285	An improved method of packaging the carbon canisters has been introduced into production. Reviewed - no further action is required.
286	Vehicles may be equipped with an improperly functioning on-board emission-related diagnostic system. Certain emission control system faults could develop without the Malfunction Indicator Lamp (MIL) being illuminated. Remedy: Dealers will reprogram the Engine Control Module (ECM).
287	Vehicles may be equipped with an improperly functioning on-board emission-related diagnostic system. Certain emission control system faults could develop without the Malfunction Indicator Lamp (MIL) being illuminated. Remedy: Dealers will reprogram the Engine Control Module (ECM).
288	Vehicles may be equipped with an improperly functioning on-board emission-related diagnostic system. Certain emission control system faults could develop without the Malfunction Indicator Lamp (MIL) being illuminated. Remedy: Dealers will reprogram the Engine Control Module (ECM).
289	Porsche is replacing TCU's as customer complaints are received. Reviewed - no further action is required.
290	No effect on emissions. A Powertrain Control Module (PCM) with an improved calibration has been applied to the assembly line and has been made available for repairs under Running Change #X9. When this defect occurs, the Malfunction Indicator Light (MIL) illuminates, and the vehicle will probably be brought to a de
291	This part is replaced as a required replacement during major engine or transmission repairs or any time the exhaust system is removed from the engine. Reviewed - no further action is required.
292	When this defect occurs, a Malfunction Indicator Light (MIL) illuminates, and the vehicle will probably be brought to a dealership and diagnosed under emission warranty. An Electronic Control Module (ECM) with improved programming has been made available for repairs.
293	When this defect occurs, the Malfunction Indicator Light (MIL) illuminates, and the vehicle will probably be brought to a dealership for repair. The PCM software will be updated under emission warranty according to the Honda Technical Service Bulletin and the Acura Technical Service Bulletin.
294	Certain 2007 model year Alpina B7 vehicles have a software error such that certain On-Board Diagnostics (OBD) may not operate properly.Remedy: BMW service centers will reprogram the Engine Control Module (ECM) in these vehicles with an improved version of the software.
295	Certain vehicles have a software error such that the DME programming may cause the Onboard Diagnostic (OBD) to erroneously evaluate the emissions performance of the catalytic converter and causing the "Service Engine Soon" light to illuminate prematurely. Remedy: BMW will reprogram the DME control module wit
296	Mfg. offered 10/100 extended warranty. Steve to follow-up with CARB.
297	Certain 2005 and 2006 model year 325CiA vehicles have potential problem relating to the engine's secondary air system. Due to premature material wear of the secondary air system valve and associated vacuum control lines, the system may fail to operate during cold starts causing a Service Engine Soon light to illum

285	On some vehicles the carbon canister (part # 997 201 221 04) has been replaced due to a minor leak and the setting of the Malfunction Indicator Lamp (MIL). It appears that the carbon canisters in question were damaged in transit from the supplier. An improved method of packaging the carbon canisters has been in
286	Certain 2006 GM and Isuzu vehicles equipped with 2.2L, 4.2L and 4.6L engines and Secondary Air Injection Reaction (SAIR) systems have a condition in which the SAIR system and diagnostics can be disabled without MIL illumination in the presence of a short-to-power fault in the SAIR pump or valve relay driver circuit.F
287	Certain 2006 GM and Isuzu vehicles equipped with 2.2L, 4.2L and 4.6L engines and Secondary Air Injection Reaction (SAIR) systems have a condition in which the SAIR system and diagnostics can be disabled without MIL illumination in the presence of a short-to-power fault in the SAIR pump or valve relay driver circuit.F
288	Certain 2006 GM and Isuzu vehicles equipped with 2.2L, 4.2L and 4.6L engines and Secondary Air Injection Reaction (SAIR) systems have a condition in which the SAIR system and diagnostics can be disabled without MIL illumination in the presence of a short-to-power fault in the SAIR pump or valve relay driver circuit.F
289	Transmission control units (part # 996 618 180 07) are being replaced due to harsh shifting of transmission, or transmission shifting too aggressively complaints from customers. Indication of manufacturer Follow-Up - None.Update 1 dated 11/8/2007 adds 2003 engine family.
290	Under certain driving conditions, the Onboard Diagnostic (OBD) system may falsely detect a malfunction of the thermostat. The cause of the failure is inappropriate calibration of the OBD system. Remedy: A Powertrain Control Module (PCM) with an improved calibration has been applied to the assembly line and has b
291	Some vehicles have had the exhaust gasket (Part #955 111 113 20) replaced. This part is replaced as a required replacement during major engine or transmission repairs or any time the exhaust system is removed from the engine. They are not being replaced because they are defective.
292	The Onboard Diagnostic (OBD) system may falsely detect a deterioration of the catalyst system efficiency. The cause of the failure is inappropriate programming of the OBD system. When this defect occurs, a Malfunction Indicator Light (MIL) illuminates, and the vehicle will probably be brought to a dealership and diag
293	The On-Board Diagnostic (OBD) system may falsely detect a malfunction of the number 2 engine coolant temperature sensor and the intake air temperature sensor. The cause of the failure is inappropriate calibration of the OBD system system. REMEDY: A Powertrain Control Module (PCM) with an improved calibration
294	During On-Board Diagnostics (OBD) Production Vehicle Evaluation (PVE) testing, required by California Air Resources Board (CARB) regulations. BMW discovered a software error in the Electronic Control Unit (ECU) module. The diagnostics of the thermostat, the Mass-Air Flow (MAF) sensor, radiator outlet temperature sens
295	Because of thermal shock conditions during high performance driving events and due to different material expansions the welding points of the metal monoliths of the affected converters may break causing a rattling noise. If left unattended this could lead to a deformation of the monolith's cell structure. Update dated
296	Because of thermal shock conditions during high performance driving events and due to different material expansions the welding points of the metal monoliths of the affected converters may break causing a rattling noise. If left unattended this could lead to a deformation of the monolith's cell structure. Update dated
297	The affected part number 11727553064 relates to the SAS (Secondary Air System) valve. In June 2005, a new redesigned SAS valve (free from chromium) was introduced into production. This valve tends to jam more because of condensate and may not open sometimes. Which may cause premature wear and cause th
298	The affected part number 11727553064 relates to the SAS (Secondary Air System) valve. In June 2005, a new redesigned SAS valve (free from chromium) was introduced into production. This valve tends to jam more because of condensate and may not open sometimes. Which may cause premature wear and cause th
299	Malfunction Indicator Lamp (MIL) illumination with trouble codes P0116 and P0117 stored in the Engine Control Units (ECU). May be the result of the Engine Coolant Sensor (ECT) failing. Failures are attributed to internal electrical concerns of part number 059 919 501 A. The effect on emissions and drivability is yet to b
300	Malfunction Indicator Lamp (MIL) illumination with trouble codes P0116 and P0117 stored in the Engine Control Units (ECU). May be the result of the Engine Coolant Sensor (ECT) failing. Failures are attributed to internal electrical concerns of part number 059 919 501 A. The effect on emissions and drivability is yet to b
301	Malfunction Indicator Lamp (MIL) illumination with diagnostic trouble code P0420 and rattling noise from underneath can be caused by broken monolith inside the catalytic converter (1J0 254 503 K). Some converters returned for inspection had broken flex pipes. Emissions impact of converters with a broken monolith ex
302	Malfunction Indicator Lamp (MIL) illumination with diagnostic trouble codes P0442 and P0456 may be related to defective fuel caps (part number 3C0 201 550 G). Trouble codes relate to small and very small Evaporative Emissions (EVAP) leaks respectively. Parts analyzed found the majority of the defective components
303	The Vehicle Emissions Control Information (VECI) label with incorrect spark plug information was affixed to some 2005 model year Dodge Dakota trucks equipped with high output 4.7L engines.Remedy: Chrysler will conduct a Voluntary Emission Recall (G46) to replace the VECI label on the affected vehicles.
304	Malfunction Indicator Lamp (MIL) illumination and setting a Diagnostic Trouble Code (DTC) P2181 is related to the sealing ring on the thermostat moving inside the housing. The engine will not reach proper operating temperature. Impact on emissions and drivability was not reported. New thermostat housing with a mo
305	Malfunction Indicator Lamp (MIL) illumination and setting a Diagnostic Trouble Code (DTC) P2181 is related to the sealing ring on the thermostat moving inside the housing. The engine will not reach proper operating temperature. Impact on emissions and drivability was not reported. New thermostat housing with a mo
306	Malfunction Indicator Lamp (MIL) illumination and a Diagnostic Trouble Code (DTC) (not given) set in memory, may be caused by incorrect engine control unit programming. The automatic diagnosis of the evaporative emissions system may detect a leak when there is none. No emission or drivability impacts were given
307	Malfunction Indicator Lamp (MIL) illumination and a Diagnostic Trouble Code (DTC) (not given) set in memory, may be caused by incorrect engine control unit programming. The automatic diagnosis of the evaporative emissions system may detect a leak when there is none. No emission or drivability impacts were given
308	A VECI label with incorrect spark plug information was affixed to some 2007 Dodge Nitro vehicles equipped with 4.0L engines.Remedy: Chrysler will conduct a Voluntary Emissions Recall (G45) to replace the VECI label on the affected vehicles.
309	A VECI label with incorrect spark plug information was affixed to some 2007 Dodge Nitro vehicles equipped with 4.0L engines.Remedy: Chrysler will conduct a Voluntary Emissions Recall (G45) to replace the VECI label on the affected vehicles.
310	Malfunction Indicator Lamp (MIL) illumination and numerous Diagnostic Trouble Codes (DTC) could be caused by an electrical malfunction of the fuel pressure sensor, part number 06E 906 051 E. DTC codes noted were P2539, 2540, 2541, 2543, 310B and 129F all related to low fuel pressure caused by intermittent, weal
311	Malfunction Indicator Lamp (MIL) illumination and numerous Diagnostic Trouble Codes (DTC) could be caused by an electrical malfunction of the fuel pressure sensor, part number 06E 906 051 E. DTC codes noted were P2539, 2540, 2541, 2543, 310B and 129F all related to low fuel pressure caused by intermittent, weal
312	Malfunction Indicator Lamp (MIL) illumination and numerous Diagnostic Trouble Codes (DTC) could be caused by an electrical malfunction of the fuel pressure sensor, part number 06E 906 051 E. DTC codes noted were P2539, 2540, 2541, 2543, 310B and 129F all related to low fuel pressure caused by intermittent, weal
313	Malfunction Indicator Lamp (MIL) illumination and numerous Diagnostic Trouble Codes (DTC) could be caused by an electrical malfunction of the fuel pressure sensor, part number 06E 906 051 E. DTC codes noted were P2539, 2540, 2541, 2543, 310B and 129F all related to low fuel pressure caused by intermittent, weal
314	Malfunction Indicator Lamp (MIL) illumination and numerous Diagnostic Trouble Codes (DTC) could be caused by an electrical malfunction of the fuel pressure sensor, part number 06E 906 051 E. DTC codes noted were P2539, 2540, 2541, 2543, 310B and 129F all related to low fuel pressure caused by intermittent, weal
315	An inapplicable Vehicle Emissions Control Information (VECI) label was installed on some early 2008 model year Dodge Ram 3500 vehicles. Some 50 state certified 2008 model year D1 vehicles were built with VECI labels that incorrectly state "Not for sale in states with California emissions standards".Remedy: Chrysler
316	A Safety Recall was initiated for concerns of engines stalling or quitting while driving due to premature wear of the carbon brush set in the fuel pump. Part numbers 8E0 906 087 D/E/N/P are involved in the recall. Remedy: Volkswagen and Audi dealers were sent instructions on or about September 26, 2007 to inspect su

Update 1 dated 7/22/2008 adds part numbers 955 618 020 11, 955 618 021 11, 955 618 022 11 and 955 618 022 00. A
332	Transmission control units are being replaced to address harsh shifting of the transmission when cold. Part numbers 955 618 022 12, 955 618 021 12 and 955 618 020 12, were listed in the report. Update 1 dated 7/22/2008 adds part numbers 955 618 020 11, 955 618 021 11, 955 618 022 11 and 955 618 022 00. A
333	Transmission control units are being replaced to address harsh shifting of the transmission when cold. Part numbers 955 618 022 12, 955 618 021 12 and 955 618 020 12, were listed in the report. Update 1 dated 7/22/2008 adds part numbers 955 618 020 11, 955 618 021 11, 955 618 022 11 and 955 618 022 00. A
334	Transmission control units are being replaced to address harsh shifting of the transmission when cold. Part numbers 955 618 022 12, 955 618 021 12 and 955 618 020 12, were listed in the report. Update 1 dated 7/22/2008 adds part numbers 955 618 020 11, 955 618 021 11, 955 618 022 11 and 955 618 022 00. A
335	Transmission control units are being replaced to address harsh shifting of the transmission when cold. Part numbers 955 618 022 12, 955 618 021 12 and 955 618 020 12, were listed in the report. Update 1 dated 7/22/2008 adds part numbers 955 618 020 11, 955 618 021 11, 955 618 022 11 and 955 618 022 00. A
336	Transmission control units are being replaced to address harsh shifting of the transmission when cold. Part numbers 955 618 022 12, 955 618 021 12 and 955 618 020 12, were listed in the report. Update 1 dated 7/22/2008 adds part numbers 955 618 020 11, 955 618 021 11, 955 618 022 11 and 955 618 022 00. A
337	Transmission control units are being replaced to address harsh shifting of the transmission when cold. Part numbers 955 618 022 12, 955 618 021 12 and 955 618 020 12, were listed in the report. Update 1 dated 7/22/2008 adds part numbers 955 618 020 11, 955 618 021 11, 955 618 022 11 and 955 618 022 00. A
338	Some 2005 E-Series vehicles may have Fuel Delivery Modules replaced due to a degradation in engine performance. The analysis of the returned module found a loss of fuel pump flow due to contaminates. Sources of contaminates can be from various sources such as fleet fuel contaminates (e.g. sand) and weld spatt
339	Some 2005 Ford Escape vehicles experience damaged ignition coil drivers in the Powertrain Control Module (PCM) due to electrical noise reflected back from the spark plugs. Emissions may be adversely affected if this condition is present. However, the PCM will recognize the problem, shut off fuel to the affected cylinder
340	Some 2005 Ford Explorer and Mercury Mountaineer vehicles may have fuel tank senders with disconnected or intermittent contact between the fuel level float and the back plate. No emission effect accompanies this problem, however, in some cases, certain OBD monitoring may be suspended when fuel level signal is stu
341	A loose wiring harness connection at the Oxygen sensor, part number 955 606 136 01, would cause Malfunction Indicator Lamp (MIL) illumination. Also numerous fault codes would be stored in the Engine Control Unit (ECU). Production changes were made in mid 2004 which have addressed this problem.
342	A loose wiring harness connection at the Oxygen sensor, part number 955 606 136 01, would cause Malfunction Indicator Lamp (MIL) illumination. Also numerous fault codes would be stored in the Engine Control Unit (ECU). Production changes were made in mid 2004 which have addressed this problem.
343	The O-ring (996 106 801 06) that connects the Y-pipe to the intercooler is replaced every time the exhaust system is taken apart. This report is based on parts sold on warranty claims and not necessarily part failure.
344	Rough running concerns and various fault codes stored are related to speed (hall) sensor failure. Part number 966 606 106 02. Manufacturer is asking dealers to return parts for analysis. Information concerning the impact on emissions and emissions related test data were not sent. A change to this part was made in C
345	Rough running concerns and various fault codes stored are related to speed (hall) sensor failure. Part number 966 606 106 02. Manufacturer is asking dealers to return parts for analysis. Information concerning the impact on emissions and emissions related test data were not sent. A change to this part was made in C
346	The program in the Engine Control Module (ECM) for controlling evaporative emissions canister purges may not allow purging. Remedy: Nissan will conduct a recall in California, and in those states which require the sale of California emissions vehicles. The recall will involve reprogramming the ECM to correct the proble
347	The program in the Engine Control Module (ECM) for controlling evaporative emissions canister purges may not allow purging. Remedy: Nissan will conduct a recall in California, and in those states which require the sale of California emissions vehicles. The recall will involve reprogramming the ECM to correct the proble
348	The program in the Engine Control Module (ECM) for controlling evaporative emissions canister purges may not allow purging. These particles may prevent the ESIM from sealing the evaporative system, resulting in a Malfunction In
718	Malfunction Indicator Lamp (MIL) on with the following Diagnostic Trouble Code (DTC) observed P0171 (Fuel trim, system too lean), signal too high, may be caused by a cracked Oxygen (O2) sensor. Part number 06A 906 262 CG. No test data was provided, the effect on emissions and drivability are yet to be determine
719	There are two unused pin cavities in the 12-way fuel sender harness connector assembly. Undersized silicone rubber cavity plugs were installed in the two locations, which could allow moisture to enter the connector. Subsequent corrosion in the 12-way connector could result in failure of the evaporative canister vent soler
720	There are two unused pin cavities in the 12-way fuel sender harness connector assembly. Undersized silicone rubber cavity plugs were installed in the two locations, which could allow moisture to enter the connector. Subsequent corrosion in the 12-way connector could result in failure of the evaporative canister vent soler
721	There are two unused pin cavities in the 12-way fuel sender harness connector assembly. Undersized silicone rubber cavity plugs were installed in the two locations, which could allow moisture to enter the connector. Subsequent corrosion in the 12-way connector could result in failure of the evaporative canister vent soler
722	There is no specific complaint regarding this component (part no. 997 111 217 70 or 997 111 215 70). Metal exhaust seals located between the turbocharger and catalyst are being replaced in the field. This component is a service part which must be replaced anytime the gasket is removed. For many engine service ope
723	Exhaust manifolds with integrated catalyst are being replaced in the field. The vast majority of complaints are for a rattling noise. Failed parts (part no. 996 113 104 07) are being called in from the field for analysis. The impact on emissions and drivability are yet to be determined and no emissions data is available at
724	Customers have been experiencing vehicle hesitation issues and / or Malfunction Indicator Lamp (MIL) on. The source of the problem appears to be the high pressure fuel pump, part number 948 110 315 02. It has been determined that the following types of problems are root causes. 1) The steel bellow within the pu
725	Some 2005 Subaru Legacy/Outback 2.5L models will experience Malfunction Indicator Light (MIL)illumination. The On-Board Diagnostics system code for catalyst system efficiency below threshold (P0420) will be illuminated. Under certain unique driving patterns, such as repetitions of acceleration and deceleration or co
726	The vehicles current On-Board Diagnostic (OBD) strategy illuminates the Malfunction Indicator Lamp (MIL) with Diagnostic Trouble Codes (DTC) P0642 and P2008 after only one driving cycle. Proper function of the vehicles OBD system requires the MIL to illuminate after two driving cycles . This software issue can result in
727	The vehicles current On-Board Diagnostic (OBD) strategy illuminates the Malfunction Indicator Lamp (MIL) with Diagnostic Trouble Codes (DTC) P0642 and P2008 after only one driving cycle. Proper function of the vehicles OBD system requires the MIL to illuminate after two driving cycles . This software issue can result in
728	The vehicles current On-Board Diagnostic (OBD) strategy illuminates the Malfunction Indicator Lamp (MIL) with Diagnostic Trouble Codes (DTC) P0642 and P2008 after only one driving cycle. Proper function of the vehicles OBD system requires the MIL to illuminate after two driving cycles . This software issue can result in
729	The vehicles current On-Board Diagnostic (OBD) strategy illuminates the Malfunction Indicator Lamp (MIL) with Diagnostic Trouble Codes (DTC) P0642 and P2008 after only one driving cycle. Proper function of the vehicles OBD system requires the MIL to illuminate after two driving cycles . This software issue can result in
730	The vehicles current On-Board Diagnostic (OBD) strategy illuminates the Malfunction Indicator Lamp (MIL) with Diagnostic Trouble Codes (DTC) P0642 and P2008 after only one driving cycle. Proper function of the vehicles OBD system requires the MIL to illuminate after two driving cycles . This software issue can result in
731	The vehicles current On-Board Diagnostic (OBD) strategy illuminates the Malfunction Indicator Lamp (MIL) with Diagnostic Trouble Codes (DTC) P0642 and P2008 after only one driving cycle. Proper function of the vehicles OBD system requires the MIL to illuminate after two driving cycles . This software issue can result in
732	During cold starts, certain 2008 Cadillac Escalade, GMC Yukon/Sierra equipped with the 6.2L V8 engine may illuminate the MIL for DTC P1400 (Cold Start Emission Reduction Control System Fault) when no system fault is present. The condition is more likely to occur in cold weather with low mileage engines.Remedy: Mo
733	During cold starts, certain 2008 Cadillac Escalade, GMC Yukon/Sierra equipped with the 6.2L V8 engine may illuminate the MIL for DTC P1400 (Cold Start Emission Reduction Control System Fault) when no system fault is present. The condition is more likely to occur in cold weather with low mileage engines.Remedy: Mo
734	Malfunction Indicator Lamp (MIL) illumination with Diagnostic Trouble Code (DTC) P0030 Oxygen (O2) Sensor Heater Control Circuit Bank 1 - Sensor 1 and P0130 Oxygen Sensor Circuit Bank 1 - Sensor/ Malfunction may be caused by concerns with front O2 Sensor and wiring harness. O2 sensor part numbers 06A 906 26
735	Malfunction Indicator Lamp (MIL) illumination with Diagnostic Trouble Code (DTC) P0030 Oxygen (O2) Sensor Heater Control Circuit Bank 1 - Sensor 1 and P0130 Oxygen Sensor Circuit Bank 1 - Sensor/ Malfunction may be caused by concerns with front O2 Sensor and wiring harness. O2 sensor part numbers 06A 906 26
736	Some 2005 through 2008 Ford Escape, Escape Hybrid, Mercury Marine, Mariner Hybrid and Mazda Tribute vehicles may develop restrictions in the canister vent tube causing slow fuel fill or early pump shut off. These restrictions are due to water or ice in the tube.Remedy: An improved vent tube insert screen was impleme
737	Some 2005 through 2008 Ford Escape, Escape Hybrid, Mercury Marine, Mariner Hybrid and Mazda Tribute vehicles may develop restrictions in the canister vent tube causing slow fuel fill or early pump shut off. These restrictions are due to water or ice in the tube.Remedy: An improved vent tube insert screen was impleme

794	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
795	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
796	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
797	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
798	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
799	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
800	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
801	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
802	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
803	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
804	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
805	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
806	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
807	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
808	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
809	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
810	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
811	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
812	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
813	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
814	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
815	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
816	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
817	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
818	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
819	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
820	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
821	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
822	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
823	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
824	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.

