1.0 Applicability

This Fugitive Emissions Inspection and Maintenance Plan (I&M Plan) is applicable to Conoco Phillips (Conoco) operated under the following Texas Commission on Environmental Quality (TCEQ) codes:

Facility Name	Regulated Entity Reference Number	Customer Reference Number	Standard Permit
Bordovsky Stabilization Facility	RN106224843	602989436	6002

The Bordovsky Stabilization Facility (Bordovsky) is regulated locally by the TCEQ under Rule 116.620 and the Standard Permit which require a formal LDAR program with Method 21 type inspections to be conducted routinely. Bordovsky operates under the Standard Industrial Code (SIC) of 1311 and meets the definition of an Oil & Gas Production facility for determining the applicability under the following rule.

1.1 Rule Applicability

Rule 116.620 Installation and/or Modification of Oil and Gas Facilities

(a)(8) states that no facility which is 500 feet or more from the nearest off-plant receptor shall be allowed to emit uncontrolled VOC process fugitive emissions equal to or greater than 25 tpy unless the equipment is inspected and repaired according to subsection (c)(1).

Bordovsky has over 25 tons per year of uncontrolled VOC emissions due to fugitive components and is located over 6,880 feet away from the nearest off-plant receptor and is therefore applicable.

1.2 Permit Applicability

Air Quality Standard Permit For Oil and Gas Handling and Production Facilities

SP (a) Standard permit applies to all stationary facilities, or groups of facilities, at a site which handle gases and liquids associated with the production, conditioning, processing, and pipeline transfer of fluids or gases found in geologic formations on or beneath the earth's surface including, but not limited to, crude oil, natural gas, condensate, and produced water with the following conditions

Bordovsky is considered a stationary natural gas production facility.

(1) The requirement in paragraph (a-k) of the standard permit are applicable in only for new projects and dependent facilities located in the Barnett Shale.

Although Bordovsky is not located in the Barnett Shale and is located in Karnes County, Conoco voluntarily has implemented an LDAR Program in accordance with Table 9.

1.3 Facility Applicability

SP (d) Facilities applicable under the standard permit and implemented in the I&M Plan are listed below:

- Fugitive components, including valves, pressure relief valves, pipe flanges and connectors, pumps, compressors, stuffing boxes, instrumentation and meters, natural gas driven pneumatic pumps, and other similar devices with seals that separate process and waster material from the atmosphere and the associated piping;
- Separators, including all gas, oil and water physical separation units;
- Treatment and processing equipment, including heater-treaters, methanol injection, glycol dehydrators, molecular or mole sieves, amine sweeteners, H2S scavenger chemical reaction vessels for sulfur removal, and iron sponge units;
- Cooling tower and associated heat exchangers;
- Gas recovery units, including cryogenic expansion, absorption, adsorption, heat exchanger and refrigeration units;
- Combustion units, including engines, turbines, boilers, reboilers and heaters;
- Storage tanks for crude oil, condensate, produced water fuels, treatment chemicals, slop and sump oils and pressure tanks with liquefied petroleum gases;
- Surface facilities associate with underground storage of gas or liquids;
- Truck loading equipment;
- Control equipment, including vapor recovery systems, glycol and amine reboilers condensers, flares, vapor combustors, and thermal oxidizers; and
- Temporary facilities used for planned maintenance, and temporary control devices for planned start-ups and shutdowns

1.4 I&M Applicability

Standard Permit Table 8 Monitoring and Records Demonstrations

A monitoring program plan must be maintained that contains, at a minimum, the following information:

- An accounting of all fugitive components by type and service at the site with the total uncontrolled fugitive potential to emit estimate;
- Identification of the components at the site that are required to be monitored with an instrument or are exempt with the justification, in an electronic database;
- The monitoring schedule for each component at the site with difficult-to-monitor and unsafe-to-monitor valves identified and justified;
- The monitoring method that will be used (AVO, Method 21, Alternative Work Practice)
- For components where instrument monitoring is used, information clarifying the adequacy of the instrument response
- The plan for hydraulic or pressure testing or instrument monitoring new and reworked components.

2.0 Introduction

Conoco owns and operates Bordovsky which is located in the jurisdiction of the TCEQ, Region 13 as indicated in the Facility Maps in Section 2.3.

Conoco has been the operator since February 27, 2011 and is currently implementing an LDAR program in compliance with the TCEQ. While Bordovsky is not subject to TCEQ's Rule 116.620, the facility is opting to comply with the Air Quality Standard Permit voluntarily. The rule requires facilities with components in liquid or gaseous hydrocarbon services at oil and gas processing plants to submit a Fugitive Emissions I&M Plan. A copy of the Standard Permit and Rule 116.620 is provided in **Exhibit 1**. The I&M Plan describes procedures the facility will use to comply with the requirements of the Rule and to identify components subject to the Rule.

Conoco was directed by U.S. EPA in its 114 Information Request to demonstrate documentation of an LDAR program. This I&M Plan demonstrates that Conoco's Brodovsky's current LDAR program goes above and beyond the requirements set forth by the TCEQ rule.

2.1 Facility Process Description

It is conservatively represented that 20,000 bbl/day of unstabilized condensate liquids from nearby production wells are off-loaded at the site via tanker trucks. The unstabilized condensate is routed to ten (10) atmospheric pre-stabilization condensate storage tanks (Facility Identification Numbers [FIN] TK-01 through TK-10), in which working and breathing emissions will occur. Flash emissions due to changes in pressure are minimal during this offloading, as the liquids underwent their primary and main pressure drop at the individual well sites. At this site, the only flash emissions are associated with the small change in the truck pressures to atmospheric ones at the tanks. All working/breathing and flash emissions at these tanks are routed to the flare control device (FIN FL-1) and combusted at a 98% control efficiency.

As the liquids settle in tanks TK-01 through TK-10, off-spec portions will filter to the controlled atmospheric off-spec condensate tank (FIN TK-11). This off-spec tank will be periodically loaded out and away from the site via tanker truck (FIN TRUCK1). Emissions from the off spec tank and the unstabilized condensate tanks are also routed to flare for control.

