George and Jennifer

Thank you for your response to Harvey. We would appreciate seeing photos of the final installation.
Debbie

Mr. Morginstin,

The photographs from your shutterfly album were pre-completion conditions and showed the stone layer, which is the second to last layer to be placed at the River Mile 10.9 mudflat. A sand habitat layer, which is the surface layer of the cap, has since been placed over the stone layer. The sand layer has not yet been completely placed, but that work is estimated to be completed by the end of this week (5/30).

There will still be a strip of stones that will remain exposed directly along the shoreline. This strip of stone is outside the dredged area and helps to anchor the geotextile layer of the cap. The strip of stones near the shoreline can be seen in attached photographs 1 and 2.

To help orient you with the attached photographs:

Photo 1 – Photo taken near the shoreline and south of the "no dredge zone."
The "no dredge zone" is the area without stone in photographs GEDC0047 and GEDC0048 from your shutterfly album.

Photo 2 – Photo taken when standing north of the "no dredge zone." Camera was facing south.

Photo 3 – Photo taken when standing south of the "no dredge zone." Camera was facing north.

I hope these photographs help to give you a sense of the current state of the capping. Feel free to email me back or give me a call if there is anything else I can help you with.

Sincerely,

Jennifer LaPoma

George,

Thanks for the update and alleviating my concerns,

Harvey

George,

I took these pictures today at the 10.9 site. My understanding is that the job will be finished, maybe next week.

The condition of the surface has been changed from smooth silt and mud to sharp rocks. The will cause extensive damage to any vessel that happens to hit bottom when the tide is higher.

Please advise if you plan to correct this situation.

Harvey Morginstin