	P
825	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
826	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
827	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
828	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
829	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
830	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
831	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
832	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
833	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
834	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
835	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
836	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
837	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
838	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
839	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
840	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
841	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
842	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
843	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
844	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
845	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
846	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
847	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
848	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
849	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
850	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
851	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
852	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
853	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
854	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
855	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
856	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
857	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
858	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
859	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
860	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
861	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
862	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
863	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
864	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
865	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
866	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
867	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
868	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
869	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
870	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
871	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
872	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
873	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
874	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
875	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
876	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
877	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
878	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
879	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
880	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
881	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
882	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
883	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
884	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
885	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
886	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
887	
888	Some trucks with 7.5L engines may have inoperative HEGO sensors.
889	Some trucks with 7.5L engines may have inoperative HEGO sensors.
890	Some cars may have throttle position sensors that wear out prematurely.
891	
892	
893	
894	The catalytic converter will be replaced with a redesigned part.
895	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
896	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
897	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
898	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
899	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
900	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
901	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
902	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
903	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
904	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
905	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
906	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
907	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
908	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
909	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
910	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.
911	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.
912	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.
913	Positive Crankcase Ventilation hoses exhibit a deterioration of the material, which causes cracking, resulting in crankcase vent system leaks and vacuum leaks.
914	Positive Crankcase Ventilation hoses exhibit a deterioration of the material, which causes cracking, resulting in crankcase vent system leaks and vacuum leaks.
915	The existing Powertrain Control Modules (PCMs) will be replaced using PCMs having newly certified calibrations.
916	The existing Powertrain Control Modules (PCMs) will be replaced using PCMs having newly certified calibrations.
917	The potential defect involves fuel hoses and metal lines in the engine compartment that deliver fuel to and from the engine. It is possible that seepage could occur between a hose and the metal line on either side of the hose. If this seepage occurs, a conspicuous fuel odor will be present.
918	The potential defect involves fuel hoses and metal lines in the engine compartment that deliver fuel to and from the engine. It is possible that seepage could occur between a hose and the metal line on either side of the hose. If this seepage occurs, a conspicuous fuel odor will be present.
919	The potential defect involves fuel hoses and metal lines in the engine compartment that deliver fuel to and from the engine. It is possible that seepage could occur between a hose and the metal line on either side of the hose. If this seepage occurs, a conspicuous fuel odor will be present.
920	An engine may experience starting difficulty when vehicles are soaked for a long time in an extremely cold area. This situation is caused by incorrect vacuum signal into the MAP sensor due to frozen moisture which clogs the vacuum line between the MAP sensor and the intake manifold.
921	An engine may experience starting difficulty when vehicles are soaked for a long time in an extremely cold area. This situation is caused by incorrect vacuum signal into the MAP sensor due to frozen moisture which clogs the vacuum line between the MAP sensor and the intake manifold.
922	Oxygen sensors deteriorate and result in poor fuel/air control, reduced catalyst efficiency, and high emission levels.
923	Oxygen sensors deteriorate and result in poor fuel/air control, reduced catalyst efficiency, and high emission levels.
924	A processing error in the DME engine control module of the initial production phase can lead to an erroneous setting of the check engine light and erroneous fault code storage.
925	The check engine light may become illuminated for a short period of time and fault code 41 set in the engine control module. The problem is caused by an onboard diagnostic system threshold adaption error. It is corrected by reprogramming the ECM EPROM with an updated software program.
926	Certain cars exhibit an incorrect hose routing on the emission label.
927	Certain cars exhibit an incorrect hose routing on the emission label.
928	The emission label on these vehicles erroneously indicates compliance with "TLEV" emissions standards.
929	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
930	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
931	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
932	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
933	The protective internal coating of the electronic crank angle sensor was manufactured from material that did not meet specifications.
934	The monoliths in the underbody catalytic converter may rattle and break up during the vehicles' useful lives.
935	The monoliths in the underbody catalytic converter may rattle and break up during the vehicles' useful lives.
936	Some cars have a rattling noise underneath the vehicle since the monolith has been abraded by mat erosion.
937	Illumination of the malfunction indicator light results from unstable signal output from the oxygen sensor.
938	The drive belt pulley on your car's engine could develop fatigue cracks in the metal and break. If the drive pulley breaks, your car would not have engine cooling, battery charging and power steering. Loss of these systems could cause you to lose control of the car.
939	The drive belt pulley on your car's engine could develop fatigue cracks in the metal and break. If the drive pulley breaks, your car would not have engine cooling, battery charging and power steering. Loss of these systems could cause you to lose control of the car.
940	This engine family is equipped with a secondary air injection system, delivering air into the exhaust manifold. Part of this system is a non-return or check valve, which prevents hot exhaust gases from entering the pump. Some vehicles may have been equipped with a warped sealing disk which could allow flow back to
941	Due to a logistical error incorrect coolant temperature sensors (NTCs) may have been installed on M5 vehicles during a specified production period.
942	Due to a logistical error incorrect coolant temperature sensors (NTCs) may have been installed on M5 vehicles during a specified production period.
943	Engines were assembled with the incorrect Positive Crankcase Ventilation (PCV) valve.The affected vehicles will be recalled to replace the incorrect valve with the released valve.
944	It is possible that some of the affected vehicles do not comply with OBD2 access requirements as outlined in the SAE J1962 standardization. The problem consists of difficulty with the connection of a diagnosis unit, other than the VAG 1551, because of some extremely close adapter plug tolerances.
945	It is possible that some of the affected vehicles do not comply with OBD2 access requirements as outlined in the SAE J1962 standardization. The problem consists of difficulty with the connection of a diagnosis unit, other than the VAG 1551, because of some extremely close adapter plug tolerances.
946	The supplier of spark plug wires for the affected vehicles began using a new vendor for the PBT resin used in making the wires. The spark plug wires made using the PBT from the new vendor have been found to exhibit ignition leak problems under high temperature and high humidity conditions.
947	The supplier of spark plug wires for the affected vehicles began using a new vendor for the PBT resin used in making the wires. The spark plug wires made using the PBT from the new vendor have been found to exhibit ignition leak problems under high temperature and high humidity conditions.
948	Signal wires for the oxygen sensors located after the catalytic converters are potentially incorrectly positioned in the ECM wiring harness connector.
949	Some Vehicle Control Modules (VCM) may have been incorrectly programmed with an engine calibration intended for Canadian usage. The Canadian calibration would not allow certain OBD2 malfunction lights to illuminate.
950	Secondary Air Pump Wire Connection-During the initial production period of 3-series vehicles with 2.8L engines, the two wires supplying power to the air pump may have been reversed in the connecting plug, causing the pump to run backwards. ECM Programming Error-During above production period, software was used
951	Secondary Air Pump Wire Connection-During the initial production period of 3-series vehicles with 2.8L engines, the two wires supplying power to the air pump may have been reversed in the connecting plug, causing the pump to run backwards. ECM Programming Error-During above production period, software was used
952	Multec Bottom Feed Injectors with D195A and D195B build date codes may have abnormal stresses in the plastic encapsulant resulting in leakage of fuel vapor to the atmosphere.A voluntary Emission Recall will be conducted to replace all the injectors with the suspect build date.
953	Multec Bottom Feed Injectors with D195A and D195B build date codes may have abnormal stresses in the plastic encapsulant resulting in leakage of fuel vapor to the atmosphere.A voluntary Emission Recall will be conducted to replace all the injectors with the suspect build date.
954	Multec Bottom Feed Injectors with D195A and D195B build date codes may have abnormal stresses in the plastic encapsulant resulting in leakage of fuel vapor to the atmosphere.A voluntary Emission Recall will be conducted to replace all the injectors with the suspect build date.
955	The emission control information label affixed to certain 1996 model year V8 and V12 models may contain an error. An incorrect barcode is indicated on the label.
956	The emission control information label affixed to certain 1996 model year V8 and V12 models may contain an error. An incorrect barcode is indicated on the label.
957	The Emission Control Information label affixed to certain 1995 model year V8 models may contain an error. An incorrect EVAP family is indicated on the label.
958	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
959	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
960	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
961	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
962	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
963	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
964	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
965	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
966	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
967	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
968	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
969	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
970	Ignition coils are being replaced on engines due to a failure of the secondary magnet wire. The failures are caused by the difference in the coefficient of thermal expansion of the fine secondary wire and bobbin.
971	Ignition coils are being replaced on engines due to a failure of the secondary magnet wire. The failures are caused by the difference in the coefficient of thermal expansion of the fine secondary wire and bobbin.
972	Ignition coils are being replaced on engines due to a failure of the secondary magnet wire. The failures are caused by the difference in the coefficient of thermal expansion of the fine secondary wire and bobbin.
973	Ignition coils are being replaced on engines due to a failure of the secondary magnet wire. The failures are caused by the difference in the coefficient of thermal expansion of the fine secondary wire and bobbin.
974	Failed fuel pump due to worn out commutator.
975	The emission system is modified by installing a modulator kit.The catalyst and fuel pump is inspected.
976	The emission system is modified by installing a modulator kit.The catalyst and fuel pump is inspected.
977	The emission system is modified by installing a modulator kit.The catalyst and fuel pump is inspected.(Vehicles were manufactured by Hyundai for Mitsubishi)
978	Some cars may have been shipped with incorrect Electric Air Pumps installed.
979	Some cars may have been shipped with incorrect Electric Air Pumps installed.
980	Some trucks may have been built with incorrect Mass Airflow Sensors.
981	Some trucks may have been built with incorrect Mass Airflow Sensors.
982	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
983	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
984	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
985	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
986	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
987	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
988	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
989	Cracking of the spark plug wire insulation may occur on some Federal 1994-95 Chevrolet Geo Tracker vehicles with 1.6L L4 (RPO L01) engine. This condition can manifest itself as a driveability problem.
990	Cracking of the spark plug wire insulation may occur on some Federal 1994-95 Chevrolet Geo Tracker vehicles with 1.6L L4 (RPO L01) engine. This condition can manifest itself as a driveability problem.
991	The coolant temperature signal to the control module is modified by the installation of a modulator kit.
992	The coolant temperature signal to the control module is modified by the installation of a modulator kit.
993	Mitsubishi hereby notifies the EPA that a safety recall campaign concerning fuel tank replacement has been initiated for all Federal and California emissions equipped 1995 and 1996 Mitsubishi Eclipse GSX and Eagle Talon TSI ALL Wheel Drive, turbocharged vehicles.
994	Mitsubishi hereby notifies the EPA that a safety recall campaign concerning fuel tank replacement has been initiated for all Federal and California emissions equipped 1995 and 1996 Mitsubishi Eclipse GSX and Eagle Talon TSI ALL Wheel Drive, turbocharged vehicles.
995	Mitsubishi hereby notifies the EPA that a safety recall campaign concerning fuel tank replacement has been initiated for all Federal and California emissions equipped 1995 and 1996 Mitsubishi Eclipse GSX and Eagle Talon TSI ALL Wheel Drive, turbocharged vehicles.
996	Mitsubishi hereby notifies the EPA that a safety recall campaign concerning fuel tank replacement has been initiated for all Federal and California emissions equipped 1995 and 1996 Mitsubishi Eclipse GSX and Eagle Talon TSI ALL Wheel Drive, turbocharged vehicles.
997	Freeze frame (Mode 2) values for the "lambda control factor" and the "lambda control adaption factor" for cylinder bank 2 are not stored and available on the scan tool. The values are available real-time (Mode 1) and are available for cylinder bank 1 in both freeze frame and real time. This is not according to SAE J19
998	Freeze frame (Mode 2) values for the "lambda control factor" and the "lambda control adaption factor" for cylinder bank 2 are not stored and available on the scan tool. The values are available real-time (Mode 1) and are available for cylinder bank 1 in both freeze frame and real time. This is not according to SAE J19
999	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
1000	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
1001	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
1002	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
1003	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
1004	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
1005	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
1006	Vacuum hose routing diagram has been printed incorrectly. The hose routing between throttle body, EGR vacuum modulator and pulse width modulated vacuum switching valve was incorrect
1007	Vacuum hose routing diagram has been printed incorrectly. The hose routing between throttle body, EGR vacuum modulator and pulse width modulated vacuum switching valve was incorrect
1008	Some cars may have inoperative HEGO sensors caused by a cracked sensing element.
1009	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1010	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1011	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1012	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1013	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1014	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1015	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1016	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1017	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1018	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1019	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1020	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1021	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1022	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1023	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
1024	Some trucks may have bolts that lose torque due to incompatible expansion characteristics with the improved exhaust manifold material. (Covers FED and CA, =50S)
1025	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
1026	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
1027	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
1028	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
1029	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
1030	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)

1087	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1088	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1089	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1090	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1091	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1092	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1093	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1094	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
1095	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
1096	Thermal fatigue fracture on inner braid portion of the front exhaust pipe assembly due to insufficient welding.
1097	Thermal fatigue fracture on inner braid portion of the front exhaust pipe assembly due to insufficient welding.
1098	Thermal fatigue fracture on inner braid portion of the front exhaust pipe assembly due to insufficient welding.
1099	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
1100	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
1101	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
1102	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
1103	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
1104	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
1105	The vehicles in this engine family may be releasing air pollutants which exceed California standards for NMHC and NOx. To correct this condition, there will be a Voluntary Emission Recalll to replace the catalytic converter catalyst beads on vehicles in this engine family.
1106	The "light" inertia weight class vehicles in this engine family may be releasing air pollutants which exceed California standards for NMHC. To correct this condition, there will be a Voluntary Emission Recall to replace the catalytic converter catalyst beads on vehicles in this engine family.
1107	The "light" inertia weight class vehicles in this engine family may be releasing air pollutants which exceed California standards for NMHC. To correct this condition, there will be a Voluntary Emission Recall to replace the catalytic converter catalyst beads on vehicles in this engine family.
1108	The emission tune-up label on some vehicles has an incorrect evaporative emission family designation.
1109	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1110	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1111	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1112	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1113	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1114	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1115	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
1116	Some cars equipped with EGR may experience a difficult starting condition. Water vapor and cold temperature may result in ice build up at the tip of the fuel injector.
1117	Some cars equipped with EGR may experience a difficult starting condition. Water vapor and cold temperature may result in ice build up at the tip of the fuel injector.
1118	Some trucks have been shipped with an incorrect tune-up label installed on the engine air cleaner.
1119	Volvo has found that the block heater contact surface may not match correctly with the engine block as intended. In extreme circumstances the block heater may come loose from the engine block, and may possibly overheat if being used. This may cause damage if it comes in contact with with other engine compartm
1120	Volvo has found that the block heater contact surface may not match correctly with the engine block as intended. In extreme circumstances the block heater may come loose from the engine block, and may possibly overheat if being used. This may cause damage if it comes in contact with with other engine compartm
1121	Volvo has found that the block heater contact surface may not match correctly with the engine block as intended. In extreme circumstances the block heater may come loose from the engine block, and may possibly overheat if being used. This may cause damage if it comes in contact with with other engine compartm
1122	Volvo has found that the block heater contact surface may not match correctly with the engine block as intended. In extreme circumstances the block heater may come loose from the engine block, and may possibly overheat if being used. This may cause damage if it comes in contact with with other engine compartm
1123	There is the possibility of excessive chafing of the insulation of the battery cables. This could lead to a short circuit.
1124	There is the possibility of excessive chafing of the insulation of the battery cables. This could lead to a short circuit.
1125	Some trucks were built with an engine calibration certified for E-250 standard vans.
1126	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
1127	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
1128	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
1129	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
1130	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
1131	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
1132	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1133	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1134	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1135	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1136	The pressure transducer may experience binding at low temperatures potentially causing the MIL to illuminate. The binding has been attributed to out of tolerance conditions within the transducer.
1137	Grease comes out from a bearing in an idle air control valve and attaches to the surface of the valve seat. Carbon in exhaust gas clings to the attaching grease and is pressed by the valve surface. This occurs due to some valve axle clearance of the bearing which moves from the manifold vacuum pressure. This resu
1138	Secondary air injection pump relay may be contaminated by materials present in the underhood atmosphere. This prevents the air pump from operating correctly.
1139	Secondary air injection pump relay may be contaminated by materials present in the underhood atmosphere. This prevents the air pump from operating correctly.
1140	Some cars may have inoperative Idle Air Bypass valves caused by resonance in the air supply tube inducing mechanical damage to the valve and valve seat.
1141	Some cars may have inoperative Mass Airflow sensors caused by silicone contamination of the sensing element during the manufacturing process.
1142	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1143	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1144	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1145	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1146	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1147	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1148	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1149	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1150	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1151	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1152	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1153	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1154	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1155	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1156	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1157	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1158	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1159	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1160	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1161	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1162	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1163	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
1164	Some 1997 4.6L Federal Continental passenger cars may have been built with California Powertrain Control Modules (PCM).
1165	Some cars equipped with the 2.4L (RPO LD9) VIN Engine Code "T" engine may have been built with an incorrect Evaporative Emission (EVAP) Canister Purge Solenoid.
1166	Some cars equipped with the 2.4L (RPO LD9) VIN Engine Code "T" engine may have been built with an incorrect Evaporative Emission (EVAP) Canister Purge Solenoid.
1167	Based on the results of our supplier's analyses, the principal failure mode is a slowed or absence of switching of the oxygen sensor due to the cracking of the ceramic substrate.
1168	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1169	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1170	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1171	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1172	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1173	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1174	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1175	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1176	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1177	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1178	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
1179	The Engine Control Module (ECM) installed in some 1997 Sportage models produced before 2/19/97 may have software errors that affects the readiness function for Evaporative Emissions System leakage monitoring. The result of this malfunction is loss of evaporative emissions diagnostic function and non-compliance
1180	The Engine Control Module (ECM) installed in some 1997 Sportage models produced before 2/19/97 may have software errors that affects the readiness function for Evaporative Emissions System leakage monitoring. The result of this malfunction is loss of evaporative emissions diagnostic function and non-compliance
1181	Carbon tracking may occur on the inner surface of the distributor cap as a result of moisture settling on the rib pattern. If moisture settles on the rib pattern, a reduced path of resistance is created and a high voltage short may result when the coil fires.
1182	Carbon tracking may occur on the inner surface of the distributor cap as a result of moisture settling on the rib pattern. If moisture settles on the rib pattern, a reduced path of resistance is created and a high voltage short may result when the coil fires.
1183	Carbon tracking may occur on the inner surface of the distributor cap as a result of moisture settling on the rib pattern. If moisture settles on the rib pattern, a reduced path of resistance is created and a high voltage short may result when the coil fires.
1184	Some trucks may have jumper hoses to the fuel tank that can develop cracks due to being overheated during the manufacturing process.
1185	Some trucks may have jumper hoses to the fuel tank that can develop cracks due to being overheated during the manufacturing process.
1186	Some cars may have been built with 400 cpi catalytic converter substrates in place of 350 cpi substrates.
1187	The Vehicle Emissions Control Information (VECI) labels on certain California 2.4L minivan models contain an error in the emission configuration code and the bar code.
1188	The Vehicle Emission Control Information (VECI) labels on some Dakota models with GVWRs less than 6000 lbs incorrectly identify the vehicle as certified to California emissions.
1189	The rear O2 sensor wiring may be reversed, with the left sensor connected to the right side wiring and vice-versa.Campaign #725 represents FEDERAL vehicles in this EF.Campaign #726 represents CALIFORNIA vehicles in this EF.
1190	The owners manual for the 1996 Plymouth Breeze model, does not contain the recommended shift speeds used for emission certification and fuel economy testing of the vehicle as required by the regulations.Chrysler will conduct a recall to provide customers with an owners manual addendum giving the shift speeds.
1191	The owners manual for the 1996 Plymouth Breeze model, does not contain the recommended shift speeds used for emission certification and fuel economy testing of the vehicle as required by the regulations.Chrysler will conduct a recall to provide customers with an owners manual addendum giving the shift speeds.
1192	Federal Vehicle Emission Control Information (VECI) labels were mistakenly installed on certain California 5.2L trucks.A correct label for each affected vehicle will be enclosed with the recall notification mailed to owners and dealers.
1193	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by fatigue failure of the wire.
1194	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
1195	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
1196	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
1197	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
1198	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
1199	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
1200	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
1201	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
1202	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
1203	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
1204	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
1205	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
1206	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1207	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1208	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1209	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1210	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1211	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1212	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1213	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1214	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1215	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
1216	The power train control module (PCM) installed on certain early production Dodge Ram pickups equipped with 3.9L engine, manual transmission, and Federal emissions, contained an uncertified calibration.
1217	The catalytic converter in some cases fails to last the useful life of the vehicle. This is caused by the thermal expansion of the catalyst can, and the subsequent erosion of the mat surrounding the biscuits. Also, the carburetor accelerator pump will be replaced, a throttle return dashpot will be added, and the vacuum adv
1218	The catalytic converter in some cases fails to last the useful life of the vehicle. This is caused by the thermal expansion of the catalyst can, and the subsequent erosion of the mat surrounding the biscuits. Also, the carburetor accelerator pump will be replaced, a throttle return dashpot will be added, and the vacuum adv
1219	The catalytic converter in some cases fails to last the useful life of the vehicle. This is caused by the thermal expansion of the catalyst can, and the subsequent erosion of the mat surrounding the biscuits. Also, the carburetor accelerator pump will be replaced, a throttle return dashpot will be added, and the vacuum adv
1220	The catalytic converter in some cases fails to last the useful life of the vehicle. This is caused by the thermal expansion of the catalyst can, and the subsequent erosion of the mat surrounding the biscuits. Also, the carburetor accelerator pump will be replaced, a throttle return dashpot will be added, and the vacuum adv
1221	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
1222	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.
1223	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
1224	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.
1225	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
1226	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.
1227	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
1228	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.
1229	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
1230	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.
1231	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
1232	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.
1233	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
1234	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.
1235	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.
1236	Some trucks may have a Managed Fuel Air (MFA) strategy which may cause the vehicle to run lean of stoichiometry under certain conditions.Field Campaign 98E02 has been approved to recalibrate the vehicles.

1268	The vapor control valve and tube assembly on the fuel tank will be removed and replaced with an assembly which contains improved vapor control and vapor vent valves. In addition, the affected vehicles will also have a wiring harness seal replaced during this recall service.
1269	The vapor control valve and tube assembly on the fuel tank will be removed and replaced with an assembly which contains improved vapor control and vapor vent valves. In addition, the affected vehicles will also have a wiring harness seal replaced during this recall service.
1270	The vapor control valve and tube assembly on the fuel tank will be removed and replaced with an assembly which contains improved vapor control and vapor vent valves. In addition, the affected vehicles will also have a wiring harness seal replaced during this recall service.
1271	The valve lash specifications are incorrect on the under-hood Vehicle Emissions Control Information label.
1272	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
1273	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
1274	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
1275	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
1276	Some vehicles may experience corrosion of an oxygen sensor wiring harness connector. The cause is due to water drainage from a hood scoop onto the affected connector.
1277	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1278	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1279	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1280	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1281	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1282	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1283	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1284	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1285	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1286	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1287	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1288	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1289	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1290	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1291	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1292	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1293	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1294	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1295	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1296	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1297	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1298	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1299	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1300	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1301	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released b
1302	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1303	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
1304	Some trucks may have inoperative HEGO sensors due to weak gas seal rings or contamination by carbon, lead, oil, or silicone.
1305	Some trucks may have inoperative Idle Air Bypass valves caused by engine sludging.
1306	Corrupted data communication between the (PCM) and Instrument Panel Cluster (IPC) and (HVAC) processors may cause a PCM reset to occur and/or the setting of DTC P1518 (Reduced Engine Power).The correction to be made is to recall all potentially affected vehicles and reflash the PCM calibration to make the syst
1307	Corrupted data communication between the (PCM) and Instrument Panel Cluster (IPC) and (HVAC) processors may cause a PCM reset to occur and/or the setting of DTC P1518 (Reduced Engine Power).The correction to be made is to recall all potentially affected vehicles and reflash the PCM calibration to make the syst
1308	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
1309	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
1310	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
1311	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
1312	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1313	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1314	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1315	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1316	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1317	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1318	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1319	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1320	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1321	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
1322	It may be possible that the connector of the ignition coil may intermittently lose contact with the electronic ignition control unit.
1323	825 warranty claims related to the ignition coil. The warranty claims were prompted by complaints of rough idling, engine stumbling, or poor performance.
1324	825 warranty claims related to the ignition coil. The warranty claims were prompted by complaints of rough idling, engine stumbling, or poor performance.
1325	ISC Servo Kit failures caused by water intrusion into the ISC Servo Kit.
1326	The turbine wheel may brush the housing, caused by the narrow clearance.
1327	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1328	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1329	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1330	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1331	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1332	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1333	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1334	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
1335	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
1336	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
1337	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
1338	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
1339	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1340	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1341	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1342	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1343	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
1344	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
1345	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
1346	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
1347	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1348	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1349	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
1350	An intermittent connector leads to a check engine light on condition in some vehicles. The sensor was replaced as indicated by the fault code. The check engine light condition could not be corrected with the new sensor. The connector was subsequently modified to improve the connection with the knock sensor.
1351	An intermittent connector leads to a check engine light on condition in some vehicles. The sensor was replaced as indicated by the fault code. The check engine light condition could not be corrected with the new sensor. The connector was subsequently modified to improve the connection with the knock sensor.
1352	The container holding the left side catalytic converter may have been manufactured with variances in tolerance which could allow the substrate to come loose within the converter housing. Loose subsrates tend to generate a loud "rattling" noise which is audible inside the vehicle.
1353	The container holding the left side catalytic converter may have been manufactured with variances in tolerance which could allow the substrate to come loose within the converter housing. Loose subsrates tend to generate a loud "rattling" noise which is audible inside the vehicle.
1354	The container holding the left side catalytic converter may have been manufactured with variances in tolerance which could allow the substrate to come loose within the converter housing. Loose subsrates tend to generate a loud "rattling" noise which is audible inside the vehicle.
1355	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1356	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1357	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1358	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1359	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1360	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1361	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1362	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1363	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
1364	Some cases of water intrusion into ISC Servo Kit have been found. Hyundai believes that most ISC replacements are improper diagnosis and repair.
1365	Some cases of carbon deposits inside the Idle Speed Actuator (ISA) have caused complaints of rough idling and engine stumbling.
1366	Some cases of carbon deposits inside the Idle Speed Actuator (ISA) have caused complaints of rough idling and engine stumbling.
1367	Poor engine starting may result from a failed purge control valve. The valve failed as a result of contamination with dust or oil used to insert the PCV hose onto the valve nipple.
1368	Poor engine starting may result from a failed purge control valve. The valve failed as a result of contamination with dust or oil used to insert the PCV hose onto the valve nipple.
1369	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. Some parts failed as a result of intrusion of water into the sensor body; however, the main cause of failure was a short circuit at the soldering spot between the terminal and the thermistor wire. Hyundai belie
1370	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. Some parts failed as a result of intrusion of water into the sensor body; however, the main cause of failure was a short circuit at the soldering spot between the terminal and the thermistor wire. Hyundai belie
1371	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. Some parts failed as a result of intrusion of water into the sensor body; however, the main cause of failure was a short circuit at the soldering spot between the terminal and the thermistor wire. Hyundai belie
1372	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. The main cause of failure was an intermittent short circuit at the soldering spot between the terminal and the thermistor wire, although there were some cases of water intrusion into the sensor body.
1373	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. The main cause of failure was an intermittent short circuit at the soldering spot between the terminal and the thermistor wire, although there were some cases of water intrusion into the sensor body.
1374	Outflow of charcoal from the canister may result in difficulty in starting the engine.
1375	Outflow of charcoal from the canister may hinder operation of the purge solenoid valve resulting in difficulty in starting the engine.
1376	Illumination of the MIL caused by oxygen sensor failure. The main cause of oxygen sensor failure was internal electrode damage, resulting from unsatisfactory reproducibility of Pt Powder grain size and surface area.
1377	Illumination of the MIL caused by oxygen sensor failure. The main cause of oxygen sensor failure was internal electrode damage, resulting from unsatisfactory reproducibility of Pt Powder grain size and surface area.
1378	Illumination of the MIL caused by oxygen sensor failure. The main cause of oxygen sensor failure was internal electrode damage, resulting from unsatisfactory reproducibility of Pt Powder grain size and surface area.
1379	The charcoal canister check ball sticks to the aluminum seat due to thermal expansion difference of the ball and the seat. This causes MIL illumination.
1380	One of the following problems may have been present:Intake manifold plug cap on the left rear side of the crankcase ventilation valve may be torn or missing.Intake manifold gaskets may be leaking.
1381	One of the following problems may have been present:Intake manifold plug cap on the left rear side of the crankcase ventilation valve may be torn or missing.Intake manifold gaskets may be leaking.
1382	A ceramic spacer is fixed between both monoliths of the catalytic converter. Due to faulty packaging, the ceramic ring becomes loose and causes a rattling noise.
1383	A ceramic spacer is fixed between both monoliths of the catalytic converter. Due to faulty packaging, the ceramic ring becomes loose and causes a rattling noise.
1384	The affected part is the oxygen sensor. The sensors showed signs of a decreased control frequency. Analysis of the affected oxygen sensors has found exhaust-carried deposits on the ceramic sensing element.The corrective measure consists of reprogramming the Engine Control Module with new updated software.
1385	The affected part is the oxygen sensor. The sensors showed signs of a decreased control frequency. Analysis of the affected oxygen sensors has found exhaust-carried deposits on the ceramic sensing element.The corrective measure consists of reprogramming the Engine Control Module with new updated software.
1386	The affected part is the oxygen sensor. The sensors showed signs of a decreased control frequency. Analysis of the affected oxygen sensors has found exhaust-carried deposits on the ceramic sensing element.The corrective measure consists of reprogramming the Engine Control Module with new updated software.
1387	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
1388	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
1389	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
1390	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
1391	Some cars may have inoperative Idle Air Control Valves caused by the rubber orifice seat sticking closed.
1392	Some vans may have HEGO sensors with reference cavities that may become contaminated by exhaust gas under certain conditions. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1393	Some cars may have inoperative HEGO sensors caused by oil absorption through the wire connector.
1394	Due to an error in the OBD computer logic, the evaporative system readiness codes remains incomplete even after the computer confirms that the system operates correctly. However, a malfunction will be correctly detected and the MIL will be illuminated according to Toyota.
1395	Illumination of the MIL caused by oxygen sensor malfunction. The oxygen sensor lead wire can come under excessive tension leading to the potential of malfunction. The excessive tension can cause intermittent unstable signal voltage.
1396	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1397	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1398	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1399	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
1400	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
1401	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
1402	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
1403	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
1404	Some cars may have fuel line jumpers that can rub on the floorpan.
1405	Some cars may have fuel line jumpers that can rub on the floorpan.
1406	Some cars may have fuel line jumpers that can rub on the floorpan.
1407	Some cars may have fuel line jumpers that can rub on the floorpan.
1408	Some cars may have fatigue cracks in the fuel tank at the heat shield attachment point.
1409	Some cars may have fatigue cracks in the fuel tank at the heat shield attachment point.
1410	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
1411	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
1412	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
1413	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
1414	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
1415	The elbow containing the crankcase ventilation orifice was installed on the wrong valve cover during reconditioning of the engine.
1416	The elbow containing the crankcase ventilation orifice was installed on the wrong valve cover during reconditioning of the engine.
1417	Spark plug wire boots may become cracked on some cylinders, allowing secondary ignition voltage to arc through the crack(s) to heat shields around the boots, and then to ground, under certain operating conditions.
1418	Spark plug wire boots may become cracked on some cylinders, allowing secondary ignition voltage to arc through the crack(s) to heat shields around the boots, and then to ground, under certain operating conditions.
1419	Spark plug wire boots may become cracked on some cylinders, allowing secondary ignition voltage to arc through the crack(s) to heat shields around the boots, and then to ground, under certain operating conditions.
1420	The failing component is the AIR injection reactor (AIR) system fuse. The failure that has been ocurring is blown AIR fuses. The probable cause is high in-rush current from repeated on-off cycles of the AIR pump when the manual transmission vehicles are driven agressively, with heavy throttle acceleration or high RPM
1421	The failing component is the AIR injection reactor (AIR) system fuse. The failure that has been ocurring is blown AIR fuses. The probable cause is high in-rush current from repeated on-off cycles of the AIR pump when the manual transmission vehicles are driven agressively, with heavy throttle acceleration or high RPM
1422	The calibration of the Powertrain Control Module (PCM) may fail to adequately control CO emissions during certain Inspection and Maintenance (IM) tests, such as the steady state Acceleration Simulation Mode (ASM) test.
1423	The calibration of the Powertrain Control Module (PCM) may fail to adequately control CO emissions during certain Inspection and Maintenance (IM) tests, such as the steady state Acceleration Simulation Mode (ASM) test.
1424	The VECI labels on certain Federal and California AWD minivan models were reversed, with the Federal label installed on the California and vice versa,
1425	Chrysler is conducting a recall of trucks equipped with 5.9L engines certified to the California Transitional Low Emission Vehicle (TLEV) emission standards. These vehicles were found to possibly emit high NOx emissions during the 2% audit of production vehicles required by CARB.
1426	Chrysler is conducting a recall of trucks equipped with 5.9L engines certified to the California Transitional Low Emission Vehicle (TLEV) emission standards. These vehicles were found to possibly emit high NOx emissions during the 2% audit of production vehicles required by CARB.
1427	The VECI labels on certain 1998 MY HD trucks mistakenly indicated that the trucks were 1997 MY vehicles.
1428	The VECI labels on certain 1998 MY HD trucks mistakenly indicated that the trucks were 1997 MY vehicles.
1429	The VECI labels on certain 1998 MY 2.4L Sebring convertibles contained an error involving the purge control valve hose routing.
1430	The VECI labels on certain 1998 MY 2.4L Sebring convertibles contained an error involving the purge control valve hose routing.
1431	Due to a programming error, the Powertrain Control Module (PCM) installed in the affected vehicles may, under certain driving conditions, trigger a shift in air-fuel ratio to an over-lean condition, resulting in an engine stall. An engine stall may lead to a loss of vehicle control and/or a vehicle crash. This DR is actually a
1432	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1433	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1434	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1435	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1436	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1437	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1438	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1439	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1440	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1441	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1442	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.