The unstabilized condensate is pumped to one of three stabilizer units from the unstabilized condensate tanks. Each unit will heat the unstabilized condensate via one of three associated 3 MMBtu/hr heaters (FINs H-1 through H-3). Off-gas created as the liquid heats are routed to the compressor which increases the pressure so that the gas may be sent through metering and onto the sales pipeline. The compressor will have occasional blowdowns during maintenance and start up activities (FIN COMP-01-BD). These blowdown emissions are routed to the flare control device.

Once heated in the stabilizer units, the condensates lighter ends will be driven off from the liquid resulting in a condensate liquid with lower RVP. During the stabilization process, heavy NGLs and light NGLs are separated from the lighter ends driven off during the heating process and routed to three pressurized storage tanks. One for heavy NGLs and two for light NGLs. Natural gas liquids in the pressurized storage tanks are periodically loaded out via a pressurized loading system (FINs TRUCK 3 and truck 4). The stabilized condensate passes through one of two accumulator tanks (FINs TK-13 and TK-14) to maintain a static liquid level and then pumped out via pipeline for sales.

2.2 Precedence

The requirements or limits that are more protective of air quality shall apply if any conflict arises between the requirement and limits of this Plan and TCEQ permits, Rules or Policies and Procedures associated with the equipment referenced herein.

2.3 Facility Maps

The maps below indicate the location of the facility within the jurisdiction of the TCEQ, Region 13.

3.0 Leak Detection and Repair (LDAR) Program Objectives

The specific objectives of the LDAR program are:

- Demonstrate that this facility meets applicable regulatory requirements;
- Document LDAR Contractor personnel roles and responsibilities for overseeing and implementing the LDAR program;
- Demonstrate frequency of monitoring;
- Demonstrate leak definitions;
- Demonstrate that leak repairs are being made within the required time periods;
- Demonstrate that monitoring results are being reported;
- Demonstrate that all equipment subject to the regulations is identified properly;

4.0 Personnel Roles and Responsibilities

The facility's LDAR program is executed through a combination of in-house and third-party contract resources. The following positions of responsibility have been identified:

- LDAR Coordinator & Responsible Official – James Woodall, Conoco Phillips
- Monitoring Technician - Lead Field Technicians & Supervisor, Avanti
- Project Manager - Project Manager, Avanti

LDAR Coordinator: The LDAR Coordinator is responsible for the entire program and is designated as the Responsible Official for Conoco. The LDAR Coordinator approves all third party contractors and scheduling needed for compliance with the program.

The LDAR Coordinator reviews the inspection results provided by the third party contractor to ensure that all component leaks are repaired in a timely manner. The LDAR Coordinator reviews each leak to determine if improved processes can be implemented for fixing leaks sooner, or if improved repair actions can be performed to reduce future leaks on similar components.

The LDAR Coordinator is also responsible for delegating certain field level responsibilities such as conducting routine Visual/Audio/Olfactory inspections (VAOs).

The LDAR Coordinator also has primary responsibility for ensuring that all contractors working on the location are providing their services in a compliant manner. This includes installing plugs and caps when lines are opened, using teflon tape for any piping configurations, and reducing the amount of time systems are open to the atmosphere during maintenance of equipment.

Monitoring Technicians: Monitoring Technicians are provided by a third party contractor, Avanti Environmental, Inc. (Avanti). Avanti has specialized in implementing LDAR programs for the Oil & Gas industry since 1990. Monitoring Technicians conduct routine monitoring of all components pursuant to EPA Method 21 methodologies. Inspections are scheduled and are conducted on all components in VOC service as required by the TCEQ Rules and Permits. Monitoring Technicians are responsible for making repairs of leaking components that are considered quick fixes. This includes first attempts at repair. Complicated repairs, or repairs that require more time, expertise, materials that are available, are provided to Conoco Foreman for the facility and maintenance department using the Avanti form "Request for Repair".

Certain Technicians are also trained to prepare component identifications (Tagging & Inventory). These services are provided initially and on an as needed basis as changes are made to equipment.

Project Managers: Avanti provides Project Managers for oversight at the highest level of the LDAR program. Project Managers are responsible for providing other LDAR related services. This can include permitting, emissions reporting, compliance with rules and regulations, and Greenhouse Gas Reporting.

The Project Manager also serves as the liaison between Conoco and Avanti, ensuring that all aspects of compliance are being met, such as account set-up, special projects and QA/QC.

5.0 Leak Detection and Repair (LDAR) Program

This program will be implemented by Conoco's contractor company; Avanti Environmental, Inc., 14050 Southton, Road San Antonio, TX 78223 (Avanti). At the beginning of each inspection sequence, Avanti will contact Conoco personnel to schedule inspections and to determine the existence of any scheduled maintenance activity or potential safety concerns.

5.1 Definitions

Definitions of several important terms used in the Plan are provided below. Definitions are taken from Texas Administrative Code, Title 30, Part 1, Chapter 116, Subchapter F, Rule 116.620 and the Standard Permit. For a full list of definitions, refer to **Exhibit 1**.

- Fugitive Emission--Any volatile organic compound entering the atmosphere that could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening design to direct or control.
- Component--A piece of equipment, including, but not limited to, pumps, valves, compressors, connectors, and pressure relief valves, which has the potential to leak volatile organic compounds.
- Difficult-to-monitor (DTM)-- Any component located at a height that requires personnel to use mechanical lift equipment in order to inspect/monitor/repair it. Any component that requires dismantling/moving a portion or piece of equipment obstructing access to it. (Valves elevated more than two meters above a support surface will be considered non-accessible and shall be identified in a list to be made available upon request).
- Liquid Leak-- A visible mist, dripping of liquid or visible residue or exuding of process fluid based on sight, smell, or sound on or beneath a component for all components.
- Gas Leak-- The detection of total gaseous hydrocarbons in excess of 500 parts per million for all valves, except pumps, compressors and agitators which in excess of 2,000 ppm as measured by approved instrumentation utilizing EPA Method 21.

5.2 Instrumentation

Inspections will be conducted utilizing the Thermo TVA 1000B flame ionization detector, or another TCEQ-approved portable instrument (i.e., an instrument meeting the requirements of EPA Reference Method 21 and approved by the TCEQ), as listed in the table below.

