Date:	Monday, November 18, 2013 11:25:00 AM

Maybe two questions. I'm trying to estimate at how much elemental mercury could end up at the bottom of a container of shipped soil to Canada.

By weight, how much of a ton of the PTW soil is mercury? I can't even figure out a way to estimate it, maybe double or quadruple the highest measured concentration?

Any ideas on how to do this?

Thanks, jon

Ps, John do not read anything into this question!