	P
1443	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1444	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
1445	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
1446	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
1447	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
1448	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
1449	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
1450	The OBD2 systems installed on 1995 MY Sephias do not under all driving conditions perform as required by California's OBD2 regulations.Defects include: Readiness Function Code (RFC), Component Monitoring Timer and incorrect VECI label.
1451	The OBD2 systems installed on 1995 MY Sephias do not under all driving conditions perform as required by California's OBD2 regulations.Defects include: Readiness Function Code (RFC), Component Monitoring Timer and incorrect VECI label.
1452	The main under-floor catalytic converter assemblies on certain 1998 Model Year ML320 models may have been assembled incorrectly by the supplier. The right side converter may be installed on the left side in the reverse orientation and the left side converter may be installed on the right side in the reverse orientatio
1453	The misfire detection strategy does not fully meet the requirements of CARB OBD2 in that monitoring for misfire during positive torque engine operation is not continuous. CARB confirmed their concerns to Jaguar in a letter dated 23 April, received 24 April, 1997.
1454	The misfire detection strategy does not fully meet the requirements of CARB OBD2 in that monitoring for misfire during positive torque engine operation is not continuous. CARB confirmed their concerns to Jaguar in a letter dated 23 April, received 24 April, 1997.
1455	The misfire detection strategy does not fully meet the requirements of CARB OBD2 in that monitoring for misfire during positive torque engine operation is not continuous. CARB confirmed their concerns to Jaguar in a letter dated 23 April, received 24 April, 1997.
1456	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1457	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1458	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1459	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1460	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1461	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1462	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1463	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1464	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
1465	Recalibration of early production volume of 1993 MY 2.5L flex fuel engines in California. This recalibration changes the certified emission levels of the family from Tier one to TLEV, allowing a recalculation of corporate NMOG average.
1466	Malfunction Indicator Light (MIL) falsely illuminates as a malfunction of automatic transmission (A/T) input speed sensor under the limited condition after A/T gear is shifted from 5th to 4th during coast down deceleration.
1467	Reprogram the EMS ECM using the portable diagnostic unit (PDU) and new diskette. The PDU will flash program new operating strategies into the ECM (the strategies are identical to that used on the 1998 XK8's).
1468	The emission tune-up label states the engine family had EGR; the family was certified without EGR.
1469	Some vehicles are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock detection routine so as not to permit this condition.
1470	Some vehicles are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock detection routine so as not to permit this condition.
1471	Some vehicles are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock detection routine so as not to permit this condition.
1472	Some vans may draw water into the evaporative emission canister when driven in slushy-snow conditions. This can result in setting a MIL, misfire, rough idle, lack of power and eventually, an engine stall if driveability symptoms and MIL are ignored.
1473	Some vans may draw water into the evaporative emission canister when driven in slushy-snow conditions. This can result in setting a MIL, misfire, rough idle, lack of power and eventually, an engine stall if driveability symptoms and MIL are ignored.
1474	The secondary air injection valve with built-in check valve prevents exhaust gases from being forced into the secondary air injection pump. The failed valves were inoperable, i.e. stuck in the open or closed position.
1475	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1476	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1477	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1478	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1479	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1480	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1481	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1482	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1483	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1484	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1485	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1486	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1487	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
1488	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
1489	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
1490	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
1491	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
1492	The throttle shaft ball bearing on the sensor side of the throttle body assembly of the subject vehicles may not have been installed in certain throttle bodies produced.
1493	The throttle shaft ball bearing on the sensor side of the throttle body assembly of the subject vehicles may not have been installed in certain throttle bodies produced.
1494	The throttle shaft ball bearing on the sensor side of the throttle body assembly of the subject vehicles may not have been installed in certain throttle bodies produced.
1495	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. The main cause of failure was an intermittent short circuit at the soldering spot between the terminal and the thermistor wire, and an intermittent connection caused by engine vibration.
1496	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
1497	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
1498	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
1499	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
1500	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
1501	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
1502	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
1503	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
1504	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
1505	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1506	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1507	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1508	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1509	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1510	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1511	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1512	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1513	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1514	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
1515	Some cars may have a misfire monitor strategy that can cause unintended Malfunction Indicator Light (MIL) illumination.
1516	Some cars may have a misfire monitor strategy that can cause unintended Malfunction Indicator Light (MIL) illumination.
1517	Some cars are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock calibration routine so as not to permit this condition.
1518	Some cars are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock calibration routine so as not to permit this condition.
1519	As the consequence of variations in the length and routing of the injector harness, it may contact the manifold at the EGR pipe. If the harness is damaged, a short circuit may occur, blowing the fuse for the fuel injector, resulting in the engine stalling. It may also cause the injector to continue fueling if a short circuit oc
1520	As the consequence of variations in the length and routing of the injector harness, it may contact the manifold at the EGR pipe. If the harness is damaged, a short circuit may occur, blowing the fuse for the fuel injector, resulting in the engine stalling. It may also cause the injector to continue fueling if a short circuit oc
1521	The Aspirator System installed on the subject vehicles may fail, resulting in the creation of NOx emissions which could exceed the allowable standards. The presence of the Aspirator System also allows moisture to contact the fuel pressure regulator causing corrosion and jeopardizing its integrity.
1522	Some cars may have inoperative Mass Airflow sensors caused by silicone contamination of the sensing element during the manufacturing process.
1523	Some cars may have inoperative Mass Airflow sensors caused by silicone contamination of the sensing element during the manufacturing process.
1524	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings, exhaust contamination, or broken heaters.
1525	Some cars may have Spark Plug Wires which have experienced dielectric failure.
1526	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings, exhaust contamination, or broken heaters.
1527	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings, exhaust contamination, or broken heaters.
1528	An engine calibration released for vehicles intended to meet California Low Emission Vehicle standards was incorrectly programmed into vehicles intended to meet Federal Tier 1 standards.
1529	Some of the affected vehicles were built with a kinked vacuum purge harness to the distributor. The harness was kinked during the vehicle assembly process and results in no ventilation from the distributor housing. Excessive NOx gas is trapped in the distributor.
1530	Some of the affected vehicles were built with a kinked vacuum purge harness to the distributor. The harness was kinked during the vehicle assembly process and results in no ventilation from the distributor housing. Excessive NOx gas is trapped in the distributor.
1531	Replace engine control module with a remedied one.
1532	Some vehicles may experience water intrusion into the Evaporative Emission Control System canisters.
1533	Elboe fittings connecting the EVAP canister to the OBD2 valve on certain fuel tank assemblies may be abraded or cracked. The abrasions or cracks stem from an improper handling procedure during early production. This procedure was corrected during September production.
1534	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1535	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1536	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1537	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1538	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1539	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1540	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1541	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1542	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1543	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1544	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1545	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1546	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1547	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1548	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1549	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1550	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1551	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1552	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1553	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1554	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1555	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1556	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1557	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1558	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1559	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1560	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1561	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1562	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1563	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1564	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1565	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1566	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1567	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1568	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1569	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1570	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1571	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1572	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1573	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1574	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1575	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1576	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1577	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1578	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1579	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1580	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1581	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1582	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1583	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1584	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1585	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1586	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1587	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1588	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1589	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1590	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1591	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1592	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1593	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1594	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1595	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1596	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1597	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1598	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1599	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1600	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1601	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1602	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1603	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1604	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1605	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1606	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1607	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1608	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1609	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1610	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1611	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1612	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1613	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1614	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1615	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1616	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1617	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1618	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1619	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1620	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
1621	Some trucks may have Thermactor Air Injection Manifolds that leak Thermactor air or exhaust gas.
1622	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1623	Some cars may have inoperative heated exhaust gas oxygen sensors due to broken sensing elements.
1624	Some cars may have inoperative heated exhaust gas oxygen sensors due to broken sensing elements.
1625	Some cars may have inoperative heated exhaust gas oxygen sensors due to broken sensing elements.
1626	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
1627	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
1628	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
1629	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
1630	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
1631	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
1632	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
1633	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
1634	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
1635	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
1636	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
1637	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1638	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1639	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1640	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1641	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1642	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1643	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1644	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1645	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1646	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1647	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
1648	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.

	P
1649	Some cars may have been built with incorrect catalytic converters. Six brick converters were installed in place of four brick converters used in this application.
1650	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1651	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1652	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1653	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1654	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1655	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1656	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1657	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1658	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
1659	Wall thickness of production fuel tanks is greater than the wall thickness of developmental vehicles. This difference results in a tank with greater stiffness. A stiffer tank with decreased elasticity may result in a reduced pressure compensation during the OBD EVAP system leak check process. The pressure peak could e
1660	During extremly low temperature start-up conditions, the Transfer Case control module may not communicate with the remainder of the vehicle (CAN).
1661	Vehicles were manufactured with an incorrect Vehicle Emission Control Information (VECI) label. These carryover vehicles were equipped with an underhood VECI label, which identifies the vehicles as compling with 1998 model year LDV standards.
1662	Vehicles were manufactured with an incorrect Vehicle Emission Control Information (VECI) label. These carryover vehicles were equipped with an underhood VECI label, which identifies the vehicles as compling with 1998 model year LDV standards.
1663	Rear oxygen sensor failure caused by corrosion and breakaway of the outer electrode conductive strip of the sensor ceramic body.
1664	This defect involves the rear oxygen sensor. In this case, Nissan has determined from the diagnostic trouble code and investigation of replaced oxygen sensors that the sensor is malfunctioning. In most cases this has been determined to be due to corrosion of the sensor from moisture in the exhaust gas. Some ma
1665	This defect involves the front oxygen sensor. Unexpected deterioration of the oxygen sensor is occurring as a result of contamination possibly from fuel, oil or other unknown sources and causing the MIL to illuminate.
1666	This defect involves the fuel temperature sensor. One of the electrical leads to the temperature sensor which is located in the fuel tank can fatigue and break off of the sensor over a period of time due to vibration. This results in illumination of the MIL.
1667	This defect involves the auxiliary air control valve. As a result of deposits on the valve, it may intermittently stick and not open or close smoothly. During the OBD system self-test of the auxiliary air control valve, the MIL may be illuminated as a result of the valve intermittently sticking.
1668	This defect involves the throttle valve switch. Degradation/wear of the resistance material in the switch can affect the resistance of the variable resistor which can cause the MIL to illuminate.
1669	This defect involves the vent control valve for the evaporative emission control system. On some vehicles the valve is sticking in the open position due to corrosion so that when the OBD system attempts to do a check for leaks in the evaporative control system, the MIL illuminates because the system is not sealed.
1670	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
1671	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
1672	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
1673	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
1674	Secondary Air Changeover Valve becomes non-functional due to internal contamination, which comes from an outside source.
1675	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1676	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1677	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1678	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1679	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1680	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1681	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1682	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1683	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1684	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1685	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1686	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1687	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1688	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1689	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1690	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1691	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1692	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1693	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1694	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1695	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1696	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1697	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1698	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1699	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1700	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1701	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1702	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1703	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1704	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1705	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
1706	The fuel tank rollover valve may allow liquid fuel to pass through and fill the evaporative canister.
1707	The oxygen sensor harness may have been mistakenly secured with clips to the exhaust heat shield and/or to a bracket on the transmission housing. Due to the movement between the vehicle body, transmission and exhaust system, the oxygen sensor harness may stretch and break over time causing the check eng
1708	There may be condensation in the exhaust system causing thermal shock condition to the outer shell of the oxygen sensor. There may also be a loosening of the conductive strip from the protective layer of the sensor element due to production failure, interrupting the signal from the outer electrode.
1709	There may be condensation in the exhaust system causing thermal shock condition to the outer shell of the oxygen sensor. There may also be a loosening of the conductive strip from the protective layer of the sensor element due to production failure, interrupting the signal from the outer electrode.
1710	Oxygen sensors cause DTC fault codes within the vehicles OBD2 diagnostic system.
1711	The On-board Diagnostic II (OBDII) evaporative system monitor on 1997 and 1998 model year vehicles certified to the enhanced evaporative emission requirements may allow pending diagnostic trouble codes to be erased under limited conditions.Ford amended this DR on 4/4/2001.
1712	The On-board Diagnostic II (OBDII) evaporative system monitor on 1997 and 1998 model year vehicles certified to the enhanced evaporative emission requirements may allow pending diagnostic trouble codes to be erased under limited conditions.Ford amended this DR on 4/4/2001.
1713	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
1714	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
1715	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
1716	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
1717	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
1718	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
1719	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1720	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1721	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1722	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1723	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1724	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1725	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1726	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1727	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1728	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1729	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1730	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1731	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1732	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1733	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1734	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1735	Some cars, trucks and vans may have loose electrical contact leads on the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor
1736	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1737	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1738	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1739	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1740	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1741	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1742	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1743	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1744	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1745	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1746	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1747	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1748	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1749	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1750	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1751	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1752	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1753	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1754	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1755	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1756	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1757	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1758	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1759	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1760	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1761	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1762	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1763	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1764	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1765	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1766	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1767	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1768	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1769	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1770	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1771	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1772	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1773	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
1774	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
1775	The wrong Vehicle Emission Control Information (VECI) label may have been installed on the subject vehicles.
1776	The Fuel tank level sending unit may display an inaccurate level.
1777	The main cause of failure was abrasion of the monolith caused by mat erosion and thermal cracking of the front face of the monolith.
1778	Rear oxygen sensor failure caused by corrosion and breakaway of the outer electrode conductive strip of the sensor ceramic body.
1779	The Onboard Diagnostic System on the subject vehicles may have been disabled in the area of purge flow detection.
1780	This recall concerns some 1994 vehicles which may be emitting nitrogen oxides (NOx) in excess of California emissions standards. GM will conduct a Voluntary Emission Recall to correct these vehicles by replacing the calibration in the Powertrain Control Module with a new calibration. Also, the connectors on either side
1781	The component that failed is the spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires.
1782	The component that failed is the spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires.
1783	The component that failed is the spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires.
1784	A faulty ground causes electrical noise to be transmitted to the rear oxygen sensor when the heater of the air fuel ratio sensor switches on and off. As a result, the readiness code on the catalyst monitor remains incomplete and does not make a pass determination. The "noise" does not interfere with monitor's ability
1785	Visible smoke from exhaust on acceleration, after prolonged idle period.
1786	Internal corrosion of the Exhaust Gas Recirculation (EGR) valve. A design change to the valve had been made for this 98' F car application to make it more robust against water splash intrusion.Part of the design change has resulted in moist gases feeding into the center body of the valve, causing corrosion of the arma
1787	Internal corrosion of the Exhaust Gas Recirculation (EGR) valve. A design change to the valve had been made for this 98' F car application to make it more robust against water splash intrusion.Part of the design change has resulted in moist gases feeding into the center body of the valve, causing corrosion of the arma
1788	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
1789	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
1790	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
1791	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
1792	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1793	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1794	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1795	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1796	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1797	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1798	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1799	Some vans may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings.
1800	Spark plug wires #2 and #8 were cut by contact with the accessory drive belt or pulley. There was a stack-up tolerance problem as well as lead length dimensional issue that allowed potential interference with the accessory drive system for the #2 or #8 spark plug wire.
1801	Spark plug wires #2 and #8 were cut by contact with the accessory drive belt or pulley. There was a stack-up tolerance problem as well as lead length dimensional issue that allowed potential interference with the accessory drive system for the #2 or #8 spark plug wire.
1802	Failures are occurring to the ignition coil and the coil to distributor wire due to corrosion and erosion of the coil wire terminal and the coil terminal post.
1803	Failures are occurring to the ignition coil and the coil to distributor wire due to corrosion and erosion of the coil wire terminal and the coil terminal post.
1804	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1805	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1806	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1807	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1808	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1809	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1810	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1811	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1812	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1813	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1814	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1815	Failures have been occurring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets. The deposit build-up may cause the poppets to stick closed.
1816	Dealers are to replace the evaporative emission canister purge solenoid valve. Also, the PROM calibration in the Oldsmobile Cutlass Supreme convertible, only, will be replaced.
1817	The wrong VECI label may have been installed on the subject vehicles.
1818	The wrong VECI label may have been installed on the subject vehicles.
1819	The wrong Vehicle Emission Control Information label may have been installed on the subject vehicles.
1820	Spark plugs may fail due to loose center electrodes.
1821	Some cars experience engine stumble during driving above 2000 rpm. Generally, this has occurred at approximately 50 mph, in 4th gear, and during slightly uphill driving.Hyundai will publish a TSB providing a description of this problem, and will issue a running change and field fix to replace the affected ECM's as nece
1822	Some cars experience engine stumble during driving above 2000 rpm. Generally, this has occurred at approximately 50 mph, in 4th gear, and during slightly uphill driving.Hyundai will publish a TSB providing a description of this problem, and will issue a running change and field fix to replace the affected ECM's as nece
1823	Some cars experience engine stumble during driving above 2000 rpm. Generally, this has occurred at approximately 50 mph, in 4th gear, and during slightly uphill driving.Hyundai will publish a TSB providing a description of this problem, and will issue a running change and field fix to replace the affected ECM's as nece
1824	Oxygen sensor problem as follows: Loosening of the conductive strip from the protective layer of the sensor element due to production failure, interrupting the signal from the outer electrode OR the ceramic seals of the O2 sensor may over time develop porosity. This may lead to an electrical short or interruptions of th
1825	Oxygen sensor problem as follows: Loosening of the conductive strip from the protective layer of the sensor element due to production failure, interrupting the signal from the outer electrode OR the ceramic seals of the O2 sensor may over time develop porosity. This may lead to an electrical short or interruptions of th
1826	Oxygen sensor problem as follows: Loosening of the conductive strip from the protective layer of the sensor element due to production failure, interrupting the signal from the outer electrode OR the ceramic seals of the O2 sensor may over time develop porosity. This may lead to an electrical short or interruptions of th
1827	Some 1998 MY Elantra and Tiburon owners may experience difficulty filling their vehicle with gasoline due to premature shut off of the fuel nozzle as a result of a faulty fuel vent valve.
1828	Some 1998 MY Elantra and Tiburon owners may experience difficulty filling their vehicle with gasoline due to premature shut off of the fuel nozzle as a result of a faulty fuel vent valve.
1829	The intumescent mat used to retain the catalyst monolith may fail allowing the "brick" to move within the can and eventually erode to the point of disppearance.
1830	The intumescent mat used to retain the catalyst monolith may fail allowing the "brick" to move within the can and eventually erode to the point of disppearance.
1831	Visible smoke from exhaust during acceleration after prolonged idle period.
1832	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1833	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1834	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1835	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1836	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1837	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1838	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1839	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1840	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1841	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1842	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1843	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1844	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1845	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1846	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1847	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1848	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1849	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1850	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1851	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1852	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1853	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1854	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.