Instrument Specifications Table

Specification	Thermo TVA 1000B	Thermo TVA 2020
Sensor Type	Flame Ionization	Flame Ionization
Readout	1 to 50,000 ppm	1 to 30,000 ppm
Response Time	< 5 seconds to achieve 90%	< 3.5 seconds to achieve 90%
Sampling Method	Integral Pump	Integral Pump
Sample Flow Rate	1.0 liter per minute	1.0 liters per minute
Intrinsically Safe	Yes	Yes

5.3 Calibration and Maintenance

Instruments are precision tested to determine if instrument calibration is required prior to an inspection as documented in **Exhibit 2** - EPA Method 21 Daily Precision Test. The procedure is summarized as follows:

Two known concentrations of Methane gas (100 ppm & 10,000 ppm) are measured three times each. The instrument readings are recorded. The average difference of the actual concentration of methane vs. the instrument reading is calculated. Should the average difference be less than or equal to 10% the precision testing sheet is completed and signed by the field technician, however, should the average difference be greater than 10% the instrument is calibrated according to the manufacturer's guidelines and the precision test is repeated as necessary until the instrument is within the 10% range. The TVA 1000B is incorporated with this plan by reference, including any subsequent updates. A copy of the current TVA 1000B manual has been provided to the TCEQ.

Pump adequacy, correct operation of electronics, and particle filters are evaluated daily, and throughout periods of operation. As technologies develop and other instruments not mentioned herein are chosen for leak inspection, Conoco will provide the TCEQ with the required specification and calibration criteria for review and approval.

As required by Table 8, subsection (B) A log will be maintained showing maintenance and calibration records of the instrument, including dates and methods of calibration and/or repairs and are available upon request.

5.4 Component Screening Procedures

Inspections of components are conducted pursuant to the requirements of EPA Reference Method. When conducting inspections using an approved instrument, the probe inlet is placed at the surface of the component interface where leakage could occur, and is moved along the interface periphery while observing the readout. If the source is a rotating shaft, the probe inlet is positioned within 1 centimeter of the shaft-seal interface for the survey.

Soap bubble screening can be utilized as an alternative screening method where appropriate as described in EPA Reference Method 21. The soap bubble solution cannot be applied to moving parts, components that have temperatures greater than the boiling point of water or less than the freezing point of water, or where the soap solution cannot form a soap solution bridge. Components

(or parts of components) that are good candidates for using soap solution are: valve stems (both rising and rotating stems), all threaded connections, small tube fittings, and gauges. In cases where soap solution cannot be used, inspections are performed using an approved analyzer. The soap solution, when applied, must be sprayed over all potential leak sources using a pressurized spray device. The components are observed for bubbles. If no bubbles are formed, the source is presumed to have no detectable emissions or leaks. If bubbles are observed then an analyzer is used to quantify the leaks pursuant to EPA Reference Method 21 within the same working day.

5.5 Inspections

All monitoring will be performed by Avanti Field Technicians, with the exception of the weekly VAO monitoring.

- **All new and reworked** piping connections shall be monitored for leaks using an approved gas analyzer within **15 days** of the components being returned to service. May use soap bubble test within 8 hours of being returned to service in lieu of instrument testing.
- **All components** will be inspected on a **weekly** basis by Conoco Personnel using Visual, Auditory and Olfactory (VAO) method.
- **Accessible valves** will be monitored for leaks **quarterly** using an approved gas analyzer.
- **Difficult-to-monitor (DTM) components** will be inspected on an **annual** basis.
- **Unsafe-To-Monitor (UTM) valves** will be monitored as soon as possible during safe-to-monitor times.
- **Pump, compressor and agitator seals** will be monitored for leaks **quarterly** with an approved gas analyzer.
- **Flanges and threaded connectors** will be monitored for leaks **quarterly** with an approved gas analyzer.

According to Rule 116.620, Conoco may after completion of the required quarterly inspections for a period of at least two years, the operator may request in writing to the Office of Permitting, Remediation and Registration, that the monitoring schedule be revised.

- After two consecutive quarterly leak detection periods with the percent of valves leaking equal to or less than 2.0%, an owner or operator may begin to skip one of the quarterly leak detection periods for the valves in gas/vapor and light liquid service.
- After five consecutive quarterly leak detection periods with the percent of valves leaking equal to or less than 2.0%, an owner or operator may begin to skip three of the quarterly leak detection periods for the valves in gas/vapor and light liquid service.

The following table summarizes the inspection frequency and methodology to be implemented at the facility. Except where otherwise noted, these are the minimum requirements set forth by Table 9.

Inspection Frequency and Methodology Table (Referencing Table 9)

Component Type		When Safe To Do So/Turn Around	Weekly	15 Days	Quarterly	Annually
Accessible	Valves		VAO		M	
	Flanges/Connectors[2]		VAO		M	
	Pump/Compressor/ Agitator Seals		VAO		M	
	PRDs		VAO		M	
Difficult-To-Monitor			VAO			M
Unsafe-To-Monitor		M				
Minimized / Repaired Leaks				M		
New or Reworked Connections				M		

[1] M indicates that inspection is by Method 21 approved instrumentation;
V indicates visual inspection. Instrumentation is also acceptable in these cases.
VAO indicates visual, audible, olfactory inspection.

[2] Not required quarterly monitoring, voluntary quarterly monitoring

5.6 Open Ended Line Guidelines

Rule 116.620 and the Standard Permit prohibits open-ended lines (OELs) on valves in hydrocarbon or gas service unless they are sealed with a blind flange, plug, cap, or a second valve to seal the line so that no leakage occurs. Except during sampling, both valves shall be closed.

If removal of a component for repair or replacement results in an open ended line or valve, it is exempt from the requirement to install a cap, blind flange, plug or second valve for 72 hours. If the repair or replacement is not completed within 72 hours, one of the following must occur: the line or valve must have a cap, blind flange, plug, or second valve installed; or the open-ended valve or line shall be monitored once for leaks above background for a plant or unit turnaround lasting up to 45 days with an approved gas analyzer and the results recorded.

For all other situations, the open-ended valve or line shall be monitored once at the end of the 72 hour period following the creation of the open-ended line and monthly thereafter with an approved gas analyzer and the results recorded.

Leaks are indicated by readings 20 ppmv above background and must be repaired within 24 hours or a cap, blind flange, plug or second valve must be installed on the line or valve.

