position close to a heat protector for the exhaust pipe. Despite the use of heat resistant material in the hose, the ho
2198	The defect relates to a camrail connecting the lead free flapper valve inside the vehicle's filler neck with a vent valve that is a part of the vehicle's ORVR system. In a small number of vehicles manufactured by Audi prior to April 20, 1998, a filler neck assembly with a damaged camrail may have been delivered to Audi b
2199	Replacement of the Linear EGR Valve. Some returned parts have an exhaust deposit build up on the EGR pintle shaft, resulting in the valve sticking open. Some of the analyzed customer returned parts have indicated no trouble exited in the part.
2200	Replacement of the Linear EGR Valve. Some returned parts have an exhaust deposit build up on the EGR pintle shaft, resulting in the valve sticking open. Some of the analyzed customer returned parts have indicated no trouble exited in the part.
2201	Some 1996 2.5L Contour and Mystique passenger cars may have inoperative Catalyst Monitor sensors due to degraded gas seal rings or internal contamination of the sensing element.
2202	Some 1997 5.8L F-series trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to degraded gas seal rings.
2203	Some 1997 1.3L Aspire passenger cars may have cracked Distributor Rotor or Vane Covers.
2204	Some 1997 and 1998 4.0L Explorer trucks may have Throttle Plates that can stick closed due to insufficient clearance and sludge accumulation.
2205	Some 1997 4.2L E-series trucks may have Catalysts with deteriorated substrates.
2206	Some 1997 4.2L E-series trucks may have Catalysts with deteriorated substrates.
2207	Some 1997 4.2L E-series trucks may have Catalysts with deteriorated substrates.
2208	Some 1997 6.8L E-Series trucks may have inoperative Catalyst Monitor sensors due to heater pad corrosion.
2209	Some 1998 5.4L Navigator trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to degraded gas seal rings.
2210	The Solid State Fan Relay (SSR) installed on 1996 model year Mini-Vans may fail due to electrical and/or thermal over-stress, caused by excessive current draw, poor attachment of the part's heat sink to the vehicles, and in some cases binding of the radiator fan blade with the shroud.
2211	The Solid State Fan Relay (SSR) installed on 1996 model year Mini-Vans may fail due to electrical and/or thermal over-stress, caused by excessive current draw, poor attachment of the part's heat sink to the vehicles, and in some cases binding of the radiator fan blade with the shroud.
2212	The Solid State Fan Relay (SSR) installed on 1996 model year Mini-Vans may fail due to electrical and/or thermal over-stress, caused by excessive current draw, poor attachment of the part's heat sink to the vehicles, and in some cases binding of the radiator fan blade with the shroud.
2213	The Solid State Fan Relay (SSR) installed on 1996 model year Mini-Vans may fail due to electrical and/or thermal over-stress, caused by excessive current draw, poor attachment of the part's heat sink to the vehicles, and in some cases binding of the radiator fan blade with the shroud.
2214	The Solid State Fan Relay (SSR) installed on 1996 model year Mini-Vans may fail due to electrical and/or thermal over-stress, caused by excessive current draw, poor attachment of the part's heat sink to the vehicles, and in some cases binding of the radiator fan blade with the shroud.
2215	The Solid State Fan Relay (SSR) installed on 1996 model year Mini-Vans may fail due to electrical and/or thermal over-stress, caused by excessive current draw, poor attachment of the part's heat sink to the vehicles, and in some cases binding of the radiator fan blade with the shroud.
2216	Canadian VECI labels were placed on US Federal vehicles and vice-versa.
2217	Some cars equipped with the 1.8L engines have experienced MIL illumination as a result of purge control valve malfunction. The valve malfunctioned as a result of contamination from small grains of charcoal not retained by the canister filter.
2218	Some cars equipped with the 1.8L engines may have coil assemblies which may be defective. Foreign material may have contaminated the coil assembly during manufacture. This contamination may cause rough idle or stumbling.
2219	Some cars equipped with the 1.8L engines may experience a MIL illumination caused by a canister close valve malfunction. A mis-assembly of the valve seal at the vendor eventually may cause the valve seal to not seat properly. If the valve seal does not seat properly, the engine management system will detect a "C
2220	Some cars equipped with the 1.8L engines may experience a MIL illumination caused by a canister close valve malfunction. A mis-assembly of the valve seal at the vendor eventually may cause the valve seal to not seat properly. If the valve seal does not seat properly, the engine management system will detect a "C
2221	Some cars equipped with the 3.0L engines and automatic transmissions may experience engine hesitation during acceleration shortly after a cold start when the ambient temperature and humidity are high.
2222	Some cars equipped with the 3.0L engines and automatic transmissions may experience engine hesitation during acceleration shortly after a cold start when the ambient temperature and humidity are high.
2223	The O2 sensor wiring on Jeep Grand Cherokees equipped with 4.0L engines and a CA emission control system may come in contact with the exhaust system in the area of the close coupled mini-catalysts. This could cause the wiring to short out and cause illumination of the OBD malfunction indicator light.
2224	An erratic signal from the automatic transmission shift position switch causes the MIL to illuminate.
2225	An erratic signal from the automatic transmission shift position switch causes the MIL to illuminate.
2226	Overfueling or fuel entering the sensor line causes the MIL to illuminate.
2227	Overfueling or fuel entering the sensor line causes the MIL to illuminate.
2228	Overfueling or fuel entering the sensor line causes the MIL to illuminate.
2229	Overfueling or fuel entering the sensor line causes the MIL to illuminate.
2230	Overfueling or fuel entering the sensor line causes the MIL to illuminate.
2231	Overfueling or fuel entering the sensor line causes the MIL to illuminate.
2232	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2233	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2234	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2235	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2236	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2237	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2238	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2239	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2240	When the engine is cold and the transmission is in Drive or Reverse, the engine idle speed fluctuates. When the engine reaches normal operating temperature, the fluctuation stops. The vehicle surges while driving at highway speeds. The cause of failure is inappropriate calibration of the transmission control module.
2241	When the engine is cold and the transmission is in Drive or Reverse, the engine idle speed fluctuates. When the engine reaches normal operating temperature, the fluctuation stops. The vehicle surges while driving at highway speeds. The cause of failure is inappropriate calibration of the transmission control module.
2242	When the engine is cold and the transmission is in Drive or Reverse, the engine idle speed fluctuates. When the engine reaches normal operating temperature, the fluctuation stops. The vehicle surges while driving at highway speeds. The cause of failure is inappropriate calibration of the transmission control module.
2243	When the engine is cold and the transmission is in Drive or Reverse, the engine idle speed fluctuates. When the engine reaches normal operating temperature, the fluctuation stops. The vehicle surges while driving at highway speeds. The cause of failure is inappropriate calibration of the transmission control module.
2244	When the engine is cold and the transmission is in Drive or Reverse, the engine idle speed fluctuates. When the engine reaches normal operating temperature, the fluctuation stops. The vehicle surges while driving at highway speeds. The cause of failure is inappropriate calibration of the transmission control module.
2245	When the engine is cold and the transmission is in Drive or Reverse, the engine idle speed fluctuates. When the engine reaches normal operating temperature, the fluctuation stops. The vehicle surges while driving at highway speeds. The cause of failure is inappropriate calibration of the transmission control module.
2246	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2247	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2248	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2249	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2250	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2251	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2252	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2253	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2254	Sticking of the Secondary Air Injection Check Valve that results from the usage of soap lubricant for the mounting of the hose at the production line. A residue is left from the soap lubricant that may cause the check valve to stick.
2255	Sticking of the Secondary Air Injection Check Valve that results from the usage of soap lubricant for the mounting of the hose at the production line. A residue is left from the soap lubricant that may cause the check valve to stick.
2256	The "In-Use Emission Standard" label of model year 1998 diesel and 12 cylinder passenger vehicles indicates a "Tier 1 Intermediary" in-use standard, when in fact all vehicles are certified to the "Tier 1" In-use standard" for model year 1998.
2257	The "In-Use Emission Standard" label of model year 1998 diesel and 12 cylinder passenger vehicles indicates a "Tier 1 Intermediary" in-use standard, when in fact all vehicles are certified to the "Tier 1" In-use standard" for model year 1998.
2258	The "In-Use Emission Standard" label of model year 1998 diesel and 12 cylinder passenger vehicles indicates a "Tier 1 Intermediary" in-use standard, when in fact all vehicles are certified to the "Tier 1" In-use standard" for model year 1998.
2259	The "In-Use Emission Standard" label of model year 1998 diesel and 12 cylinder passenger vehicles indicates a "Tier 1 Intermediary" in-use standard, when in fact all vehicles are certified to the "Tier 1" In-use standard" for model year 1998.
2260	Some of the heated sensors used for catalyst efficiency monitoring have had failures due to heater problems.
2261	Some of the heated sensors used for catalyst efficiency monitoring have had failures due to heater problems.
2262	Engine stall at idle.
2263	Some trucks may have an OBD strategy that can illuminate the MIL for an EGR pressure sensor hose concern when the concern is not present.
2264	Some trucks may have an OBD strategy that can illuminate the MIL for an EGR pressure sensor hose concern when the concern is not present.
2265	Some cars may have a transmission wiring harness that can contact the EGR sleeve and tube. Prolonged contact could cause damage to the wiring harness convolute and wires. Field Campaign 99E04 will be conducted to correct vehicles in the field.
2266	Some cars may have a transmission wiring harness that can contact the EGR sleeve and tube. Prolonged contact could cause damage to the wiring harness convolute and wires. Field Campaign 99E04 will be conducted to correct vehicles in the field.
2267	Some cars may have fuel tank vent tube hoses with inadequate ozone resistance that may become brittle and crack.Field campaign 99S25 will be conducted to install new fuel tank vent tube hoses on the potentially affected vehicles in the field.
2268	Some cars may have fuel tank vent tube hoses with inadequate ozone resistance that may become brittle and crack.Field campaign 99S25 will be conducted to install new fuel tank vent tube hoses on the potentially affected vehicles in the field.
2269	Some cars may have fuel tank vent tube hoses with inadequate ozone resistance that may become brittle and crack.Field campaign 99S25 will be conducted to install new fuel tank vent tube hoses on the potentially affected vehicles in the field.
2270	Some cars may have fuel tank vent tube hoses with inadequate ozone resistance that may become brittle and crack.Field campaign 99S25 will be conducted to install new fuel tank vent tube hoses on the potentially affected vehicles in the field.
2271	Some trucks may have been built with an Onboard Diagnostic Strategy that does not execute the misfire monitor.
2272	During engine warm-up (coolant temperature 40 to 60 degrees C), a hesitation or stall occurs when accelerating from a complete stop. The failure mode does not occur during FTP testing and occurs only under very limited operating conditions in normal use.
2273	During engine warm-up (coolant temperature 40 to 60 degrees C), a hesitation or stall occurs when accelerating from a complete stop. The failure mode does not occur during FTP testing and occurs only under very limited operating conditions in normal use.
2274	Incorrect identifying mark was stamped on the manifold converter. (Stamped with "S24" and should have been stamped with "S29").
2275	Nissan has inspected failed rear oxygen sensors replaced under warranty and has identified three causes of failure. These include cracking of the ceramic element due to condensed water, peeling of the ceramic element due to condensed water, and carbon sticking to the ceramic element during abnormal engine startin
2276	Nissan has inspected failed rear oxygen sensors replaced under warranty and has identified three causes of failure. These include cracking of the ceramic element due to condensed water, peeling of the ceramic element due to condensed water, and carbon sticking to the ceramic element during abnormal engine startin
2277	Abrasion of the resistance material in the switch occurs in use. Grease exuded from the shaft mixes with the abraded resistance material (powder) and accumulates in a gel condition at the throttle closed position. If the throttle is closed/partially open, and then fully closed, some of the abraded resistance material ma
2278	Abrasion of the resistance material in the switch occurs in use. Grease exuded from the shaft mixes with the abraded resistance material (powder) and accumulates in a gel condition at the throttle closed position. If the throttle is closed/partially open, and then fully closed, some of the abraded resistance material ma
2279	Abrasion of the resistance material in the switch occurs in use. Grease exuded from the shaft mixes with the abraded resistance material (powder) and accumulates in a gel condition at the throttle closed position. If the throttle is closed/partially open, and then fully closed, some of the abraded resistance material ma
2280	Abrasion of the resistance material in the switch occurs in use. Grease exuded from the shaft mixes with the abraded resistance material (powder) and accumulates in a gel condition at the throttle closed position. If the throttle is closed/partially open, and then fully closed, some of the abraded resistance material ma
2281	Abrasion of the resistance material in the switch occurs in use. Grease exuded from the shaft mixes with the abraded resistance material (powder) and accumulates in a gel condition at the throttle closed position. If the throttle is closed/partially open, and then fully closed, some of the abraded resistance material ma
2282	One of the electrical leads to the fuel temperature sensor can fatigue and eventually break off over a period of time due to vibration. If the electrical lead breaks off the fuel temperature sensor, an open circuit occurs and the MIL will illuminate.
2283	During manufacture, incorrect emission labels were inadvertently affixed to some 1999 model Cabrio vehicles. The error pertains to incorrectly identifying the 1999 model year engine family, which is identified as XVWXV02.0227 INSTEAD OF XVWXV02.0223.
2284	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2285	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2286	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2287	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2288	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2289	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2290	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2291	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2292	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2293	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2294	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2295	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2296	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2297	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2298	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2299	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2300	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2301	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2302	Due to a software error, the On-Board Diagnostic (OBD) catalyst monitor will not run.Daimler/Chrysler will conduct a recall of the affected vehicles to install (reflash) a calibration in the Powertrain Control Module (PCM) to enable the catalyst monitor.
2303	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit buil-up may cause the poppets to stick closed. The deposit appears to be created by an interaction with some elements of certain summer grade CA fuels a