1886	Some cars may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1887	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1888	Some cars may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1889	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1890	Some cars may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1891	Some cars, trucks and vans may have Mass Airflow sensors that have been contaminated by silicone used in the manufacturing process.
1892	Some trucks may have an On-Board Diagnostic (OBD) strategy that can illuminate the MIL due to circuit integrity or current imbalance.
1893	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1894	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1895	Some cars may have Spark Plug Wires which have experienced thermal deterioration of the insulation material.
1896	Some cars may have Spark Plug Wires which have experienced thermal deterioration of the insulation material.
1897	Some cars may have Spark Plug Wires which have experienced thermal deterioration of the insulation material.
1898	Some vans may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings.
1899	Some vans may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings or contamination of the sensing element. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1900	Some vans may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings or contamination of the sensing element. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1901	Some vans may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings or contamination of the sensing element. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1902	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings.
1903	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings.
1904	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings.
1905	Some trucks may have inoperative Catalyst Monitor sensors due to exhaust contamination of the sensing element. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
1906	Some trucks may have inoperative Idle Air Control valves caused by the rubber orifice seat sticking closed.
1907	Some vans may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
1908	Some vans may have inoperative Throttle Position sensors caused by abrasion of the variable resistor.
1909	Some vans may have inoperative Throttle Position sensors caused by abrasion of the variable resistor.
1910	Some vans may have inoperative Throttle Position sensors caused by abrasion of the variable resistor.
1911	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors dut to weak gas seal rings.
1912	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors dut to weak gas seal rings.
1913	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors dut to weak gas seal rings.
1914	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors dut to weak gas seal rings.
1915	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors dut to weak gas seal rings.
1916	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors dut to weak gas seal rings.
1917	The O2 sensor causes DTC fault codes within the vehicles OBD2 diagnostic system. The following DTC fault codes are evident:-oxygen sensor circuit, no activity-oxygen sensor, slow response-oxygen sensor, long term fuel trim (system lean)-oxygen sensor, heater circuit - malfunction
1918	The O2 sensor causes DTC fault codes within the vehicles OBD2 diagnostic system. The following DTC fault codes are evident:-oxygen sensor circuit, no activity-oxygen sensor, slow response-oxygen sensor, long term fuel trim (system lean)-oxygen sensor, heater circuit - malfunction
1919	The O2 sensor causes DTC fault codes within the vehicles OBD2 diagnostic system. The following DTC fault codes are evident:-oxygen sensor circuit, no activity-oxygen sensor, slow response-oxygen sensor, long term fuel trim (system lean)-oxygen sensor, heater circuit - malfunction
1920	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1921	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1922	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1923	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1924	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1925	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1926	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1927	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1928	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1929	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1930	Some trucks may have an incomplete blow pin plug weld in the fuel tank.
1931	Failures have been occuring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets.
1932	Failures have been occuring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets.
1933	Failures have been occuring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets.
1934	Failures have been occuring on Sequential Central Port Injectors (SCPI), mainly in California, due to a deposit build-up on individual injector poppets.
1935	There have been secondary failures of the catalytic converter due to extreme misfire caused by an ignition coil wire burn through condition (ref. GM letter FE-6209 dated 2/19/98). Although the converters are not defective in design, materials, or workmanship, the failures are being reported. The extreme misfire cause
1936	There have been secondary failures of the catalytic converter due to extreme misfire caused by an ignition coil wire burn through condition (ref. GM letter FE-6209 dated 2/19/98). Although the converters are not defective in design, materials, or workmanship, the failures are being reported. The extreme misfire cause
1937	There have been secondary failures of the catalytic converter due to extreme misfire caused by an ignition coil wire burn through condition (ref. GM letter FE-6209 dated 2/19/98). Although the converters are not defective in design, materials, or workmanship, the failures are being reported. The extreme misfire cause
1938	The corrective measure consists of installation of a new EPROM into the engine control module and reprogramming same with new software. The revised software is trimming the air/fuel mixture, correcting a lean bias caused by excessive oxygen sensor deposits.
1939	The corrective measure consists of installation of a new EPROM into the engine control module and reprogramming same with new software. The revised software is trimming the air/fuel mixture, correcting a lean bias caused by excessive oxygen sensor deposits.
1940	Some ignition control modules may have been made without a nickel layer that helps bond to a transistor driver. Without the nickel layer, the transistor driver may become delaminated from the remaining bond layers. If the transistor driver becomes delaminated, inadequate internal heat dissipation can cause prema
1941	Some ignition control modules may have been made without a nickel layer that helps bond to a transistor driver. Without the nickel layer, the transistor driver may become delaminated from the remaining bond layers. If the transistor driver becomes delaminated, inadequate internal heat dissipation can cause prema
1942	Some trucks may have Thermactor Check valves with cracked leaf springs.
1943	Some trucks may have Thermactor Check valves with cracked leaf springs.
1944	Some trucks may have Thermactor Check valves with cracked leaf springs.
1945	Some trucks may have Thermactor Check valves with cracked leaf springs.
1946	Some trucks may have Thermactor Check valves with cracked leaf springs.
1947	Some trucks may have Thermactor Check valves with cracked leaf springs.
1948	Some trucks may have Thermactor Check valves with cracked leaf springs.
1949	Some trucks may have Thermactor Check valves with cracked leaf springs.
1950	Some trucks may have Thermactor Check valves with cracked leaf springs.
1951	The On-Board Diagnostic (OBD) evaporative purge monitor will not detect a plugged purge line.
1952	The On-Board Diagnostic (OBD) evaporative purge monitor will not detect a plugged purge line.
1953	The intumescent mat used to retain the catalyst monolith may fail allowing the "brick" to move within the can and eventually erode to the point of disappearance.
1954	The intumescent mat used to retain the catalyst monolith may fail allowing the "brick" to move within the can and eventually erode to the point of disappearance.
1955	The intumescent mat used to retain the catalyst monolith may fail allowing the "brick" to move within the can and eventually erode to the point of disappearance.
1956	The intumescent mat used to retain the catalyst monolith may fail allowing the "brick" to move within the can and eventually erode to the point of disappearance.
1957	The welds on the catalytic converter were made using mild steel weld wire. In combination with the stainless steel converter shell, the welds may rust causing premature failure of the assembly.
1958	The Powertrain Control Module (PCM) will be re-flashed with the proper On-Board Diagnostic (OBD) purge monitor calibration.
1959	Check emission testing has shown that low mileage vehicles fail to meet the NOx standard of 0.4gm/mi. GM will conduct a Voluntary Emission Recall to correct these vehicles by reflashing the VCM calibration.
1960	On-Board Diagnostic (OBD) readiness codes are cleared during a "key on/Key off" sequence. The codes indicate that the OBD checks have been performed by the diagnostic software. This violates a California Air Resources Board regulation on the performance of OBD systems.
1961	The affected part is the crankshaft position/RPM sensor. The reason for the defect is a thermal mismatch of the materials used in the sensor. Due to different coefficients of thermal expansion of these materials, alternating thermal stress could cause a breakage of internal solder connections. Under certain condition
1962	The affected part is the crankshaft position/RPM sensor. The reason for the defect is a thermal mismatch of the materials used in the sensor. Due to different coefficients of thermal expansion of these materials, alternating thermal stress could cause a breakage of internal solder connections. Under certain condition
1963	The affected part is the crankshaft position/RPM sensor. The reason for the defect is a thermal mismatch of the materials used in the sensor. Due to different coefficients of thermal expansion of these materials, alternating thermal stress could cause a breakage of internal solder connections. Under certain condition
1964	The affected part is the crankshaft position/RPM sensor. The reason for the defect is a thermal mismatch of the materials used in the sensor. Due to different coefficients of thermal expansion of these materials, alternating thermal stress could cause a breakage of internal solder connections. Under certain condition
1965	The affected part is the crankshaft position/RPM sensor. The reason for the defect is a thermal mismatch of the materials used in the sensor. Due to different coefficients of thermal expansion of these materials, alternating thermal stress could cause a breakage of internal solder connections. Under certain condition
1966	The affected part is the crankshaft position/RPM sensor. The reason for the defect is a thermal mismatch of the materials used in the sensor. Due to different coefficients of thermal expansion of these materials, alternating thermal stress could cause a breakage of internal solder connections. Under certain condition
1967	The affected part is the crankshaft position/RPM sensor. The reason for the defect is a thermal mismatch of the materials used in the sensor. Due to different coefficients of thermal expansion of these materials, alternating thermal stress could cause a breakage of internal solder connections. Under certain condition
1968	An incorrect fuel filler pipe assembly was installed in certain 1998 heavy-duty vehicles. The incorrect assembly does not incorporate a one-way valve to reduce fuel-dispensing spitback. When a vehicle with the incorrect fuel filler pipe assembly is refueled, a small amount of excess fuel can be ejected from the fuel filler
1969	Some cars may experience fuel seepage at the interface of the metal fuel line with the nylon jumper, due to manufacturing problems at the part supplier.The interfacing joint of a metal fuel line and nylon jumper tube will be inspected and, if necessary, a fuel line clamp kit will be installed.
1970	Some cars may experience fuel seepage at the interface of the metal fuel line with the nylon jumper, due to manufacturing problems at the part supplier.The interfacing joint of a metal fuel line and nylon jumper tube will be inspected and, if necessary, a fuel line clamp kit will be installed.
1971	Some cars may experience fuel seepage at the interface of the metal fuel line with the nylon jumper, due to manufacturing problems at the part supplier.The interfacing joint of a metal fuel line and nylon jumper tube will be inspected and, if necessary, a fuel line clamp kit will be installed.
1972	Some cars may experience fuel seepage at the interface of the metal fuel line with the nylon jumper, due to manufacturing problems at the part supplier.The interfacing joint of a metal fuel line and nylon jumper tube will be inspected and, if necessary, a fuel line clamp kit will be installed.
1973	Some vehicles may experience carbon deposit buildup on the LEGR valve pintle shaft causing the shaft to stick in the open or closed position.
1974	Some vehicles may experience carbon deposit buildup on the LEGR valve pintle shaft causing the shaft to stick in the open or closed position.
1975	Some vehicles may experience carbon deposit buildup on the LEGR valve pintle shaft causing the shaft to stick in the open or closed position.
1976	Some vehicles may experience carbon deposit buildup on the LEGR valve pintle shaft causing the shaft to stick in the open or closed position.
1977	Some vehicles may experience carbon deposit buildup on the LEGR valve pintle shaft causing the shaft to stick in the open or closed position.
1978	Some vehicles may experience carbon deposit buildup on the LEGR valve pintle shaft causing the shaft to stick in the open or closed position.
1979	Vehicles may experience a condition that will cause the evaporative emission control system canister to not be purged of fuel vapors for the remainder of a drive trip.
1980	Some cars may have a wring harness that can chafe on a power steering hose, which can interrupt the camshaft position sensor signal.
1981	Engine stalling, rough idling or MIL illuminating due to the deterioration on the output voltage of the throttle position sensor (sensor output noise).
1982	Engine stalling, rough idling or MIL illuminating due to the deterioration on the output voltage of the throttle position sensor (sensor output noise).
1983	Fuel vapor may leak through the fuel cap due to improper sealing between o-ring of fuel cap and the fuel pipe. The root cause is under investigation.
1984	Fuel vapor may leak through the fuel cap due to improper sealing between o-ring of fuel cap and the fuel pipe. The root cause is under investigation.
1985	Fuel vapor may leak through the fuel cap due to improper sealing between o-ring of fuel cap and the fuel pipe. The root cause is under investigation.
1986	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1987	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1988	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1989	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1990	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1991	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1992	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1993	The methanol fuel sensor on the affected vehicles may fail due to grounding of the circuit board and a software problem.
1994	The wrong VECI label may have been installed on the subject vehicles.
1995	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1996	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1997	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1998	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
1999	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
2000	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
2001	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
2002	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
2003	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
2004	Some cars may have EGR Pressure sensors that experience fatigue failure of the sensing element wires.
2005	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors due to weak gas seal rings.
2006	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors due to weak gas seal rings.
2007	Some cars may have the MIL illuminated for random misfire without any misfire occuring. The illumination is attributed to background crankshaft acceleration noise.
2008	Some cars may have the MIL illuminated for random misfire without any misfire occuring. The illumination is attributed to background crankshaft acceleration noise.
2009	Some cars may have the MIL illuminated for random misfire without any misfire occuring. The illumination is attributed to background crankshaft acceleration noise.
2010	Some trucks may have faulty Mass Airflow sensors due to corrosion of the electronic circuit.
2011	Some trucks may have faulty Mass Airflow sensors due to corrosion of the electronic circuit.
2012	Some trucks may have faulty Mass Airflow sensors due to corrosion of the electronic circuit.
2013	Some trucks may have faulty Mass Airflow sensors due to corrosion of the electronic circuit.
2014	Some trucks may have faulty Mass Airflow sensors due to corrosion of the electronic circuit.
2015	Some trucks may have faulty Mass Airflow sensors due to corrosion of the electronic circuit.
2016	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2017	During engine warm up (coolant temperature 40 - 60C) when accelerating with small throttle openings there may be a hesitation or engine stall. When the throttle is opened slowly and slightly, the idle air control changes from the idle mode to the off idle mode. This change is made to quickly and is too large and eng
2018	The Emission Information Label on these vehicles have a vacuum hose routing diagram which incorrectly shows hoses reversed in the connections to the Canister Purge Solenoid valve.
2019	The Emission Information Label on these vehicles have a vacuum hose routing diagram which incorrectly shows hoses reversed in the connections to the Canister Purge Solenoid valve.
2020	The Emission Information Label on these vehicles have a vacuum hose routing diagram which incorrectly shows the two vacuum ports on the Canister Purge Solenoid valve on the opposite ends of the valve. The correct representation should have both ports on the same end of the valve.
2021	The Emission Information Label on these vehicles have a vacuum hose routing diagram which incorrectly shows the two vacuum ports on the Canister Purge Solenoid valve on the opposite ends of the valve. The correct representation should have both ports on the same end of the valve.
2022	A Vehicle Emission Control Information (VECI) label with an inaccurate evaporative emission control hose routing sketch was installed on the vehicle.
2023	Some cars may have inoperative Mass Airflow sensors due to contamination of the sensing element.
2024	Some cars may have inoperative Vehicle Speed sensors due to broken sensor shafts.
2025	Some cars may have inoperative Vehicle Speed sensors due to broken sensor shafts.
2026	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to oil contamination.
2027	Some cars may have inoperative Purge Control valves due to faulty electrical terminal insertion during the manufacturing process, or wire chafing.
2028	Some vans may have inoperative Heated Exhaust Gas Oxygen sensors due to weak gas seal rings.
2029	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to contamination of the reference cavity. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2030	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to contamination of the reference cavity. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2031	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to contamination of the reference cavity. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2032	Exhaust manifold on certain Honda vehicles may crack due to repeated exposure to severe thermal stress.
2033	The exhaust manifold may crack due to repeated exposure to severe thermal stress.
2034	The exhaust manifold may crack due to repeated exposure to severe thermal stress.
2035	Some vehicles may not start at cold ambient temperature (+5F) or below, due to a rich fuel mixture.A VERR will be conducted on affected vehicles to install a new Powertrain Control Module (PCM). If the vehicle has a history of no start, spark plugs will also be replaced.
2036	Some vehicles may not start at cold ambient temperature (+5F) or below, due to a rich fuel mixture.A VERR will be conducted on affected vehicles to install a new Powertrain Control Module (PCM). If the vehicle has a history of no start, spark plugs will also be replaced.
2037	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
2038	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
2039	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
2040	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
2041	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
2042	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
2043	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
2044	Some cars may have an insufficient wiring harness connection with the Throttle Position sensor.
2045	Some trucks may have the MIL illuminated for an ignition system malfunction without a malfunction being present.
2046	Some trucks may have the MIL illuminated for an ignition system malfunction without a malfunction being present.
2047	Some trucks may have the MIL illuminated for an ignition system malfunction without a malfunction being present.
2048	Some trucks may have the MIL illuminated for an ignition system malfunction without a malfunction being present.
2049	Some trucks may have the MIL illuminated for an ignition system malfunction without a malfunction being present.
2050	Some trucks may have the MIL illuminated for an ignition system malfunction without a malfunction being present.
2051	The affected part is the idle speed control valve. The engine may not start or may only start with the accelerator pedal depressed due to a binding idle control valve.
2052	The affected part is the idle speed control valve. The engine may not start or may only start with the accelerator pedal depressed due to a binding idle control valve.
2053	The affected part is the idle speed control valve. The engine may not start or may only start with the accelerator pedal depressed due to a binding idle control valve.
2054	During initial production start-up an incorrect US exhaust emission control information label may have been placed in the engine compartment.
2055	Vehicles may experience poor driveability and/or MIL illumination due to O2 sensor failure. Analysis of returned sensors show the major failure as the loss of the electrical signal from the sensor to the controller due to abrasion of the sensor element inner conductive strip.
2056	The exhaust downpipe seal is being replaced due to premature deterioration of the seal, which results in audible exhaust noise.
2057	Improper software coding of the "torque converter lock-up program", in the automatic transmission control module, may result in the variable camshaft timing device to incorrectly identify the cam position when in fact it is correct.
2058	Defective solder joints in the fuel injection pump may sporadically interrupt proper electrical contact to the engine control module, signaling the pump to shut off. The presence of OBD codes PO 1220 and / or PO 1223 indicate that this has occurred.
2059	Defective solder joints in the fuel injection pump may sporadically interrupt proper electrical contact to the engine control module, signaling the pump to shut off. The presence of OBD codes PO 1220 and / or PO 1223 indicate that this has occurred.
2060	Defective solder joints in the fuel injection pump may sporadically interrupt proper electrical contact to the engine control module, signaling the pump to shut off. The presence of OBD codes PO 1220 and / or PO 1223 indicate that this has occurred.

2068	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.
2069	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.Field Campaign 99E02 will be conducted to correct vehicles in the field.
2070	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.
2071	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.Field Campaign 99E02 will be conducted to correct vehicles in the field.
2072	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.
2073	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.Field Campaign 99E02 will be conducted to correct vehicles in the field.
2074	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.
2075	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.Field Campaign 99E02 will be conducted to correct vehicles in the field.
2076	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.
2077	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.Field Campaign 99E02 will be conducted to correct vehicles in the field.
2078	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.
2079	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.Field Campaign 99E02 will be conducted to correct vehicles in the field.
2080	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.
2081	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.Field Campaign 99E02 will be conducted to correct vehicles in the field.
2082	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.
2083	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.Field Campaign 99E02 will be conducted to correct vehicles in the field.
2084	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.
2085	Some cars may have fuel caps that do not seal properly on the fuel filler pipe.Field Campaign 99E02 will be conducted to correct vehicles in the field.
2086	After a rapid sucession of repeated cold starts, the air injection pump contacts may stick causing the pump to run for an extended period of time. Extended air pump operation may result in an "over-current condition", causing damage to the air injection pump. The vehicle's check engine light will illuminate under such
2087	After a rapid sucession of repeated cold starts, the air injection pump contacts may stick causing the pump to run for an extended period of time. Extended air pump operation may result in an "over-current condition", causing damage to the air injection pump. The vehicle's check engine light will illuminate under such
2088	The Powertrain Control Module (PCM) will be reflashed with a emissions compliant calibration.
2089	The oxygen sensor lead wire may become damaged if placed in excessive tension. A short circuit can result and cause the MIL to illuminate.
2090	The oxygen sensor lead wire may become damaged if placed in excessive tension. A short circuit can result and cause the MIL to illuminate.
2091	When the traction control system is operating to control engine output the manifold vacuum will increase. Under certain conditions the OBD system will mistakenly judge that the Barometric Pressure Sensor (BPS) has failed when the difference between the BPS and the MAP sensor signals exceeds the malfunction criteria
2092	This system incorrectly detects the deterioration of the primary oxygen sensor due to an unexpected primary oxygen sensor signal which occurs under certain conditions.
2093	This system incorrectly detects the deterioration of the primary oxygen sensor due to an unexpected primary oxygen sensor signal which occurs under certain conditions.
2094	This system incorrectly detects the deterioration of the primary oxygen sensor due to an unexpected primary oxygen sensor signal which occurs under certain conditions.
2095	This system incorrectly detects the deterioration of the primary oxygen sensor due to an unexpected primary oxygen sensor signal which occurs under certain conditions.
2096	This system incorrectly detects the deterioration of the primary oxygen sensor due to an unexpected primary oxygen sensor signal which occurs under certain conditions.
2097	The malfunction detection threshold for torque converter lock-up operation is wrong causing the MIL to be illuminated under certain operating conditions.
2098	The engine wire harness is chafed and rubbing on the intake manifold stay bracket. Fuse number 15 is blown and the MIL is illuminated.
2099	The engine wire harness is chafed and rubbing on the intake manifold stay bracket. Fuse number 15 is blown and the MIL is illuminated.
2100	The engine wire harness is chafed and rubbing on the intake manifold stay bracket. Fuse number 15 is blown and the MIL is illuminated.
2101	The engine wire harness is chafed and rubbing on the intake manifold stay bracket. Fuse number 15 is blown and the MIL is illuminated.
2102	The engine wire harness is chafed and rubbing on the intake manifold stay bracket. Fuse number 15 is blown and the MIL is illuminated.
2103	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2104	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2105	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2106	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2107	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2108	Fuel vapor may leak through the fuel cap due to improper sealing between o-ring of fuel cap and fuel pipe. The root cause is under investigation.
2109	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2110	Fuel vapor may leak through the fuel cap due to improper sealing between o-ring of fuel cap and fuel pipe. The root cause is under investigation.
2111	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2112	Fuel vapor may leak through the fuel cap due to improper sealing between o-ring of fuel cap and fuel pipe. The root cause is under investigation.
2113	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2114	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2115	Fuel vapor may leak from the interface of the gap between the fuel cap and fuel filler pipe.
2116	An over-rich mixture caused by exhaust gas in the intake manifold results in hard starting.
2117	An over-rich mixture caused by exhaust gas in the intake manifold results in hard starting.
2118	Water may leak into the Spark-Plug Voltage Detection Module, causing a short circuit. The MIL is illuminated
2119	Water may leak into the Spark-Plug Voltage Detection Module, causing a short circuit. The MIL is illuminated
2120	A short circuit of the knock sensor out-put line causes the MIL to illuminate.
2121	A short circuit of the knock sensor out-put line causes the MIL to illuminate.
2122	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2123	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2124	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2125	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2126	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2127	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2128	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2129	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2130	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2131	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2132	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2133	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2134	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2135	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2136	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2137	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2138	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2139	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2140	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2141	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2142	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2143	The EGR frequency solenoid valve stopper is broken causing gas leakage at the valve seat. The MIL is illuminated.
2144	The poor connection between the high tension lead and the ignition coil causes radio noise.
2145	The poor connection between the high tension lead and the ignition coil causes radio noise.
2146	The poor connection between the high tension lead and the ignition coil causes radio noise.
2147	The poor connection between the high tension lead and the ignition coil causes radio noise.
2148	The poor connection between the high tension lead and the ignition coil causes radio noise.
2149	The poor connection between the high tension lead and the ignition coil causes radio noise.
2150	When the ignition key is released after engine starting, power to the Transmission Control Module may be interrupted causing the MIL to illuminate.
2151	When the ignition key is released after engine starting, power to the Transmission Control Module may be interrupted causing the MIL to illuminate.
2152	When the ignition key is released after engine starting, power to the Transmission Control Module may be interrupted causing the MIL to illuminate.
2153	When the ignition key is released after engine starting, power to the Transmission Control Module may be interrupted causing the MIL to illuminate.
2154	The exhaust manifold with close-coupled catalyst on certain Honda vehicles may crack due to repeated exposure to severe thermal stress.
2155	The exhaust manifold with close-coupled catalyst on certain Honda vehicles may crack due to repeated exposure to severe thermal stress.
2156	The exhaust manifold with close-coupled catalyst on certain Honda vehicles may crack due to repeated exposure to severe thermal stress.
2157	The exhaust manifold with close-coupled catalyst on certain Honda vehicles may crack due to repeated exposure to severe thermal stress.
2158	Misdetection of automatic transmission shift position switch malfunction causing MIL illumination.
2159	When the ignition key is turned on to start the engine, voltage to the ECU can drop. This affects the oscillation of the ECU clock and as a result the ECU works in the back-up mode. This causes the engine idle speed to increase to 1500 rpm and limits maximum engine speed to 2500 rpm. The MIL is always illuminate
2160	Software mistake causing engine surge on closing throttle at high rpm.
2161	Some trucks may have rolled or twisted Intake Manifold gaskets, which can cause a vacuum leak.
2162	Some trucks may have rolled or twisted Intake Manifold gaskets, which can cause a vacuum leak.
2163	Some trucks may have rolled or twisted Intake Manifold gaskets, which can cause a vacuum leak.
2164	Some trucks may have rolled or twisted Intake Manifold gaskets, which can cause a vacuum leak.
2165	The affected vehicles are equipped with incorrect powertrain control modules, catalysts, and certain OBD system components. As a result, the vehicles do not meet OBD2 requirements.
2166	The affected vehicles are equipped with incorrect powertrain control modules, catalysts, and certain OBD system components. As a result, the vehicles do not meet OBD2 requirements.
2167	Some vehicles may have the wrong EGR enable and disable temperatures due to an input error. The errant calibration causes the EGR to be turned on-off every 50 msec. The EGR pintle cannot keep up with the rapidly cycling commanded position and may cause diagnostic P-codes to be set.
2168	Some vehicles may have the wrong EGR enable and disable temperatures due to an input error. The errant calibration causes the EGR to be turned on-off every 50 msec. The EGR pintle cannot keep up with the rapidly cycling commanded position and may cause diagnostic P-codes to be set.
2169	Some vehicles may have the wrong EGR enable and disable temperatures due to an input error. The errant calibration causes the EGR to be turned on-off every 50 msec. The EGR pintle cannot keep up with the rapidly cycling commanded position and may cause diagnostic P-codes to be set.
2170	Some vehicles may have the wrong EGR enable and disable temperatures due to an input error. The errant calibration causes the EGR to be turned on-off every 50 msec. The EGR pintle cannot keep up with the rapidly cycling commanded position and may cause diagnostic P-codes to be set.
2171	Some of the subject vehicles may have been built with the wrong LEGR valve.
2172	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2173	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2174	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2175	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2176	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2177	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2178	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2179	The misfire monitoring system detects false misfire due to improper programming for the crankshaft position sensor signal. The MIL is illuminated.
2180	The spark plug wire design for the affected engine families utilizes a three piece 90 degree boot that has a plastic extender and a rubber plug seal. The wires have been failing due to a dielectric breakdown of the plastic extender or between the extender and the rubber plug seal.
2181	The spark plug wire design for the affected engine families utilizes a three piece 90 degree boot that has a plastic extender and a rubber plug seal. The wires have been failing due to a dielectric breakdown of the plastic extender or between the extender and the rubber plug seal.
2182	The spark plug wire design for the affected engine families utilizes a three piece 90 degree boot that has a plastic extender and a rubber plug seal. The wires have been failing due to a dielectric breakdown of the plastic extender or between the extender and the rubber plug seal.
2183	The engine wire harness is chafed by rubbing on the brake light switch bracket. Fuse number 15 is blown and the MIL is illuminated.
2184	The engine wire harness is chafed by rubbing on the brake light switch bracket. Fuse number 15 is blown and the MIL is illuminated.
2185	The engine wire harness is chafed by rubbing on the brake light switch bracket. Fuse number 15 is blown and the MIL is illuminated.
2186	Rough idling and rough running during cold starting.
2187	Failures of the fuel pressure regulators have been occuring due to chemical degradation of the regulator diaphragms.
2188	Failures of the fuel pressure regulators have been occuring due to chemical degradation of the regulator diaphragms.
2189	Failures of the fuel pressure regulators have been occuring due to chemical degradation of the regulator diaphragms.
2190	Failures of the fuel pressure regulators have been occuring due to chemical degradation of the regulator diaphragms.
2191	Some cars may have inoperative EGR pressure sensors due to leaking fill plugs.
2192	Some cars may have inoperative HEGO sensors due to degraded gas seal rings.
2193	Some cars may have inoperative Purge Flow sensors due to an electronic open circuit.
2194	Some cars may have inoperative Purge Flow sensors due to an electronic open circuit.
2195	Some cars may have inoperative Purge Flow sensors due to an electronic open circuit.
2196	Low tank pressure under certain conditions causes a false MIL for a leaking canister. Repair involves modification of the charcoal canister.
2197	Low tank pressure under certain conditions causes a false MIL for a leaking canister. Repair involves modification of the charcoal canister.
2198	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2199	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2200	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2201	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2202	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2203	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2204	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2205	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2206	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2207	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2208	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2209	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2210	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2211	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2212	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2213	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2214	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2215	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2216	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2217	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2218	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2219	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2220	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2221	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2222	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2223	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2224	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2225	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2226	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2227	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2228	Some vehicles may have intake manifold gaskets that can allow coolant to leak into the cylinders.
2229	The wiring for the secondary air circuit is reversed at the Engine Control Modules (ECM/DME) which may lead to the illumination of the Check Engine light and set a fault code.
2230	Incorrect EGR part numbers were found on 29 parts examined from warranty claims returns. The parts came from two different days of engine build date codes.
2231	Incorrect EGR part numbers were found on 29 parts examined from warranty claims returns. The parts came from two different days of engine build date codes.
2232	Incorrect EGR part numbers were found on 29 parts examined from warranty claims returns. The parts came from two different days of engine build date codes.
2233	Incorrect EGR part numbers were found on 29 parts examined from warranty claims returns. The parts came from two different days of engine build date codes.
2234	An erratic signal from the fuel tank pressure sensor causes the MIL to illuminate.
2235	Due to inappropriate programming in the PCM the, MIL may not illuminate even if the solenoid valve in the automatic transmission fails.
2236	Due to inappropriate programming in the PCM the, MIL may not illuminate even if the solenoid valve in the automatic transmission fails.
2237	Due to inappropriate programming in the PCM the, MIL may not illuminate even if the solenoid valve in the automatic transmission fails.
2238	Due to inappropriate programming in the PCM the, MIL may not illuminate even if the solenoid valve in the automatic transmission fails.
2239	Some vehicles have experienced false MIL illumination because the OBD logic related to the rationality check of the oxygen sensor system included thresholds that were too severe for normal operation.
2240	Some vehicles equipped with the 2.5L engine and automatic transmissions have experienced ECU communication errors with generic scan tools. This results from a protocol difference between the Engine Control Units (ECU) and Transmission Control Units (TCU). The Sonata 2.5L V6 ECU protocol is KWP 2000 and the T
2241	Some vehicles equipped with the 2.5L engine and automatic transmissions have experienced ECU communication errors with generic scan tools. This results from a protocol difference between the Engine Control Units (ECU) and Transmission Control Units (TCU). The Sonata 2.5L V6 ECU protocol is KWP 2000 and the T
2242	Confirmed failures are the result of catalytic converter mat damage due to over temperature exposure or mechanical failure. Damage to the mat support material may allow one or both of the catalytic converter bricks to become loose inside the converter housing causing the rattling noise and/or performance degradati
2243	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2244	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2245	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2246	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2247	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2248	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2249	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2250	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2251	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2252	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2253	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2254	The calibration of the OBD purge monitor may not be robust enough to detect a purge problem during normal urban driving and use.
2255	The Powertrain Control Module (PCM) will be reflashed with an emissions compliant calibration.
2256	The vehicles while certified for sale in California were equipped with Vehicle Emission Control Information (VECI) labels intended for sale in the Northeast Trading Region (NLEV).
2257	The mini-catalyst which should have been installed on the 2.5L Dakota Pick-up certified for the 1999 model year in California was omitted.
2258	When the AIR valve is open, it is designed to function as a check valve to prevent the flow of exhaust gases from the engine into the AIR pump. The failures noted to date are that the valve is inoperable; typically the valve is stuck in the closed position.
2259	The On Board Diagnostic (OBD) system calibration will not illuminate the Malfunction Indicator Light (MIL) if one of the dual close-coupled mini-catalysts should fail.DaimlerChrysler will conduct a recall of the affected vehicles to install (flash) the required OBD calibration in the affected vehicles.
2260	The On Board Diagnostic (OBD) system calibration will not illuminate the Malfunction Indicator Light (MIL) if one of the dual close-coupled mini-catalysts should fail.DaimlerChrysler will conduct a recall of the affected vehicles to install (flash) the required OBD calibration in the affected vehicles.
2261	Replacement of fuel tank vapor hoses.
2262	Some vehicles may be found with evaporative hoses exhibiting signs of premature deterioration.Replacement of fuel tank vapor hoses.
2263	Replacement of fuel tank vapor hoses.
2264	Some vehicles may be found with evaporative hoses exhibiting signs of premature deterioration.Replacement of fuel tank vapor hoses.
2265	Some cars may be found with a defective EGR pressure sensor due to a cracked hose nipple.
2266	Some vehicles may be found with defective oxygen sensors due to corrosion and breakway of the outer surface of the electrode.