5.7 Leak Threshold

Bordovsky's annual emissions are estimated to be > 25TYP VOC, the following leak thresholds are established according to Table 8 & 9 of Rule 116.620:

Component Type	Leak Threshold
Valves	500 PPM
Pumps, Compressors, & Agitator Seals	2,000 PPM
All Other Components	10,000 PPM

5.8 Leak Repair

Leak repairs will follow the requirements of Rule 116.620and the Standard Permit. When a leak from a component is detected, an initial attempt will be made to minimize or stop the leak within 5 days. If needed, further repair actions will follow subject to the availability of parts and tools.

Leaks not repaired by these actions by the end of the workday will be scheduled for repair no later than 15 days after the leak is detected utilizing the Request For Repair Form.

If the repair of a component would require a unit shutdown, the repair may be delayed until the next scheduled shutdown and will be identified for such repair by hanging a leak tag and put on a Delay of Repair List (DOR).

5.9 Leaking Component Identification

At the time of gaseous or liquid leak detection, all leaking components will be physically labeled with a bright green tag displaying the following information: component ID, date and time of initial leak detection, and severity of leak. Additionally, tags will show repair date and re-inspection information. Tags will be placed as near as possible to components that cannot feasibly be tagged. A sample of the leak tag is attached as **Exhibit 3**.

As a supplement to leak tag placement, after the leaking component has been repaired, reinspected and found to be in a leak free condition, the "Component Leak Report", described in Section 6.0 - Recordkeeping and Reporting, will provide a record of the required leak information.

5.10 Requests for Repair

The Request for Repair form will be completed in color-coded triplicate by the LDAR technician for each leak not successfully repaired at the end of each inspection workday. The Request for Repair will serve as notification to Conoco personnel (white and pink copy) that action is required. The technician will retain the third copy of the form (yellow copy). The technician will also email copies of the RFR to each Foreman and Facility Operator and Avanti Project Manager. A sample of the Request for Repair is attached as **Exhibit 4**. Upon successful repair of the leaking component, Conoco personnel will complete the Facility Operator section of the form and transmit the completed form, via telefax or email, to Avanti. The form will then be filed in the facility folder and retained as proof of compliance.

All of the above reports will be maintained by Conoco as required by Rule 116.620 and the Standard Permit, and will be made available to the TCEQ upon request.

5.11 Reinspection

Following the repair or replacement of leaking components, the inspection protocol described above will be used to evaluate the results of the repair actions. The reinspection will take place as soon as

practicable, but no later than 15 calendar days from the date on which the component was found leaking.

6.0 Recordkeeping and Reporting

A recordkeeping system in accordance with Table 8 in the Standard Permit will be employed to contain the following reports and forms**: Component Leak Report, Component Summary Report and Data At Every Point** Log. Identical copies of the reports will be maintained at three locations: at the Conoco facility maintenance office, at the office of the Avanti Project Manager, and with the Avanti LDAR field technician. The following are the protocols for the use of these reports and forms:

6.1 Component Leak Report

The Component Leak Report is generated following the compilation of data from the field after each inspection sequence. It is the inspection log required by Table 8 Subsection D and contains all the information required therein. The report shall document all leaks found greater than the leak definition of VOC detected using Method 21, all leaks detected by AVO inspection, and all leaks found using the Alternative Work Practice.

The report contains the following: method used to monitor the leaking components, the name of the process unit, the component type and tag identification, the results of the monitoring, the date the leaking component was discovered, the date the first attempt at repair was made, the date of repair, the date and instrument reading of the recheck procedure after repair, the leaks that cannot be repaired until turnaround and the date that the leaking component is placed on the shutdown list (i.e. Delay of Repair (DOR)). All components that have been repaired with BACT shall be included in this report along with the new leak thresholds. A sample of the Component Leak Report is attached as **Exhibit 5**.

6.2 Component Summary Report

The Component Summary Report provides totals of all components by component type and process fluid service. A copy of the Component Summary Report is attached in **Exhibit 6**.

6.3 Data At Every Point (DAEP)

Avanti utilizes a handheld Windows CE Mobile device (Data Logger) to electronically record monitoring results. The Data Logger is used in place of traditional hard copy, paper-based documentation to record the monitored background and reading of each fugitive component with an automatic date stamp. Avanti maintains an electronic database for storing and reporting LDAR data. Monitoring technicians are trained to download the electronic data from the Data Logger into the database at the end of each work day. Back-up paper logs are used when necessary, such as when Data Loggers are not available.

The Data At Every Point (DAEP) Log provides as required in Table 8 subsection (C), records are maintained for all monitoring and inspection data collected for each component required to be monitored with a Method 21 portable analyzer that includes the type of component and the monitoring results in ppmv regardless if the screening value is above or below the leak definition. A sample report is attached in **Exhibit 7**. These records are available upon request.

6.4 Retention of Records

Inspection and repair records will be retained at the facility for the previous two years, at a minimum. Those records will be made available at the time of TCEQ inspection and will be provided upon request.

7.0 Component Identification System

A *Component Inventory* has been created to identify the components at Bordovsky and is attached in electronic format (CD) as **Exhibit 8**. The entire facility is divided into broad areas and then area is split into smaller sub-areas such as a vessel or a tank. Sub-areas are further delineated by a description of the components location.

Each component contains the following component information: unique tag number, component name, TCEQ component category, size, location, leak paths, service type (gas/vapor, light liquid or heavy liquid service), whether the component is accessible, difficult-to-monitor, unsafe-to-monitor and exempt components.

A sample tag is shown below; any information pertaining to a given component not printed directly on the tag is recorded in the inventory.

A component's unique identification number is tracked by the placement of aluminum tags (above) which are fixed with a stainless steel braided wire or silicon adhesive. These tags contain a unique tracking number that can easily be referenced to a hard copy print out or electronic database. Components that do not have tags are referenced with a decimal number related to a nearby tag.

No CADD diagrams are used for identification purposes.

7.1 Management of Change (MOC)

As changes are made to equipment and piping, certain components may be added or removed from VOC service. Conoco is responsible for notifying Avanti when such changes are made so that the modified components can be updated in the LDAR database. This process is critical for maintaining accurate component totals which are used for estimating fugitive mass emissions and for documenting leaks.