The deposit buil-up may cause the poppets to stick closed. The deposit appears to be created by an interaction with some elements of certain summer grade CA fuels a
2312	Failures of the fuel pressure regulators have been occurring due to chemical degradation of the regulator diaphragms. The diaphragm degradation appears to be related to something in specific brands of fuel, mainly in CA beginning May of 1997. GM is currently working with a specific brand supplier and the supplier of
2313	Failures of the fuel pressure regulators have been occurring due to chemical degradation of the regulator diaphragms. The diaphragm degradation appears to be related to something in specific brands of fuel, mainly in CA beginning May of 1997. GM is currently working with a specific brand supplier and the supplier of
2314	Failures of the fuel pressure regulators have been occurring due to chemical degradation of the regulator diaphragms. The diaphragm degradation appears to be related to something in specific brands of fuel, mainly in CA beginning May of 1997. GM is currently working with a specific brand supplier and the supplier of
2315	Failures of the fuel pressure regulators have been occurring due to chemical degradation of the regulator diaphragms. The diaphragm degradation appears to be related to something in specific brands of fuel, mainly in CA beginning May of 1997. GM is currently working with a specific brand supplier and the supplier of
2316	Failures of the fuel pressure regulators have been occurring due to chemical degradation of the regulator diaphragms. The diaphragm degradation appears to be related to something in specific brands of fuel, mainly in CA beginning May of 1997. GM is currently working with a specific brand supplier and the supplier of
2317	Due to a false constant value in the ECU, communication with diagnostic scan tools for model year 2000 may not be possible.Running change "00-TR-15" has been submitted.Manufacturer follow up: TBD.
2318	Contamination in the ignition distributor cap causes a misfire at cold start and the MIL to illuminate.
2319	Contamination in the ignition distributor cap causes a misfire at cold start and the MIL to illuminate.
2320	The problem is that the vehicles in this engine family have an incorrect data setting in their OBD system. This means that a fault detected by the purge flow diagnostic will not result in fault code storage and MIL illumination.
2321	Some cars may have inoperative Transmission Range Sensors due to moisture intrusion or the resistance being out of specification.
2322	Some cars may have cracked intake manifolds in a high stress concentration area of the water crossover. The crack is caused by cyclic high pressure associated with high engine speeds during rapid acceleration.
2323	Some trucks may have inoperative Heated Exhaust Gas Oxygen Sensors due to degraded gas seal rings.
2324	Some trucks may have inoperative Heated Exhaust Gas Oxygen Sensors due to degraded gas seal rings.
2325	Some trucks may have Fuel Tank Filler Cap O-rings that cannot maintain the seal of the fuel tank.
2326	Some trucks may have EGR Tubes that can crack.
2327	Some cars may have Fuel Tank Filler Hoses that can deteriorate and plug the fuel delivery modules.Field campaign 99E07 will be conducted to install the new part on the vehicles in the field.
2328	Some cars may have Fuel Tank Filler Hoses that can deteriorate and plug the fuel delivery modules.Field campaign 99E07 will be conducted to install the new part on the vehicles in the field.
2329	The waste gate activation rod (mounted on the turbo charger) breaks caused by a mechanical overload. If the waste gate activation rod becomes disconnected from the waste gate diaphragm, little or no intake boost will be present. Under hard acceleration the driver will feel a notable loss of power.
2330	Some Windstar vans have fuel tanks that may experience fatigue fracture near the fuel tank strap attachment due to the excessive stress resulting from a combination of tank height and loading in high ambient temperatures.Field Campaign 99S33 will be conducted to inspect the vehicles, install a new fuel tank strap,
2331	Some Windstar vans have fuel tanks that may experience fatigue fracture near the fuel tank strap attachment due to the excessive stress resulting from a combination of tank height and loading in high ambient temperatures.Field Campaign 99S33 will be conducted to inspect the vehicles, install a new fuel tank strap,
2332	Some Windstar vans have fuel tanks that may experience fatigue fracture near the fuel tank strap attachment due to the excessive stress resulting from a combination of tank height and loading in high ambient temperatures.Field Campaign 99S33 will be conducted to inspect the vehicles, install a new fuel tank strap,
2333	Some Windstar vans have fuel tanks that may experience fatigue fracture near the fuel tank strap attachment due to the excessive stress resulting from a combination of tank height and loading in high ambient temperatures.Field Campaign 99S33 will be conducted to inspect the vehicles, install a new fuel tank strap,
2334	Some Windstar vans have fuel tanks that may experience fatigue fracture near the fuel tank strap attachment due to the excessive stress resulting from a combination of tank height and loading in high ambient temperatures.Field Campaign 99S33 will be conducted to inspect the vehicles, install a new fuel tank strap,
2335	The secondary air injection system consists of an air pump driven by an electric motor, a relay, solenoid valve, a combination control / check valve, a manifold vacuum check valve and associated hardware. The control/check valve which when the valve is open, is designed to function as a check valve to prevent the flo
2336	Available data and reports indicate that all of the subject catalytic converters were replaced due to exhaust noise. In most cases, the source of the noise was identified as a crack in the front pipes near the inlet to the converter.
2337	Missing or faulty front oxygen sensor.
2338	Some 1996 cars may have an oil pressure switch which may leak engine oil due to an "inappropriate production" of the part.
2339	The exhaust manifold with closed-coupled catalyst on some vehicles may crack due to repeated exposure to severe thermal stress.
2340	The exhaust manifold with closed-coupled catalyst on some vehicles may crack due to repeated exposure to severe thermal stress.
2341	Because of incorrect base engine idle speed setting, a hesitation or stall occurs when accelerating from a complete stop.
2342	Because of incorrect base engine idle speed setting, a hesitation or stall occurs when accelerating from a complete stop.
2343	A concern has arisen regarding the fit of fuel filler caps within a certain VIN range. Improper fit could cause a MIL to illuminate.
2344	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2345	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2346	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2347	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2348	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2349	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2350	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2351	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2352	Based on an owner complaint of rough idle, poor starting, poor engine performance, or the MIL illumination, the EGR valves were being replaced.
2353	Based on an owner complaint of rough idle, poor starting, poor engine performance, or the MIL illumination, the EGR valves were being replaced.
2354	A stack-up of tolerances within the fuel filler latching mechanism could result in MIL illumination.
2355	Oxygen sensors with internal electrical faults.
2356	Failed Purge Valves leaking.
2357	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2358	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2359	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2360	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2361	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2362	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2363	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2364	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2365	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2366	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2367	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2368	The Malfunction Indicator Light (MIL) will not be illuminated if an On-Board Diagnostic (OBD) Exhaust Gas Recirculation (EGR) fault code P04060 (EGR sensor circuit high) is stored as a result of an EGR system malfunction.
2369	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2370	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2371	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2372	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2373	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2374	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2375	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2376	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.

2377	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2378	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2379	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2380	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2381	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2382	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2383	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2384	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2385	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2386	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2387	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2388	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2389	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2390	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2391	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2392	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2393	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2394	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2395	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2396	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2397	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2398	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2399	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2400	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2401	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2402	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause various driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.A VERR will be conducted on affected vehicles registered in fifteen (15) high road salt corrosion states to
2403	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.A VERR will be conducted on affected vehicles registered in fifteen (15) high road salt corrosion states to
2404	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.A VERR will be conducted on affected vehicles registered in fifteen (15) high road salt corrosion states to
2405	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.A VERR will be conducted on affected vehicles registered in fifteen (15) high road salt corrosion states to
2406	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.A VERR will be conducted on affected vehicles registered in fifteen (15) high road salt corrosion states to
2407	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.A VERR will be conducted on affected vehicles registered in fifteen (15) high road salt corrosion states to
2408	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.A VERR will be conducted on affected vehicles registered in fifteen (15) high road salt corrosion states to
2409	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.A VERR will be conducted on affected vehicles registered in fifteen (15) high road salt corrosion states to

2425	This defect involves the rear oxygen sensor. In this case, Nissan has determined from the diagnostic trouble code and investigation of replaced oxygen sensors that the sensor is malfunctioning. In most cases this has been determined to be due to corrosion of the sensor from moisture in the exhaust gas. Some ma
2426	This defect involves the front oxygen sensor. Unexpected deterioration of the oxygen sensor is occurring as a result of contamination possibly from fuel, oil or other unknown sources and causing the MIL to illuminate.
2427	This defect involves the front oxygen sensor. Unexpected deterioration of the oxygen sensor is occurring as a result of contamination possibly from fuel, oil or other unknown sources and causing the MIL to illuminate.
2428	This defect involves the fuel temperature sensor. One of the electrical leads to the temperature sensor which is located in the fuel tank can fatigue and break off of the sensor over a period of time due to vibration. This results in illumination of the MIL.
2429	This defect involves the auxiliary air control valve. As a result of deposits on the valve, it may intermittently stick and not open or close smoothly. During the OBD system self-test of the auxiliary air control valve, the MIL may be illuminated as a result of the valve intermittently sticking.
2430	This defect involves the throttle valve switch. Degradation/wear of the resistance material in the switch can affect the resistance of the variable resistor which can cause the MIL to illuminate.
2431	This defect involves the vent control valve for the evaporative emission control system. On some vehicles the valve is sticking in the open position due to corrosion so that when the OBD system attempts to do a check for leaks in the evaporative control system, the MIL illuminates because the system is not sealed.
2432	This defect involves the vent control valve for the evaporative emission control system. On some vehicles the valve is sticking in the open position due to corrosion so that when the OBD system attempts to do a check for leaks in the evaporative control system, the MIL illuminates because the system is not sealed.
2433	This defect involves the vent control valve for the evaporative emission control system. On some vehicles the valve is sticking in the open position due to corrosion so that when the OBD system attempts to do a check for leaks in the evaporative control system, the MIL illuminates because the system is not sealed.
2434	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
2435	Some 1997 and 1998 4.0L Explorer trucks may have Throttle Plates that can stick closed due to insufficient clearance and sludge accumulation.
2436	MIL illumination related misfire (P0300 to P0309) due to unstable combustion. New fuel injectors with modified specs will be part of Field Fix.
2437	Some cars may have inoperative Purge Regulator Valves due to faulty electrical terminal insertion or wire chafing.
2438	Some cars may have inoperative Mass Airflow Sensors due to silicone contamination of the sensing element.
2439	Some vans may have inoperative Transmission Range Sensors due to moisture intrusion into the sensor.
2440	Some trucks may have inoperative Catalyst Monitor Sensors due to heater pad corrosion.
2441	Some trucks may have inoperative Catalyst Monitor Sensors due to heater pad corrosion.
2442	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2443	Some vans may have Throttle Bodies which may not provide adequate airflow during certain operating conditions.
2444	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2445	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2446	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2447	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2448	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2449	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2450	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2451	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2452	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2453	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2454	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2455	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2456	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2457	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2458	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2459	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2460	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2461	The vehicles, certified for sale in U.S. federal regions, were equipped with (VECI) labels intended for vehicles to be sold in Canada. The VECI did not state the vehicle conforms to "U.S. EPA ... regulations."
2462	Due to an error in the On-Board Diagnostic (OBD) programming, the Malfunction Indicator Light (MIL) may light due to a false failure (torque converter lockup), or fail to light when a failure (pressure transducer) occurs.
2463	Some car models may experience breakage of the lower air intake-chamber box during extremely cold weather starting conditions due to an overly rich mixture in the intake manifold and retarded ignition timing.
2464	Some car models may experience breakage of the lower air intake-chamber box during extremely cold weather starting conditions due to an overly rich mixture in the intake manifold and retarded ignition timing.
2465	Some car models may experience breakage of the lower air intake-chamber box during extremely cold weather starting conditions due to an overly rich mixture in the intake manifold and retarded ignition timing.
2466	Some car models may experience breakage of the lower air intake-chamber box during extremely cold weather starting conditions due to an overly rich mixture in the intake manifold and retarded ignition timing.
2467	Some car models may experience breakage of the lower air intake-chamber box during extremely cold weather starting conditions due to an overly rich mixture in the intake manifold and retarded ignition timing.
2468	In some Miata vehicles, the non-return valve installed at the lower end of the fuel filler pipe may stick due to insufficent clearance between the valve case and the valve shutter combined with the material properties of the fuel hose between the filler pipe and the fuel tank. This may cause a "hard to refuel" condition ar
2469	In some Miata vehicles, the non-return valve installed at the lower end of the fuel filler pipe may stick due to insufficent clearance between the valve case and the valve shutter combined with the material properties of the fuel hose between the filler pipe and the fuel tank. This may cause a "hard to refuel" condition ar
2470	MIL illuminates, indicating an air fuel ratio sensor failure due to inferior cold temperature activation of the sensor.
2471	MIL illumination related misfire (P030*) due to the failure of fuel injectors, because of a production problem by the part supplier of these fuel injectors. Fix is new fuel injectors.
2472	MIL illumination related misfire (P030*) due to the failure of fuel injectors, because of a production problem by the part supplier of these fuel injectors.
2473	MIL illumination related misfire (P030*) due to the failure of fuel injectors, because of a production problem by the part supplier of these fuel injectors.
2474	MIL illumination related misfire (P030*) due to the failure of fuel injectors, because of a production problem by the part supplier of these fuel injectors.
2475	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2476	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2477	Replace EGR valve if MIL illuminates and any of the following DTCs are stored: P0400, P1400, P1401, P1408, P1409.From 5/5/2000 revision letter; Emission warranty information reports indicate the EGR valve (DBC10500) has been replaced on 474 fed. and 70 Cal. 1995 Jaguar LJS's. Further investigation showed the E