2267	Some vehicles may be found with defective oxygen sensors due to corrosion and breakway of the outer surface of the electrode.
2268	Underbody noise caused by loose catalytic converter material caused by mat erosion and monolith cracking.Some 1995 MY Sportages equipped with DOHC engines may have catalytic converters that have deteriorated internally.To correct these potential problems, Kia is recalling all affected 1995 Sportage DOHC models
2269	Underbody noise caused by loose catalytic converter material caused by mat erosion and monolith cracking.Some 1995 MY Sportages equipped with DOHC engines may have catalytic converters that have deteriorated internally.To correct these potential problems, Kia is recalling all affected 1995 Sportage DOHC models
2270	Underbody noise caused by loose catalytic converter material caused by mat erosion and monolith cracking.
2271	Underbody noise caused by loose catalytic converter material caused by mat erosion and monolith cracking.
2272	Due to defective programming, the ECU is unable to access output functions such as error codes.VER states that a special label will be mailed to vehicle owners that will inform technicians of the necessity to have the engine running in order to read OBD II diagnostic trouble codes.
2273	Due to defective programming, the ECU is unable to access output functions such as error codes.VER states that a special label will be mailed to vehicle owners that will inform technicians of the necessity to have the engine running in order to read OBD II diagnostic trouble codes.
2274	Due to defective programming, the ECU is unable to access output functions such as error codes.VER states that a special label will be mailed to vehicle owners that will inform technicians of the necessity to have the engine running in order to read OBD II diagnostic trouble codes.
2275	Due to defective programming, the ECU is unable to access output functions such as error codes.VER states that a special label will be mailed to vehicle owners that will inform technicians of the necessity to have the engine running in order to read OBD II diagnostic trouble codes.
2276	Due to defective programming, the ECU is unable to access output functions such as error codes.
2277	Due to defective programming, the ECU is unable to access output functions such as error codes.
2278	Daimler/Chrysler will conduct a recall of the affected vehicles to reflash the Powertrain Control Module to illuminate the EMR light at the appropriate mileages.
2279	Daimler/Chrysler will conduct a recall of the affected vehicles to reflash the Powertrain Control Module to illuminate the EMR light at the appropriate mileages.
2280	Fuel vapor leak from the interface of the gap between the fuel cap and fuel filler pipe. The gap could be generated by improper dimension in distance between the top ends of inner pipe and outer pipe of the fuel filler pipe.
2281	Fuel vapor leak from the interface of the gap between the fuel cap and fuel filler pipe. The gap could be generated by improper dimension in distance between the top ends of inner pipe and outer pipe of the fuel filler pipe.
2282	Fuel vapor leak from the interface of the gap between the fuel cap and fuel filler pipe. The gap could be generated by improper dimension in distance between the top ends of inner pipe and outer pipe of the fuel filler pipe.
2283	Fuel vapor leak from the interface of the gap between the fuel cap and fuel filler pipe. The gap could be generated by improper dimension in distance between the top ends of inner pipe and outer pipe of the fuel filler pipe.
2284	Fuel vapor leak from the interface of the gap between the fuel cap and fuel filler pipe. The gap could be generated by improper dimension in distance between the top ends of inner pipe and outer pipe of the fuel filler pipe.
2285	Fuel vapor leak from the interface of the gap between the fuel cap and fuel filler pipe. The gap could be generated by improper dimension in distance between the top ends of inner pipe and outer pipe of the fuel filler pipe.
2286	Fuel vapor leak from the interface of the gap between the fuel cap and fuel filler pipe. The gap could be generated by improper dimension in distance between the top ends of inner pipe and outer pipe of the fuel filler pipe.
2287	Fuel vapor leak from the interface of the gap between the fuel cap and fuel filler pipe. The gap could be generated by improper dimension in distance between the top ends of inner pipe and outer pipe of the fuel filler pipe.
2288	Fuel vapor leak from the interface of the gap between the fuel cap and fuel filler pipe. The gap could be generated by improper dimension in distance between the top ends of inner pipe and outer pipe of the fuel filler pipe.
2289	Fuel vapor leak from the interface of the gap between the fuel cap and fuel filler pipe. The gap could be generated by improper dimension in distance between the top ends of inner pipe and outer pipe of the fuel filler pipe.
2290	Due to a lack of inspection and correction during the assembly process, a small percentage of vehicles may have insufficient evaporative emission purge hose clearance. The hose may be installed in a position close to a heat protector for the exhaust pipe. Despite the use of heat resistant material in the hose, the ho
2291	Due to a lack of inspection and correction during the assembly process, a small percentage of vehicles may have insufficient evaporative emission purge hose clearance. The hose may be installed in a position close to a heat protector for the exhaust pipe. Despite the use of heat resistant material in the hose, the ho
2292	Due to a lack of inspection and correction during the assembly process, a small percentage of vehicles may have insufficient evaporative emission purge hose clearance. The hose may be installed in a position close to a heat protector for the exhaust pipe. Despite the use of heat resistant material in the hose, the ho
2293	The defect relates to a camrail connecting the lead free flapper valve inside the vehicle's filler neck with a vent valve that is a part of the vehicle's ORVR system. In a small number of vehicles manufactured by Audi prior to April 20, 1998, a filler neck assembly with a damaged camrail may have been delivered to Audi b
2294	Replacement of the Linear EGR Valve. Some returned parts have an exhaust deposit build up on the EGR pintle shaft, resulting in the valve sticking open. Some of the analyzed customer returned parts have indicated no trouble exited in the part.
2295	Replacement of the Linear EGR Valve. Some returned parts have an exhaust deposit build up on the EGR pintle shaft, resulting in the valve sticking open. Some of the analyzed customer returned parts have indicated no trouble exited in the part.
2296	Some 1996 2.5L Contour and Mystique passenger cars may have inoperative Catalyst Monitor sensors due to degraded gas seal rings or internal contamination of the sensing element.
2297	Some 1997 5.8L F-series trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to degraded gas seal rings.
2298	Some 1997 1.3L Aspire passenger cars may have cracked Distributor Rotor or Vane Covers.
2299	Some 1997 and 1998 4.0L Explorer trucks may have Throttle Plates that can stick closed due to insufficient clearance and sludge accumulation.
2300	Some 1997 4.2L E-series trucks may have Catalysts with deteriorated substrates.
2301	Some 1997 4.2L E-series trucks may have Catalysts with deteriorated substrates.
2302	Some 1997 4.2L E-series trucks may have Catalysts with deteriorated substrates.
2303	Some 1997 6.8L E-Series trucks may have inoperative Catalyst Monitor sensors due to heater pad corrosion.
2304	Some 1998 5.4L Navigator trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to degraded gas seal rings.
2305	The fuel filler cap will be replaced with a cap which will properly seal the fuel filler pipe.
2306	The fuel filler cap will be replaced with a cap which will properly seal the fuel filler pipe.
2307	The fuel filler cap will be replaced with a cap which will properly seal the fuel filler pipe.
2308	The fuel filler cap will be replaced with a cap which will properly seal the fuel filler pipe.
2309	The fuel filler cap will be replaced with a cap which will properly seal the fuel filler pipe.
2310	The fuel filler cap will be replaced with a cap which will properly seal the fuel filler pipe.
2311	The fuel filler cap will be replaced with a cap which will properly seal the fuel filler pipe.
2312	The fuel filler cap will be replaced with a cap which will properly seal the fuel filler pipe.
2313	The fuel filler cap will be replaced with a cap which will properly seal the fuel filler pipe.
2314	The fuel filler cap will be replaced with a cap which will properly seal the fuel filler pipe.
2315	The fuel filler cap will be replaced with a cap which will properly seal the fuel filler pipe.
2316	The fuel filler cap will be replaced with a cap which will properly seal the fuel filler pipe.
2317	The Solid State Fan Relay (SSR) installed on 1996 model year Mini-Vans may fail due to electrical and/or thermal over-stress, caused by excessive current draw, poor attachment of the part's heat sink to the vehicles, and in some cases binding of the radiator fan blade with the shroud.
2318	The Solid State Fan Relay (SSR) installed on 1996 model year Mini-Vans may fail due to electrical and/or thermal over-stress, caused by excessive current draw, poor attachment of the part's heat sink to the vehicles, and in some cases binding of the radiator fan blade with the shroud.
2319	The Solid State Fan Relay (SSR) installed on 1996 model year Mini-Vans may fail due to electrical and/or thermal over-stress, caused by excessive current draw, poor attachment of the part's heat sink to the vehicles, and in some cases binding of the radiator fan blade with the shroud.
2320	The Solid State Fan Relay (SSR) installed on 1996 model year Mini-Vans may fail due to electrical and/or thermal over-stress, caused by excessive current draw, poor attachment of the part's heat sink to the vehicles, and in some cases binding of the radiator fan blade with the shroud.
2321	The Solid State Fan Relay (SSR) installed on 1996 model year Mini-Vans may fail due to electrical and/or thermal over-stress, caused by excessive current draw, poor attachment of the part's heat sink to the vehicles, and in some cases binding of the radiator fan blade with the shroud.
2322	The Solid State Fan Relay (SSR) installed on 1996 model year Mini-Vans may fail due to electrical and/or thermal over-stress, caused by excessive current draw, poor attachment of the part's heat sink to the vehicles, and in some cases binding of the radiator fan blade with the shroud.
2323	Canadian VECI labels were placed on US Federal vehicles and vice-versa.
2324	Some cars equipped with the 1.8L engines have experienced MIL illumination as a result of purge control valve malfunction. The valve malfunctioned as a result of contamination from small grains of charcoal not retained by the canister filter.
2325	Some cars equipped with the 1.8L engines may have coil assemblies which may be defective. Foreign material may have contaminated the coil assembly during manufacture. This contamination may cause rough idle or stumbling.
2326	Some cars equipped with the 1.8L engines may experience a MIL illumination caused by a canister close valve malfunction. A mis-assembly of the valve seal at the vendor eventually may cause the valve seal to not seat properly. If the valve seal does not seat properly, the engine management system will detect a "C
2327	Some cars equipped with the 1.8L engines may experience a MIL illumination caused by a canister close valve malfunction. A mis-assembly of the valve seal at the vendor eventually may cause the valve seal to not seat properly. If the valve seal does not seat properly, the engine management system will detect a "C
2328	Some cars equipped with the 3.0L engines and automatic transmissions may experience engine hesitation during acceleration shortly after a cold start when the ambient temperature and humidity are high.
2329	Some cars equipped with the 3.0L engines and automatic transmissions may experience engine hesitation during acceleration shortly after a cold start when the ambient temperature and humidity are high.
2330	The O2 sensor wiring on Jeep Grand Cherokees equipped with 4.0L engines and a CA emission control system may come in contact with the exhaust system in the area of the close coupled mini-catalysts. This could cause the wiring to short out and cause illumination of the OBD malfunction indicator light.
2331	In some of the affected vehicles, the transmission control wiring harness may be routed too close to the Exhaust Gas Recirculation (EGR) sleeve and tube.
2332	In some of the affected vehicles, the transmission control wiring harness may be routed too close to the Exhaust Gas Recirculation (EGR) sleeve and tube.
2333	An erratic signal from the automatic transmission shift position switch causes the MIL to illuminate.
2334	An erratic signal from the automatic transmission shift position switch causes the MIL to illuminate.
2335	Overfueling or fuel entering the sensor line causes the MIL to illuminate.
2336	Overfueling or fuel entering the sensor line causes the MIL to illuminate.
2337	Overfueling or fuel entering the sensor line causes the MIL to illuminate.
2338	Overfueling or fuel entering the sensor line causes the MIL to illuminate.
2339	Overfueling or fuel entering the sensor line causes the MIL to illuminate.
2340	Overfueling or fuel entering the sensor line causes the MIL to illuminate.
2341	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2342	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2343	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2344	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2345	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2346	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2347	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2348	The EGR port in the intake manifold becomes blocked with carbon deposits. The problem does not occur on vehicles driven in California because of the difference in gasoline content.
2349	When the engine is cold and the transmission is in Drive or Reverse, the engine idle speed fluctuates. When the engine reaches normal operating temperature, the fluctuation stops. The vehicle surges while driving at highway speeds. The cause of failure is inappropriate calibration of the transmission control module.
2350	When the engine is cold and the transmission is in Drive or Reverse, the engine idle speed fluctuates. When the engine reaches normal operating temperature, the fluctuation stops. The vehicle surges while driving at highway speeds. The cause of failure is inappropriate calibration of the transmission control module.
2351	When the engine is cold and the transmission is in Drive or Reverse, the engine idle speed fluctuates. When the engine reaches normal operating temperature, the fluctuation stops. The vehicle surges while driving at highway speeds. The cause of failure is inappropriate calibration of the transmission control module.
2352	When the engine is cold and the transmission is in Drive or Reverse, the engine idle speed fluctuates. When the engine reaches normal operating temperature, the fluctuation stops. The vehicle surges while driving at highway speeds. The cause of failure is inappropriate calibration of the transmission control module.
2353	When the engine is cold and the transmission is in Drive or Reverse, the engine idle speed fluctuates. When the engine reaches normal operating temperature, the fluctuation stops. The vehicle surges while driving at highway speeds. The cause of failure is inappropriate calibration of the transmission control module.
2354	When the engine is cold and the transmission is in Drive or Reverse, the engine idle speed fluctuates. When the engine reaches normal operating temperature, the fluctuation stops. The vehicle surges while driving at highway speeds. The cause of failure is inappropriate calibration of the transmission control module.
2355	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2356	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2357	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2358	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2359	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.

2361	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2362	The misfire monitoring system falsely detects misfire causing the MIL to illuminate.
2363	Sticking of the Secondary Air Injection Check Valve that results from the usage of soap lubricant for the mounting of the hose at the production line. A residue is left from the soap lubricant that may cause the check valve to stick.
2364	Sticking of the Secondary Air Injection Check Valve that results from the usage of soap lubricant for the mounting of the hose at the production line. A residue is left from the soap lubricant that may cause the check valve to stick.
2365	The "In-Use Emission Standard" label of model year 1998 diesel and 12 cylinder passenger vehicles indicates a "Tier 1 Intermediary" in-use standard, when in fact all vehicles are certified to the "Tier 1" In-use standard" for model year 1998.
2366	The "In-Use Emission Standard" label of model year 1998 diesel and 12 cylinder passenger vehicles indicates a "Tier 1 Intermediary" in-use standard, when in fact all vehicles are certified to the "Tier 1" In-use standard" for model year 1998.
2367	The "In-Use Emission Standard" label of model year 1998 diesel and 12 cylinder passenger vehicles indicates a "Tier 1 Intermediary" in-use standard, when in fact all vehicles are certified to the "Tier 1" In-use standard" for model year 1998.
2368	The "In-Use Emission Standard" label of model year 1998 diesel and 12 cylinder passenger vehicles indicates a "Tier 1 Intermediary" in-use standard, when in fact all vehicles are certified to the "Tier 1" In-use standard" for model year 1998.
2369	Some of the heated sensors used for catalyst efficiency monitoring have had failures due to heater problems.
2370	Some of the heated sensors used for catalyst efficiency monitoring have had failures due to heater problems.
2371	Engine stall at idle.
2372	Some trucks may have an OBD strategy that can illuminate the MIL for an EGR pressure sensor hose concern when the concern is not present.
2373	Some trucks may have an OBD strategy that can illuminate the MIL for an EGR pressure sensor hose concern when the concern is not present.
2374	Some cars may have a transmission wiring harness that can contact the EGR sleeve and tube. Prolonged contact could cause damage to the wiring harness convolute and wires. Field Campaign 99E04 will be conducted to correct vehicles in the field.
2375	Some cars may have a transmission wiring harness that can contact the EGR sleeve and tube. Prolonged contact could cause damage to the wiring harness convolute and wires. Field Campaign 99E04 will be conducted to correct vehicles in the field.
2376	Some cars may have fuel tank vent tube hoses with inadequate ozone resistance that may become brittle and crack.Field campaign 99S25 will be conducted to install new fuel tank vent tube hoses on the potentially affected vehicles in the field.
2377	Some cars may have fuel tank vent tube hoses with inadequate ozone resistance that may become brittle and crack.Field campaign 99S25 will be conducted to install new fuel tank vent tube hoses on the potentially affected vehicles in the field.
2378	Some cars may have fuel tank vent tube hoses with inadequate ozone resistance that may become brittle and crack.Field campaign 99S25 will be conducted to install new fuel tank vent tube hoses on the potentially affected vehicles in the field.
2379	Some cars may have fuel tank vent tube hoses with inadequate ozone resistance that may become brittle and crack.Field campaign 99S25 will be conducted to install new fuel tank vent tube hoses on the potentially affected vehicles in the field.
2380	Some trucks may have been built with an Onboard Diagnostic Strategy that does not execute the misfire monitor.
2381	During engine warm-up (coolant temperature 40 to 60 degrees C), a hesitation or stall occurs when accelerating from a complete stop. The failure mode does not occur during FTP testing and occurs only under very limited operating conditions in normal use.
2382	During engine warm-up (coolant temperature 40 to 60 degrees C), a hesitation or stall occurs when accelerating from a complete stop. The failure mode does not occur during FTP testing and occurs only under very limited operating conditions in normal use.
2383	Incorrect identifying mark was stamped on the manifold converter. (Stamped with "S24" and should have been stamped with "S29").
2384	The average CO of the above subject vehicles may exceed the standard (3.4 gpm) due to insufficient robustness of emission control logic and calibration with emission parts at high mileage.
2385	MMMA will conduct a Voluntary Remedial Plan to replace the VECI label on 2000 MY vehicles. The label incorrectly lists the engine family as YDSXV03.0G2H.
2386	In some of the affected vehicles, the fuel fill hose material did not meet specification and may react with the gasoline in the fuel tank. Over a period of time the in-tank fuel filter may become contaminated and eventually lead to lack of engine performance, hesitation or may have an adverse affect on your vehicle's e
2387	In some of the affected vehicles, the fuel fill hose material did not meet specification and may react with the gasoline in the fuel tank. Over a period of time the in-tank fuel filter may become contaminated and eventually lead to lack of engine performance, hesitation or may have an adverse affect on your vehicle's e
2388	Nissan has inspected failed rear oxygen sensors replaced under warranty and has identified three causes of failure. These include cracking of the ceramic element due to condensed water, peeling of the ceramic element due to condensed water, and carbon sticking to the ceramic element during abnormal engine startin
2389	Nissan has inspected failed rear oxygen sensors replaced under warranty and has identified three causes of failure. These include cracking of the ceramic element due to condensed water, peeling of the ceramic element due to condensed water, and carbon sticking to the ceramic element during abnormal engine startin
2390	Abrasion of the resistance material in the switch occurs in use. Grease exuded from the shaft mixes with the abraded resistance material (powder) and accumulates in a gel condition at the throttle closed position. If the throttle is closed/partially open, and then fully closed, some of the abraded resistance material ma

The diaphragm degradation appears to be related to something in specific brands of fuel, mainly in CA beginning May of 1997. GM is currently working with a specific brand supplier and the supplier of
2429	Failures of the fuel pressure regulators have been occurring due to chemical degradation of the regulator diaphragms. The diaphragm degradation appears to be related to something in specific brands of fuel, mainly in CA beginning May of 1997. GM is currently working with a specific brand supplier and the supplier of
2430	Failures of the fuel pressure regulators have been occurring due to chemical degradation of the regulator diaphragms. The diaphragm degradation appears to be related to something in specific brands of fuel, mainly in CA beginning May of 1997. GM is currently working with a specific brand supplier and the supplier of
2431	Due to a false constant value in the ECU, communication with diagnostic scan tools for model year 2000 may not be possible.Running change "00-TR-15" has been submitted.Manufacturer follow up: TBD.
2432	Some cars have experienced small vapor leaks caused by excessive vacuum in the fuel tank.The fuel filler cap will be replaced with a cap that reduces the amount of vacuum applied to the fuel tank.
2433	Some cars have experienced small vapor leaks caused by excessive vacuum in the fuel tank.The fuel filler cap will be replaced with a cap that reduces the amount of vacuum applied to the fuel tank.
2434	Some cars have experienced small vapor leaks caused by excessive vacuum in the fuel tank.The fuel filler cap will be replaced with a cap that reduces the amount of vacuum applied to the fuel tank.
2435	Some cars have experienced small vapor leaks caused by excessive vacuum in the fuel tank.The fuel filler cap will be replaced with a cap that reduces the amount of vacuum applied to the fuel tank.
2436	Some cars have experienced small vapor leaks caused by excessive vacuum in the fuel tank.The fuel filler cap will be replaced with a cap that reduces the amount of vacuum applied to the fuel tank.
2437	Some cars have experienced small vapor leaks caused by excessive vacuum in the fuel tank.The fuel filler cap will be replaced with a cap that reduces the amount of vacuum applied to the fuel tank.
2438	Contamination in the ignition distributor cap causes a misfire at cold start and the MIL to illuminate.
2439	Contamination in the ignition distributor cap causes a misfire at cold start and the MIL to illuminate.
2440	The problem is that the vehicles in this engine family have an incorrect data setting in their OBD system. This means that a fault detected by the purge flow diagnostic will not result in fault code storage and MIL illumination.
2441	Some cars may have inoperative Transmission Range Sensors due to moisture intrusion or the resistance being out of specification.
2442	Some cars may have cracked intake manifolds in a high stress concentration area of the water crossover. The crack is caused by cyclic high pressure associated with high engine speeds during rapid acceleration.
2443	Some trucks may have inoperative Heated Exhaust Gas Oxygen Sensors due to degraded gas seal rings.
2444	Some trucks may have inoperative Heated Exhaust Gas Oxygen Sensors due to degraded gas seal rings.
2445	Some trucks may have Fuel Tank Filler Cap O-rings that cannot maintain the seal of the fuel tank.
2446	Some trucks may have EGR Tubes that can crack.
2447	Some cars may have Fuel Tank Filler Hoses that can deteriorate and plug the fuel delivery modules.Field campaign 99E07 will be conducted to install the new part on the vehicles in the field.
2448	Some cars may have Fuel Tank Filler Hoses that can deteriorate and plug the fuel delivery modules.Field campaign 99E07 will be conducted to install the new part on the vehicles in the field.
2449	The waste gate activation rod (mounted on the turbo charger) breaks caused by a mechanical overload. If the waste gate activation rod becomes disconnected from the waste gate diaphragm, little or no intake boost will be present. Under hard acceleration the driver will feel a notable loss of power.
2450	Some Windstar vans have fuel tanks that may experience fatigue fracture near the fuel tank strap attachment due to the excessive stress resulting from a combination of tank height and loading in high ambient temperatures.Field Campaign 99S33 will be conducted to inspect the vehicles, install a new fuel tank strap,
2451	Some Windstar vans have fuel tanks that may experience fatigue fracture near the fuel tank strap attachment due to the excessive stress resulting from a combination of tank height and loading in high ambient temperatures.Field Campaign 99S33 will be conducted to inspect the vehicles, install a new fuel tank strap,
2452	Some Windstar vans have fuel tanks that may experience fatigue fracture near the fuel tank strap attachment due to the excessive stress resulting from a combination of tank height and loading in high ambient temperatures.Field Campaign 99S33 will be conducted to inspect the vehicles, install a new fuel tank strap,
2453	Some Windstar vans have fuel tanks that may experience fatigue fracture near the fuel tank strap attachment due to the excessive stress resulting from a combination of tank height and loading in high ambient temperatures.Field Campaign 99S33 will be conducted to inspect the vehicles, install a new fuel tank strap,
2454	Some Windstar vans have fuel tanks that may experience fatigue fracture near the fuel tank strap attachment due to the excessive stress resulting from a combination of tank height and loading in high ambient temperatures.Field Campaign 99S33 will be conducted to inspect the vehicles, install a new fuel tank strap,
2455	The secondary air injection system consists of an air pump driven by an electric motor, a relay, solenoid valve, a combination control / check valve, a manifold vacuum check valve and associated hardware. The control/check valve which when the valve is open, is designed to function as a check valve to prevent the flov
2456	Available data and reports indicate that all of the subject catalytic converters were replaced due to exhaust noise. In most cases, the source of the noise was identified as a crack in the front pipes near the inlet to the converter.
2457	Missing or faulty front oxygen sensor.
2458	Some 1996 cars may have an oil pressure switch which may leak engine oil due to an "inappropriate production" of the part.
2459	The exhaust manifold with closed-coupled catalyst on some vehicles may crack due to repeated exposure to severe thermal stress.
2460	The exhaust manifold with closed-coupled catalyst on some vehicles may crack due to repeated exposure to severe thermal stress.
2461	Because of incorrect base engine idle speed setting, a hesitation or stall occurs when accelerating from a complete stop.
2462	Because of incorrect base engine idle speed setting, a hesitation or stall occurs when accelerating from a complete stop.
2463	A concern has arisen regarding the fit of fuel filler caps within a certain VIN range. Improper fit could cause a MIL to illuminate.
2464	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2465	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2466	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2467	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2468	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2469	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2470	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2471	The defect affects automatic transmission related diagnostic trouble code (DTC) faults. When such a fault is recorded, the engine causes default to be recorded and enters its "limp home" mode of operation. The malfuction indicator lamp (MIL) does not stay illuminated. The defect is software related.
2472	Based on an owner complaint of rough idle, poor starting, poor engine performance, or the MIL illumination, the EGR valves were being replaced.

