Clean Water from the dike, originating off site, has been collected and per agreement with Mike Dorsey used for the dilution of glycerin to produce freeze conditioning antifreeze and shipped to Freedoms customers. The material was stored in tank 399

All water regardless of origin is now being stored in tank 400. The plan was to dilute with a fatty acid glycerin blend to produce a dust suppressant which has been used previously at the Big Run KY landfill. Since recent communications with Big Run we are exploring alternative disposal options.
