EXECUTIVE SECRETARIAT

The New York Times found that at least 116 wells in Pennsylvania and West Virginia produced wastewater with radiation levels that were at least a hundred times the U.S. EPA's drinking water standard and at least 15 of these wells had wastewater at more than a thousand times the standard.

Many of these contaminants simply flow through conventional treatment plants and get discharged into public streams and rivers because the plants are not equipped to treat radioactive materials in fracking wastewater.

I await your response.

Sincerely,

Mrs. Edward T. Swanton

Dear Lisa Jackson

There appears to be a recent proposal of a "fracking" or [illegible] information in Wyoming to be of some concern to me.

Having spent the [illegible] years [illegible] I am well aware of the fracking negotiations. I would only hope and pray that your agency would uphold the drinking water standards set by the United States and not let the powerful [illegible] [illegible] you are now considering [illegible] to settle the negotiations [illegible] discern the [illegible] and fracking water.