	P
2473	Based on an owner complaint of rough idle, poor starting, poor engine performance, or the MIL illumination, the EGR valves were being replaced.
2474	A stack-up of tolerances within the fuel filler latching mechanism could result in MIL illumination.
2475	Oxygen sensors with internal electrical faults.
2476	Failed Purge Valves leaking.
2477	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2478	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2479	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2480	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2481	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2482	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2483	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2484	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2485	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2486	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2487	Some vehicles may have a non-emission related malfunction (Fault Code P0478 - Transmission Force Motor) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault code P0401. Fault code P748 will not illuminate the MIL when detected. This condition applies to automatic transmission equipped vehicles
2488	The Malfunction Indicator Light (MIL) will not be illuminated if an On-Board Diagnostic (OBD) Exhaust Gas Recirculation (EGR) fault code P04060 (EGR sensor circuit high) is stored as a result of an EGR system malfunction.
2489	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2490	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2491	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2492	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2493	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2494	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2495	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2496	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2497	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2498	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2499	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2500	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2501	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2502	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2503	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2504	Some vehicles may have a non-emission related malfunction (Fault Code P0724 - Torque Converter Clutch (TCC) Brake Switch Circuit) that will disable Exhaust Gas Recirculation (EGR) flow diagnostic fault codes P0400 for passenger cars and P0401 for trucks. Fault code P0724 will not illuminate the MIL when detected.
2505	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2506	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2507	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2508	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2509	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2510	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2511	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2512	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2513	Corrosion of the solenoid internal to the AIR pump may cause failure of the AIR system. When corrosion causes the solenoid to fail, the AIR pump air is not allowed to flow into the engine exhaust.
2514	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2515	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2516	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2517	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2518	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2519	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2520	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2521	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.
2522	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause various driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.A VERR will be conducted on affected vehicles registered in fifteen (15) high road salt corrosion states to
2523	Water inside the PCM and harness connector, in the presence of contaminants such as road salt, can cause variuos driveability problems or Malfunction Indicator Lamp (MIL) illuminations, and/or a no start condition.A VERR will be conducted on affected vehicles registered in fifteen (15) high road salt corrosion states to

2545	This defect involves the rear oxygen sensor. In this case, Nissan has determined from the diagnostic trouble code and investigation of replaced oxygen sensors that the sensor is malfunctioning. In most cases this has been determined to be due to corrosion of the sensor from moisture in the exhaust gas. Some ma
2546	This defect involves the front oxygen sensor. Unexpected deterioration of the oxygen sensor is occurring as a result of contamination possibly from fuel, oil or other unknown sources and causing the MIL to illuminate.
2547	This defect involves the front oxygen sensor. Unexpected deterioration of the oxygen sensor is occurring as a result of contamination possibly from fuel, oil or other unknown sources and causing the MIL to illuminate.
2548	This defect involves the fuel temperature sensor. One of the electrical leads to the temperature sensor which is located in the fuel tank can fatigue and break off of the sensor over a period of time due to vibration. This results in illumination of the MIL.
2549	This defect involves the auxiliary air control valve. As a result of deposits on the valve, it may intermittently stick and not open or close smoothly. During the OBD system self-test of the auxiliary air control valve, the MIL may be illuminated as a result of the valve intermittently sticking.
2550	This defect involves the throttle valve switch. Degradation/wear of the resistance material in the switch can affect the resistance of the variable resistor which can cause the MIL to illuminate.
2551	This defect involves the vent control valve for the evaporative emission control system. On some vehicles the valve is sticking in the open position due to corrosion so that when the OBD system attempts to do a check for leaks in the evaporative control system, the MIL illuminates because the system is not sealed.
2552	This defect involves the vent control valve for the evaporative emission control system. On some vehicles the valve is sticking in the open position due to corrosion so that when the OBD system attempts to do a check for leaks in the evaporative control system, the MIL illuminates because the system is not sealed.
2553	This defect involves the vent control valve for the evaporative emission control system. On some vehicles the valve is sticking in the open position due to corrosion so that when the OBD system attempts to do a check for leaks in the evaporative control system, the MIL illuminates because the system is not sealed.
2554	The natural gas fuel fill valves may leak.
2555	An incorrect PCM calibration may have been installed in service.
2556	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
2557	Some 1997 and 1998 4.0L Explorer trucks may have Throttle Plates that can stick closed due to insufficient clearance and sludge accumulation.
2558	MIL illumination related misfire (P0300 to P0309) due to unstable combustion. New fuel injectors with modified specs will be part of Field Fix.
2559	Some cars may have inoperative Purge Regulator Valves due to faulty electrical terminal insertion or wire chafing.
2560	Some cars may have inoperative Mass Airflow Sensors due to silicone contamination of the sensing element.
2561	Some vans may have inoperative Transmission Range Sensors due to moisture intrusion into the sensor.
2562	Some trucks may have inoperative Catalyst Monitor Sensors due to heater pad corrosion.
2563	Some trucks may have inoperative Catalyst Monitor Sensors due to heater pad corrosion.
2564	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2565	Some vans may have Throttle Bodies which may not provide adequate airflow during certain operating conditions.
2566	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2567	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2568	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2569	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2570	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2571	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2572	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2573	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2574	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2575	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2576	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2577	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2578	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2579	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2580	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2581	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2582	Some trucks may have inoperative ignition coils due to coolant leaking on the coil.
2583	The vehicles, certified for sale in U.S. federal regions, were equipped with (VECI) labels intended for vehicles to be sold in Canada. The VECI did not state the vehicle conforms to "U.S. EPA ... regulations."
2584	Due to an error in the On-Board Diagnostic (OBD) programming, the Malfunction Indicator Light (MIL) may light due to a false failure (torque converter lockup), or fail to light when a failure (pressure transducer) occurs.
2585	Some car models may experience breakage of the lower air intake-chamber box during extremely cold weather starting conditions due to an overly rich mixture in the intake manifold and retarded ignition timing.
2586	Some car models may experience breakage of the lower air intake-chamber box during extremely cold weather starting conditions due to an overly rich mixture in the intake manifold and retarded ignition timing.
2587	Some car models may experience breakage of the lower air intake-chamber box during extremely cold weather starting conditions due to an overly rich mixture in the intake manifold and retarded ignition timing.
2588	Some car models may experience breakage of the lower air intake-chamber box during extremely cold weather starting conditions due to an overly rich mixture in the intake manifold and retarded ignition timing.
2589	Some car models may experience breakage of the lower air intake-chamber box during extremely cold weather starting conditions due to an overly rich mixture in the intake manifold and retarded ignition timing.
2590	In some Miata vehicles, the non-return valve installed at the lower end of the fuel filler pipe may stick due to insufficent clearance between the valve case and the valve shutter combined with the material properties of the fuel hose between the filler pipe and the fuel tank. This may cause a "hard to refuel" condition ar

2689	Failures of the Central Multipoint Fuel Injector occur due to a deposit build-up on the injector poppets causing the poppets to stick in a closed position.
2690	Failures of the Central Multipoint Fuel Injector occur due to a deposit build-up on the injector poppets causing the poppets to stick in a closed position.
2691	Failures of the Central Multipoint Fuel Injector occur due to a deposit build-up on the injector poppets causing the poppets to stick in a closed position.
2692	Ignition Control Module failure due to a higher than required current flow at idle (and low engine speeds).
2693	Ignition Control Module failure due to a higher than required current flow at idle (and low engine speeds).
2694	Some 1996 3.0L Taurus and Sable passenger cars may have evaporative purge lines that can contact the dash panel bracket and wear through.
2695	Oxygen sensor exposure to extreme temperature may cause a seal inside the sensor to allow exhaust gas to leak to the reference air side of the sensor, thereby letting the output signal temporarily go outside the range of usable values.
2696	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2697	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2698	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2699	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2700	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2701	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2702	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2703	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2704	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2705	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2706	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2707	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2708	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2709	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2710	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2711	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2712	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2713	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2714	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2715	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2716	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2717	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2718	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2719	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2720	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2721	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2722	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2723	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2724	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2725	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2726	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2727	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2728	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2729	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2730	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2731	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2732	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2733	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2734	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2735	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2736	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2737	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2738	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2739	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2740	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2741	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2742	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2743	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2744	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2745	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2746	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2747	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2748	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2749	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2750	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2751	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2752	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2753	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2754	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2755	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2756	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2757	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2758	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2759	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2760	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2761	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2762	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2763	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2764	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2765	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2766	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2767	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2768	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2769	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2770	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2771	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2772	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2773	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2774	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2775	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2776	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2777	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2778	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2779	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2780	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2781	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2782	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2783	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2784	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2785	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2786	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2787	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2788	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2789	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2790	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2791	Some 1991-1994 trucks may have HEGO sensors with reference cavities that may become contaminated with water, oil, exhaust gas, or unburned fuel under certain conditions. The contamination may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
2792	
2793	Some trucks with 7.5L engines may have inoperative HEGO sensors.
2794	Some trucks with 7.5L engines may have inoperative HEGO sensors.
2795	Some cars may have throttle position sensors that wear out prematurely.
2796	
2797	
2798	
2799	The catalytic converter will be replaced with a redesigned part.
2800	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2801	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2802	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2803	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2804	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2805	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2806	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2807	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2808	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2809	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2810	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2811	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2812	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2813	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2814	Some cars may have Carbon buildup in the EGR groove of the intake manifold.
2815	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.
2816	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.
2817	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.
2818	Positive Crankcase Ventilation hoses exhibit a deterioration of the material, which causes cracking, resulting in crankcase vent system leaks and vacuum leaks.
2819	Positive Crankcase Ventilation hoses exhibit a deterioration of the material, which causes cracking, resulting in crankcase vent system leaks and vacuum leaks.
2820	The existing Powertrain Control Modules (PCMs) will be replaced using PCMs having newly certified calibrations.
2821	The existing Powertrain Control Modules (PCMs) will be replaced using PCMs having newly certified calibrations.
2822	The potential defect involves fuel hoses and metal lines in the engine compartment that deliver fuel to and from the engine. It is possible that seepage could occur between a hose and the metal line on either side of the hose. If this seepage occurs, a conspicuous fuel odor will be present.
2823	The potential defect involves fuel hoses and metal lines in the engine compartment that deliver fuel to and from the engine. It is possible that seepage could occur between a hose and the metal line on either side of the hose. If this seepage occurs, a conspicuous fuel odor will be present.
2824	The potential defect involves fuel hoses and metal lines in the engine compartment that deliver fuel to and from the engine. It is possible that seepage could occur between a hose and the metal line on either side of the hose. If this seepage occurs, a conspicuous fuel odor will be present.
2825	An engine may experience starting difficulty when vehicles are soaked for a long time in an extremely cold area. This situation is caused by incorrect vacuum signal into the MAP sensor due to frozen moisture which clogs the vacuum line between the MAP sensor and the intake manifold.
2826	An engine may experience starting difficulty when vehicles are soaked for a long time in an extremely cold area. This situation is caused by incorrect vacuum signal into the MAP sensor due to frozen moisture which clogs the vacuum line between the MAP sensor and the intake manifold.
2827	Oxygen sensors deteriorate and result in poor fuel/air control, reduced catalyst efficiency, and high emission levels.
2828	Oxygen sensors deteriorate and result in poor fuel/air control, reduced catalyst efficiency, and high emission levels.
2829	A processing error in the DME engine control module of the initial production phase can lead to an erroneous setting of the check engine light and erroneous fault code storage.
2830	The check engine light may become illuminated for a short period of time and fault code 41 set in the engine control module. The problem is caused by an onboard diagnostic system threshold adaption error. It is corrected by reprogramming the ECM EPROM with an updated software program.
2831	Certain cars exhibit an incorrect hose routing on the emission label.
2832	Certain cars exhibit an incorrect hose routing on the emission label.
2833	The emission label on these vehicles erroneously indicates compliance with "TLEV" emissions standards.
2834	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
2835	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
2836	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
2837	Stalling problem when the water temperature is below 70F during the initial 15s after engine start. Defective Modulator.
2838	The protective internal coating of the electronic crank angle sensor was manufactured from material that did not meet specifications.
2839	The monoliths in the underbody catalytic converter may rattle and break up during the vehicles' useful lives.
2840	The monoliths in the underbody catalytic converter may rattle and break up during the vehicles' useful lives.
2841	Some cars have a rattling noise underneath the vehicle since the monolith has been abraded by mat erosion.
2842	Illumination of the malfunction indicator light results from unstable signal output from the oxygen sensor.
2843	The drive belt pulley on your car's engine could develop fatigue cracks in the metal and break. If the drive pulley breaks, your car would not have engine cooling, battery charging and power steering. Loss of these systems could cause you to lose control of the car.
2844	The drive belt pulley on your car's engine could develop fatigue cracks in the metal and break. If the drive pulley breaks, your car would not have engine cooling, battery charging and power steering. Loss of these systems could cause you to lose control of the car.
2845	This engine family is equipped with a secondary air injection system, delivering air into the exhaust manifold. Part of this system is a non-return or check valve, which prevents hot exhaust gases from entering the pump. Some vehicles may have been equipped with a warped sealing disk which could allow flow back to
2846	Due to a logistical error incorrect coolant temperature sensors (NTCs) may have been installed on M5 vehicles during a specified production period.
2847	Due to a logistical error incorrect coolant temperature sensors (NTCs) may have been installed on M5 vehicles during a specified production period.
2848	Engines were assembled with the incorrect Positive Crankcase Ventilation (PCV) valve.The affected vehicles will be recalled to replace the incorrect valve with the released valve.
2849	It is possible that some of the affected vehicles do not comply with OBD2 access requirements as outlined in the SAE J1962 standardization. The problem consists of difficulty with the connection of a diagnosis unit, other than the VAG 1551, because of some extremely close adapter plug tolerances.
2850	It is possible that some of the affected vehicles do not comply with OBD2 access requirements as outlined in the SAE J1962 standardization. The problem consists of difficulty with the connection of a diagnosis unit, other than the VAG 1551, because of some extremely close adapter plug tolerances.
2851	The supplier of spark plug wires for the affected vehicles began using a new vendor for the PBT resin used in making the wires. The spark plug wires made using the PBT from the new vendor have been found to exhibit ignition leak problems under high temperature and high humidity conditions.
2852	The supplier of spark plug wires for the affected vehicles began using a new vendor for the PBT resin used in making the wires. The spark plug wires made using the PBT from the new vendor have been found to exhibit ignition leak problems under high temperature and high humidity conditions.
2853	Signal wires for the oxygen sensors located after the catalytic converters are potentially incorrectly positioned in the ECM wiring harness connector.
2854	Some Vehicle Control Modules (VCM) may have been incorrectly programmed with an engine calibration intended for Canadian usage. The Canadian calibration would not allow certain OBD2 malfunction lights to illuminate.
2855	Secondary Air Pump Wire Connection-During the initial production period of 3-series vehicles with 2.8L engines, the two wires supplying power to the air pump may have been reversed in the connecting plug, causing the pump to run backwards. ECM Programming Error-During above production period, software was used
2856	Secondary Air Pump Wire Connection-During the initial production period of 3-series vehicles with 2.8L engines, the two wires supplying power to the air pump may have been reversed in the connecting plug, causing the pump to run backwards. ECM Programming Error-During above production period, software was used
2857	Multec Bottom Feed Injectors with D195A and D195B build date codes may have abnormal stresses in the plastic encapsulant resulting in leakage of fuel vapor to the atmosphere.A voluntary Emission Recall will be conducted to replace all the injectors with the suspect build date.
2858	Multec Bottom Feed Injectors with D195A and D195B build date codes may have abnormal stresses in the plastic encapsulant resulting in leakage of fuel vapor to the atmosphere.A voluntary Emission Recall will be conducted to replace all the injectors with the suspect build date.
2859	Multec Bottom Feed Injectors with D195A and D195B build date codes may have abnormal stresses in the plastic encapsulant resulting in leakage of fuel vapor to the atmosphere.A voluntary Emission Recall will be conducted to replace all the injectors with the suspect build date.
2860	The emission control information label affixed to certain 1996 model year V8 and V12 models may contain an error. An incorrect barcode is indicated on the label.
2861	The emission control information label affixed to certain 1996 model year V8 and V12 models may contain an error. An incorrect barcode is indicated on the label.
2862	The Emission Control Information label affixed to certain 1995 model year V8 models may contain an error. An incorrect EVAP family is indicated on the label.
2863	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2864	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2865	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2866	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2867	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2868	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2869	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2870	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2871	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2872	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2873	Some cars may exhibit an internal whistling noise from the air control valve (ISC valve) and in some cases experience a fluctuation of idle speed. The cause of the noise is the shape of the outlet passage of the ISC valve.
2874	Some cars may exhib

2885	Some trucks may have been built with incorrect Mass Airflow Sensors.
2886	Some trucks may have been built with incorrect Mass Airflow Sensors.
2887	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2888	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2889	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2890	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2891	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2892	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2893	Some cars and 5.0L Explorer trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the On Board Diagnostic System to detect an Evaporative System Vent Control malfunction.
2894	Cracking of the spark plug wire insulation may occur on some Federal 1994-95 Chevrolet Geo Tracker vehicles with 1.6L L4 (RPO L01) engine. This condition can manifest itself as a driveability problem.
2895	Cracking of the spark plug wire insulation may occur on some Federal 1994-95 Chevrolet Geo Tracker vehicles with 1.6L L4 (RPO L01) engine. This condition can manifest itself as a driveability problem.
2896	The coolant temperature signal to the control module is modified by the installation of a modulator kit.
2897	The coolant temperature signal to the control module is modified by the installation of a modulator kit.
2898	Mitsubishi hereby notifies the EPA that a safety recall campaign concerning fuel tank replacement has been initiated for all Federal and California emissions equipped 1995 and 1996 Mitsubishi Eclipse GSX and Eagle Talon TSI ALL Wheel Drive, turbocharged vehicles.
2899	Mitsubishi hereby notifies the EPA that a safety recall campaign concerning fuel tank replacement has been initiated for all Federal and California emissions equipped 1995 and 1996 Mitsubishi Eclipse GSX and Eagle Talon TSI ALL Wheel Drive, turbocharged vehicles.
2900	Mitsubishi hereby notifies the EPA that a safety recall campaign concerning fuel tank replacement has been initiated for all Federal and California emissions equipped 1995 and 1996 Mitsubishi Eclipse GSX and Eagle Talon TSI ALL Wheel Drive, turbocharged vehicles.
2901	Mitsubishi hereby notifies the EPA that a safety recall campaign concerning fuel tank replacement has been initiated for all Federal and California emissions equipped 1995 and 1996 Mitsubishi Eclipse GSX and Eagle Talon TSI ALL Wheel Drive, turbocharged vehicles.
2902	Freeze frame (Mode 2) values for the "lambda control factor" and the "lambda control adaption factor" for cylinder bank 2 are not stored and available on the scan tool. The values are available real-time (Mode 1) and are available for cylinder bank 1 in both freeze frame and real time. This is not according to SAE J19
2903	Freeze frame (Mode 2) values for the "lambda control factor" and the "lambda control adaption factor" for cylinder bank 2 are not stored and available on the scan tool. The values are available real-time (Mode 1) and are available for cylinder bank 1 in both freeze frame and real time. This is not according to SAE J19
2904	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2905	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2906	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2907	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2908	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2909	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2910	The oxygen sensor wire for circuit 412 may have perforations in the insulation causing intermittent corruption of the oxygen sensor signal. These perforations are only visible with magnification.
2911	Vacuum hose routing diagram has been printed incorrectly. The hose routing between throttle body, EGR vacuum modulator and pulse width modulated vacuum switching valve was incorrect
2912	Vacuum hose routing diagram has been printed incorrectly. The hose routing between throttle body, EGR vacuum modulator and pulse width modulated vacuum switching valve was incorrect
2913	Some cars may have inoperative HEGO sensors caused by a cracked sensing element.
2914	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2915	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2916	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2917	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2918	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2919	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2920	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2921	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2922	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2923	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2924	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2925	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2926	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2927	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2928	Some cars and trucks may have been built with Fuel Tank Pressure Transducers which can trap liquid fuel, and during large temperature decreases, generate a vacuum which causes the OBD system to detect an Evaporative System Vent Control malfunction.
2929	Some trucks may have bolts that lose torque due to incompatible expansion characteristics with the improved exhaust manifold material. (Covers FED and CA, =50S)
2930	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2931	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2932	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2933	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2934	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2935	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2936	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2937	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2938	Some trucks may have exhaust manifold fasteners that anneal and lose torque, causing exhaust manifold to warp and leak. (Covers FED and CA, =50S)
2939	Some cars may have Fuel Pressure Regulators with diaphragms that can rupture.
2940	Some cars may have Fuel Pressure Regulators with diaphragms that can rupture.
2941	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2942	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2943	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2944	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2945	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2946	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2947	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2948	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2949	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2950	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2951	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2952	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2953	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2954	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2955	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2956	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2957	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2958	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2959	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2960	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2961	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2962	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2963	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2964	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2965	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2966	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2967	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2968	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2969	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2970	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2971	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2972	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2973	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2974	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2975	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2976	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2977	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2978	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2979	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2980	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2981	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2982	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2983	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2984	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2985	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2986	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2987	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2988	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2989	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2990	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2991	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2992	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2993	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2994	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2995	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2996	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2997	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
2998	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
2999	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.
3000	On some vehicles, dimensional deviation in the assembly process of the fuel liquid/vapor separator causes a connecting hose to put excessive tensile load on a nipple of that device, causing a crack through which fuel vapor escapes.(REVISED DR CONTAINS CORRECTION OF ARITHMETICAL ERRORS UNDER ITEM #5 OF D
3001	Thermal fatigue fracture on inner braid portion of the front exhaust pipe assembly due to insufficient welding.
3002	Thermal fatigue fracture on inner braid portion of the front exhaust pipe assembly due to insufficient welding.
3003	Thermal fatigue fracture on inner braid portion of the front exhaust pipe assembly due to insufficient welding.
3004	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
3005	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
3006	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
3007	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
3008	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
3009	Replacement of rear oxygen sensor due to liiumination of the MIL by the OBD2 system.
3010	The vehicles in this engine family may be releasing air pollutants which exceed California standards for NMHC and NOx. To correct this condition, there will be a Voluntary Emission Recalll to replace the catalytic converter catalyst beads on vehicles in this engine family.
3011	The "light" inertia weight class vehicles in this engine family may be releasing air pollutants which exceed California standards for NMHC. To correct this condition, there will be a Voluntary Emission Recall to replace the catalytic converter catalyst beads on vehicles in this engine family.
3012	The "light" inertia weight class vehicles in this engine family may be releasing air pollutants which exceed California standards for NMHC. To correct this condition, there will be a Voluntary Emission Recall to replace the catalytic converter catalyst beads on vehicles in this engine family.
3013	The emission tune-up label on some vehicles has an incorrect evaporative emission family designation.
3014	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
3015	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
3016	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
3017	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
3018	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
3019	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
3020	Some trucks may have been built with incorrect vapor management valves which have a reduced flow rate.The vapor management valve will be replaced.
3021	Some cars equipped with EGR may experience a difficult starting condition. Water vapor and cold temperature may result in ice build up at the tip of the fuel injector.
3022	Some cars equipped with EGR may experience a difficult starting condition. Water vapor and cold temperature may result in ice build up at the tip of the fuel injector.
3023	Some trucks have been shipped with an incorrect tune-up label installed on the engine air cleaner.
3024	Volvo has found that the block heater contact surface may not match correctly with the engine block as intended. In extreme circumstances the block heater may come loose from the engine block, and may possibly overheat if being used. This may cause damage if it comes in contact with with other engine compartm
3025	Volvo has found that the block heater contact surface may not match correctly with the engine block as intended. In extreme circumstances the block heater may come loose from the engine block, and may possibly overheat if being used. This may cause damage if it comes in contact with with other engine compartm
3026	Volvo has found that the block heater contact surface may not match correctly with the engine block as intended. In extreme circumstances the block heater may come loose from the engine block, and may possibly overheat if being used. This may cause damage if it comes in contact with with other engine compartm
3027	Volvo has found that the block heater contact surface may not match correctly with the engine block as intended. In extreme circumstances the block heater may come loose from the engine block, and may possibly overheat if being used. This may cause damage if it comes in contact with with other engine compartm
3028	There is the possibility of excessive chafing of the insulation of the battery cables. This could lead to a short circuit.
3029	There is the possibility of excessive chafing of the insulation of the battery cables. This could lead to a short circuit.
3030	Some trucks were built with an engine calibration certified for E-250 standard vans.
3031	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
3032	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
3033	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
3034	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
3035	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
3036	This report concerns all 1991-1995 Cadillac vehicles that were either built with the fueling strategy in question or received it through installation of a service PROM. General Motors will conduct a remedial campaign to install the revised PROMs which have been developed and validated in accordance with the requirements
3037	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
3038	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
3039	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
3040	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
3041	The pressure transducer may experience binding at low temperatures potentially causing the MIL to illuminate. The binding has been attributed to out of tolerance conditions within the transducer.
3042	Grease comes out from a bearing in an idle air control valve and attaches to the surface of the valve seat. Carbon in exhaust gas clings to the attaching grease and is pressed by the valve surface. This occurs due to some valve axle clearance of the bearing which moves from the manifold vacuum pressure. This resu
3043	Secondary air injection pump relay may be contaminated by materials present in the underhood atmosphere. This prevents the air pump from operating correctly.
3044	Secondary air injection pump relay may be contaminated by materials present in the underhood atmosphere. This prevents the air pump from operating correctly.
3045	Some cars may have inoperative Idle Air Bypass valves caused by resonance in the air supply tube inducing mechanical damage to the valve and valve seat.
3046	Some cars may have inoperative Mass Airflow sensors caused by silicone contamination of the sensing element during the manufacturing process.
3047	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3048	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3049	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3050	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3051	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3052	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3053	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3054	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3055	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3056	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3057	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3058	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3059	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3060	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3061	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3062	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3063	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3064	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3065	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3066	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3067	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3068	Some cars and trucks may have spark plug wires that can become dislodged by a pressure buildup in the spark plug well.
3069	Some 1997 4.6L Federal Continental passenger cars may have been built with California Powertrain Control Modules (PCM).
3070	Some cars equipped with the 2.4L (RPO LD9) VIN Engine Code "T" engine may have been built with an incorrect Evaporative Emission (EVAP) Canister Purge Solenoid.
3071	Some cars equipped with the 2.4L (RPO LD9) VIN Engine Code "T" engine may have been built with an incorrect Evaporative Emission (EVAP) Canister Purge Solenoid.
3072	Based on the results of our supplier's analyses, the principal failure mode is a slowed or absence of switching of the oxygen sensor due to the cracking of the ceramic substrate.
3073	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
3074	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
3075	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
3076	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
3077	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
3078	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
3079	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
3080	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
3081	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
3082	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
3083	Exhaust deposit build-up on the EGR pintle shaft which may lead to the pintle shaft sticking inside an internal bearing. Also, there may be a condition where carbon debris becomes lodged in the pintle shaft area, causing the shaft to stick open. A new pintle design was released for production and service in 1996. A Sp
3084	The Engine Control Module (ECM) installed in some 1997 Sportage models produced before 2/19/97 may have software errors that affects the readiness function for Evaporative Emissions System leakage monitoring. The result of this malfunction is loss of evaporative emissions diagnostic function and non-compliance
3085	The Engine Control Module (ECM) installed in some 1997 Sportage models produced before 2/19/97 may have software errors that affects the readiness function for Evaporative Emissions System leakage monitoring. The result of this malfunction is loss of evaporative emissions diagnostic function and non-compliance
3086	Carbon tracking may occur on the inner surface of the distributor cap as a result of moisture settling on the rib pattern. If moisture settles on the rib pattern, a reduced path of resistance is created and a high voltage short may result when the coil fires.
3087	Carbon tracking may occur on the inner surface of the distributor cap as a result of moisture settling on the rib pattern. If moisture settles on the rib pattern, a reduced path of resistance is created and a high voltage short may result when the coil fires.
3088	Carbon tracking may occur on the inner surface of the distributor cap as a result of moisture settling on the rib pattern. If moisture settles on the rib pattern, a reduced path of resistance is created and a high voltage short may result when the coil fires.
3089	Some trucks may have jumper hoses to the fuel tank that can develop cracks due to being overheated during the manufacturing process.
3090	Some trucks may have jumper hoses to the fuel tank that can develop cracks due to being overheated during the manufacturing process.