	O
2575	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2576	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2577	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2578	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2579	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2580	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2581	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2582	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2583	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2584	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2585	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2586	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2587	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2588	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2589	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2590	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2591	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2592	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2593	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2594	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2595	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2596	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2597	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2598	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2599	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2600	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2601	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2602	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2603	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2604	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2605	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2606	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2607	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2608	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2609	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2610	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2611	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2612	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2613	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2614	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2615	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2616	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2617	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2618	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2619	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2620	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2621	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2622	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2623	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2624	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2625	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2626	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2627	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2628	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2629	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2630	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2631	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2632	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2633	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2634	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2635	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2636	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2637	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2638	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2639	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2640	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2641	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2642	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2643	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2644	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2645	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2646	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2647	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2648	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2649	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2650	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2651	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2652	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2653	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2654	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2655	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2656	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2657	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2658	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2659	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2660	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2661	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2662	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2663	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2664	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2665	
2666	Some trucks with 7.5L engines may have inoperative HEGO sensors.
2667	Some trucks with 7.5L engines may have inoperative HEGO sensors.
2668	Some cars may have throttle position sensors that wear out prematurely.
2669	
2670	
2671	
2672	The catalytic converter will be replaced with a redesigned part.
2673	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2674	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2675	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2676	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2677	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2678	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2679	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2680	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2681	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2682	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2683	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2684	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2685	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2686	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2687	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2688	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.
2689	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.
2690	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.
2691	Positive Crankcase Ventilation hoses exhibit a deterioration of the material, which causes cracking, resulting in crankcase vent system leaks and vacuum leaks.
2692	Positive Crankcase Ventilation hoses exhibit a deterioration of the material, which causes cracking, resulting in crankcase vent system leaks and vacuum leaks.
2693	An engine may experience starting difficulty when vehicles are soaked for a long time in an extremely cold area. This situation is caused by incorrect vacuum signal into the MAP sensor due to frozen moisture which clogs the vacuum line between the MAP sensor and the intake manifold.
2694	An engine may experience starting difficulty when vehicles are soaked for a long time in an extremely cold area. This situation is caused by incorrect vacuum signal into the MAP sensor due to frozen moisture which clogs the vacuum line between the MAP sensor and the intake manifold.
2695	Oxygen sensors deteriorate and result in poor fuel/air control, reduced catalyst efficiency, and high emission levels.
2696	Oxygen sensors deteriorate and result in poor fuel/air control, reduced catalyst efficiency, and high emission levels.
2697	A processing error in the DME engine control module of the initial production phase can lead to an erroneous setting of the check engine light and erroneous fault code storage.
2698	The check engine light may become illuminated for a short period of time and fault code 41 set in the engine control module. The problem is caused by an onboard diagnostic system threshold adaption error. It is corrected by reprogramming the ECM EPROM with an updated software program.
2699	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
2700	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
2701	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
2702	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
2703	Some cars have a rattling noise underneath the vehicle since the monolith has been abraded by mat erosion.
2704	Illumination of the malfunction indicator light results from unstable signal output from the oxygen sensor.
2705	This engine family is equipped with a secondary air injection system, delivering air into the exhaust manifold. Part of this system is a non-return or check valve, which prevents hot exhaust gases from entering the pump. Some vehicles may have been equipped with a warped sealing disk which could allow flow back to
2706	Due to a logistical error incorrect coolant temperature sensors (NTCs) may have been installed on M5 vehicles during a specified production period.
2707	Due to a logistical error incorrect coolant temperature sensors (NTCs) may have been installed on M5 vehicles during a specified production period.
2708	Engines were assembled with the incorrect Positive Crankcase Ventilation (PCV) valve.The affected vehicles will be recalled to replace the incorrect valve with the released valve.
2709	It is possible that some of the affected vehicles do not comply with OBD2 access requirements as outlined in the SAE J1962 standardization. The problem consists of difficulty with the connection of a diagnosis unit, other than the VAG 1551, because of some extremely close adapter plug tolerances.
2710	It is possible that some of the affected vehicles do not comply with OBD2 access requirements as outlined in the SAE J1962 standardization. The problem consists of difficulty with the connection of a diagnosis unit, other than the VAG 1551, because of some extremely close adapter plug tolerances.
2711	The supplier of spark plug wires for the affected vehicles began using a new vendor for the PBT resin used in making the wires. The spark plug wires made using the PBT from the new vendor have been found to exhibit ignition leak problems under high temperature and high humidity conditions.
2712	The supplier of spark plug wires for the affected vehicles began using a new vendor for the PBT resin used in making the wires. The spark plug wires made using the PBT from the new vendor have been found to exhibit ignition leak problems under high temperature and high humidity conditions.
2713	Signal wires for the oxygen sensors located after the catalytic converters are potentially incorrectly positioned in the ECM wiring harness connector.
2714	Some Vehicle Control Modules (VCM) may have been incorrectly programmed with an engine calibration intended for Canadian usage. The Canadian calibration would not allow certain OBD2 malfunction lights to illuminate.
2715	Secondary Air Pump Wire Connection-During the initial production period of 3-series vehicles with 2.8L engines, the two wires supplying power to the air pump may have been reversed in the connecting plug, causing the pump to run backwards. ECM Programming Error-During above production period, software was used
2716	Secondary Air Pump Wire Connection-During the initial production period of 3-series vehicles with 2.8L engines, the two wires supplying power to the air pump may have been reversed in the connecting plug, causing the pump to run backwards. ECM Programming Error-During above production period, software was used
2717	Multec Bottom Feed Injectors with D195A and D195B build date codes may have abnormal stresses in the plastic encapsulant resulting in leakage of fuel vapor to the atmosphere.A voluntary Emission Recall will be conducted to replace all the injectors with the suspect build date.
2718	Multec Bottom Feed Injectors with D195A and D195B build date codes may have abnormal stresses in the plastic encapsulant resulting in leakage of fuel vapor to the atmosphere.A voluntary Emission Recall will be conducted to replace all the injectors with the suspect build date.
2719	Multec Bottom Feed Injectors with D195A and D195B build date codes may have abnormal stresses in the plastic encapsulant resulting in leakage of fuel vapor to the atmosphere.A voluntary Emission Recall will be conducted to replace all the injectors with the suspect build date.
2720	The emission control information label affixed to certain 1996 model year V8 and V12 models may contain an error. An incorrect barcode is indicated on the label.
2721	The emission control information label affixed to certain 1996 model year V8 and V12 models may contain an error. An incorrect barcode is indicated on the label.
2722	The Emission Control Information label affixed to certain 1995 model year V8 models may contain an error. An incorrect EVAP family is indicated on the label.
2723	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2724	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2725	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2726	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2727	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2728	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2729	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2730	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2731	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2732	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2733	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2734	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2735	Ignition coils are being replaced on engines due to a failure of the secondary magnet wire. The failures are caused by the difference in the coefficient of thermal expansion of the fine secondary wire and bobbin.
2736	Ignition coils are being replaced on engines due to a failure of the secondary magnet wire. The failures are caused by the difference in the coefficient of thermal expansion of the fine secondary wire and bobbin.
2737	Ignition coils are being replaced on engines due to a failure of the secondary magnet wire. The failures are caused by the difference in the coefficient of thermal expansion of the fine secondary wire and bobbin.
2738	Ignition coils are being replaced on engines due to a failure of the secondary magnet wire. The failures are caused by the difference in the coefficient of thermal expansion of the fine secondary wire and bobbin.
2739	Failed fuel pump due to worn out commutator.
2740	Some cars may have been shipped with incorrect Electric Air Pumps installed.
2741	Some cars may have been shipped with incorrect Electric Air Pumps installed.
2742	Some trucks may have been built with incorrect Mass Airflow Sensors.
2743	Some trucks may have been built with incorrect Mass Airflow Sensors.
2744	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2745	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2746	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2747	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2748	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2749	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2750	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2751	Cracking of the spark plug wire insulation may occur on some Federal 1994-95 Chevrolet Geo Tracker vehicles with 1.6L L4 (RPO L01) engine. This condition can manifest itself as a driveability problem.
2752	Cracking of the spark plug wire insulation may occur on some Federal 1994-95 Chevrolet Geo Tracker vehicles with 1.6L L4 (RPO L01) engine. This condition can manifest itself as a driveability problem.
2753	Freeze frame (Mode 2) values for the "lambda control factor" and the "lambda control adaption factor" for cylinder bank 2 are not stored and available on the scan tool. The values are available real-time (Mode 1) and are available for cylinder bank 1 in both freeze frame and real time. This is not according to SAE J19
2754	Freeze frame (Mode 2) values for the "lambda control factor" and the "lambda control adaption factor" for cylinder bank 2 are not stored and available on the scan tool. The values are available real-time (Mode 1) and are available for cylinder bank 1 in both freeze frame and real time. This is not according to SAE J19
2755	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2756	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2757	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2758	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2759	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2760	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2761	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2762	Vacuum hose routing diagram has been printed incorrectly. The hose routing between throttle body, EGR vacuum modulator and pulse width modulated vacuum switching valve was incorrect
2763	Vacuum hose routing diagram has been printed incorrectly. The hose routing between throttle body, EGR vacuum modulator and pulse width modulated vacuum switching valve was incorrect
2764	Some cars may have inoperative HEGO sensors caused by a cracked sensing element.
2765	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2766	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2767	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2768	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate

	P
2705	the pump causing condensation to form and ultimately leading to pump failure.
2708	Aurora model has 4.0L displacement.
2715	Multiple Defects (See Description)
2716	Multiple Defects (See Description)
2753	79 or as described in our Application for Certification.
2754	79 or as described in our Application for Certification.

	O
2773	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2774	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2775	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2776	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2777	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2778	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2779	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2780	Some trucks may have bolts that lose torque due to incompatible expansion characteristics with the improved exhaust manifold material. (Covers FED and CA, =50S)
2781	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2782	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2783	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2784	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2785	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2786	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2787	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2788	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2789	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2790	Some cars may have Fuel Pressure Regulators with diaphragms that can rupture.
2791	Some cars may have Fuel Pressure Regulators with diaphragms that can rupture.
2792	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2793	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2794	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2795	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2796	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2797	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2798	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2799	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2800	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2801	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2802	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2803	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2804	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2805	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2806	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2807	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2808	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2809	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2810	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2811	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2812	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2813	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2814	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2815	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2816	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2817	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2818	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2819	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2820	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2821	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2822	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2823	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2824	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2825	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2826	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2827	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2828	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2829	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2830	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2831	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2832	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2833	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2834	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2835	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2836	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2837	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2838	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2839	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2840	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2841	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2842	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2843	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2844	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2845	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2846	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2847	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2848	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2849	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2850	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2851	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2852	Thermal fatigue fracture on inner braid portion of the front exhaust pipe assembly due to insufficient welding.
2853	Thermal fatigue fracture on inner braid portion of the front exhaust pipe assembly due to insufficient welding.
2854	Thermal fatigue fracture on inner braid portion of the front exhaust pipe assembly due to insufficient welding.
2855	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
2856	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
2857	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
2858	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
2859	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
2860	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
2861	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
2862	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
2863	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
2864	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
2865	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
2866	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
2867	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
2868	Some cars equipped with EGR may experience a difficult starting condition. Water vapor and cold temperature may result in ice build up at the tip of the fuel injector.
2869	Some cars equipped with EGR may experience a difficult starting condition. Water vapor and cold temperature may result in ice build up at the tip of the fuel injector.
2870	Some trucks were built with an engine calibration certified for E-250 standard vans.
2871	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
2872	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
2873	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
2874	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
2875	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
2876	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
2877	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
2878	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
2879	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
2880	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
2881	The pressure transducer may experience binding at low temperatures potentially causing the MIL to illuminate. The binding has been attributed to out of tolerance conditions within the transducer.
2882	Grease comes out from a bearing in an idle air control valve and attaches to the surface of the valve seat. Carbon in exhaust gas clings to the attaching grease and is pressed by the valve surface. This occurs due to some valve axle clearance of the bearing which moves from the manifold vacuum pressure. This resu
2883	Secondary air injection pump relay may be contaminated by materials present in the underhood atmosphere. This prevents the air pump from operating correctly.
2884	Secondary air injection pump relay may be contaminated by materials present in the underhood atmosphere. This prevents the air pump from operating correctly.
2885	Some cars may have inoperative Idle Air Bypass valves caused by resonance in the air supply tube inducing mechanical damage to the valve and valve seat.
2886	Some cars may have inoperative Mass Airflow sensors caused by silicone contamination of the sensing element during the manufacturing process.
2887	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2888	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2889	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2890	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2891	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2892	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2893	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2894	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2895	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2896	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2897	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2898	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2899	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2900	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2901	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2902	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2903	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2904	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2905	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2906	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2907	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2908	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
2909	Some 1997 4.6L Federal Continental passenger cars may have been built with California Powertrain Control Modules (PCM).
2910	Some cars equipped with the 2.4L (RPO LD9) VIN Engine Code "T" engine may have been built with an incorrect Evaporative Emission (EVAP) Canister Purge Solenoid.
2911	Some cars equipped with the 2.4L (RPO LD9) VIN Engine Code "T" engine may have been built with an incorrect Evaporative Emission (EVAP) Canister Purge Solenoid.
2912	Based on the results of our supplier's analyses, the principal failure mode is a slowed or absence of switching of the oxygen sensor due to the cracking of the ceramic substrate.
2913	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
2914	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
2915	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
2916	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
2917	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
2918	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
2919	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
2920	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
2921	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
2922	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
2923	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
2924	The Engine Control Module (ECM) installed in some 1997 Sportage models produced before 2/19/97 may have software errors that affects the readiness function for Evaporative Emissions System leakage monitoring. The result of this malfunction is loss of evaporative emissions diagnostic function and non-compliance
2925	The Engine Control Module (ECM) installed in some 1997 Sportage models produced before 2/19/97 may have software errors that affects the readiness function for Evaporative Emissions System leakage monitoring. The result of this malfunction is loss of evaporative emissions diagnostic function and non-compliance
2926	Carbon tracking may occur on the inner surface of the distributor cap as a result of moisture settling on the rib pattern. If moisture settles on the rib pattern, a reduced path of resistance is created and a high voltage short may result when the coil fires.
2927	Carbon tracking may occur on the inner surface of the distributor cap as a result of moisture settling on the rib pattern. If moisture settles on the rib pattern, a reduced path of resistance is created and a high voltage short may result when the coil fires.
2928	Carbon tracking may occur on the inner surface of the distributor cap as a result of moisture settling on the rib pattern. If moisture settles on the rib pattern, a reduced path of resistance is created and a high voltage short may result when the coil fires.
2929	Some trucks may have jumper hoses to the fuel tank that can develop cracks due to being overheated during the manufacturing process.
2930	Some trucks may have jumper hoses to the fuel tank that can develop cracks due to being overheated during the manufacturing process.
2931	Some cars may have been built with 400 cpi catalytic converter substrates in place of 350 cpi substrates.
2932	The Vehicle Emissions Control Information (VECI) labels on certain California 2.4L minivan models contain an error in the emission configuration code and the bar code.
2933	The Vehicle Emission Control Information (VECI) labels on some Dakota models with GVWRs less than 6000 lbs incorrectly identify the vehicle as certified to California emissions.
2934	The rear O2 sensor wiring may be reversed, with the left sensor connected to the right side wiring and vice-versa.Campaign #725 represents FEDERAL vehicles in this EF.Campaign #726 represents CALIFORNIA vehicles in this EF.
2935	The owners manual for the 1996 Plymouth Breeze model, does not contain the recommended shift speeds used for emission certification and fuel economy testing of the vehicle as required by the regulations.Chrysler will conduct a recall to provide customers with an owners manual addendum giving the shift speeds.
2936	The owners manual for the 1996 Plymouth Breeze model, does not contain the recommended shift speeds used for emission certification and fuel economy testing of the vehicle as required by the regulations.Chrysler will conduct a recall to provide customers with an owners manual addendum giving the shift speeds.
2937	Federal Vehicle Emission Control Information (VECI) labels were mistakenly installed on certain California 5.2L trucks.A correct label for each affected vehicle will be enclosed with the recall notification mailed to owners and dealers.
2938	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by fatigue failure of the wire.
2939	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
2940	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
2941	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
2942	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
2943	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
2944	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
2945	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
2946	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
2947	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
2948	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
2949	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
2950	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
2951	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
2952	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
2953	The catalytic converter in some cases fails to last the useful life of the vehicle. This is caused by the thermal expansion of the catalyst can, and the subsequent erosion of the mat surrounding the biscuits. Also, the carburetor accelerator pump will be replaced, a throttle return dashpot will be added, and the vacuum adv
2954	The catalytic converter in some cases fails to last the useful life of the vehicle. This is caused by the thermal expansion of the catalyst can, and the subsequent erosion of the mat surrounding the biscuits. Also, the carburetor accelerator pump will be replaced, a throttle return dashpot will be added, and the vacuum adv
2955	The catalytic converter in some cases fails to last the useful life of the vehicle. This is caused by the thermal expansion of the catalyst can, and the subsequent erosion of the mat surrounding the biscuits. Also, the carburetor accelerator pump will be replaced, a throttle return dashpot will be added, and the vacuum adv
2956	The catalytic converter in some cases fails to last the useful life of the vehicle. This is caused by the thermal expansion of the catalyst can, and the subsequent erosion of the mat surrounding the biscuits. Also, the carburetor accelerator pump will be replaced, a throttle return dashpot will be added, and the vacuum adv
2957	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
2958	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.
2959	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
2960	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.
2961	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
2962	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.
2963	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
2964	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.
2965	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
2966	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.
2967	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
2968	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.
2969	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
2970	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.

