---

Good Afternoon,

On April 19, 2016 in Fresno County, 34 field workers entered a vineyard 2 ½ hours after a ground application of Microthiol Disperss (sulfur) and Quintec (quinoxyfen) was completed. Eight workers reported they experienced symptoms such as numb lips, itchiness, trouble breathing, headache, and rash. Clothing and foliage samples collected by Fresno CAC were submitted to the California Department of Food and Agriculture Center for Analytical Chemistry and tested positive for sulfur and quinoxyfen residues. The Fresno County District Attorney's office will be given the opportunity to accept the case.