3091	Some cars may have been built with 400 cpi catalytic converter substrates in place of 350 cpi substrates.
3092	The Vehicle Emissions Control Information (VECI) labels on certain California 2.4L minivan models contain an error in the emission configuration code and the bar code.
3093	The Vehicle Emission Control Information (VECI) labels on some Dakota models with GVWRs less than 6000 lbs incorrectly identify the vehicle as certified to California emissions.
3094	The rear O2 sensor wiring may be reversed, with the left sensor connected to the right side wiring and vice-versa.Campaign #725 represents FEDERAL vehicles in this EF.Campaign #726 represents CALIFORNIA vehicles in this EF.
3095	The owners manual for the 1996 Plymouth Breeze model, does not contain the recommended shift speeds used for emission certification and fuel economy testing of the vehicle as required by the regulations.Chrysler will conduct a recall to provide customers with an owners manual addendum giving the shift speeds.
3096	The owners manual for the 1996 Plymouth Breeze model, does not contain the recommended shift speeds used for emission certification and fuel economy testing of the vehicle as required by the regulations.Chrysler will conduct a recall to provide customers with an owners manual addendum giving the shift speeds.
3097	Federal Vehicle Emission Control Information (VECI) labels were mistakenly installed on certain California 5.2L trucks.A correct label for each affected vehicle will be enclosed with the recall notification mailed to owners and dealers.
3098	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by fatigue failure of the wire.
3099	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
3100	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
3101	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
3102	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
3103	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
3104	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
3105	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
3106	The Vehicle Emission Control Information (VECI) labels on Federal and California full sized Dodge Ram Van and Wagon models with 3.9L and 5.2L engines were incorrect.Chrysler will conduct a recall to install correct VECI labels on the subject vehicles.
3107	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
3108	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
3109	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
3110	EPA has notified Hyundai that the Agency is concerned that the OBD2 system supplied by a vendor to Hyundai is not in compliance with ARB regulations.
3111	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
3112	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
3113	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
3114	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.
3115	Some vehicles may have OBD strategies that reset the misfire counter during non-positive torque conditions.

3172	The EPA has expressed some concerns regarding Onboard Diagnostic (OBD) strategies that reset the misfire counter during certain non-positive torque conditions. Some 1995, 1996 and 1997 models employ this strategy.
3173	The vapor control valve and tube assembly on the fuel tank will be removed and replaced with an assembly which contains improved vapor control and vapor vent valves. In addition, the affected vehicles will also have a wiring harness seal replaced during this recall service.
3174	The vapor control valve and tube assembly on the fuel tank will be removed and replaced with an assembly which contains improved vapor control and vapor vent valves. In addition, the affected vehicles will also have a wiring harness seal replaced during this recall service.
3175	The vapor control valve and tube assembly on the fuel tank will be removed and replaced with an assembly which contains improved vapor control and vapor vent valves. In addition, the affected vehicles will also have a wiring harness seal replaced during this recall service.
3176	The valve lash specifications are incorrect on the under-hood Vehicle Emissions Control Information label.
3177	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
3178	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
3179	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
3180	Some vehicles may experience a no-start condition due to improper operation of the crankshaft angle sensor and/or camshaft position sensor. The cause is due to false contact of a solder joint, which has different expansion rates between the resin and the terminals.
3181	Some vehicles may experience corrosion of an oxygen sensor wiring harness connector. The cause is due to water drainage from a hood scoop onto the affected connector.
3182	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released by
3183	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released by
3184	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3185	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3186	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3187	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3188	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3189	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3190	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3191	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3192	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released by
3193	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3194	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released by
3195	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3196	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3197	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released by
3198	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released by
3199	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released by
3200	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released by
3201	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released by
3202	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released by
3203	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3204	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released by
3205	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released by
3206	The Service Parts Catalogs for certain 96 and 97 MY truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released by
3207	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3208	The Service Parts Catalogs for certain 1996 and 1997 truck models were released with errors in the listed part numbers for the Linear Exhaust Gas Recirculation (LEGR) valves. The correct valves that were used in original build and emission certified have 14gm/s flow specification. Parts that were inadvertently released
3209	Some trucks may have inoperative HEGO sensors due to weak gas seal rings or contamination by carbon, lead, oil, or silicone.
3210	Some trucks may have inoperative Idle Air Bypass valves caused by engine sludging.
3211	Corrupted data communication between the (PCM) and Instrument Panel Cluster (IPC) and (HVAC) processors may cause a PCM reset to occur and/or the setting of DTC P1518 (Reduced Engine Power).The correction to be made is to recall all potentially affected vehicles and reflash the PCM calibration to make the syst
3212	Corrupted data communication between the (PCM) and Instrument Panel Cluster (IPC) and (HVAC) processors may cause a PCM reset to occur and/or the setting of DTC P1518 (Reduced Engine Power).The correction to be made is to recall all potentially affected vehicles and reflash the PCM calibration to make the syst
3213	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
3214	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
3215	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
3216	Some vans may have inoperative catalyst monitor sensors caused by wire shorts, corrosion, or contamination.
3217	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3218	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3219	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3220	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3221	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3222	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3223	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3224	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3225	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3226	Some cars and trucks may have inoperative Vapor Purge Valves due to a problem inserting the electrical terminals in the component assembly process.
3227	It may be possible that the connector of the ignition coil may intermittently lose contact with the electronic ignition control unit.
3228	825 warranty claims related to the ignition coil. The warranty claims were prompted by complaints of rough idling, engine stumbling, or poor performance.
3229	825 warranty claims related to the ignition coil. The warranty claims were prompted by complaints of rough idling, engine stumbling, or poor performance.
3230	ISC Servo Kit failures caused by water intrusion into the ISC Servo Kit.
3231	The turbine wheel may brush the housing, caused by the narrow clearance.
3232	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3233	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3234	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3235	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3236	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3237	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3238	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3239	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
3240	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
3241	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
3242	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
3243	Illumination of the MIL results from unstable signal outputs from the oxygen sensor.
3244	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3245	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3246	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3247	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3248	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
3249	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
3250	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
3251	Some cars have a rattling noise from the underbody of the vehicle when starting the vehicle, accelerating/decelerating or turning the air conditioner on/off if the monolith has been abraded by mat erosion.
3252	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3253	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3254	Illumination of the MIL or poor engine starting in cold weather as a result of a malfunctioning water temperature sensor. The main reason for the failure was a short circuit at the soldering spot between the terminal and the thermistor wire caused by engine vibration.
3255	An intermittent connector leads to a check engine light on condition in some vehicles. The sensor was replaced as indicated by the fault code. The check engine light condition could not be corrected with the new sensor. The connector was subsequently modified to improve the connection with the knock sensor.
3256	An intermittent connector leads to a check engine light on condition in some vehicles. The sensor was replaced as indicated by the fault code. The check engine light condition could not be corrected with the new sensor. The connector was subsequently modified to improve the connection with the knock sensor.
3257	The container holding the left side catalytic converter may have been manufactured with variances in tolerance which could allow the substrate to come loose within the converter housing. Loose subsrates tend to generate a loud "rattling" noise which is audible inside the vehicle.
3258	The container holding the left side catalytic converter may have been manufactured with variances in tolerance which could allow the substrate to come loose within the converter housing. Loose subsrates tend to generate a loud "rattling" noise which is audible inside the vehicle.
3259	The container holding the left side catalytic converter may have been manufactured with variances in tolerance which could allow the substrate to come loose within the converter housing. Loose subsrates tend to generate a loud "rattling" noise which is audible inside the vehicle.
3260	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3261	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3262	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3263	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3264	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3265	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3266	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3267	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3268	The ignition coil wire is routed in close proximity to engine components, and under extremly damp conditions this proximity in conjunction with insufficient wire insulation, could cause leakage of secondary voltage and corrosion of the secondary connector to the distributor cap.
3269	Some cases of water intrusion into ISC Servo Kit have been found. Hyundai believes that most ISC replacements are improper diagnosis and repair.
3270	Some cases of carbon deposits inside the Idle Speed Actuator (ISA) have caused complaints of rough idling and engine stumbling.
3271	Some cases of carbon deposits inside the Idle Speed Actuator (ISA) have caused complaints of rough idling and engine stumbling.
3272	Poor engine starting may result from a failed purge control valve. The valve failed as a result of contamination with dust or oil used to insert the PCV hose onto the valve nipple.
3273	Poor engine starting may result from a failed purge control valve. The valve failed as a result of contamination with dust or oil used to insert the PCV hose onto the valve nipple.
3274	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. Some parts failed as a result of intrusion of water into the sensor body; however, the main cause of failure was a short circuit at the soldering spot between the terminal and the thermistor wire. Hyundai belie
3275	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. Some parts failed as a result of intrusion of water into the sensor body; however, the main cause of failure was a short circuit at the soldering spot between the terminal and the thermistor wire. Hyundai belie
3276	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. Some parts failed as a result of intrusion of water into the sensor body; however, the main cause of failure was a short circuit at the soldering spot between the terminal and the thermistor wire. Hyundai belie
3277	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. The main cause of failure was an intermittent short circuit at the soldering spot between the terminal and the thermistor wire, although there were some cases of water intrusion into the sensor body.
3278	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. The main cause of failure was an intermittent short circuit at the soldering spot between the terminal and the thermistor wire, although there were some cases of water intrusion into the sensor body.
3279	Outflow of charcoal from the canister may result in difficulty in starting the engine.
3280	Outflow of charcoal from the canister may hinder operation of the purge solenoid valve resulting in difficulty in starting the engine.
3281	Illumination of the MIL caused by oxygen sensor failure. The main cause of oxygen sensor failure was internal electrode damage, resulting from unsatisfactory reproducibility of Pt Powder grain size and surface area.
3282	Illumination of the MIL caused by oxygen sensor failure. The main cause of oxygen sensor failure was internal electrode damage, resulting from unsatisfactory reproducibility of Pt Powder grain size and surface area.
3283	Illumination of the MIL caused by oxygen sensor failure. The main cause of oxygen sensor failure was internal electrode damage, resulting from unsatisfactory reproducibility of Pt Powder grain size and surface area.
3284	The charcoal canister check ball sticks to the aluminum seat due to thermal expansion difference of the ball and the seat. This causes MIL illumination.
3285	One of the following problems may have been present:Intake manifold plug cap on the left rear side of the crankcase ventilation valve may be torn or missing.Intake manifold gaskets may be leaking.
3286	One of the following problems may have been present:Intake manifold plug cap on the left rear side of the crankcase ventilation valve may be torn or missing.Intake manifold gaskets may be leaking.
3287	A ceramic spacer is fixed between both monoliths of the catalytic converter. Due to faulty packaging, the ceramic ring becomes loose and causes a rattling noise.
3288	A ceramic spacer is fixed between both monoliths of the catalytic converter. Due to faulty packaging, the ceramic ring becomes loose and causes a rattling noise.
3289	The affected part is the oxygen sensor. The sensors showed signs of a decreased control frequency. Analysis of the affected oxygen sensors has found exhaust-carried deposits on the ceramic sensing element.The corrective measure consists of reprogramming the Engine Control Module with new updated software.
3290	The affected part is the oxygen sensor. The sensors showed signs of a decreased control frequency. Analysis of the affected oxygen sensors has found exhaust-carried deposits on the ceramic sensing element.The corrective measure consists of reprogramming the Engine Control Module with new updated software.
3291	The affected part is the oxygen sensor. The sensors showed signs of a decreased control frequency. Analysis of the affected oxygen sensors has found exhaust-carried deposits on the ceramic sensing element.The corrective measure consists of reprogramming the Engine Control Module with new updated software.
3292	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
3293	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
3294	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
3295	Some trucks may have been built with incorrect Powertrain Control Modules (PCM) and Catalysts.Field Campaign 99E01 will be conducted to correct the affected vehicles.
3296	Some cars may have inoperative Idle Air Control Valves caused by the rubber orifice seat sticking closed.

	P
3297	Some vans may have HEGO sensors with reference cavities that may become contaminated by exhaust gas under certain conditions. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3298	Some cars may have inoperative HEGO sensors caused by oil absorption through the wire connector.
3299	Due to an error in the OBD computer logic, the evaporative system readiness codes remains incomplete even after the computer confirms that the system operates correctly. However, a malfunction will be correctly detected and the MIL will be illuminated according to Toyota.
3300	Illumination of the MIL caused by oxygen sensor malfunction. The oxygen sensor lead wire can come under excessive tension leading to the potential of malfunction. The excessive tension can cause intermittent unstable signal voltage.
3301	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
3302	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
3303	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
3304	Some cars may have light-off catalysts that experience premature failure of the substrate support system. The support system can wear away and allow the substrate to rattle and breakup.
3305	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
3306	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
3307	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
3308	Some cars may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by failure of the sensor wires.
3309	Some cars may have fuel line jumpers that can rub on the floorpan.
3310	Some cars may have fuel line jumpers that can rub on the floorpan.
3311	Some cars may have fuel line jumpers that can rub on the floorpan.
3312	Some cars may have fuel line jumpers that can rub on the floorpan.
3313	Some cars may have fatigue cracks in the fuel tank at the heat shield attachment point.
3314	Some cars may have fatigue cracks in the fuel tank at the heat shield attachment point.
3315	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
3316	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
3317	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
3318	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
3319	Some trucks may have calibrations that can illuminate the MIL for a spark output circuit failure when a failure is not present.
3320	The elbow containing the crankcase ventilation orifice was installed on the wrong valve cover during reconditioning of the engine.
3321	The elbow containing the crankcase ventilation orifice was installed on the wrong valve cover during reconditioning of the engine.
3322	Spark plug wire boots may become cracked on some cylinders, allowing secondary ignition voltage to arc through the crack(s) to heat shields around the boots, and then to ground, under certain operating conditions.
3323	Spark plug wire boots may become cracked on some cylinders, allowing secondary ignition voltage to arc through the crack(s) to heat shields around the boots, and then to ground, under certain operating conditions.
3324	Spark plug wire boots may become cracked on some cylinders, allowing secondary ignition voltage to arc through the crack(s) to heat shields around the boots, and then to ground, under certain operating conditions.
3325	The failing component is the AIR injection reactor (AIR) system fuse. The failure that has been ocurring is blown AIR fuses. The probable cause is high in-rush current from repeated on-off cycles of the AIR pump when the manual transmission vehicles are driven agressively, with heavy throttle acceleration or high RPM
3326	The failing component is the AIR injection reactor (AIR) system fuse. The failure that has been ocurring is blown AIR fuses. The probable cause is high in-rush current from repeated on-off cycles of the AIR pump when the manual transmission vehicles are driven agressively, with heavy throttle acceleration or high RPM
3327	The calibration of the Powertrain Control Module (PCM) may fail to adequately control CO emissions during certain Inspection and Maintenance (IM) tests, such as the steady state Acceleration Simulation Mode (ASM) test.
3328	The calibration of the Powertrain Control Module (PCM) may fail to adequately control CO emissions during certain Inspection and Maintenance (IM) tests, such as the steady state Acceleration Simulation Mode (ASM) test.
3329	The VECI labels on certain Federal and California AWD minivan models were reversed, with the Federal label installed on the California and vice versa,
3330	Chrysler is conducting a recall of trucks equipped with 5.9L engines certified to the California Transitional Low Emission Vehicle (TLEV) emission standards. These vehicles were found to possibly emit high NOx emissions during the 2% audit of production vehicles required by CARB.
3331	Chrysler is conducting a recall of trucks equipped with 5.9L engines certified to the California Transitional Low Emission Vehicle (TLEV) emission standards. These vehicles were found to possibly emit high NOx emissions during the 2% audit of production vehicles required by CARB.
3332	The VECI labels on certain 1998 MY HD trucks mistakenly indicated that the trucks were 1997 MY vehicles.
3333	The VECI labels on certain 1998 MY HD trucks mistakenly indicated that the trucks were 1997 MY vehicles.
3334	The VECI labels on certain 1998 MY 2.4L Sebring convertibles contained an error involving the purge control valve hose routing.
3335	The VECI labels on certain 1998 MY 2.4L Sebring convertibles contained an error involving the purge control valve hose routing.
3336	Due to a programming error, the Powertrain Control Module (PCM) installed in the affected vehicles may, under certain driving conditions, trigger a shift in air-fuel ratio to an over-lean condition, resulting in an engine stall. An engine stall may lead to a loss of vehicle control and/or a vehicle crash. This DR is actually a
3337	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3338	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3339	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3340	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3341	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3342	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3343	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3344	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3345	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3346	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3347	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3348	Some trucks may have Heated Exhaust Gas Oxygen (HEGO) sensors that can be contaminated by exhaust gas due to failure of the internal seal. The contamination, which may be temporary, can cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3349	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
3350	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
3351	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
3352	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
3353	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
3354	Some vans may have been built with the incorrect combination of fuel tank and Powertrain Control Module (PCM).Field Campaign 98E03 will be conducted to correct vehicles in the field.
3355	The OBD2 systems installed on 1995 MY Sephias do not under all driving conditions perform as required by California's OBD2 regulations.Defects include: Readiness Function Code (RFC), Component Monitoring Timer and incorrect VECI label.
3356	The OBD2 systems installed on 1995 MY Sephias do not under all driving conditions perform as required by California's OBD2 regulations.Defects include: Readiness Function Code (RFC), Component Monitoring Timer and incorrect VECI label.
3357	The main under-floor catalytic converter assemblies on certain 1998 Model Year ML320 models may have been assembled incorrectly by the supplier. The right side converter may be installed on the left side in the reverse orientation and the left side converter may be installed on the right side in the reverse orientatio
3358	The misfire detection strategy does not fully meet the requirements of CARB OBD2 in that monitoring for misfire during positive torque engine operation is not continuous. CARB confirmed their concerns to Jaguar in a letter dated 23 April, received 24 April, 1997.
3359	The misfire detection strategy does not fully meet the requirements of CARB OBD2 in that monitoring for misfire during positive torque engine operation is not continuous. CARB confirmed their concerns to Jaguar in a letter dated 23 April, received 24 April, 1997.
3360	The misfire detection strategy does not fully meet the requirements of CARB OBD2 in that monitoring for misfire during positive torque engine operation is not continuous. CARB confirmed their concerns to Jaguar in a letter dated 23 April, received 24 April, 1997.
3361	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3362	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3363	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3364	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3365	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3366	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3367	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3368	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3369	The solid state fan relay (SSR) may fail because of heat related electrical over stress (EOS) causing the fan(s) to stop and the vehicle to overheat.The (SSR) will be replaced and a "jumper" containing a diode will be added to the fan wiring harness.
3370	Recalibration of early production volume of 1993 MY 2.5L flex fuel engines in California. This recalibration changes the certified emission levels of the family from Tier one to TLEV, allowing a recalculation of corporate NMOG average.
3371	Malfunction Indicator Light (MIL) falsely illuminates as a malfunction of automatic transmission (A/T) input speed sensor under the limited condition after A/T gear is shifted from 5th to 4th during coast down deceleration.
3372	Reprogram the EMS ECM using the portable diagnostic unit (PDU) and new diskette. The PDU will flash program new operating strategies into the ECM (the strategies are identical to that used on the 1998 XK8's).
3373	The emission tune-up label states the engine family had EGR; the family was certified without EGR.
3374	Some vehicles are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock detection routine so as not to permit this condition.
3375	Some vehicles are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock detection routine so as not to permit this condition.
3376	Some vehicles are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock detection routine so as not to permit this condition.
3377	Some vans may draw water into the evaporative emission canister when driven in slushy-snow conditions. This can result in setting a MIL, misfire, rough idle, lack of power and eventually, an engine stall if driveability symptoms and MIL are ignored.
3378	Some vans may draw water into the evaporative emission canister when driven in slushy-snow conditions. This can result in setting a MIL, misfire, rough idle, lack of power and eventually, an engine stall if driveability symptoms and MIL are ignored.
3379	The secondary air injection valve with built-in check valve prevents exhaust gases from being forced into the secondary air injection pump. The failed valves were inoperable, i.e. stuck in the open or closed position.
3380	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3381	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3382	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3383	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3384	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3385	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3386	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3387	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3388	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3389	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3390	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3391	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3392	Some ignition coil wires (coil to distributor) were routed too close to metal brackets or metal transmission tubes in the vehicle assembly process. When in direct contact with the brackets or tubes, the wires may experience a burn through condition due to arching of the electrical current to the metal brackets or tubes.
3393	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
3394	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
3395	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
3396	Failed spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires. The corrosion is due to the mild steel construction of the terminals which has a low ability to resist oxidation.
3397	The throttle shaft ball bearing on the sensor side of the throttle body assembly of the subject vehicles may not have been installed in certain throttle bodies produced.
3398	The throttle shaft ball bearing on the sensor side of the throttle body assembly of the subject vehicles may not have been installed in certain throttle bodies produced.
3399	The throttle shaft ball bearing on the sensor side of the throttle body assembly of the subject vehicles may not have been installed in certain throttle bodies produced.
3400	Illumination of the MIL or poor engine starting in cold weather as a result of a failed water temperature sensor. The main cause of failure was an intermittent short circuit at the soldering spot between the terminal and the thermistor wire, and an intermittent connection caused by engine vibration.
3401	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
3402	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
3403	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
3404	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
3405	Some cars may have crankshaft position sensors that can experience premature failure due to an internal open circuit.
3406	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
3407	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
3408	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
3409	Some cars may have Fuel Vapor Valves which have not been properly welded, and can allow fuel vapor to leak at high ambient temperatures.
3410	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3411	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3412	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3413	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3414	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3415	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3416	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3417	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3418	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3419	Some cars may have Vapor Management Valves which were contaminated during the manufacturing process. The contamination, in certain cases, can cause an internal leak which will trigger the Malfunction Indicator Light (MIL) to be illuminated.
3420	Some cars may have a misfire monitor strategy that can cause unintended Malfunction Indicator Light (MIL) illumination.
3421	Some cars may have a misfire monitor strategy that can cause unintended Malfunction Indicator Light (MIL) illumination.
3422	Some cars are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock calibration routine so as not to permit this condition.
3423	Some cars are exhibiting, under certain driving conditions, uncontrolled spark knock. Correction will consist of reflashing the PCM with a calibration that will enhance the knock calibration routine so as not to permit this condition.
3424	As the consequence of variations in the length and routing of the injector harness, it may contact the manifold at the EGR pipe. If the harness is damaged, a short circuit may occur, blowing the fuse for the fuel injector, resulting in the engine stalling. It may also cause the injector to continue fueling if a short circuit oc
3425	As the consequence of variations in the length and routing of the injector harness, it may contact the manifold at the EGR pipe. If the harness is damaged, a short circuit may occur, blowing the fuse for the fuel injector, resulting in the engine stalling. It may also cause the injector to continue fueling if a short circuit oc
3426	The Aspirator System installed on the subject vehicles may fail, resulting in the creation of NOx emissions which could exceed the allowable standards. The presence of the Aspirator System also allows moisture to contact the fuel pressure regulator causing corrosion and jeopardizing its integrity.
3427	Some cars may have inoperative Mass Airflow sensors caused by silicone contamination of the sensing element during the manufacturing process.
3428	Some cars may have inoperative Mass Airflow sensors caused by silicone contamination of the sensing element during the manufacturing process.
3429	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings, exhaust contamination, or broken heaters.
3430	Some cars may have Spark Plug Wires which have experienced dielectric failure.
3431	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings, exhaust contamination, or broken heaters.
3432	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings, exhaust contamination, or broken heaters.
3433	An engine calibration released for vehicles intended to meet California Low Emission Vehicle standards was incorrectly programmed into vehicles intended to meet Federal Tier 1 standards.
3434	Some of the affected vehicles were built with a kinked vacuum purge harness to the distributor. The harness was kinked during the vehicle assembly process and results in no ventilation from the distributor housing. Excessive NOx gas is trapped in the distributor.
3435	Some of the affected vehicles were built with a kinked vacuum purge harness to the distributor. The harness was kinked during the vehicle assembly process and results in no ventilation from the distributor housing. Excessive NOx gas is trapped in the distributor.
3436	Replace engine control module with a remedied one.
3437	Some vehicles may experience water intrusion into the Evaporative Emission Control System canisters.
3438	Elboe fittings connecting the EVAP canister to the OBD2 valve on certain fuel tank assemblies may be abraded or cracked. The abrasions or cracks stem from an improper handling procedure during early production. This procedure was corrected during September production.
3439	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3440	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3441	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3442	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3443	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3444	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3445	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3446	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3447	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3448	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3449	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3450	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3451	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3452	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3453	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3454	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3455	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3456	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3457	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3458	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3459	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3460	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3461	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3462	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3463	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3464	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3465	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3466	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3467	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3468	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3469	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3470	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3471	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3472	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3473	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3474	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3475	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3476	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3477	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3478	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3479	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3480	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3481	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3482	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3483	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3484	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3485	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3486	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3487	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3488	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3489	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3490	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3491	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3492	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3493	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3494	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3495	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3496	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3497	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3498	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3499	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3500	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3501	Some trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3502	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.