Avanti maintains the history of all component changes in a database. At any time, a report can be generated showing all of the component changes by date and equipment.

7.2 Difficult-To-Monitor Components

Difficult-To-Monitor (DTM) components have been identified. Each of these components is itemized in the inventory and monitored annually as part of the LDAR program during 3rd Quarter inspections. These components are also listed in **Exhibit 9**.

7.3 Unsafe-To-Monitor Components

Unsafe-To-Monitor (UTM) components have been identified. Each of these components is itemized in the inventory and monitored as part of the LDAR program when it is safe to do so. These components are also listed in **Exhibit 10**.

8.0 Exemptions

Rule 116.620 and the Standard Permit includes certain exemptions and excludes certain facilities from applicability from the entire rule or from certain inspection requirements. However, some Rule exempt components (e.g.,2" or smaller connections determined to be leak-free) may be incorporated into the LDAR inspections, regardless of their Rule exemption status, to comply with emissions calculation procedures. **Exhibit 11** has been designated to track component exemptions (and unsafe to monitor components).

8.1 Exempt Facilities

The following facilities are exempt from applicability under the Standard Permit

- Sour water strippers or sulfur recovery units;
- Carbon dioxide hot carbonates processing units;
- Water injection facilities;
- Liquefied petroleum gases, crude oil, or condensate transfer or loading into or from railcars, ships, or barges;
- Incinerators for solid waste destruction;
- Remediation of petroleum contaminated water and soil
- Cooling towers and heat exchangers with direct contact with gaseous or liquid process streams containing VOC, H2S halogens or halogen compounds, cyanide compounds, inorganic acids, or acid gases.

8.2 Exempt From Monitoring

The following components are exempt from instrument monitoring, according to Table 9

- Nitrogen Lines
- Steam Lines (non contact)
- Flexible plastic tubing $\leq$ 0.5 inches in diameter, unless it is subject to monitoring by other state or federal regulations
- Components containing only noble gases, inserts such as CO2 and water or air contaminants not typically listed on a MAERT such as methane, ethane, and Freon.
- Pipeline quality sweet natural gas

- Waste water lines containing less than 1% VOC by weight and operated at ≤ 1 psig
- Cooling water line components
- Sealless/leakless valves and relief valves equipped with rupture disc upstream or venting to a control device.
- Dual pump seals with barrier fluid at higher pressure than process pressure, seals degassing to vent control systems kept in good working order, or seals equipped with an automatic seal failure detection and alarm system, submerged pumps, or sealless pumps, including diaphragm, canned, or magnetic-driven pumps).
- All piping and valves two inches nominal size and smaller, unless subject to federal NSPS requiring a fugitive VOC emissions leak detection and repair program or Chapter 115 of this title.
- VOC fugitive emissions components which contact process fluids where the VOCs have an aggregate partial pressure or vapor pressure of less than 0.044 psia at 68 degrees Fahrenheit or at maximum process operating temperature.
- VOC fugitive emissions components in service where the operating pressure is at least 5 kilopascals (0.725 pounds per square inch) below ambient pressure.
- Mixtures in streams where the VOC has an aggregate partial pressure of less than 0.002 psia at 68 degrees Fahrenheit.

However, if any components not subject to a instrument monitoring program but found to be emitting VOC in excess of 10,000 ppmv using EPA Method 21, found by audio, visual or olfactory inspection to be leaking shall be considered to be leaking and shall be repaired, replaced, or tagged as specified. All components are subject to monitoring when using the Alternative Work Practice.

8.3 Lab Results

Certain requirements under Rule 116.620 and the Standard Permit may require samples to be analyzed for determining inclusion or exemption from any monitoring or reporting requirements. Any applicable lab results will be contained in this binder.

.

Exhibit 1

§116.620. Installation and/or Modification of Oil and Gas Facilities.

(a) Emission specifications

(1) Venting or flaring more than 0.3 long tons per day of total sulfur shall not be allowed.

(2) No facility shall be allowed to emit total uncontrolled emissions of sulfur compounds, except sulfur dioxide (SO_2), from all vents (excluding process fugitives emissions) equal to or greater than four pounds per hour unless the vapors are collected and routed to a flare.

(3) Any vent, excluding any safety relief valves that discharge to the atmosphere only as a result of fire or failure of utilities, emitting sulfur compounds other than SO_2 shall be at least 20 feet above ground level.

(4) New or modified internal combustion reciprocating engines or gas turbines permitted under this standard permit shall satisfy all of the requirements of §106.512 of this title (relating to Stationary Engines and Turbines), except that registration using the Form PI-7 or PI-8 shall not be required. Emissions from engines or turbines shall be limited to the amounts found in §106.4(a)(1) of this title (relating to Requirements for Permitting by Rule).

(5) Total Volatile Organic Compound (VOC) emissions from a natural gas glycol dehydration unit shall not exceed ten tons per year (tpy) unless the vapors are collected and controlled in accordance with subsection (b)(2) of this section.

(6) Any combustion unit (excluding flares, internal combustion engines, or natural gas turbines), with a design maximum heat input greater than 40 million British thermal units (Btu) per hour (using lower heating values) shall not emit more than 0.06 pounds of nitrogen oxides per million Btu.

(7) No facility which is less than 500 feet from the nearest off-plant receptor shall be allowed to emit uncontrolled VOC process fugitive emissions equal to or greater than ten tpy, but less than 25 tpy, unless the equipment is inspected and repaired according to subsection (c)(1) of this section.

(8) No facility which is 500 feet or more from the nearest off-plant receptor shall be allowed to emit uncontrolled VOC process fugitive emissions equal to or greater than 25 tpy unless the equipment is inspected and repaired according to subsection (c)(1) of this section.

(9) No facility which is less than 500 feet from the nearest off-plant receptor shall be allowed to emit uncontrolled VOC process fugitive emissions equal to or greater than 25 tpy unless the equipment is inspected and repaired according to subsection (c)(2) of this section.

(10) No facility shall be allowed to emit uncontrolled VOC process fugitive emissions equal to or greater than 40 tpy unless the equipment is inspected and repaired according to subsection (c)(2) of this section.