2991	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
2992	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
2993	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
2994	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
2995	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
2996	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
2997	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
2998	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
2999	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
3000	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
3001	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
3002	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
3003	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
3004	The valve lash specifications are incorrect on the under-hood Vehicle Emissions Control Information label.
3005	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
3006	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
3007	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
3008	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
3009	Some vehicles may experience corrosion of an oxygen sensor wiring harness connector. The cause is due to water drainage from a hood scoop onto the affected connector.
3010	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
3011	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
3012	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3013	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3014	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3015	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3016	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3017	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3018	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3019	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3020	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
3021	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3022	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
3023	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3024	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3025	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
3026	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
3027	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
3028	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
3029	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
3030	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
3031	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3032	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
3033	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
3034	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
3035	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3036	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3037	Some trucks may have inoperative HEGO sensors due to weak gas seal rings or contamination by carbon, lead, oil, or silicone.
3038	Some trucks may have inoperative Idle Air Bypass valves caused by engine sludging.
3039	Corrupted data communication between the (PCM) and Instrument Panel Cluster (IPC) and (HVAC) processors may cause a PCM reset to occur and/or the setting of DTC P1518 (Reduced Engine Power).The correction to be made is to recall all potentially affected vehicles and reflash the PCM calibration to make the syst
3040	Corrupted data communication between the (PCM) and Instrument Panel Cluster (IPC) and (HVAC) processors may cause a PCM reset to occur and/or the setting of DTC P1518 (Reduced Engine Power).The correction to be made is to recall all potentially affected vehicles and reflash the PCM calibration to make the syst
3041	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
3042	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
3043	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
3044	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
3045	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3046	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3047	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3048	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3049	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3050	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3051	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3052	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3053	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3054	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3055	It may be possible that the connector of the ignition coil may intermittently lose contact with the electronic ignition control unit.
3056	825 warranty claims related to the ignition coil. The warranty claims were prompted by complaints of rough idling, engine stumbling, or poor performance.
3057	825 warranty claims related to the ignition coil. The warranty claims were prompted by complaints of rough idling, engine stumbling, or poor performance.
3058	ISC Servo Kit failures caused by water intrusion into the ISC Servo Kit.
3059	The turbine wheel may brush the housing, caused by the narrow clearance.
3060	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3061	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3062	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3063	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3064	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3065	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3066	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3067	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
3068	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
3069	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
3070	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
3071	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
3072	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3073	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3074	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3075	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3076	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
3077	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
3078	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
3079	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
3080	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3081	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3082	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3083	An intermittent connector leads to a check engine light on condition in some vehicles. The sensor was replaced as indicated by the fault code. The check engine light condition could not be corrected with the new sensor. The connector was subsequently modified to improve the connection with the knock sensor.
3084	An intermittent connector leads to a check engine light on condition in some vehicles. The sensor was replaced as indicated by the fault code. The check engine light condition could not be corrected with the new sensor. The connector was subsequently modified to improve the connection with the knock sensor.
3085	The container holding the left side catalytic converter may have been manufactured with variances in tolerance which could allow the substrate to come loose within the converter housing. Loose subsrates tend to generate a loud "rattling" noise which is audible inside the vehicle.
3086	The container holding the left side catalytic converter may have been manufactured with variances in tolerance which could allow the substrate to come loose within the converter housing. Loose subsrates tend to generate a loud "rattling" noise which is audible inside the vehicle.
3087	The container holding the left side catalytic converter may have been manufactured with variances in tolerance which could allow the substrate to come loose within the converter housing. Loose subsrates tend to generate a loud "rattling" noise which is audible inside the vehicle.
3088	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3089	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3090	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3091	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3092	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3093	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3094	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3095	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3096	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3097	Some cases of water intrusion into ISC Servo Kit have been found. Hyundai believes that most ISC replacements are improper diagnosis and repair.
3098	Some cases of carbon deposits inside the Idle Speed Actuator (ISA) have caused complaints of rough idling and engine stumbling.
3099	Some cases of carbon deposits inside the Idle Speed Actuator (ISA) have caused complaints of rough idling and engine stumbling.
3100	Poor engine starting may result from a failed purge control valve. The valve failed as a result of contamination with dust or oil used to insert the PCV hose onto the valve nipple.
3101	Poor engine starting may result from a failed purge control valve. The valve failed as a result of contamination with dust or oil used to insert the PCV hose onto the valve nipple.
3102	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. Some parts failed as a result of intrusion of water into the sensor body; however, the main cause of failure was a short circuit at the soldering spot between the terminal and the thermistor wire. Hyundai belie
3103	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. Some parts failed as a result of intrusion of water into the sensor body; however, the main cause of failure was a short circuit at the soldering spot between the terminal and the thermistor wire. Hyundai belie
3104	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. Some parts failed as a result of intrusion of water into the sensor body; however, the main cause of failure was a short circuit at the soldering spot between the terminal and the thermistor wire. Hyundai belie
3105	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. The main cause of failure was an intermittent short circuit at the soldering spot between the terminal and the thermistor wire, although there were some cases of water intrusion into the sensor body.
3106	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. The main cause of failure was an intermittent short circuit at the soldering spot between the terminal and the thermistor wire, although there were some cases of water intrusion into the sensor body.
3107	Outflow of charcoal from the canister may result in difficulty in starting the engine.
3108	Outflow of charcoal from the canister may hinder operation of the purge solenoid valve resulting in difficulty in starting the engine.
3109	Illumination of the MIL caused by oxygen sensor failure. The main cause of oxygen sensor failure was internal electrode damage, resulting from unsatisfactory reproducibility of Pt Powder grain size and surface area.
3110	Illumination of the MIL caused by oxygen sensor failure. The main cause of oxygen sensor failure was internal electrode damage, resulting from unsatisfactory reproducibility of Pt Powder grain size and surface area.
3111	Illumination of the MIL caused by oxygen sensor failure. The main cause of oxygen sensor failure was internal electrode damage, resulting from unsatisfactory reproducibility of Pt Powder grain size and surface area.
3112	The charcoal canister check ball sticks to the aluminum seat due to thermal expansion difference of the ball and the seat. This causes MIL illumination.
3113	One of the following problems may have been present:Intake manifold plug cap on the left rear side of the crankcase ventilation valve may be torn or missing.Intake manifold gaskets may be leaking.
3114	One of the following problems may have been present:Intake manifold plug cap on the left rear side of the crankcase ventilation valve may be torn or missing.Intake manifold gaskets may be leaking.
3115	A ceramic spacer is fixed between both monoliths of the catalytic converter. Due to faulty packaging, the ceramic ring becomes loose and causes a rattling noise.
3116	A ceramic spacer is fixed between both monoliths of the catalytic converter. Due to faulty packaging, the ceramic ring becomes loose and causes a rattling noise.
3117	The affected part is the oxygen sensor. The sensors showed signs of a decreased control frequency. Analysis of the affected oxygen sensors has found exhaust-carried deposits on the ceramic sensing element.The corrective measure consists of reprogramming the Engine Control Module with new updated software.
3118	The affected part is the oxygen sensor. The sensors showed signs of a decreased control frequency. Analysis of the affected oxygen sensors has found exhaust-carried deposits on the ceramic sensing element.The corrective measure consists of reprogramming the Engine Control Module with new updated software.
3119	The affected part is the oxygen sensor. The sensors showed signs of a decreased control frequency. Analysis of the affected oxygen sensors has found exhaust-carried deposits on the ceramic sensing element.The corrective measure consists of reprogramming the Engine Control Module with new updated software.
3120	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
3121	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
3122	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
3123	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
3124	Some cars may have inoperative Idle Air Control Valves caused by the rubber orifice seat sticking closed.
3125	Some vans may have HEGO sensors with reference cavities that may become contaminated by exhaust gas under certain conditions. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3126	Some cars may have inoperative HEGO sensors caused by oil absorption through the wire connector.
3127	Due to an error in the OBD computer logic, the evaporative system readiness codes remains incomplete even after the computer confirms that the system operates correctly. However, a malfunction will be correctly detected and the MIL will be illuminated according to Toyota.
3128	Illumination of the MIL caused by oxygen sensor malfunction. The oxygen sensor lead wire can come under excessive tension leading to the potential of malfunction. The excessive tension can cause intermittent unstable signal voltage.
3129	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
3130	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
3131	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
3132	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
3133	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
3134	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
3135	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
3136	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
3137	Some cars may have fuel line jumpers that can rub on the floorpan.
3138	Some cars may have fuel line jumpers that can rub on the floorpan.
3139	Some cars may have fuel line jumpers that can rub on the floorpan.
3140	Some cars may have fuel line jumpers that can rub on the floorpan.
3141	Some cars may have fatigue cracks in the fuel tank at the heat shield attachment point.
3142	Some cars may have fatigue cracks in the fuel tank at the heat shield attachment point.
3143	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
3144	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
3145	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
3146	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
3147	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
3148	The elbow containing the crankcase ventilation orifice was installed on the wrong valve cover during reconditioning of the engine.
3149	The elbow containing the crankcase ventilation orifice was installed on the wrong valve cover during reconditioning of the engine.
3150	Spark plug wire boots may become cracked on some cylinders, allowing secondary ignition voltage to arc through the crack(s) to heat shields around the boots, and then to ground, under certain operating conditions.
3151	Spark plug wire boots may become cracked on some cylinders, allowing secondary ignition voltage to arc through the crack(s) to heat shields around the boots, and then to ground, under certain operating conditions.
3152	Spark plug wire boots may become cracked on some cylinders, allowing secondary ignition voltage to arc through the crack(s) to heat shields around the boots, and then to ground, under certain operating conditions.
3153	The failing component is the AIR injection reactor (AIR) system fuse. The failure that has been ocurring is blown AIR fuses. The probable cause is high in-rush current from repeated on-off cycles of the AIR pump when the manual transmission vehicles are driven agressively, with heavy throttle acceleration or high RPM
3154	The failing component is the AIR injection reactor (AIR) system fuse. The failure that has been ocurring is blown AIR fuses. The probable cause is high in-rush current from repeated on-off cycles of the AIR pump when the manual transmission vehicles are driven agressively, with heavy throttle acceleration or high RPM
3155	The calibration of the Powertrain Control Module (PCM) may fail to adequately control CO emissions during certain Inspection and Maintenance (IM) tests, such as the steady state Acceleration Simulation Mode (ASM) test.
3156	The calibration of the Powertrain Control Module (PCM) may fail to adequately control CO emissions during certain Inspection and Maintenance (IM) tests, such as the steady state Acceleration Simulation Mode (ASM) test.
3157	The VECI labels on certain Federal and California AWD minivan models were reversed, with the Federal label installed on the California and vice versa,
3158	Chrysler is conducting a recall of trucks equipped with 5.9L engines certified to the California Transitional Low Emission Vehicle (TLEV) emission standards. These vehicles were found to possibly emit high NOx emissions during the 2% audit of production vehicles required by CARB.
3159	Chrysler is conducting a recall of trucks equipped with 5.9L engines certified to the California Transitional Low Emission Vehicle (TLEV) emission standards. These vehicles were found to possibly emit high NOx emissions during the 2% audit of production vehicles required by CARB.
3160	The VECI labels on certain 1998 MY HD trucks mistakenly indicated that the trucks were 1997 MY vehicles.
3161	The VECI labels on certain 1998 MY HD trucks mistakenly indicated that the trucks were 1997 MY vehicles.
3162	The VECI labels on certain 1998 MY 2.4L Sebring convertibles contained an error involving the purge control valve hose routing.
3163	The VECI labels on certain 1998 MY 2.4L Sebring convertibles contained an error involving the purge control valve hose routing.
3164	Due to a programming error, the Powertrain Control Module (PCM) installed in the affected vehicles may, under certain driving conditions, trigger a shift in air-fuel ratio to an over-lean condition, resulting in an engine stall. An engine stall may lead to a loss of vehicle control and/or a vehicle crash. This DR is actually a
3165	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3166	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3167	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3168	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.

	O
3169	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3170	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3171	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3172	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3173	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3174	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3175	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3176	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3177	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
3178	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
3179	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
3180	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
3181	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
3182	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
3183	The main under-floor catalytic converter assemblies on certain 1998 Model Year ML320 models may have been assembled incorrectly by the supplier. The right side converter may be installed on the left side in the reverse orientation and the left side converter may be installed on the right side in the reverse orientatio
3184	The misfire detection strategy does not fully meet the requirements of CARB OBD2 in that monitoring for misfire during positive torque engine operation is not continuous. CARB confirmed their concerns to Jaguar in a letter dated 23 April, received 24 April, 1997.
3185	The misfire detection strategy does not fully meet the requirements of CARB OBD2 in that monitoring for misfire during positive torque engine operation is not continuous. CARB confirmed their concerns to Jaguar in a letter dated 23 April, received 24 April, 1997.
3186	The misfire detection strategy does not fully meet the requirements of CARB OBD2 in that monitoring for misfire during positive torque engine operation is not continuous. CARB confirmed their concerns to Jaguar in a letter dated 23 April, received 24 April, 1997.
3187	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3188	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3189	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3190	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3191	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3192	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3193	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3194	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3195	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3196	Malfunction Indicator Light (MIL) falsely illuminates as a malfunction of automatic transmission (A/T) input speed sensor under the limited condition after A/T gear is shifted from 5th to 4th during coast down deceleration.
3197	The emission tune-up label states the engine family had EGR; the family was certified without EGR.
3198	Some vehicles are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock detection routine so as not to permit this condition.
3199	Some vehicles are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock detection routine so as not to permit this condition.
3200	Some vans may draw water into the evaporative emission canister when driven in slushy-snow conditions. This can result in setting a MIL, misfire, rough idle, lack of power and eventually, an engine stall if driveability symptoms and MIL are ignored.
3201	Some vans may draw water into the evaporative emission canister when driven in slushy-snow conditions. This can result in setting a MIL, misfire, rough idle, lack of power and eventually, an engine stall if driveability symptoms and MIL are ignored.
3202	The secondary air injection valve with built-in check valve prevents exhaust gases from being forced into the secondary air injection pump. The failed valves were inoperable, i.e. stuck in the open or closed position.
3203	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3204	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3205	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3206	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3207	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3208	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3209	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3210	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3211	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3212	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3213	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3214	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3215	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3216	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
3217	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
3218	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
3219	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
3220	The throttle shaft ball bearing on the sensor side of the throttle body assembly of the subject vehicles may not have been installed in certain throttle bodies produced.
3221	The throttle shaft ball bearing on the sensor side of the throttle body assembly of the subject vehicles may not have been installed in certain throttle bodies produced.
3222	The throttle shaft ball bearing on the sensor side of the throttle body assembly of the subject vehicles may not have been installed in certain throttle bodies produced.
3223	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. The main cause of failure was an intermittent short circuit at the soldering spot between the terminal and the thermistor wire, and an intermittent connection caused by engine vibration.
3224	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
3225	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
3226	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
3227	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
3228	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
3229	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
3230	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
3231	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
3232	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
3233	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3234	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3235	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3236	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3237	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3238	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3239	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3240	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3241	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3242	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3243	Some cars may have a misfire monitor strategy that can cause unintended Malfunction Indicator Light (MIL) illumination.
3244	Some cars may have a misfire monitor strategy that can cause unintended Malfunction Indicator Light (MIL) illumination.
3245	Some cars are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock calibration routine so as not to permit this condition.
3246	Some cars are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock calibration routine so as not to permit this condition.
3247	As the consequence of variations in the length and routing of the injector harness, it may contact the manifold at the EGR pipe. If the harness is damaged, a short circuit may occur, blowing the fuse for the fuel injector, resulting in the engine stalling. It may also cause the injector to continue fueling if a short circuit oc
3248	As the consequence of variations in the length and routing of the injector harness, it may contact the manifold at the EGR pipe. If the harness is damaged, a short circuit may occur, blowing the fuse for the fuel injector, resulting in the engine stalling. It may also cause the injector to continue fueling if a short circuit oc
3249	The Aspirator System installed on the subject vehicles may fail, resulting in the creation of NOx emissions which could exceed the allowable standards. The presence of the Aspirator System also allows moisture to contact the fuel pressure regulator causing corrosion and jeopardizing its integrity.
3250	Some cars may have inoperative Mass Airflow sensors caused by silicone contamination of the sensing element during the manufacturing process.
3251	Some cars may have inoperative Mass Airflow sensors caused by silicone contamination of the sensing element during the manufacturing process.
3252	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings, exhaust contamination, or broken heaters.
3253	Some cars may have Spark Plug Wires which have experienced dielectric failure.
3254	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings, exhaust contamination, or broken heaters.
3255	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings, exhaust contamination, or broken heaters.
3256	An engine calibration released for vehicles intended to meet California Low Emission Vehicle standards was incorrectly programmed into vehicles intended to meet Federal Tier 1 standards.
3257	Some of the affected vehicles were built with a kinked vacuum purge harness to the distributor. The harness was kinked during the vehicle assembly process and results in no ventilation from the distributor housing. Excessive NOx gas is trapped in the distributor.
3258	Some of the affected vehicles were built with a kinked vacuum purge harness to the distributor. The harness was kinked during the vehicle assembly process and results in no ventilation from the distributor housing. Excessive NOx gas is trapped in the distributor.
3259	Elboe fittings connecting the EVAP canister to the OBD2 valve on certain fuel tank assemblies may be abraded or cracked. The abrasions or cracks stem from an improper handling procedure during early production. This procedure was corrected during September production.
3260	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3261	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3262	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3263	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3264	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3265	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3266	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3267	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3268	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3269	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3270	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3271	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3272	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3273	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3274	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3275	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3276	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3277	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3278	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3279	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3280	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3281	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3282	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3283	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3284	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3285	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3286	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3287	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3288	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3289	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3290	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3291	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3292	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3293	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3294	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3295	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3296	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3297	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3298	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3299	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3300	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3301	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3302	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3303	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3304	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3305	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3306	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3307	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3308	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3309	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3310	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3311	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3312	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3313	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3314	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3315	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3316	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3317	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3318	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3319	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3320	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3321	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3322	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3323	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3324	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3325	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3326	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3327	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3328	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3329	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3330	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3331	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3332	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3333	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3334	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3335	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3336	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3337	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3338	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3339	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3340	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3341	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3342	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3343	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3344	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3345	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3346	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3347	Some trucks may have Thermactor Air Injection Manifolds that leak Thermactor air or exhaust gas.
3348	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3349	Some cars may have inoperative heated exhaust gas oxygen sensors due to broken sensing elements.
3350	Some cars may have inoperative heated exhaust gas oxygen sensors due to broken sensing elements.
3351	Some cars may have inoperative heated exhaust gas oxygen sensors due to broken sensing elements.
3352	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
3353	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
3354	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
3355	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
3356	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
3357	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
3358	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
3359	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
3360	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
3361	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
3362	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
3363	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3364	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3365	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3366	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.

