Dear Ms. Gina McCarthy, administrator

Your agency has apparently been operating on an EXPIRED water discharge system in which Pilgrim Power Plant draws in 500,000,000 (million) gallons of water daily and increases the temperature by 32 degrees which of highly radioactive heating is destroying our fish and marine life and is a travesty of criminal negligence. We have a valuable and nutrient ecosystem in Cape Cod bay and hold that your so-called "Protection" agency should do its job. The EPA is charged with overseeing or at least ensuring that nuclear plants follow ethical practices in an effort to protect the environment and its aquaculture. This nuclear plant fails to follow the best practices. It has an out-moded cooling system, requires requiring a recirculating one, not a single pass one such as Pilgrims. Being unregulated and generationally outgrated it should be shutter. Now instead of in 2019 with more defects & flaws