(11) No facility which is located less than 1/4 mile from the nearest off-plant receptor shall be allowed to emit hydrogen sulfide H_2S or SO_2 process fugitive emissions unless the equipment is inspected and repaired according

to subsection (c)(3) of this section. No facility which is located at least 1/4 mile from the nearest off-plant receptor shall be allowed to emit H_2S or SO_2 process fugitive emissions unless the equipment is inspected and repaired according to subsection (c)(3) of this section or unless the H_2S or SO_2 emissions are monitored with ambient property line monitors according to subsection (e)(1) of this section. Components in sweet crude oil or gas service as defined by Chapter 101 of this title (relating to General Air Quality Rules) are exempt from these limitations.

(12) Flares shall be designed and operated in accordance with 40 Code of Federal Regulations (CFR), Part 60.18 or equivalent standard approved by the commission, including specifications of minimum heating values of waste gas, maximum tip velocity, and pilot flame monitoring. If necessary to ensure adequate combustion, sufficient gas shall be added to make the gases combustible. An infrared monitor is considered equivalent to a thermocouple for flame monitoring purposes. An automatic ignition system may be used in lieu of a continuous pilot.

(13) Appropriate documentation shall be submitted to demonstrate that compliance with the Prevention of Significant Deterioration (PSD) and nonattainment new source review provisions of the FCAA, Parts C and D, and regulations promulgated thereunder, and with Subchapter C of this chapter (relating to Hazardous Air Pollutants: Regulations Governing Constructed or Reconstructed Major Sources (FCAA, §112(g), 40 CFR Part 63)) are being met. The oil and gas facility shall be required to meet the requirements of Subchapter B of this chapter (relating to New Source Review Permits) instead of this subchapter if a PSD or nonattainment permit or a review under Subchapter C of this chapter is required.

(14) Documentation shall be submitted to demonstrate compliance with applicable New Source Performance Standards (NSPS, 40 CFR Part 60).

(15) Documentation shall be submitted to demonstrate compliance with applicable National Emission Standards for Hazardous Air Pollution (NESHAP, 40 CFR Part 61).

(16) Documentation shall be submitted to demonstrate compliance with applicable maximum achievable control technology standards as listed under 40 CFR Part 63, promulgated by the EPA under FCAA, §112 or as listed in Chapter 113, Subchapter C of this title (relating to National Emissions Standards for Hazardous Air Pollutants for Source Categories (FCAA §112, 40 CFR Part 63)).

(17) New and increased emissions shall not cause or contribute to a violation of any National Ambient Air Quality Standard or regulation property line standards as specified in Chapters 111, 112, and 113 of this title (relating to Control of Air Pollution from Visible Emissions and Particulate Matter; Control of Air Pollution from Sulfur Compounds; and Control of Air Pollution from Toxic Materials). Engineering judgment and/or computerized air dispersion modeling may be used in this demonstration. To show compliance with §116.610(a)(1) of this title (relating to Applicability) for H_2S emissions from process vents, ten milligrams per cubic meter shall be used

as the "L" value instead of the value represented by §116.610(a)(1) of this title.

(18) Fuel for all combustion units and flare pilots shall be sweet natural gas or liquid petroleum gas, fuel gas containing no more than ten grains of total sulfur per 100 dry standard cubic feet (dscf), or field gas. If field gas contains more than 1.5

(A) If total uncontrolled VOC emissions are equal to or greater than ten tpy, but less than 50 tpy, a minimum of 80% by weight minimum control efficiency shall be achieved by either operating a condenser and a separator (or flash tank), vapor recovery unit, destruction device, or equivalent control device.

(B) If total uncontrolled VOC emissions are equal to or greater than 50 tpy, a minimum of:

(i) 98% by weight minimum destruction efficiency shall be achieved by a destruction device or equivalent; or

(ii) 95% by weight minimum control efficiency shall be achieved by a vapor recovery system or equivalent.

(b) Control requirements

(1) Floating roofs or equivalent controls shall be required on all new or modified storage tanks, other than pressurized tanks which meet §106.476 of this title (relating to Pressurized Tanks or Tanks Vented to Control), unless the tank is less than 25,000 gallons in nominal size or the vapor pressure of the compound to be stored in the tank is less than 0.5 pounds per square inch absolute (psia) at maximum short-term storage temperature.

(A) For internal floating roofs, mechanical shoe primary seal or liquid-mounted primary seal or a vapor-mounted primary with rim-mounted secondary seal shall be used.

(B) Mechanical shoe or liquid-mounted primary seals shall include a rim-mounted secondary seal on all external floating roofs tanks. Vapor-mounted primary seals will not be accepted.

(C) All floating roof tanks shall comply with the requirements under §115.112(a)(2)(A) - (F) of this title (relating to Control Requirements).

(D) In lieu of a floating roof, tank emissions may be routed to:

(i) a destruction device such that a minimum VOC destruction efficiency of 98% is achieved; or

(ii) a vapor recovery system such that a minimum VOC recovery efficiency of 95% is achieved.

(E) Independent of the permits by rule listed in this paragraph, if the emissions from any fixed roof tank exceed ten tpy of VOC or ten tpy of sulfur compounds, the tank emissions shall be routed to a destruction device, vapor recovery unit, or equivalent method of control that meets the requirements listed in subparagraph (D) of this paragraph.

(2) The VOC emissions from a natural gas glycol dehydration unit shall be controlled as follows.

(A) If total uncontrolled VOC emissions are equal to or greater than ten tpy, but less than 50 tpy, a minimum of 80% by weight minimum control efficiency shall be achieved by either operating a condenser and a separator (or flash tank), vapor recovery unit, destruction device, or equivalent control device.

(B) If total uncontrolled VOC emissions are equal to or greater than 50 tpy, a minimum of:

(i) 98% by weight minimum destruction efficiency shall be achieved by a destruction device or equivalent; or

(ii) 95% by weight minimum control efficiency shall be achieved by a vapor recovery system or equivalent.

(c) Inspection requirements

(1) Owners or operators who are subject to subsection (a)(7) or (8) of this section shall comply with the following requirements.