3367	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3368	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3369	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3370	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3371	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3372	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3373	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3374	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3375	Some cars may have been built with incorrect catalytic converters. Six brick converters were installed in place of four brick converters used in this application.
3376	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3377	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3378	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3379	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3380	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3381	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3382	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3383	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3384	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3385	Wall thickness of production fuel tanks is greater than the wall thickness of developmental vehicles. This difference results in a tank with greater stiffness. A stiffer tank with decreased elasticity may result in a reduced pressure compensation during the OBD EVAP system leak check process. The pressure peak could e
3386	During extremly low temperature start-up conditions, the Transfer Case control module may not communicate with the remainder of the vehicle (CAN).
3387	Vehicles were manufactured with an incorrect Vehicle Emission Control Information (VECI) label. These carryover vehicles were equipped with an underhood VECI label, which identifies the vehicles as complying with 1998 model year LDV standards.
3388	Vehicles were manufactured with an incorrect Vehicle Emission Control Information (VECI) label. These carryover vehicles were equipped with an underhood VECI label, which identifies the vehicles as complying with 1998 model year LDV standards.
3389	Rear oxygen sensor failure caused by corrosion and breakaway of the outer electrode conductive strip of the sensor ceramic body.
3390	This defect involves the rear oxygen sensor. In this case, Nissan has determined from the diagnostic trouble code and investigation of replaced oxygen sensors that the sensor is malfunctioning. In most cases this has been determined to be due to corrosion of the sensor from moisture in the exhaust gas. Some ma
3391	This defect involves the front oxygen sensor. Unexpected deterioration of the oxygen sensor is occurring as a result of contamination possibly from fuel, oil or other unknown sources and causing the MIL to illuminate.
3392	This defect involves the fuel temperature sensor. One of the electrical leads to the temperature sensor which is located in the fuel tank can fatigue and break off of the sensor over a period of time due to vibration. This results in illumination of the MIL.
3393	This defect involves the auxiliary air control valve. As a result of deposits on the valve, it may intermittently stick and not open or close smoothly. During the OBD system self-test of the auxiliary air control valve, the MIL may be illuminated as a result of the valve intermittently sticking.
3394	This defect involves the throttle valve switch. Degradation/wear of the resistance material in the switch can affect the resistance of the variable resistor which can cause the MIL to illuminate.
3395	This defect involves the vent control valve for the evaporative emission control system. On some vehicles the valve is sticking in the open position due to corrosion so that when the OBD system attempts to do a check for leaks in the evaporative control system, the MIL illuminates because the system is not sealed.
3396	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
3397	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
3398	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
3399	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
3400	Secondary Air Changeover Valve becomes non-functional due to internal contamination, which comes from an outside source.
3401	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3402	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3403	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3404	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3405	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3406	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3407	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3408	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3409	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3410	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3411	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3412	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3413	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3414	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3415	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3416	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3417	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3418	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3419	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3420	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3421	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3422	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3423	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3424	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3425	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3426	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3427	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3428	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3429	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3430	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3431	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3432	The fuel tank rollover valve may allow liquid fuel to pass through and fill the evaporative canister.
3433	The oxygen sensor harness may have been mistakenly secured with clips to the exhaust heat shield and/or to a bracket on the transmission housing. Due to the movement between the vehicle body, transmission and exhaust system, the oxygen sensor harness may stretch and break over time causing the check eng
3434	There may be condensation in the exhaust system causing thermal shock condition to the outer shell of the oxygen sensor. There may also be a loosening of the conductive strip from the protective layer of the sensor element due to production failure, interrupting the signal from the outer electrode.
3435	There may be condensation in the exhaust system causing thermal shock condition to the outer shell of the oxygen sensor. There may also be a loosening of the conductive strip from the protective layer of the sensor element due to production failure, interrupting the signal from the outer electrode.
3436	Oxygen sensors cause DTC fault codes within the vehicles OBD2 diagnostic system.
3437	The On-board Diagnostic II (OBDII) evaporative system monitor on 1997 and 1998 model year vehicles certified to the enhanced evaporative emission requirements may allow pending diagnostic trouble codes to be erased under limited conditions.Ford amended this DR on 4/4/2001.
3438	The On-board Diagnostic II (OBDII) evaporative system monitor on 1997 and 1998 model year vehicles certified to the enhanced evaporative emission requirements may allow pending diagnostic trouble codes to be erased under limited conditions.Ford amended this DR on 4/4/2001.
3439	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
3440	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
3441	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
3442	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
3443	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
3444	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
3445	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3446	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3447	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3448	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3449	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3450	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3451	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3452	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3453	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3454	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3455	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3456	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3457	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3458	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3459	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3460	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3461	Some cars, trucks and vans may have loose electrical contact leads on the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor
3462	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3463	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3464	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3465	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3466	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3467	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3468	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3469	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3470	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste

This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3482	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3483	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3484	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3485	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3486	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3487	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3488	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3489	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3490	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3491	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3492	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3493	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3494	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3495	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3496	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3497	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3498	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3499	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3500	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3501	The wrong Vehicle Emission Control Information (VECI) label may have been installed on the subject vehicles.
3502	The Fuel tank level sending unit may display an inaccurate level.
3503	The main cause of failure was abrasion of the monolith caused by mat erosion and thermal cracking of the front face of the monolith.
3504	Rear oxygen sensor failure caused by corrosion and breakaway of the outer electrode conductive strip of the sensor ceramic body.
3505	The Onboard Diagnostic System on the subject vehicles may have been disabled in the area of purge flow detection.
3506	The component that failed is the spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires.
3507	The component that failed is the spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires.
3508	The component that failed is the spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires.
3509	A faulty ground causes electrical noise to be transmitted to the rear oxygen sensor when the heater of the air fuel ratio sensor switches on and off. As a result, the readiness code on the catalyst monitor remains incomplete and does not make a pass determination. The "noise" does not interfere with monitor's ability
3510	Visible smoke from exhaust on acceleration, after prolonged idle period.
3511	Internal corrosion of the Exhaust Gas Recirculation (EGR) valve. A design change to the valve had been made for this 98' F car application to make it more robust against water splash intrusion.Part of the design change has resulted in moist gases feeding into the center body of the valve, causing corrosion of the arma
3512	Internal corrosion of the Exhaust Gas Recirculation (EGR) valve. A design change to the valve had been made for this 98' F car application to make it more robust against water splash intrusion.Part of the design change has resulted in moist gases feeding into the center body of the valve, causing corrosion of the arma
3513	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
3514	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
3515	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
3516	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
3517	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3518	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3519	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3520	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3521	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3522	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3523	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3524	Some vans may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings.
3525	Spark plug wires #2 and #8 were cut by contact with the accessory drive belt or pulley. There was a stack-up tolerance problem as well as lead length dimensional issue that allowed potential interference with the accessory drive system for the #2 or #8 spark plug wire.
3526	Spark plug wires #2 and #8 were cut by contact with the accessory drive belt or pulley. There was a stack-up tolerance problem as well as lead length dimensional issue that allowed potential interference with the accessory drive system for the #2 or #8 spark plug wire.
3527	Failures are occurring to the ignition coil and the coil to distributor wire due to corrosion and erosion of the coil wire terminal and the coil terminal post.
3528	Failures are occurring to the ignition coil and the coil to distributor wire due to corrosion and erosion of the coil wire terminal and the coil terminal post.
3529	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
3530	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.

The standard-life spark plugs may have been installed in the left cylinder bank only.Remedy: Chrysler will conduct an emissio
3654	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3655	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3656	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3657	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3658	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3659	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3660	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3661	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3662	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3663	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3664	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3665	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3666	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3667	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3668	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3669	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3670	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3671	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3672	Malfunction Indicator Lamp (MIL) illumination with diagnostic trouble codes P0442 and P0456 may be related to defective fuel caps (part number 3C0 201 550 G). Trouble codes relate to small and very small Evaporative Emissions (EVAP) leaks respectively. Parts analyzed found the majority of the defective components
3673	Malfunction Indicator Lamp (MIL) illumination may be caused by the Intake Manifold Runner Control Motor, part number 06F 133 482. Improper internal welding and shorting of the motor windings are reported causes of the failure. There are no reported drivability or evaporative emissions problems related to this cond
3674	On some 2005-06 model year Jeep Liberty vehicles equipped with 2.8L diesel engines, one or more of the engine's glow plugs can be damaged by overheating or exposure to voltages in excess of seven volts.Remedy: Software enhancements have been made in production to increase glow plug robustness; over-voltag
3675	On some 2005-06 model year Jeep Liberty vehicles equipped with 2.8L diesel engines, one or more of the engine's glow plugs can be damaged by overheating or exposure to voltages in excess of seven volts.Remedy: Software enhancements have been made in production to increase glow plug robustness; over-voltag
3676	A crack in a Crankcase Ventilation Hose (PCV), part number 06B 103 213 AF, can cause the Malfunction Indicator Lamp (MIL) to come on. It does not result in any drivability concerns or the release of any Evaporative Emissions beyond the acceptable limits. This part is also being replaced during an internal engine repai
3677	A crack in a Crankcase Ventilation Hose (PCV), part number 06B 103 213 AF, can cause the Malfunction Indicator Lamp (MIL) to come on. It does not result in any drivability concerns or the release of any Evaporative Emissions beyond the acceptable limits. This part is also being replaced during an internal engine repai
3678	Malfunction Indicator Lamp (MIL) illumination with Diagnostic Trouble Codes (DTC) P0030, P0130, P3266 and P3255 relate to front oxygen sensor concerns. Part numbers 06F 906 262 AC and 06E 906 265 C are involved, the failure is related to improper crimping of the wires to the inside the sensor. The vendor for this
3679	Malfunction Indicator Lamp (MIL) illumination with Diagnostic Trouble Codes (DTC) P0030, P0130, P3266 and P3255 relate to front oxygen sensor concerns. Part numbers 06F 906 262 AC and 06E 906 265 C are involved, the failure is related to improper crimping of the wires to the inside the sensor. The vendor for this
3680	Due to the usage of two different On-Board Diagnostic (OBD) communication protocols (IS014230-4 for Engine Control Unit (ECU) and ISO 15765-4 (CAN) for Transmission Control Unit (TCU)), OBD communication with a Scan Tool is not possible. If OBD communication with a Scan Tool is not possible, potential malfunc
3681	Due to the usage of two different On-Board Diagnostic (OBD) communication protocols (IS014230-4 for Engine Control Unit (ECU) and ISO 15765-4 (CAN) for Transmission Control Unit (TCU)), OBD communication with a Scan Tool is not possible. If OBD communication with a Scan Tool is not possible, potential malfunc
3682	Due to the usage of two different On-Board Diagnostic (OBD) communication protocols (IS014230-4 for Engine Control Unit (ECU) and ISO 15765-4 (CAN) for Transmission Control Unit (TCU)), OBD communication with a Scan Tool is not possible. If OBD communication with a Scan Tool is not possible, potential malfunc
3683	Due to the usage of two different On-Board Diagnostic (OBD) communication protocols (IS014230-4 for Engine Control Unit (ECU) and ISO 15765-4 (CAN) for Transmission Control Unit (TCU)), OBD communication with a Scan Tool is not possible. If OBD communication with a Scan Tool is not possible, potential malfunc
3684	Due to the usage of two different On-Board Diagnostic (OBD) communication protocols (IS014230-4 for Engine Control Unit (ECU) and ISO 15765-4 (CAN) for Transmission Control Unit (TCU)), OBD communication with a Scan Tool is not possible. If OBD communication with a Scan Tool is not possible, potential malfunc

