JRB Project # 1[illegible]-XX

CONTACT REPORT

Report By: Morson Date: 9/28/84 Time: 2pm

Made Call ☒ Received Call ☐ Meeting ☐

Contact: Allan Newman (509) 575-2491

WDOE - Yakima

Discussion: Boise-Cascade

WDOE has never investigated the 103(c) notification of landfilled asbestos insulation + caustic mixture (D. Bowhay may have called BC but no one has done site investigation) - Area is log sort yard, producing acidic leachate which, over time, may neutralize some of caustic -

Discharges from plywood operation go to evaporation pit which is probably not lined - Newman thinks that glues used in process may form their own liner - most glues used are a urea-formaldehyde base + start out as solids - when pond overflows, it goes to city sanitary sewer - Newman says city has never had any concern over this discharge

Sludges + ashes from air stripper are landfilled on site - Metals would be the contaminants of concern, but the sludge + ashes have never failed a bioassay test.
