Subject: Feeding guilds
Copy of Refined feed guilds_R2.xlsx

In advance of next week's meeting we wanted to share with your group of benthic ecologists some of our thoughts regarding possible refinements to the Appendix E spreadsheet that assigns invertebrates to feeding guilds (App E_Attach E-1_6-30-15.xlsx). We acknowledge that determination of the primary mode of feeding for benthic invertebrates can be complicated, and can change within a species based on age, salinity, temperature, and available prey. In this table we have attempted to characterize "dominant feeding strategy" for each organism based on literature-reported dominant feeding guilds. We thought that maybe the conversation could start more efficiently if we sent this information to you prior to the meeting.

On another note, in a July 21 email you wrote "Summary table presented in this meeting showed that LPRSA model-predicted BSAFs are within the range of the available literature values." Can you clarify which summary table you are referring to or share that table with us if we do not already have it?

Thanks,

Jen