If OBD communication with a Scan Tool is not possible, potential malfunc
3686	Defective internal ratchet mechanism or inadequate seal at the fill pipe interface surface. If fuel tank cap fails, the MIL will illuminate and DTC will set, and the cap won't tighten properly, or the cap won't come off. Remedy: The caps available in service have an improved ratchet mechanism design that can withstand t
3687	Defective internal ratchet mechanism or inadequate seal at the fill pipe interface surface. If fuel tank cap fails, the MIL will illuminate and DTC will set, and the cap won't tighten properly, or the cap won't come off. Remedy: The caps available in service have an improved ratchet mechanism design that can withstand t
3688	Defective internal ratchet mechanism or inadequate seal at the fill pipe interface surface. If fuel tank cap fails, the MIL will illuminate and DTC will set, and the cap won't tighten properly, or the cap won't come off. Remedy: The caps available in service have an improved ratchet mechanism design that can withstand t
3689	Defective internal ratchet mechanism or inadequate seal at the fill pipe interface surface. If fuel tank cap fails, the MIL will illuminate and DTC will set, and the cap won't tighten properly, or the cap won't come off. Remedy: The caps available in service have an improved ratchet mechanism design that can withstand t
3690	Some 2005 model year Rio 1.6L, Sorento 3.5L and Sedona 3.5L have experienced a malfunction indicator light (MIL) illumination due to fuel tank pressure sensor (FTPS) malfunction. Kia is covering these vehicles under normal warranty.
3691	Some 2005 model year Rio 1.6L, Sorento 3.5L and Sedona 3.5L have experienced a malfunction indicator light (MIL) illumination due to fuel tank pressure sensor (FTPS) malfunction. Kia is covering these vehicles under normal warranty.
3692	Some 2005 model year Rio 1.6L, Sorento 3.5L and Sedona 3.5L have experienced a malfunction indicator light (MIL) illumination due to fuel tank pressure sensor (FTPS) malfunction. Kia is covering these vehicles under normal warranty.
3693	Customer complaints of Malfunction Indicator Lamp (MIL) coming on associated with Diagnostic Trouble Code (DTC) P0128 may be related to improperly operating engine thermostats. The associated part number is PG58252PA. Analysis of returned parts indicate the thermostat is opening too soon. There were no char
3694	Some 2005 Hyundai Santa Fe vehicles have experienced malfunction indicator light (MIL) illumination as a result of a canister close valve malfunction. Hyundai is covering the affected vehicles under warranty polices, and will continue to monitor canister close valve claims to determine if further action is required.
3695	Variations in the crimping process may lead to an electrical failure (open circuit) inside the oxygen sensor. When the Electronic Control Unit (ECU) detects the failure the first time it stores it in memory, when the failure is detected again, during the same drive cycle, the ECU will illuminate the Malfunction Indicator Lamp (
3696	Variations in the crimping process may lead to an electrical failure (open circuit) inside the oxygen sensor. When the Electronic Control Unit (ECU) detects the failure the first time it stores it in memory, when the failure is detected again, during the same drive cycle, the ECU will illuminate the Malfunction Indicator Lamp (
3697	Owners of Jaguar S-Type vehicles are alerted to the presence of a defective ignition coil by one or more of the following symptoms: difficult starting, engine down on power, hesitation, misfire and rough idle.Remedy: The issue is self-campaigning. MIL illumination and uneven engine performance will prompt owners to r
3698	Owners of Jaguar S-Type vehicles are alerted to the presence of a defective ignition coil by one or more of the following symptoms: difficult starting, engine down on power, hesitation, misfire and rough idle.Remedy: The issue is self-campaigning. MIL illumination and uneven engine performance will prompt owners to r
3699	Owners of S-Type vehicles are alerted to a defective throttle body by MIL illumination, restricted vehicle performance and no-start condition.Remedy: The issue is self-campaigning, MIL illumination and uneven engine performance will prompt owners to bring their vehicle to a Jaguar dealership for service.
3700	Owners of S-Type 4.2 vehicles report hesitation, misfire and rough running. The MIL illuminates with misfire codes. Replacing the ignition coil resolves the problem.Remedy: The issue is self-campaigning, MIL illumination and uneven engine performance will prompt owners to bring their vehicle to a Jaguar dealership for
3701	Owners of S-Type 4.2 vehicles report hesitation, misfire and rough running. The MIL illuminates with misfire codes. Replacing the ignition coil resolves the problem.Remedy: The issue is self-campaigning, MIL illumination and uneven engine performance will prompt owners to bring their vehicle to a Jaguar dealership for
3702	Owners of S-Type 4.2 vehicles report hesitation, misfire and rough running. The MIL illuminates with misfire codes. Replacing the ignition coil resolves the problem.Remedy: The issue is self-campaigning, MIL illumination and uneven engine performance will prompt owners to bring their vehicle to a Jaguar dealership for
3703	In some driving conditions an Engine Management System (EMS) calibration error causes an engine off timer malfunction (DTC P2610) to be incorrectly diagnosed as faulty. The fault occurs when the following conditions occur consecutively: the vehicles been driven and engine water temperature exceeds 185 degrees an
3704	Owners of Discovery vehicles are alerted to the presence of a defective oxygen sensor by MIL illumination and rough or uneven engine running.Remedy: The issue is self-campaigning, MIL illumination will prompt owners to seek service.
3705	Owners of Discovery vehicles are alerted to the presence of a defective oxygen sensor by MIL illumination and rough or uneven engine running.Remedy: The issue is self-campaigning, MIL illumination will prompt owners to seek service.
3706	Owners of Discovery vehicles are alerted to the presence of a defective oxygen sensor by MIL illumination and rough or uneven engine running.Remedy: The issue is self-campaigning, MIL illumination will prompt owners to seek service.
3707	Owners of 2003 and 2004 Freelander vehicles are alerted to the presence of one or more defective ignition coils by lack of power, rough running/vibration and hesitation accompanied by MIL illumination. Remedy: Self campaigning, MIL illumination and uneven engine performance will prompt owners to seek service. I
3708	Illumination of the Malfunction Indicator Lamp (MIL) for Diagnostic Trouble Codes (DTC) "warm up catalyst efficiency below threshold". The root cause has not been identified at this time and is still under evaluation.
3709	Illumination of the Malfunction Indicator Lamp (MIL) for Diagnostic Trouble Codes (DTC) "warm up catalyst efficiency below threshold". The root cause has not been identified at this time and is still under evaluation.
3710	Owners of 2003 and 2004 Freelander vehicles are alerted to the presence of one or more defective ignition coils by lack of power, rough running/vibration and hesitation accompanied by MIL illumination. Remedy: Self campaigning, MIL illumination and uneven engine performance will prompt owners to seek service. I
3711	Owners of 2003 S-Type R vehicles are alerted to a defective MAF sensor by MIL illumination accompanied by engine misfire, restricted performance, surging and hesitation.Remedy: Self campaigning, MIL illumination and uneven engine performance will prompt owners to seek service.
3712	Premature catalyst deterioration results in the Malfunction Indicator Lamp (MIL) illumination. An indication of any anticipated manufacturer follow-up. The quality control standard for catalysts has been amended since December 2007. For in-use vehicles, the catalysts are replaced on occurrence within the warranty pe
3713	Certain supercharged engines have a condition in which certain OBD monitors could become disabled without MIL illumination in the presence of a stuck or skewed Intake Air Temperature (IAT) sensor signal. With such faults, the IAT sensor will store a DTC that will disable it and other OBD monitors and prevent them fr
3714	Certain supercharged engines have a condition in which certain OBD monitors could become disabled without MIL illumination in the presence of a stuck or skewed Intake Air Temperature (IAT) sensor signal. With such faults, the IAT sensor will store a DTC that will disable it and other OBD monitors and prevent them fr
3715	Certain supercharged engines have a condition in which certain OBD monitors could become disabled without MIL illumination in the presence of a stuck or skewed Intake Air Temperature (IAT) sensor signal. With such faults, the IAT sensor will store a DTC that will disable it and other OBD monitors and prevent them fr
3716	Some 2003-2005 model year Kia Sorento's have experienced abnormal noise and vibration. The Malfunction Indicator Light (MIL) will illuminate. Kia will issue a voluntary service campaign (SC073), with owner notification, to inform owners that the service to install the improved induction control valve (ICV) will occur at
3717	Concerns of a slight power reduction or occasional stall may be attributed to improper Engine Control Unit (ECU) strategies. This condition occurs when the outside temperature is below 32 Degrees and the vehicle is being driven at an altitude of 8000 feet and above. The ECU (part number A 642 150 03 72) will be repro
3718	These vehicles may develop cracks in the Positive Crankcase Vent (PCV) hose where the hose connects to the intake manifold.Remedy: No further follow-up is planned as customers will seek service due to rough running, stall at idle and MIL illumination.
3719	These vehicles may develop cracks in the Positive Crankcase Vent (PCV) hose where the hose connects to the intake manifold.Remedy: No further follow-up is planned as customers will seek service due to rough running, stall at idle and MIL illumination.
3720	These vehicles may develop cracks in the Positive Crankcase Vent (PCV) hose where the hose connects to the intake manifold.Remedy: No further follow-up is planned as customers will seek service due to rough running, stall at idle and MIL illumination.
3721	Some vehicles may experience degraded throttle performance and/or inoperative throttle after the PCM memory has been cleared, generally on battery disconnect. When PCM memory is cleared the throttle returns to a default angle where it can seal off air due to a build up of oil sludge.Remedy: A calibration that corr
3722	Some vehicles may experience degraded throttle performance and/or inoperative throttle after the PCM memory has been cleared, generally on battery disconnect. When PCM memory is cleared the throttle returns to a default angle where it can seal off air due to a build up of oil sludge.Remedy: A calibration that corr
3723	Some vehicles may experience degraded throttle performance and/or inoperative throttle after the PCM memory has been cleared, generally on battery disconnect. When PCM memory is cleared the throttle returns to a default angle where it can seal off air due to a build up of oil sludge.Remedy: A calibration that corr
3724	Some vehicles may experience degraded throttle performance and/or inoperative throttle after the PCM memory has been cleared, generally on battery disconnect. When PCM memory is cleared the throttle returns to a default angle where it can seal off air due to a build up of oil sludge.Remedy: A calibration that corr
3725	Some 2003-2005 model year Kia Sorento's have experienced abnormal noise and vibration. The Malfunction Indicator Light (MIL) will illuminate. Kia will issue a voluntary service campaign (SC073), with owner notification, to inform owners that the service to install the improved induction control valve (ICV) will occur at
3726	Some 2003-2005 model year Kia Sorento's have experienced abnormal noise and vibration. The Malfunction Indicator Light (MIL) will illuminate. Kia will issue a voluntary service campaign (SC073), with owner notification, to inform owners that the service to install the improved induction control valve (ICV) will occur at
3727	Some vehicles may experience degraded throttle performance and/or inoperative throttle after the PCM memory has been cleared, generally on battery disconnect. When PCM memory is cleared the throttle returns to a default angle where it can seal off air due to a build up of oil sludge.Remedy: A calibration that corr

When PCM memory is cleared the throttle returns to a default angle where it can seal off air due to a build up of oil sludge.Remedy: A calibration that corr
3729	Some vehicles may experience degraded throttle performance and/or inoperative throttle after the PCM memory has been cleared, generally on battery disconnect. When PCM memory is cleared the throttle returns to a default angle where it can seal off air due to a build up of oil sludge.Remedy: A calibration that corr
3730	Some vehicles may experience degraded throttle performance and/or inoperative throttle after the PCM memory has been cleared, generally on battery disconnect. When PCM memory is cleared the throttle returns to a default angle where it can seal off air due to a build up of oil sludge.Remedy: A calibration that corr
3731	Some vehicles may experience fuel pump performance degradation due to sand and dirt contaminants from the operating environment.Remedy: NO follow-up is planned as affected customers will bring their vehicle in for service due to reduced power and MIL illumination.
3732	Some G8 vehicles equipped with 6.0L V8 engines and automatic transmissions have been built with the Transmission Control Module (TCM) On-Board Diagnostic (OBD) Diagnostic Trouble Code (DTC) P0601 disabled. DTC P0601 monitors the TCM internal Read Only Memory (ROM).Remedy: Vehicles identified in this re
3733	As part of the manufacturing process, a leak check is performed by dipping the fuel tanks into water. The tanks are stored in a shipment container and then transported to the vehicle assembly lines. Residual water may remain in the connector area of the Fuel Tank Pressure Sensor (FTPS) part number A 163 542 28 1
3734	Some vehicles equipped with 4.7L engines may stall under certain conditions if the amount of fuel vapor ingested during a canister purge event, typically on engine deceleration, is larger than anticipated.Remedy: This issue was addressed by running change RC51J in January of 2006. Chrysler will conduct safety recall
3735	An electrically operated air injection pump is designed to operate for less than five minutes during the engine warm-up phase. Extremely short impulses generated by electromagnetic interference's within the engine control module (ECU) may unintentionally trigger the air injection pump. The air pump relay serves as an
3736	The camshaft position sensor (CMP) is protected against engine oil by a cupped shaped cover. During the manufacturing process this cover could be deformed to the extent that the 0-ring between the sensor and the cover does not seal properly. Engine oil can then seep into the cover and disable the sensor. For vehicl
3737	The camshaft position sensor (CMP) is protected against engine oil by a cupped shaped cover. During the manufacturing process this cover could be deformed to the extent that the 0-ring between the sensor and the cover does not seal properly. Engine oil can then seep into the cover and disable the sensor. For vehicl
3738	The Electronic Control Module (ECM) programming can allow the electric engine cooling fan to run continuously under certain circumstances. Specifically, where a warm engine is shut off and then restarted within two seconds. The constant fan operation will exhibit excessive noise and Malfunction Indicator Lamp (MIL) illu

	O
3763	Some 2004 through 2006 model year vehicles equipped with 2.4L engines may illuminate the MIL for DTC P0274 (MAP/TPS Correlation-High Air Flow/Vacuum Leak Detected) when no problem exists. This condition is caused by extended downhill driving with little or no throttle input due to the steep road grades involved
3764	Some 2004 through 2006 model year vehicles equipped with 2.4L engines may illuminate the MIL for DTC P0274 (MAP/TPS Correlation-High Air Flow/Vacuum Leak Detected) when no problem exists. This condition is caused by extended downhill driving with little or no throttle input due to the steep road grades involved
3765	Some 2004 through 2006 model year vehicles equipped with 2.4L engines may illuminate the MIL for DTC P0274 (MAP/TPS Correlation-High Air Flow/Vacuum Leak Detected) when no problem exists. This condition is caused by extended downhill driving with little or no throttle input due to the steep road grades involved
3766	On some 2007 and 2008 vehicles equipped with 3.5L engines and California emissions, the OBD calibration for the Cold Start Rough Idle Diagnostics are overly sensitive and may cause MIL illumination for DTC P050D when no problem exists.Remedy: Chrysler has issued TSB 18-010-08 to instruct dealership technicians
3767	On some 2007 and 2008 vehicles equipped with 3.5L engines and California emissions, the OBD calibration for the Cold Start Rough Idle Diagnostics are overly sensitive and may cause MIL illumination for DTC P050D when no problem exists.Remedy: Chrysler has issued TSB 18-010-08 to instruct dealership technicians
3768	On some 2006 and 2007 vehicles equipped with 3.3L or 3.8L engines, the OBD calibrations for the PCM Internal Shutdown Timer Rationality are overly sensitive and may cause MIL illumination for DTC P1607 when no problem exists.Remedy: Chrysler has issued TSB 18-012-08 to instruct dealership technicians to repro
3769	On some 2006 and 2007 vehicles equipped with 3.3L or 3.8L engines, the OBD calibrations for the PCM Internal Shutdown Timer Rationality are overly sensitive and may cause MIL illumination for DTC P1607 when no problem exists.Remedy: Chrysler has issued TSB 18-012-08 to instruct dealership technicians to repro
3770	On some 2006 and 2007 vehicles equipped with 3.3L or 3.8L engines, the OBD calibrations for the PCM Internal Shutdown Timer Rationality are overly sensitive and may cause MIL illumination for DTC P1607 when no problem exists.Remedy: Chrysler has issued TSB 18-012-08 to instruct dealership technicians to repro
3771	On some 2006 and 2007 vehicles equipped with 3.3L or 3.8L engines, the OBD calibrations for the PCM Internal Shutdown Timer Rationality are overly sensitive and may cause MIL illumination for DTC P1607 when no problem exists.Remedy: Chrysler has issued TSB 18-012-08 to instruct dealership technicians to repro
3772	Some 2005 through 2007 trucks may experience slow fuel fill or early pump shut off conditions due to potentially clogged carbon canister vent tubes. Vehicles operated in particularly muddy and dusty environments can experience this condition.Remedy: Ford introduced an improved canister filter media into production
3773	Complaints of no start , hard starting, poor engine performance or Malfunction Indicator Lamp (MIL) on may be related to the fuel pump. The fuel sending unit, which is attached to the pump, may also be affected and cause the fuel gauge to be unreliable. Analysis of fuel pumps returned indicate 21% were faulty due
3774	Complaints of no start , hard starting, poor engine performance or Malfunction Indicator Lamp (MIL) on may be related to the fuel pump. The fuel sending unit, which is attached to the pump, may also be affected and cause the fuel gauge to be unreliable. Analysis of fuel pumps returned indicate 21% were faulty due
3775	Some ignition coils have been manufactured with electrical terminal damage which may lead to unintended CVT control by electrical noise.Remedy: Part quality has been improved. When this defect occurs the vehicle will likely be brought to a dealership for repair. The ignition coil will be replaced under emission warranty
3776	Some air-fuel ratio sensor elements may crack due to excess stress during manufacturing process.Remedy: Part quality has been improved. When this defect occurs the MIL illuminates, the vehicle will likely be brought to a dealership and repaired under emission warranty.
3777	Some air-fuel ratio sensor elements may crack due to excess stress during manufacturing process.Remedy: Part quality has been improved. When this defect occurs the MIL illuminates, the vehicle will likely be brought to a dealership and repaired under emission warranty.
3778	Some vehicles were manufactured with incorrect rocker arm shafts resulting in insufficient oil supply to the VTEC (Variable Valve Timing and Lift Electronic Control) system and cam shaft journals.Remedy: The correct rocker arm shaft has been applied to the assembly line. Vehicle owners will be notified to bring their veh
3779	During the operation of the throttle valve, the sliding action of the sensor's resistance coil creates a powder substance. This powder accumulates at the point of contact by mixing with a grease that is coated on the washer inside the throttle position sensor, and PTFE (Polytetrafluroethlene) in the contact material. When
3780	During the operation of the throttle valve, the sliding action of the sensor's resistance coil creates a powder substance. This powder accumulates at the point of contact by mixing with a grease that is coated on the washer inside the throttle position sensor, and PTFE (Polytetrafluroethlene) in the contact material. When
3781	During the operation of the throttle valve, the sliding action of the sensor's resistance coil creates a powder substance. This powder accumulates at the point of contact by mixing with a grease that is coated on the washer inside the throttle position sensor, and PTFE (Polytetrafluroethlene) in the contact material. When
3782	During the operation of the throttle valve, the sliding action of the sensor's resistance coil creates a powder substance. This powder accumulates at the point of contact by mixing with a grease that is coated on the washer inside the throttle position sensor, and PTFE (Polytetrafluroethlene) in the contact material. When
3783	During the operation of the throttle valve, the sliding action of the sensor's resistance coil creates a powder substance. This powder accumulates at the point of contact by mixing with a grease that is coated on the washer inside the throttle position sensor, and PTFE (Polytetrafluroethlene) in the contact material. When
3784	Some vehicles equipped with 2.4L engines were built with oversized terminals in the wiring harness connector to the Crankshaft Position Sensor (CKPS). The oversized terminals may cause an intermittent electrical connection that can result in engine misfire or other circuit continuity problems and cause illumination of th
3785	Some vehicles equipped with 2.4L engines were built with oversized terminals in the wiring harness connector to the Crankshaft Position Sensor (CKPS). The oversized terminals may cause an intermittent electrical connection that can result in engine misfire or other circuit continuity problems and cause illumination of th
3786	On some 2008 vehicles the Camshaft Position Sensor (CMPS) may be susceptible to a higher than typical electrical noise level on the 5v supply line, fail the OBD tests for either P0340 or P0344 and illuminate the MIL.Remedy: A CMPS with improved noise filtering has been released into production. Vehicles that have
3787	On some 2008 vehicles the tolerance differences between the Crankshaft Position Sensor and the flywheel target were not properly compensated for in the software resulting in engine misfire and MIL illumination for P0300.Remedy: Chrysler has issued a TSB (18-015-08) to instruct dealership technicians to reprogram
3788	On some 2008 vehicles the OBD calibrations for the Turbocharger Overboost Condition Diagnostic and Thermostat Rationality are overly sensitive and may cause MIL illumination for P0234 or P0128 codes when no problem exists.Remedy: Chrysler has issued TSB 18-014-08 to instruct dealership technicians to reprogra
3789	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3790	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3791	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3792	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3793	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3794	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3795	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3796	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3797	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3798	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3799	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3800	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3801	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3802	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3803	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3804	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3805	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3806	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3807	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3808	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3809	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3810	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3811	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3812	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3813	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3814	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3815	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3816	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3817	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3818	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3819	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3820	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3821	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3822	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3823	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3824	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3825	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3826	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3827	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3828	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3829	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3830	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3831	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3832	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3833	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3834	Due to foreign material stuck in the purge valve, which has been mixed during production or temporary valve stuck on a burr within the valve caused by insufficient burr removing process, the valve may not operate properly resulting in MIL illumination.Remedy: Mazda plans to issue a repair procedure to assist service t

