The report dismisses the above background radiation anomalies due to K-40 as "a substance found throughout nature and states, "Detection of potassium-40 is not unusual for a radiation scan of this type and is not a health or safety concern for people or the environment."

This is a false and misleading misrepresentation of facts documented in the Final Historical Radiological Assessment which documents K-40 on page 2 Table 8-1 of Radioisotopes used by NRDL at HPS. K-40 is documented as being a beta and gamma emitter with a half life of 1.26×10^9 years. Its proposed investigation levels on surfaces in dpm/100 cm^2 is 99,200 and for residential reuse in soil pCi/g 0.0442.

I also wish to address false statements widely circulated in the mainstream media and government announcements stating the