3522	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3523	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3524	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3525	Some passenger cars, vans and trucks may have inoperative Purge Flow sensors caused by a soldering imperfection.
3526	Some trucks may have Thermactor Air Injection Manifolds that leak Thermactor air or exhaust gas.
3527	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors due to weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3528	Some cars may have inoperative heated exhaust gas oxygen sensors due to broken sensing elements.
3529	Some cars may have inoperative heated exhaust gas oxygen sensors due to broken sensing elements.
3530	Some cars may have inoperative heated exhaust gas oxygen sensors due to broken sensing elements.
3531	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
3532	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
3533	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
3534	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
3535	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
3536	Some cars may have inoperative Idle Air Control valves caused by the rubber orifice sticking closed.
3537	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
3538	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
3539	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
3540	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
3541	Some trucks may have muffler or catalyst inlet pipes that can distort and crack due to excessive heat in the exhaust gas under high speed or high load operating conditions.
3542	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3543	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3544	Some trucks may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings or exhaust contamination. The contamination, which may be temporary, may cause a downward shift in the sensor reference voltage which can affect the sensor switching.
3545	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3546	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3547	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3548	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3549	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3550	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3551	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3552	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3553	Degraded fuel regulator diaphragms. The cause and overall impact of the degradation of the diaphragms is still under investigation.
3554	Some cars may have been built with incorrect catalytic converters. Six brick converters were installed in place of four brick converters used in this application.
3555	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3556	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3557	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3558	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3559	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3560	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3561	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3562	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3563	Some trucks may have fuel rail to intake manifold gaskets that can experience a loss of compressive loading.
3564	Wall thickness of production fuel tanks is greater than the wall thickness of developmental vehicles. This difference results in a tank with greater stiffness. A stiffer tank with decreased elasticity may result in a reduced pressure compensation during the OBD EVAP system leak check process. The pressure peak could e
3565	During extremly low temperature start-up conditions, the Transfer Case control module may not communicate with the remainder of the vehicle (CAN).
3566	Vehicles were manufactured with an incorrect Vehicle Emission Control Information (VECI) label. These carryover vehicles were equipped with an underhood VECI label, which identifies the vehicles as compling with 1998 model year LDV standards.
3567	Vehicles were manufactured with an incorrect Vehicle Emission Control Information (VECI) label. These carryover vehicles were equipped with an underhood VECI label, which identifies the vehicles as compling with 1998 model year LDV standards.
3568	Rear oxygen sensor failure caused by corrosion and breakaway of the outer electrode conductive strip of the sensor ceramic body.
3569	This defect involves the rear oxygen sensor. In this case, Nissan has determined from the diagnostic trouble code and investigation of replaced oxygen sensors that the sensor is malfunctioning. In most cases this has been determined to be due to corrosion of the sensor from moisture in the exhaust gas. Some ma
3570	This defect involves the front oxygen sensor. Unexpected deterioration of the oxygen sensor is occurring as a result of contamination possibly from fuel, oil or other unknown sources and causing the MIL to illuminate.
3571	This defect involves the fuel temperature sensor. One of the electrical leads to the temperature sensor which is located in the fuel tank can fatigue and break off of the sensor over a period of time due to vibration. This results in illumination of the MIL.
3572	This defect involves the auxiliary air control valve. As a result of deposits on the valve, it may intermittently stick and not open or close smoothly. During the OBD system self-test of the auxiliary air control valve, the MIL may be illuminated as a result of the valve intermittently sticking.
3573	This defect involves the throttle valve switch. Degradation/wear of the resistance material in the switch can affect the resistance of the variable resistor which can cause the MIL to illuminate.
3574	This defect involves the vent control valve for the evaporative emission control system. On some vehicles the valve is sticking in the open position due to corrosion so that when the OBD system attempts to do a check for leaks in the evaporative control system, the MIL illuminates because the system is not sealed.
3575	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
3576	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
3577	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
3578	Some cars may have Mass Airflow Sensors which have been contaminated by silicone gel during the manufacturing process.Field campaign 98E01 will be conducted to correct the gasoline powered police vehicles. (Claim self-campaigning for non-police vehicles)
3579	Secondary Air Changeover Valve becomes non-functional due to internal contamination, which comes from an outside source.
3580	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3581	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3582	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3583	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3584	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3585	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3586	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3587	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3588	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3589	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3590	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3591	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3592	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3593	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3594	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3595	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3596	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3597	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3598	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3599	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3600	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3601	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3602	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3603	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3604	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3605	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3606	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3607	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3608	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3609	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3610	The charcoal may migrate from the canister into the vehicle's engine through the purge valve in the evaporative purge system. The vehicle may fail evaporative emissions testing.
3611	The fuel tank rollover valve may allow liquid fuel to pass through and fill the evaporative canister.
3612	The oxygen sensor harness may have been mistakenly secured with clips to the exhaust heat shield and/or to a bracket on the transmission housing. Due to the movement between the vehide body, transmission and exhaust system, the oxygen sensor harness may stretch and break over time causing the check eng
3613	There may be condensation in the exhaust system causing thermal shock condition to the outer shell of the oxygen sensor. There may also be a loosening of the conductive strip from the protective layer of the sensor element due to production failure, interrupting the signal from the outer electrode.
3614	There may be condensation in the exhaust system causing thermal shock condition to the outer shell of the oxygen sensor. There may also be a loosening of the conductive strip from the protective layer of the sensor element due to production failure, interrupting the signal from the outer electrode.
3615	Oxygen sensors cause DTC fault codes within the vehicles OBD2 diagnostic system.
3616	The On-board Diagnostic II (OBDII) evaporative system monitor on 1997 and 1998 model year vehicles certified to the enhanced evaporative emission requirements may allow pending diagnostic trouble codes to be erased under limited conditions.Ford amended this DR on 4/4/2001.
3617	The On-board Diagnostic II (OBDII) evaporative system monitor on 1997 and 1998 model year vehicles certified to the enhanced evaporative emission requirements may allow pending diagnostic trouble codes to be erased under limited conditions.Ford amended this DR on 4/4/2001.
3618	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
3619	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
3620	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
3621	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
3622	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
3623	Some cars may have Catalyst Monitor sensor (CMS) wiring that can contact the automatic transmission linkage and damage the wiring.
3624	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3625	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3626	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3627	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3628	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3629	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3630	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3631	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3632	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3633	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3634	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3635	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3636	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3637	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3638	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3639	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3640	Some cars, trucks and vans may have loose electrical contact leads on the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor
3641	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3642	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3643	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3644	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3645	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3646	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3647	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3648	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3649	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3650	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3651	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3652	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3653	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3654	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3655	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3656	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3657	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3658	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3659	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3660	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3661	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3662	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3663	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3664	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3665	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3666	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3667	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3668	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3669	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3670	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3671	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3672	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3673	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3674	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3675	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3676	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3677	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3678	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. This may alter the entry and exit points for the Onboard Diagnostic System (OBD) evaporative system monitor.
3679	Some cars, trucks and vans may have loose electrical contact leadson the fuel tank level sending unit. This can cause the fuel tank gauge to indicate approximately 1/4 more than the tank actually contains. Based on further investigation, it has been determined that if this condition occurs, the OBD system evap syste
3680	The wrong Vehicle Emission Control Information (VECI) label may have been installed on the subject vehicles.
3681	The Fuel tank level sending unit may display an inaccurate level.
3682	The main cause of failure was abrasion of the monolith caused by mat erosion and thermal cracking of the front face of the monolith.
3683	Rear oxygen sensor failure caused by corrosion and breakaway of the outer electrode conductive strip of the sensor ceramic body.
3684	The Onboard Diagnostic System on the subject vehicles may have been disabled in the area of purge flow detection.
3685	This recall concerns some 1994 vehicles which may be emitting nitrogen oxides (NOx) in excess of California emissions standards. GM will conduct a Voluntary Emission Recall to correct these vehicles by replacing the calibration in the Powertrain Control Module with a new calibration. Also, the connectors on either side o
3686	The component that failed is the spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires.
3687	The component that failed is the spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires.
3688	The component that failed is the spark plug wire. The main failure is corroded terminals on the ignition module end of the spark plug wires.
3689	A faulty ground causes electrical noise to be transmitted to the rear oxygen sensor when the heater of the air fuel ratio sensor switches on and off. As a result, the readiness code on the catalyst monitor remains incomplete and does not make a pass determination. The "noise" does not interfere with monitor's ability
3690	Visible smoke from exhaust on acceleration, after prolonged idle period.
3691	Internal corrosion of the Exhaust Gas Recirculation (EGR) valve. A design change to the valve had been made for this 98' F car application to make it more robust against water splash intrusion.Part of the design change has resulted in moist gases feeding into the center body of the valve, causing corrosion of the arma
3692	Internal corrosion of the Exhaust Gas Recirculation (EGR) valve. A design change to the valve had been made for this 98' F car application to make it more robust against water splash intrusion.Part of the design change has resulted in moist gases feeding into the center body of the valve, causing corrosion of the arma
3693	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
3694	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
3695	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
3696	These vehicles may exhibit an intermittent loss of sensor signal due to an abrasion to the sensor element inner conductive stripe. The oxygen sensor terminal post design was not robust enough combined with the production terminal post flaring process.
3697	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3698	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3699	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3700	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3701	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3702	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3703	Some Ranger trucks may have inoperative Purge Control valves caused by faulty electrical terminal insertion or wire chafing.
3704	Some vans may have inoperative Heated Exhaust Gas Oxygen (HEGO) sensors caused by weak gas seal rings.
3705	Spark plug wires #2 and #8 were cut by contact with the accessory drive belt or pulley. There was a stack-up tolerance problem as well as lead length dimensional issue that allowed potential interference with the accessory drive system for the #2 or #8 spark plug wire.
3706	Spark plug wires #2 and #8 were cut by contact with the accessory drive belt or pulley. There was a stack-up tolerance problem as well as lead length dimensional issue that allowed potential interference with the accessory drive system for the #2 or #8 spark plug wire.
3707	Failures are occurring to the ignition coil and the coil to distributor wire due to corrosion and erosion of the coil wire terminal and the coil terminal post.
3708	Failures are occurring to the ignition coil and the coil to distributor wire due to corrosion and erosion of the coil wire terminal and the coil terminal post.

3622		
3623		
3624		
3625	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3626		
3627	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3628		
3629	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3630		
3631	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3632		
3633	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3634		
3635	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3636		
3637	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3638		
3639	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3640	.	
3641	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3642		
3643	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3644		
3645	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3646		
3647	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3648		
3649	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3650		
3651	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3652		
3653	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3654		
3655	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3656		
3657	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3658		
3659	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3660		
3661	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3662		
3663	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3664		
3665	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3666		
3667	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3668		
3669	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3670		
3671	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3672		
3673	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3674		
3675	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3676		
3677	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3678		
3679	m monitor will recognize the fault, store a DTC in memory, and use a default value for the fuel level.	
3680		
3681		
3682		
3683		
3684		
3685	f the positive crankcase ventilation valve (PCV) will be inspected and replaced.	
3686		
3687		
3688		
3689	to detect a malfunction and illuminate according to Toyota.	
3690		
3691	ture.	
3692	ture. The corrosion causes friction between the armature and the coil sleeve, and a sticking valve that results in a MIL illumination.

The standard-life spark plugs may have been installed in the left cylinder bank only.Remedy: Chrysler will conduct an emissio
3844	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3845	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3846	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3847	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3848	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3849	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3850	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3851	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3852	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3853	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3854	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3855	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3856	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3857	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3858	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3859	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3860	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3861	Some evaporative canisters have been manufactured with slight crack which may lead to leak. The Malfunction Indicator Light (MIL) illuminates. Part quality has been improved. When this defect occurs, the MIL illuminates, and the vehicle will likely be brought to a dealership and repaired under emission warranty.
3862	Malfunction Indicator Lamp (MIL) illumination with diagnostic trouble codes P0442 and P0456 may be related to defective fuel caps (part number 3C0 201 550 G). Trouble codes relate to small and very small Evaporative Emissions (EVAP) leaks respectively. Parts analyzed found the majority of the defective components
3863	Malfunction Indicator Lamp (MIL) illumination may be caused by the Intake Manifold Runner Control Motor, part number 06F 133 482. Improper internal welding and shorting of the motor windings are reported causes of the failure. There are no reported drivability or evaporative emissions problems related to this conc
3864	On some 2005-06 model year Jeep Liberty vehicles equipped with 2.8L diesel engines, one or more of the engine's glow plugs can be damaged by overheating or exposure to voltages in excess of seven volts.Remedy: Software enhancements have been made in production to increase glow plug robustness; over-voltag
3865	On some 2005-06 model year Jeep Liberty vehicles equipped with 2.8L diesel engines, one or more of the engine's glow plugs can be damaged by overheating or exposure to voltages in excess of seven volts.Remedy: Software enhancements have been made in production to increase glow plug robustness; over-voltag
3866	A crack in a Crankcase Ventilation Hose (PCV), part number 06B 103 213 AF, can cause the Malfunction Indicator Lamp (MIL) to come on. It does not result in any drivability concerns or the release of any Evaporative Emissions beyond the acceptable limits. This part is also being replaced during an internal engine repai

3894	Part #DE20070797738290Update dated 5/14/2008 number J07044D8B is the defect report with no new information.	711
3895	Part #MHK 100920	
3896	Part #MHK 100920	
3897	Part #MHK 100920	
3898	Ignition coil NEC000070 was replaced in production by NEC000110L.	
3899	Currently looking into Number of Vehicle Affected? Diagnostic Trouble Codes (DTC) PO421 and/or PO431	
3900	Currently looking into Number of Vehicle Affected? Diagnostic Trouble Codes (DTC) PO421 and/or PO431	
3901	Ignition coil NEC000070 was replaced in production by NEC000110L.	
3902	Part #C2C7636	
3903	Diagnostic Trouble Code (DTC) PO421 and/or PO431. 217 Claims. Catalyst defect. DTC for aged is set . Same as DR #2941? 1/27/2010: Received EIR (1-25-2010) for replacement of exhaust manifold claims.	
3904	OBD monitor disabled by defective intake air temperature (IAT) sensor	
3905	OBD monitor disabled by defective intake air temperature (IAT) sensor	
3906	OBD monitor disabled by defective intake air temperature (IAT) sensor	
3907	Tom Anderson has reported that this defect has no significant emissions impact and that the DR was closed out on 5/7/2008 by Steve Healy.	42722
3908	Reduced engine power below 32°F at 8000 ft. or greater elevations. Tom Anderson reported that Mercedes has issued a TSB related to this defect, and that this DR was closed out by Steve Healy on 5/7/2008.	
3909	Tom Anderson has reported that this defect is self campaigning, that Ford has issued a TSB related to it, and that this DR was closed out by Steve Healy on 5/7/2008.	
3910	Tom Anderson has reported that this defect is self campaigning, that Ford has issued a TSB related to it, and that this DR was closed out by Steve Healy on 5/7/2008.	
3911	Tom Anderson has reported that this defect is self campaigning, that Ford has issued a TSB related to it, and that this DR was closed out by Steve Healy on 5/7/2008.	
3912	Tom Anderson has reported that this defect is self campaigning, that Ford has issued a TSB related to it, and that this DR was closed out by Steve Healy on 5/7/2008.	
3913	Tom Anderson has reported that this defect is self campaigning, that Ford has issued a TSB related to it, and that this DR was closed out by Steve Healy on 5/7/2008.	
3914	Tom Anderson has reported that this defect is self campaigning, that Ford has issued a TSB related to it, and that this DR was closed out by Steve Healy on 5/7/2008.

This condition is caused by extended downhill driving with little or no throttle input due to the steep road grades involved
3957	On some 2007 and 2008 vehicles equipped with 3.5L engines and California emissions, the OBD calibration for the Cold Start Rough Idle Diagnostics are overly sensitive and may cause MIL illumination for DTC P050D when no problem exists.Remedy: Chrysler has issued TSB 18-010-08 to instruct dealership technicians
3958	On some 2007 and 2008 vehicles equipped with 3.5L engines and California emissions, the OBD calibration for the Cold Start Rough Idle Diagnostics are overly sensitive and may cause MIL illumination for DTC P050D when no problem exists.Remedy: Chrysler has issued TSB 18-010-08 to instruct dealership technicians
3959	On some 2006 and 2007 vehicles equipped with 3.3L or 3.8L engines, the OBD calibrations for the PCM Internal Shutdown Timer Rationality are overly sensitive and may cause MIL illumination for DTC P1607 when no problem exists.Remedy: Chrysler has issued TSB 18-012-08 to instruct dealership technicians to repro
3960	On some 2006 and 2007 vehicles equipped with 3.3L or 3.8L engines, the OBD calibrations for the PCM Internal Shutdown Timer Rationality are overly sensitive and may cause MIL illumination for DTC P1607 when no problem exists.Remedy: Chrysler has issued TSB 18-012-08 to instruct dealership technicians to repro
3961	On some 2006 and 2007 vehicles equipped with 3.3L or 3.8L engines, the OBD calibrations for the PCM Internal Shutdown Timer Rationality are overly sensitive and may cause MIL illumination for DTC P1607 when no problem exists.Remedy: Chrysler has issued TSB 18-012-08 to instruct dealership technicians to repro
3962	On some 2006 and 2007 vehicles equipped with 3.3L or 3.8L engines, the OBD calibrations for the PCM Internal Shutdown Timer Rationality are overly sensitive and may cause MIL illumination for DTC P1607 when no problem exists.Remedy: Chrysler has issued TSB 18-012-08 to instruct dealership technicians to repro
3963	Some 2005 through 2007 trucks may experience slow fuel fill or early pump shut off conditions due to potentially clogged carbon canister vent tubes. Vehicles operated in particularly muddy and dusty environments can experience this condition.Remedy: Ford introduced an improved canister filter media into production
3964	Complaints of no start , hard starting, poor engine performance or Malfunction Indicator Lamp (MIL) on may be related to the fuel pump. The fuel sending unit, which is attached to the pump, may also be affected and cause the fuel gauge to be unreliable. Analysis of fuel pumps returned indicate 21% were faulty due
3965	Complaints of no start , hard starting, poor engine performance or Malfunction Indicator Lamp (MIL) on may be related to the fuel pump. The fuel sending unit, which is attached to the pump, may also be affected and cause the fuel gauge to be unreliable. Analysis of fuel pumps returned indicate 21% were faulty due
3966	Some ignition coils have been manufactured with electrical terminal damage which may lead to unintended CVT control by electrical noise.Remedy: Part quality has been improved. When this defect occurs the vehicle will likely be brought to a dealership for repair. The ignition coil will be replaced under emission warranty
3967	Some air-fuel ratio sensor elements may crack due to excess stress during manufacturing process.Remedy: Part quality has been improved. When this defect occurs the MIL illuminates, the vehicle will likely be brought to a dealership and repaired under emission warranty.
3968	Some air-fuel ratio sensor elements may crack due to excess stress during manufacturing process.Remedy: Part quality has been improved. When this defect occurs the MIL illuminates, the vehicle will likely be brought to a dealership and repaired under emission warranty.
3969	Some vehicles were manufactured with incorrect rocker arm shafts resulting in insufficient oil supply to the VTEC (Variable Valve Timing and Lift Electronic Control) system and cam shaft journals.Remedy: The correct rocker arm shaft has been applied to the assembly line. Vehicle owners will be notified to bring their veh
3970	During the operation of the throttle valve, the sliding action of the sensor's resistance coil creates a powder substance. This powder accumulates at the point of contact by mixing with a grease that is coated on the washer inside the throttle position sensor, and PTFE (Polytetrafluroethlene) in the contact material. When
3971	During the operation of the throttle valve, the sliding action of the sensor's resistance coil creates a powder substance. This powder accumulates at the point of contact by mixing with a grease that is coated on the washer inside the throttle position sensor, and PTFE (Polytetrafluroethlene) in the contact material. When
3972	During the operation of the throttle valve, the sliding action of the sensor's resistance coil creates a powder substance. This powder accumulates at the point of contact by mixing with a grease that is coated on the washer inside the throttle position sensor, and PTFE (Polytetrafluroethlene) in the contact material. When
3973	During the operation of the throttle valve, the sliding action of the sensor's resistance coil creates a powder substance. This powder accumulates at the point of contact by mixing with a grease that is coated on the washer inside the throttle position sensor, and PTFE (Polytetrafluroethlene) in the contact material. When
3974	During the operation of the throttle valve, the sliding action of the sensor's resistance coil creates a powder substance. This powder accumulates at the point of contact by mixing with a grease that is coated on the washer inside the throttle position sensor, and PTFE (Polytetrafluroethlene) in the contact material. When
3975	Some vehicles equipped with 2.4L engines were built with oversized terminals in the wiring harness connector to the Crankshaft Position Sensor (CKPS). The oversized terminals may cause an intermittent electrical connection that can result in engine misfire or other circuit continuity problems and cause illumination of th
3976	Some vehicles equipped with 2.4L engines were built with oversized terminals in the wiring harness connector to the Crankshaft Position Sensor (CKPS). The oversized terminals may cause an intermittent electrical connection that can result in engine misfire or other circuit continuity problems and cause illumination of th
3977	On some 2008 vehicles the Camshaft Position Sensor (CMPS) may be susceptible to a higher than typical electrical noise level on the 5v supply line, fail the OBD tests for either P0340 or P0344 and illuminate the MIL.Remedy: A CMPS with improved noise filtering has been released into production. Vehicles that have
3978	On some 2008 vehicles the tolerance differences between the Crankshaft Position Sensor and the flywheel target were not properly compensated for in the software resulting in engine misfire and MIL illumination for P0300.Remedy: Chrysler has issued a TSB (18-015-08) to instruct dealership technicians to reprogram
3979	On some 2008 vehicles the OBD calibrations for the Turbocharger Overboost Condition Diagnostic and Thermostat Rationality are overly sensitive and may cause MIL illumination for P0234 or P0128 codes when no problem exists.Remedy: Chrysler has issued TSB 18-014-08 to instruct dealership technicians to reprogra
3980	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3981	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3982	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3983	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3984	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3985	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3986	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3987	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3988	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3989	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3990	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3991	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3992	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3993	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3994	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3995	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3996	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3997	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3998	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
3999	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4000	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4001	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4002	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4003	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4004	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4005	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4006	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4007	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4008	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4009	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4010	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4011	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4012	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4013	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4014	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4015	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4016	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4017	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4018	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4019	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda
4020	Due to insufficient burr removing from the valve seal plate of the purge valve, a fine burr may remain on the seal plate in rare cases. When a small purge flow is required the seal rubber may stick on the burr causing the purge valve to get stuck in the closed position. It may result in MIL illumination.Remedy: Mazda

4030	Some vehicles equipped with 1.6L engines have experienced a MI illumination as a result of fuel filler cap malfunction. According to the investigation of parts replaced, 10 out of 85 parts were found to be defective (grease sticking at O-ring of fuel filler cap and O-ring missing) and 75 out of 85 were normal. Other caus
4031	Some vehicles equipped with 2.0L engines have experienced MIL illumination with diagnostic code set indicating a thermostat malfunction. The cause is thought to be a deformation due to overheat.Remedy: Kia is covering these vehicles under warranty.
4032	Some vehicles equipped with V6 engines have experienced MIL illumination as a result of a knock sensor malfunction. Kia has inspected returned samples of the knock sensor and wire harness, but could not find a unique cause. Kia is inspecting additional vehicles to determine if there is a common fault. Remedy: K
4033	Some vehicles equipped with V6 engines have experienced MIL illumination as a result of a knock sensor malfunction. Kia has inspected returned samples of the knock sensor and wire harness, but could not find a unique cause. Kia is inspecting additional vehicles to determine if there is a common fault. Remedy: K
4034	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
4035	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
4036	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
4037	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
4038	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
4039	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
4040	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
4041	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
4042	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replace oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen sensor
4043	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replaced oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen senso
4044	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replaced oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen senso
4045	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replaced oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen senso
4046	Some vehicles equipped with 3.3 or 3.8L engines have experienced MIL illumination with a DTC of P0300-P0306 indicating an oxygen sensor malfunction. Investigation of the replaced oxygen sensors indicates damage to the contact pad in some sensors occurred when the terminals were inserted into the oxygen senso
4047	Due to inadequate welding of the filler pipe assembly the sectional form of the pipe is slightly deformed in some cases. It may cause the deformation and/or scratch the filler cap after long-term use. It may lead to poor sealing of the filler cap and result in MIL illumination.Remedy: Mazda plans to issue a repair proc
4048	Some vehicles may develop cracks in the Positive Crankcase Vent (PCV) hose where the hose connects to the intake manifold.Remedy: Mazda plans to issue a repair procedure to assist service technicians in correcting this concern.
4049	Some vehicles may develop cracks in the Positive Crankcase Vent (PCV) hose where the hose connects to the intake manifold.Remedy: Mazda plans to issue a repair procedure to assist service technicians in correcting this concern.
4050	The OBD system may falsely detect a malfunction of the engine coolant temperature sensor (correlation) after operator induced engine stall. the cause of the failure is inappropriate programming of the OBD system.Remedy: An ECM with improved calibration has been applied to the assembly line and is made availab

4052	e for repair under Running Change/Field Fix #1A. When this defect occurs the MIL illuminates and the vehicle will likely be brought to a dealership for service. The ECM software will be updated under emission warranty according to the Honda TSB #08-035.	
4053	MIL is illuminated. Diagnostic trouble codes (DTC) related to this concern are P050B-85 or P0131 and P0151. Report dated 3/31/2010 adds two engine families and the statement that a large number of the sensors are being replaced due to misdiagnosis. Also states that emissions will increase when defect is present.