Other caus
3839	Some vehicles equipped with 1.6L engines have experienced a MI illumination as a result of fuel filler cap malfunction. According to the investigation of parts replaced, 10 out of 85 parts were found to be defective (grease sticking at O-ring of fuel filler cap and O-ring missing) and 75 out of 85 were normal. Other caus
3840	Some vehicles equipped with 2.0L engines have experienced MIL illumination with diagnostic code set indicating a thermostat malfunction. The cause is thought to be a deformation due to overheat.Remedy: Kia is covering these vehicles under warranty.
3841	Some vehicles equipped with V6 engines have experienced MIL illumination as a result of a knock sensor malfunction. Kia has inspected returned samples of the knock sensor and wire harness, but could not find a unique cause. Kia is inspecting additional vehicles to determine if there is a common fault. Remedy: K
3842	Some vehicles equipped with V6 engines have experienced MIL illumination as a result of a knock sensor malfunction. Kia has inspected returned samples of the knock sensor and wire harness, but could not find a unique cause. Kia is inspecting additional vehicles to determine if there is a common fault. Remedy: K
3843	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
3844	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
3845	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
3846	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
3847	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
3848	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
3849	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
3850	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
3851	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
3852	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replaced oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen senso
3853	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replaced oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen senso
3854	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replaced oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen senso
3855	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replaced oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen senso
3856	Due to inadequate welding of the filler pipe assembly the sectional form of the pipe is slightly deformed in some cases. It may cause the deformation and/or scratch the filler cap after long-term use. It may lead to poor sealing of the filler cap and result in MIL illumination.Remedy: Mazda plans to issue a repair proc
3857	Some vehicles may develop cracks in the Positive Crankcase Vent (PCV) hose where the hose connects to the intake manifold.Remedy: Mazda plans to issue a repair procedure to assist service technicians in correcting this concern.
3858	Some vehicles may develop cracks in the Positive Crankcase Vent (PCV) hose where the hose connects to the intake manifold.Remedy: Mazda plans to issue a repair procedure to assist service technicians in correcting this concern.
3859	The OBD system may falsely detect a malfunction of the engine coolant temperature sensor (correlation) after operator induced engine stall. the cause of the failure is inappropriate programming of the OBD system.Remedy: An ECM with improved calibration has been applied to the assembly line and is made availab
3860	The OBD system may falsely detect a malfunction of the engine coolant temperature sensor (correlation) after operator induced engine stall. the cause of the failure is inappropriate programming of the OBD system.Remedy: An ECM with improved calibration has been applied to the assembly line and is made availab
3861	The OBD system may falsely detect a malfunction of the engine coolant temperature sensor (correlation) after operator induced engine stall. the cause of the failure is inappropriate programming of the OBD system.Remedy: An ECM with improved calibration has been applied to the assembly line and is made availab
3862	Numerous drivability and or idling concerns associated with Malfunction Indicator Light (MIL) illumination may be the result of faulty Oxygen Sensors (O2 sensor). The part number involved in this report is C2P8810. There is no adverse impact on emissions if the owner returns the vehicle to a Jaguar dealership once the
3863	Fuel spit out during fill up, fuel leaking and raw fuel smell can be attributed to a cracked roll over valve. The positioning of the ventilation line may cause bending stress on the nipple of the valve causing it to crack. The part number of the fuel tank is 3B0 201 075 BK/C and 4B0 201 075 BL. No changes were made durin

4159	A defect in the activated carbon container (part # 99620122107) will illuminate the Malfunction Indicator Lamp (MIL). Broken plastic parts have been found, and were probably caused by assembly or disassembly processes. It is expected owners will return to Porsche dealership to have the light investigated and repairs
4160	A defect in the activated carbon container (part # 99620122107) will illuminate the Malfunction Indicator Lamp (MIL). Broken plastic parts have been found, and were probably caused by assembly or disassembly processes. It is expected owners will return to Porsche dealership to have the light investigated and repairs
4161	A defect in the activated carbon container (part # 99620122107) will illuminate the Malfunction Indicator Lamp (MIL). Broken plastic parts have been found, and were probably caused by assembly or disassembly processes. It is expected owners will return to Porsche dealership to have the light investigated and repairs
4162	A defect in the activated carbon container (part # 99620122107) will illuminate the Malfunction Indicator Lamp (MIL). Broken plastic parts have been found, and were probably caused by assembly or disassembly processes. It is expected owners will return to Porsche dealership to have the light investigated and repairs
4163	A defect in the activated carbon container (part # 99620122107) will illuminate the Malfunction Indicator Lamp (MIL). Broken plastic parts have been found, and were probably caused by assembly or disassembly processes. It is expected owners will return to Porsche dealership to have the light investigated and repairs
4164	Spark plugs (part # 999 170 195 90) may have been fouled during transport to dealerships. Probable cause is short idling during transport. This could cause poor acceleration, and vehicle will be brought to dealership for repair. Update 2004-20 update 2 adds (2) 2004 Engine Families.
4165	Spark plugs (part # 999 170 195 90 and 999 170 210 90) may have been fouled during transport to dealerships. Probable cause is short idling/driving during transport. This could cause poor acceleration, and vehicle will be brought to dealership for repair. Update 2004-20 update 2 adds (2) 2004 Engine Families.
4166	A fault code entry to the DME (engine control unit) control unit (part # 996 618 604 00) is sometimes replaced too early in the process of finding the real problem. Most of them appear not to have a internal fault. Dealership technicians are receiving special training so the DME unit will not be replaced unless a real fau
4167	A fault code entry to the DME (engine control unit) control unit (part # 996 618 604 00) is sometimes replaced too early in the process of finding the real problem. Most of them appear not to have a internal fault. Dealership technicians are receiving special training so the DME unit will not be replaced unless a real fau
4168	A fault code entry to the DME (engine control unit) control unit (part # 996 618 604 00) is sometimes replaced too early in the process of finding the real problem. Most of them appear not to have a internal fault. Dealership technicians are receiving special training so the DME unit will not be replaced unless a real fau
4169	On-Board Diagnosis (OBD) system stores a fault entry for the oxygen sensor (part # 996 606 128 00) even if the sensor is not defective. The code relates to the oxygen sensor heating and will illuminate the Malfunction Indicator (MIL) lamp. An engine control unit data set has been introduced to minimize the risk of t
4170	Some fuel pumps (part # 955 620 103 01 and 955 620 103 21) have been replaced in the field for complaints of engine stalling or noises. There is no effect on emissions, but the vehicle could stall while driving if the fuel pump fails. An improved fuel pump has been introduced into production. No statement was given
4171	Some fuel pumps (part # 955 620 103 01 and 955 620 103 21) have been replaced in the field for complaints of engine stalling or noises. There is no effect on emissions, but the vehicle could stall while driving if the fuel pump fails. An improved fuel pump has been introduced into production. No statement was given
4172	Some fuel pumps (part # 955 620 103 01 and 955 620 103 21) have been replaced in the field for complaints of engine stalling or noises. There is no effect on emissions, but the vehicle could stall while driving if the fuel pump fails. An improved fuel pump has been introduced into production. No statement was given
4173	Some fuel pumps (part # 955 620 103 01 and 955 620 103 21) have been replaced in the field for complaints of engine stalling or noises. There is no effect on emissions, but the vehicle could stall while driving if the fuel pump fails. An improved fuel pump has been introduced into production. No statement was given
4174	Some fuel pumps (part # 955 620 103 01 and 955 620 103 21) have been replaced in the field for complaints of engine stalling or noises. There is no effect on emissions, but the vehicle could stall while driving if the fuel pump fails. An improved fuel pump has been introduced into production. No statement was given
4175	On some Cayenne Turbo vehicles the oil separator was faulty and could leak oil into the intercooler hoses. The technician would assume there was a bad seal in the turbocharger; then replace the pressure hoses, turbo and flush the intercooler, or they would replace the oil separator and pressure hoses. Examine the pre
4176	Malfunction Indicator Lamp (MIL) illumination and vehicle hesitation may be related to faulty spark plugs (part # 999 170 223 90). No information was provided relating to the effect on emissions. The condition is being monitored for follow up. Update 5 adds statement that the majority of the spark plugs are being repl
4177	Malfunction Indicator Lamp (MIL) illumination and vehicle hesitation may be related to faulty spark plugs (part # 999 170 223 90). No information was provided relating to the effect on emissions. The condition is being monitored for follow up. Update 5 adds statement that the majority of the spark plugs are being repl
4178	Malfunction Indicator Lamp (MIL) illumination and vehicle hesitation may be related to faulty spark plugs (part # 999 170 223 90). No information was provided relating to the effect on emissions. The condition is being monitored for follow up. Update 5 adds statement that the majority of the spark plugs are being repl