(A) No component shall be allowed to have a VOC leak for more than 15 days after the leak is detected to exceed a VOC concentration greater than 10,000 parts per million by volume (ppmv) above background as methane, propane, or hexane, or the dripping or exuding of process fluid based on sight, smell, or sound for all components. The VOC fugitive emission components which contact process fluids where the VOCs have an aggregate partial pressure or vapor pressure of less than 0.5 psia at 100 degrees Fahrenheit are exempt from this requirement. If VOC fugitive emission components are in service where the operating pressure is at least 0.725 pounds per square inch (psi) (five kilopascals (Kpa)) below ambient pressure, then these components are also exempt from this requirement as long as the equipment is identified in a list that is made available upon request by the agency representatives, the EPA, or any other air pollution agency having jurisdiction. All piping and valves two inches nominal size and smaller, unless subject to federal NSPS requiring a fugitive VOC emissions leak detection and repair program or Chapter 115 of this title (relating to Control of Air Pollution from Volatile Organic Compounds), are also exempt from this requirement.

(B) All technically feasible repairs shall be made to repair a VOC leaking process fugitive component within 15 days after the leak is detected. If the repair of a component would require a unit shutdown, the repair may be delayed until the next scheduled shutdown. All leaking components which cannot be repaired until a scheduled shutdown shall be identified for such repair by tagging. The executive director, at his discretion, may require early unit shutdown or other appropriate action based on the number and severity of tagged leaks awaiting shutdown.

(C) New and reworked underground process pipelines containing VOCs shall contain no buried valves such that process fugitive emission inspection and repair is rendered impractical.

(D) To the extent that good engineering practice will permit, new and reworked valves and piping connections in VOC service shall be so located to be reasonably accessible for leak-checking during plant operation. Valves elevated more than two meters above a support surface will be considered non-accessible and shall be identified in a list to be made available upon request.

(E) New and reworked piping connections in VOC service shall be welded or flanged. Screwed connections are permissible only on piping smaller than two-inch diameter. No later than the next scheduled quarterly monitoring after initial installation or replacement, all new or reworked connections shall be gas-tested or hydraulically-tested at no less than normal operating pressure and adjustments made as necessary to obtain leak-free performance. Flanges in VOC service shall be inspected by visual, audible, and/or olfactory means at least weekly by operating personnel walk-through.

(F) Each open-ended valve or line in VOC service, other than a valve or line used for safety relief, shall be equipped with a cap, blind flange, plug, or a second valve. Except during sampling, the second valve shall be closed.

(G) Accessible valves in VOC service shall be monitored by leak-checking for fugitive emissions at least quarterly using an approved gas analyzer. For valves equipped with rupture discs, a pressure gauge shall be installed between the relief valve and rupture disc to monitor disc integrity. All leaking discs shall be replaced at the earliest opportunity, but no later than the next process shutdown. Sealless/leakless valves (including, but not limited to, welded bonnet bellows and diaphragm valves) and relief valves equipped with a rupture disc or venting to a control device are exempt from monitoring.

(H) Dual pump seals with barrier fluid at higher pressure than process pressure, seals degassing to vent control systems kept in good working order, or seals equipped with an automatic seal failure detection and alarm system, submerged pumps, or sealless pumps (including, but not limited to, diaphragm, canned, or magnetic driven pumps) are exempt from monitoring.

(I) All other pump and compressor seals emitting VOC shall be monitored with an approved gas analyzer at least quarterly.

(J) After completion of the required quarterly inspections for a period of at least two years, the operator of the oil and gas facility may request in writing to the Office of Permitting, Remediation, and Registration that the monitoring schedule be revised based on the percent of valves leaking. The percent of valves leaking shall be determined by dividing the sum of valves leaking during current monitoring and valves for which repair has been delayed by the total number of valves subject to the requirements.

This request shall include all data that has been developed to justify the following modifications in the monitoring schedule.

(i) After two consecutive quarterly leak detection periods with the percent of valves leaking equal to or less than 2.0%, an owner or operator may begin to skip one of the quarterly leak detection periods for the valves in gas/vapor and light liquid service.

(ii) After five consecutive quarterly leak detection periods with the percent of valves leaking equal to or less than 2.0%, an owner or operator may begin to skip three of the quarterly leak detection periods for the valves in gas/vapor and light liquid service.

(2) Owners or operators who are subject to subsection (a)(9) or (10) of this section shall comply with the following requirements.

(A) No component shall be allowed to have a VOC leak for more than 15 days after the leak is found which exceeds a VOC concentration greater than 500 ppmv for all components except pumps and compressors and greater than 2,000 ppmv for pumps and compressors above background as methane, propane, or hexane, or the dripping or exuding of process fluid based on sight, smell, or sound. The VOC fugitive emission components which contact process fluids where the VOCs have an aggregate partial pressure or vapor pressure of less than 0.044 psia at 100 degrees Fahrenheit are exempt from this requirement. If VOC fugitive emission components are in service where the operating pressure is at least 0.725 psi (five Kpa) below ambient pressure, these components are also exempt from this requirement as long as the equipment is identified in a list that is made available upon request by agency representatives, the EPA, or any air pollution control agency having jurisdiction. All piping and valves two inches nominal size and smaller are also exempt from this requirement.

(B) All technically feasible repairs shall be made to repair a VOC leaking process fugitive component within 15 days after the leak is detected. If the repair of a component would require a unit shutdown, the repair may be delayed until the next scheduled shutdown. All leaking components which cannot be repaired until a scheduled shutdown shall be identified for such repair by tagging. The executive director, at his or her discretion, may require early unit shutdown or other appropriate action based on the number and severity of tagged leaks awaiting shutdown.

(C) New and reworked underground process pipelines containing VOCs shall contain no buried valves such that process fugitive emission inspection and repair is rendered impractical.

(D) To the extent that good engineering practice will permit, new and reworked valves and piping connections in VOC service shall be so located to be reasonably accessible for leak-checking during plant operation. Valves elevated more than two meters above a support surface will be considered non-accessible and shall be identified in a list to be made available upon request.

(E) New and reworked piping connections in VOC service shall be welded or flanged. Screwed connections are permissible only on piping smaller than two-inch diameter. No later than the next scheduled quarterly monitoring after initial installation or replacement, all new or reworked connections shall be gas-tested or hydraulically-tested at no less than normal operating pressure and adjustments made as necessary to obtain leak-free performance. Flanges in VOC service shall be inspected by visual, audible, and/or olfactory means at least weekly by operating personnel walk-through.

