Metals

4/27/16

Zach

- Bullseye Testing
  - going well.
  - uncontrolled stacks have significant opacity.
  - 4 ft and gross.
  - Testing guy couldn't get out of one of the plumes.
  - Got some video clips.
  - Dan climbed up and said that is what charging looks like, fades out when melting.
  - Fine white smoke.
- Method is working fine. Didn't have problems
- Glass samples:
  - sold out of a lot of stuff. Might not have highest.
  - Two other issues – No samples today. Doesn't have time today.
    1) Add cullet, that could complicate.
       → Would rather no cullet than
    2) Chromium glass → not highest chromium glass. They make aventurine. Product is not homogenous & residual has higher chromium in the other glass left in the furnace.
       → Zach said why not testing. DEQ said what is more normal
       Asked for ballpark in how often made, Eric.
       → Not sure what Mike now.
       → Eric thought DEQ wanted them to test normal
       → Wouldn't answer if highest aventurine
-