4247	There is no specific complaint regarding this component (part no. 997 111 217 70 or 997 111 215 70). Metal exhaust seals located between the turbocharger and catalyst are being replaced in the field. This component is a service part which must be replaced anytime the gasket is removed. For many engine service ope
4248	On some 2006 vehicles the camshaft position sensor valve used to control the exhaust camshaft phaser, using oil pressure, may become contaminated with debris due to failure of the wire mesh oil filter screens. Once the wire mesh filter screen fails, wire mesh pieces or other debris present in the engine oil may jam t
4249	One of the downstream catalyst cans has been observed to lose retention of the substrate. Each substrate is supported by an intumescent mat. Proper fit of the substrate and mat is important for catalyst durability. The substrate is wrapped in an intumescent mat during manufacture which is then pushed into a cylindr
4250	One of the downstream catalyst cans has been observed to lose retention of the substrate. Each substrate is supported by an intumescent mat. Proper fit of the substrate and mat is important for catalyst durability. The substrate is wrapped in an intumescent mat during manufacture which is then pushed into a cylindr
4251	One of the downstream catalyst cans has been observed to lose retention of the substrate. Each substrate is supported by an intumescent mat. Proper fit of the substrate and mat is important for catalyst durability. The substrate is wrapped in an intumescent mat during manufacture which is then pushed into a cylindr
4252	One of the downstream catalyst cans has been observed to lose retention of the substrate. Each substrate is supported by an intumescent mat. Proper fit of the substrate and mat is important for catalyst durability. The substrate is wrapped in an intumescent mat during manufacture which is then pushed into a cylindr
4253	One of the downstream catalyst cans has been observed to lose retention of the substrate. Each substrate is supported by an intumescent mat. Proper fit of the substrate and mat is important for catalyst durability. The substrate is wrapped in an intumescent mat during manufacture which is then pushed into a cylindr
4254	Vehicle may have inoperative ignition coil due to internal cracking of the coil housing in the coil manufacturing process. Engine is expected to experience rough running. MIL will be illuminated. Improvements in the manufacture of the ignition coil were implemented in September of 2001, and improvements were made t
4255	Under certain conditions fault code of P150A will be stored in the Engine Control Unit (ECU), part numbers 8T0 907 560 D/G. The sequence consists of the car setting approximately 36 hours, the instrument cluster timer clocking 124 instead of 120 seconds and the driver performing an on/off/on starting sequence. Ther
4256	Malfunction Indicator Lamp (MIL) on with the following Diagnostic Trouble Code (DTC) were observed P0300 (Random/Multiple Cylinder Misfire) also any single misfire code may be present (P0301-0306). Analysis of sample parts (part number 06E 905 115 D) shows that the majority of the complaints were caused by ele
4257	If the ignition coil (Part No. 948 602 104 00) is not working properly the On-Board Diagnosis system (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). The vehicle may have drivability problems such as rough idle or poor acceleration performance. As these replacements are considered random
4258	If the ignition coil (Part No. 948 602 104 00) is not working properly the On-Board Diagnosis system (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). The vehicle may have drivability problems such as rough idle or poor acceleration performance. As these replacements are considered random
4259	If the ignition coil (Part No. 948 602 104 00) is not working properly the On-Board Diagnosis system (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). The vehicle may have drivability problems such as rough idle or poor acceleration performance. As these replacements are considered random
4260	If the ignition coil (Part No. 948 602 104 00) is not working properly the On-Board Diagnosis system (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). The vehicle may have drivability problems such as rough idle or poor acceleration performance. As these replacements are considered random
4261	If the ignition coil (Part No. 948 602 104 00) is not working properly the On-Board Diagnosis system (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). The vehicle may have drivability problems such as rough idle or poor acceleration performance. As these replacements are considered random
4262	If the ignition coil (Part No. 948 602 104 00) is not working properly the On-Board Diagnosis system (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). The vehicle may have drivability problems such as rough idle or poor acceleration performance. As these replacements are considered random
4263	If the ignition coil (Part No. 948 602 104 00) is not working properly the On-Board Diagnosis system (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). The vehicle may have drivability problems such as rough idle or poor acceleration performance. As these replacements are considered random
4264	If the ignition coil (Part No. 948 602 104 00) is not working properly the On-Board Diagnosis system (OBD) misfire detection will illuminate the Malfunction Indicator Lamp (MIL). The vehicle may have drivability problems such as rough idle or poor acceleration performance. As these replacements are considered random
4265	Over sensitive diagnostics for very small evaporative emissions leak detection by the Engine Control Unit (ECU) may cause Malfunction Indicator Lamp (MIL) illumination. Diagnostic trouble code (DTC) P0456 will be stored in the ECU also. A new software algorithm was introduced to disable leak detection of 0.039 and le
4266	Over sensitive diagnostics for very small evaporative emissions leak detection by the Engine Control Unit (ECU) may cause Malfunction Indicator Lamp (MIL) illumination. Diagnostic trouble code (DTC) P0456 will be stored in the ECU also. A new software algorithm was introduced to disable leak detection of 0.039 and le
4267	Over sensitive diagnostics for very small evaporative emissions leak detection by the Engine Control Unit (ECU) may cause Malfunction Indicator Lamp (MIL) illumination. Diagnostic trouble code (DTC) P0456 will be stored in the ECU also. A new software algorithm was introduced to disable leak detection of 0.039 and le
4268	Over sensitive diagnostics for very small evaporative emissions leak detection by the Engine Control Unit (ECU) may cause Malfunction Indicator Lamp (MIL) illumination. Diagnostic trouble code (DTC) P0456 will be stored in the ECU also. A new software algorithm was introduced to disable leak detection of 0.039 and le
4269	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4270	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4271	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4272	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4273	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4274	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4275	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4276	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4277	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4278	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4279	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4280	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4281	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4282	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4283	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4284	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4285	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4286	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4287	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4288	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4289	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4290	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4291	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4292	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4293	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4294	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4295	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4296	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4297	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4298	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4299	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4300	During two specific time periods in 2008, a failure of the Central On-Line Workshop System, allowed incorrect programming to be sent to the repairing facilities. This incorrect programming causes numerous electrical malfunctions affecting, but not limited to, fuel pump system, crash detection system, speedometer, spee
4301	Engine oil fill caps are being replaced for concerns of oil leakage. A poor seal or loose fitting oil cap will allow the release of internal engine vapors into the atmosphere. The manufacturer considers these to be random occurrences thus no follow up is planned. Part number involved is 948 107 035 01.
4302	Engine oil fill caps are being replaced for concerns of oil leakage. A poor seal or loose fitting oil cap will allow the release of internal engine vapors into the atmosphere. The manufacturer considers these to be random occurrences thus no follow up is planned. Part number involved is 948 107 035 01.
4303	Engine oil fill caps are being replaced for concerns of oil leakage. A poor seal or loose fitting oil cap will allow the release of internal engine vapors into the atmosphere. The manufacturer considers these to be random occurrences thus no follow up is planned. Part number involved is 948 107 035 01.
4304	Engine oil fill caps are being replaced for concerns of oil leakage. A poor seal or loose fitting oil cap will allow the release of internal engine vapors into the atmosphere. The manufacturer considers these to be random occurrences thus no follow up is planned. Part number involved is 948 107 035 01.
4305	Engine oil fill caps are being replaced for concerns of oil leakage. A poor seal or loose fitting oil cap will allow the release of internal engine vapors into the atmosphere. The manufacturer considers these to be random occurrences thus no follow up is planned. Part number involved is 948 107 035 01.
4306	Electronic throttle valves are being replaced based on particular Diagnostic Trouble Codes (DTC) and Malfunction Indicator Lamp (MIL) illumination. Concerns of engine hesitation is also being reported. The manufacturer is currently monitoring the situation. Part number involved is 948 605 115 03.
4307	Electronic throttle valves are being replaced based on particular Diagnostic Trouble Codes (DTC) and Malfunction Indicator Lamp (MIL) illumination. Concerns of engine hesitation is also being reported. The manufacturer is currently monitoring the situation. Part number involved is 948 605 115 03.
4308	Electronic throttle valves are being replaced based on particular Diagnostic Trouble Codes (DTC) and Malfunction Indicator Lamp (MIL) illumination. Concerns of engine hesitation is also being reported. The manufacturer is currently monitoring the situation. Part number involved is 948 605 115 03.
4309	Electronic throttle valves are being replaced based on particular Diagnostic Trouble Codes (DTC) and Malfunction Indicator Lamp (MIL) illumination. Concerns of engine hesitation is also being reported. The manufacturer is currently monitoring the situation. Part number involved is 948 605 115 03.
4310	Electronic throttle valves are being replaced based on particular Diagnostic Trouble Codes (DTC) and Malfunction Indicator Lamp (MIL) illumination. Concerns of engine hesitation is also being reported. The manufacturer is currently monitoring the situation. Part number involved is 948 605 115 03.
4311	Electronic throttle valves are being replaced based on particular Diagnostic Trouble Codes (DTC) and Malfunction Indicator Lamp (MIL) illumination. Concerns of engine hesitation is also being reported. The manufacturer is currently monitoring the situation. Part number involved is 948 605 115 03.
4312	Electronic throttle valves are being replaced based on particular Diagnostic Trouble Codes (DTC) and Malfunction Indicator Lamp (MIL) illumination. Concerns of engine hesitation is also being reported. The manufacturer is currently monitoring the situation. Part number involved is 948 605 115 03.
4313	Electronic throttle valves are being replaced based on particular Diagnostic Trouble Codes (DTC) and Malfunction Indicator Lamp (MIL) illumination. Concerns of engine hesitation is also being reported. The manufacturer is currently monitoring the situation. Part number involved is 948 605 115 03.
4314	Electronic throttle valves are being replaced based on particular Diagnostic Trouble Codes (DTC) and Malfunction Indicator Lamp (MIL) illumination. Concerns of engine hesitation is also being reported. The manufacturer is currently monitoring the situation. Part number involved is 948 605 115 03.
4315	Electronic throttle valves are being replaced based on particular Diagnostic Trouble Codes (DTC) and Malfunction Indicator Lamp (MIL) illumination. Concerns of engine hesitation is also being reported. The manufacturer is currently monitoring the situation. Part number involved is 948 605 115 03.
4316	Concerns of engines being hard to start and Malfunction Indicator Lamp (MIL) illumination may be associated with engine temperature sensor failure. The manufacturer has no follow up plans at this time. Part numbers involved are 955 106 125 00 and 955 106 125 01. Update 1 adds 2009 Engine Family and updates s
4317	Concerns of engines being hard to start and Malfunction Indicator Lamp (MIL) illumination may be associated with engine temperature sensor failure. The manufacturer has no follow up plans at this time. Part numbers involved are 955 106 125 00 and 955 106 125 01. Update 1 adds 2009 Engine Family and updates s
4318	Concerns of engines being hard to start and Malfunction Indicator Lamp (MIL) illumination may be associated with engine temperature sensor failure. The manufacturer has no follow up plans at this time. Part numbers involved are 955 106 125 00 and 955 106 125 01. Update 1 adds 2009 Engine Family and updates s
4319	Concerns of engines being hard to start and Malfunction Indicator Lamp (MIL) illumination may be associated with engine temperature sensor failure. The manufacturer has no follow up plans at this time. Part numbers involved are 955 106 125 00 and 955 106 125 01. Update 1 adds 2009 Engine Family and updates s
4320	Air intake tubes are being replaced based on Malfunction Indicator Lamp (MIL) illumination. No manufacturer follow up is planned at this time. Part number involved are 955 110 046 00.
4321	Air intake tubes are being replaced based on Malfunction Indicator Lamp (MIL) illumination. No manufacturer follow up is planned at this time. Part number involved are 955 110 046 00.
4322	Air intake tubes are being replaced based on Malfunction Indicator Lamp (MIL) illumination. No manufacturer follow up is planned at this time. Part number involved are 955 110 046 00.
4323	Air intake tubes are being replaced based on Malfunction Indicator Lamp (MIL) illumination. No manufacturer follow up is planned at this time. Part number involved are 955 110 046 00.
4324	Air intake tubes are being replaced based on Malfunction Indicator Lamp (MIL) illumination. No manufacturer follow up is planned at this time. Part number involved are 955 110 046 00.
4325	Fuel filler caps are being replaced for two main concerns, a broken tether or Malfunction Indicator Lamp (MIL) illumination. Part numbers 955 201 241 20, 955 201 550 10 or 955 201 241 11 are involved. The manufacturer has no follow up plans at this time.
4326	Fuel filler caps are being replaced for two main concerns, a broken tether or Malfunction Indicator Lamp (MIL) illumination. Part numbers 955 201 241 20, 955 201 550 10 or 955 201 241 11 are involved. The manufacturer has no follow up plans at this time.
4327	Fuel filler caps are being replaced for two main concerns, a broken tether or Malfunction Indicator Lamp (MIL) illumination. Part numbers 955 201 241 20, 955 201 550 10 or 955 201 241 11 are involved. The manufacturer has no follow up plans at this time.
4328	Fuel filler caps are being replaced for two main concerns, a broken tether or Malfunction Indicator Lamp (MIL) illumination. Part numbers 955 201 241 20, 955 201 550 10 or 955 201 241 11 are involved. The manufacturer has no follow up plans at this time.
4329	Fuel filler caps are being replaced for two main concerns, a broken tether or Malfunction Indicator Lamp (MIL) illumination. Part numbers 955 201 241 20, 955 201 550 10 or 955 201 241 11 are involved. The manufacturer has no follow up plans at this time.
4330	Fuel filler caps are being replaced for two main concerns, a broken tether or Malfunction Indicator Lamp (MIL) illumination. Part numbers 955 201 241 20, 955 201 550 10 or 955 201 241 11 are involved. The manufacturer has no follow up plans at this time.
4331	Fuel filler caps are being replaced for two main concerns, a broken tether or Malfunction Indicator Lamp (MIL) illumination. Part numbers 955 201 241 20, 955 201 550 10 or 955 201 241 11 are involved. The manufacturer has no follow up plans at this time.
4332	Fuel filler caps are being replaced for two main concerns, a broken tether or Malfunction Indicator Lamp (MIL) illumination. Part numbers 955 201 241 20, 955 201 550 10 or 955 201 241 11 are involved. The manufacturer has no follow up plans at this time.
4333	Fuel filler caps are being replaced for two main concerns, a broken tether or Malfunction Indicator Lamp (MIL) illumination. Part numbers 955 201 241 20, 955 201 550 10 or 955 201 241 11 are involved. The manufacturer has no follow up plans at this time.
4334	Fuel filler caps are being replaced for two main concerns, a broken tether or Malfunction Indicator Lamp (MIL) illumination. Part numbers 955 201 241 20, 955 201 550 10 or 955 201 241 11 are involved. The manufacturer has no follow up plans at this time.
4335	Fuel filler caps are being replaced for two main concerns, a broken tether or Malfunction Indicator Lamp (MIL) illumination. Part numbers 955 201 241 20, 955 201 550 10 or 955 201 241 11 are involved. The manufacturer has no follow up plans at this time.
4336	Fuel filler caps are being replaced for two main concerns, a broken tether or Malfunction Indicator Lamp (MIL) illumination. Part numbers 955 201 241 20, 955 201 550 10 or 955 201 241 11 are involved. The manufacturer has no follow up plans at this time.
4337	Fuel filler caps are being replaced for two main concerns, a broken tether or Malfunction Indicator Lamp (MIL) illumination. Part numbers 955 201 241 20, 955 201 550 10 or 955 201 241 11 are involved. The manufacturer has no follow up plans at this time.
4338	Replacement of fuel injector valves for Malfunction indicator lamp (MIL) illumination associated with engine miss fire is being investigated. Complaints of hesitation and rough idle have also been reported. Returned parts tested by the manufacturer have been found to perform as designed. Part number 955 605 031 00
4339	Replacement of fuel injector valves for Malfunction indicator lamp (MIL) illumination associated with engine miss fire is being investigated. Complaints of hesitation and rough idle have also been reported. Returned parts tested by the manufacturer have been found to perform as designed. Part number 955 605 031 00
4340	Replacement of fuel injector valves for Malfunction indicator lamp (MIL) illumination associated with engine miss fire is being investigated. Complaints of hesitation and rough idle have also been reported. Returned parts tested by the manufacturer have been found to perform as designed. Part number 955 605 031 00
4341	Fuel tanks are being replaced for complaints of hard refueling, in some cases the anti-spit-back valve was not welded correctly. Fuel tank part numbers 955 201 075 10, 955 201 075 11, 955 201 075 12, 955 201 075 13, and 955 201 075 15 are involved. No drivability or emissions related concerns were provided. A pro
4342	Fuel tanks are being replaced for complaints of hard refueling, in some cases the anti-spit-back valve was not welded correctly. Fuel tank part numbers 955 201 075 10, 955 201 075 11, 955 201 075 12, 955 201 075 13, and 955 201 075 15 are involved. No drivability or emissions related concerns were provided. A pro
4343	Fuel tanks are being replaced for complaints of hard refueling, in some cases the anti-spit-back valve was not welded correctly. Fuel tank part numbers 955 201 075 10, 955 201 075 11, 955 201 075 12, 955 201 075 13, and 955 201 075 15 are involved. No drivability or emissions related concerns were provided. A pro
4344	Fuel tanks are being replaced for complaints of hard refueling, in some cases the anti-spit-back valve was not welded correctly. Fuel tank part numbers 955 201 075 10, 955 201 075 11, 955 201 075 12, 955 201 075 13, and 955 201 075 15 are involved. No drivability or emissions related concerns were provided. A pro
4345	Fuel tanks are being replaced for complaints of hard refueling, in some cases the anti-spit-back valve was not welded correctly. Fuel tank part numbers 955 201 075 10, 955 201 075 11, 955 201 075 12, 955 201 075 13, and 955 201 075 15 are involved. No drivability or emissions related concerns were provided. A pro
4346	Fuel tanks are being replaced for complaints of hard refueling, in some cases the anti-spit-back valve was not welded correctly. Fuel tank part numbers 955 201 075 10, 955 201 075 11, 955 201 075 12, 955 201 075 13, and 955 201 075 15 are involved. No drivability or emissions related concerns were provided. A pro
4347	Fuel tanks are being replaced for complaints of hard refueling, in some cases the anti-spit-back valve was not welded correctly. Fuel tank part numbers 955 201 075 10, 955 201 075 11, 955 201 075 12, 955 201 075 13, and 955 201 075 15 are involved. No drivability or emissions related concerns were provided. A pro
4348	Fuel tanks are being replaced for complaints of hard refueling, in some cases the anti-spit-back valve was not welded correctly.