(F) Each open-ended valve or line in VOC service, other than a valve or line used for safety relief, shall be equipped with a cap, blind flange, plug, or a second valve. Except during sampling, the second valve shall be closed.

(G) Accessible valves in VOC service shall be monitored by leak-checking for fugitive emissions at least quarterly using an approved gas analyzer. For valves equipped with rupture discs, a pressure gauge shall be installed between the relief valve and rupture disc to monitor disc integrity. All leaking discs shall be replaced at the earliest opportunity, but no later than the next process shutdown. Sealless/leakless valves (including, but not limited to, welded bonnet bellows and diaphragm valves) and relief valves equipped with a rupture disc or venting to a control device are exempt from monitoring.

(H) Dual pump seals with barrier fluid at higher pressure than process pressure, seals degassing to vent control systems kept in good working order or seals equipped with an automatic seal failure detection and alarm system, submerged pumps, or sealless pumps (including, but not limited to, diaphragm, canned, or magnetic driven pumps) are exempt from monitoring.

(I) All other pump and compressor seals emitting VOC shall be monitored with an approved gas analyzer at least quarterly.

(J) After completion of the required quarterly inspections for a period of at least two years, the operator of the oil and gas facility may request in writing to the Office of Permitting, Remediation, and Registration that the monitoring schedule be revised based on the percent of valves. Leaking. The percent of valves leaking shall be determined by dividing the sum of valves leaking during current monitoring and valves for which repair has been delayed by the total number of valves subject to the requirements. This request shall include all data that has been developed to justify the following modifications in the monitoring schedule.

(i) After two consecutive quarterly leak detection periods with the percent of valves leaking equal to or less than 2.0%, an owner or operator may begin to skip one of the quarterly leak detection periods for the valves in gas/vapor and light liquid service.

(ii) After five consecutive quarterly leak detection periods with the percent of valves leaking equal to or less than 2.0%, an owner or operator may begin to skip three of the quarterly leak detection periods for the valves in gas/vapor and light liquid service.

(K) A directed maintenance program shall be used and consist of the repair and maintenance of VOC fugitive emission components assisted simultaneously by the use of an approved gas analyzer such that a minimum concentration of leaking VOC is obtained for each component being maintained. Replaced components shall be remonitored within 30 days of being placed back into VOC service.

(3) For owners and operators who are subject to the applicable parts of subsection (a)(11) of this section, auditory and visual checks for SO_2 and H_2S leaks within the operating area shall be made every day. Immediately, but no later than eight hours upon detection of a leak, operating personnel shall take the following actions:

(A) isolate the leak; and

(B) commence repair or replacement of the leaking component; or

(C) use a leak collection/containment system to prevent the leak until repair or replacement can be made if immediate repair is not possible.

(d) Approved test methods

(1) An approved gas analyzer used for the VOC fugitive inspection and repair requirement in subsection (c) of this section, shall conform to requirements listed in 40 CFR §60.485(a) and (b).

(2) Tutweiler analysis or equivalent shall be used to determine the H_2S content as required under subsections (a) and (e) of this section.

(3) Proper operation of any condenser used as a VOC emissions control device to comply with subsection (a)(5) of this section shall be tested to demonstrate compliance with the minimum control efficiency. Sampling shall occur within 60 days after start-up of new or modified facilities. The permittee shall contact the Engineering Services Section, Office of Compliance and Enforcement 45 days prior to sampling for approval of sampling protocol. The appropriate regional office in the region where the source is located shall also be contacted 45 days prior to sampling to provide them the opportunity to view the sampling. Neither the regional office nor the Engineering Services Section, Office of Compliance and Enforcement personnel are required to view the testing. Sampling reports which comply with the provisions of the "TNRCC Sampling Procedures Manual," Chapter 14 ("Contents of Sampling Reports," dated January 1983 and revised July 1985), shall be distributed to the appropriate regional office, any local programs, and the Engineering Services Section, Office of Compliance and Enforcement.

(e) Monitoring and recordkeeping requirements

(1) If the operator elects to install and maintain ambient H_2S property line monitors to comply with subsection (a)(11) of this section, the monitors shall

be approved by the Engineering Services Section, Office of Compliance and Enforcement office in Austin, and shall be capable of detecting and alarming at H_2S concentrations of ten ppmv. Operations personnel shall perform an initial on-site inspection of the facility within 24 hours of initial alarm and take corrective actions as listed in subsection (c)(3)(A) - (C) of this section within eight hours of detection of a leak.

(2) The results of the VOC leak detection and repair requirements shall be made available to the executive director or any air pollution control agency having jurisdiction upon request. Records, for all components, shall include:
   (A) appropriate dates;
   (B) test methods;
   (C) instrument readings;
   (D) repair results; and
   (E) corrective actions. Records of flange inspections are not required unless a leak is detected.

(3) Records for repairs and replacements made due to inspections of H_2S and SO_2 components shall be maintained.

(4) Records shall be kept for each production, processing, and pipeline tank battery or for each storage tank if not located at a tank battery, on a monthly basis, as follows:
   (A) tank battery identification or storage tank identification, if not located at a tank battery;
   (B) compound stored;
   (C) monthly throughput in barrels/month; and
   (D) cumulative annual throughput, barrels/year.

(5) A plan shall be submitted to show how ongoing compliance will be demonstrated for the efficiency requirements listed in subsection (b)(1)(D) of this section. The demonstration may include, but is not limited to, monitoring flowrates, temperatures, or other operating parameters.

(6) Records shall be kept on at least a monthly basis of all production facility flow rates (in standard cubic feet per day) and total sulfur content of process vents or flares or gas processing streams. Total sulfur shall be calculated in long tons per day.

(7) Records shall be kept of all ambient property line monitor alarms and shall include the date, time, duration, and cause of alarm, date and time of initial on-site inspection, and date and time of corrective actions taken.

(8) All required records shall be made available to representatives of the agency, the EPA, or local air pollution control agencies upon request and be kept for at least two years. All required records shall be kept at the plant site, unless the plant site is unmanned during business hours. For plant sites ordinarly unmanned during business hours, the records shall be maintained at the nearest office in the state having day-to-day operations control of the plant site.
