Re: Justification for No Further Action for Lead and BaP in Soil: Main Yard
Former Chevron Perth Amboy Facility
Perth Amboy, New Jersey
SRP PI # 003621

Dear Mr. Vargas:

Enclosed please find the Justification for No Further Action (NFA) for lead and benzo(a)pyrene (BaP) in soil within the Main Yard. This NFA summarizes the areas in the Main Yard at the former Chevron Perth Amboy Facility where lead and BaP impacts in soil have not been previously addressed through remediation or administrative controls under the Corrective Measures Implemenation (CMI). This report presents Chevron request for a NFA determination for lead and BaP impacts in Area of Concern (AOC) 16A, Solid Waste Management Unit (SWMU) 51, and soil impacts identified after potential AOC (PAOC) Remedial Investigation Report (RIR) in PAOCs 46 and 73. Additionally, in accordance with the HSWA Permit, soil with BaP impacts at concentrations greater than 0.66 mg/kg and less than 10 mg/kg will be addressed with a Facility-wide deed notice.

If you require additional information regarding this work plan, please contact me at (732) 738-2023.

Sincerely,

Robert Mancini
Project Manager, Downstream

Acronym	Definition / Description
AOC	Area of concern
BaP	Benzo(a)pyrene
bgs	Below ground surface
CAMU	Corrective Action Management Unit
CEA	Classification Exception Area
CM	Corrective measures
CMI	Corrective measures implementation
CMS	Corrective Measures Study
ESS	Ex situ stabilization
ETP	Effluent Treatment Plant
Facility	Former Chevron Perth Amboy Facility
HSWA	Hazardous and Solid Waste Amendments
ISCO	In-situ chemical oxidation
ISS	In-situ stabilization
LNAPL	Light non-aqueous phase liquid
µg/L	Microgram(s) per liter
mg/kg	Milligram(s) per kilogram
MNA	Monitored natural attenuation
NFA	No further action
NJDEP	New Jersey Department of Environmental Protection
NRDCSCC	Non-Residential Direct Contact Soil Cleanup Criteria
OWSS	Oily water sewer system
PAH	Polycyclic aromatic hydrocarbons
PAOC	Potential area of concern
PCOC	Potential constituent of concern
PID	Photo-ionization detector
RCRA	Resource Conservation Recovery Act
RDCSRS	Residential Direct Contact Soil Remediation Standard
RFI	RCRA Facility Investigation
RIR	Remedial investigation report
SVOC	Semi volatile organic compound
SWMU	Solid waste management unit
TAL	Target Analyte List
TCL	Target Compound List
USEPA	United States Environmental Protection Agency
VOC	Volatile organic compound

1.0 INTRODUCTION

This justification for no further action (NFA) summarizes areas in the Main Yard at the Chevron Perth Amboy Facility (Facility) where lead and benzo(a)pyrene (BaP) impacts in soil have not been previously addressed through remediation or administrative controls under the Corrective Measures Implementation (CMI). These include Area of Concern (AOC) 16A and Solid Waste Management Unit (SWMU) 51. The Facility is located at 1200 State Street, Perth Amboy, New Jersey. The Main Yard is bounded by Spa Spring Creek to the north, Woodbridge Creek and Conrail right-of-way to the east, Maurer Road to the south, and North Jersey Coast Line right-of-way to the west.

Figures 1 and 2 show the soil boring locations in the Main Yard where samples were collected for lead and BaP analysis, respectively. Figures 1 and 2 also depict the locations of SWMUs, AOCs, and potential AOCs (PAOCs) within the Facility's Main Yard and areas where in-situ stabilization (ISS) and ex-situ stabilization (ESS) corrective measures (CMs) have been completed. Lead and BaP impacts within the ISS and ESS CM areas have been remediated and addressed per the Resource Conservation and Recovery Act (RCRA) Hazardous and Solid Waste Amendments (HSWA) permit requirements for their respective SWMUs and AOCs.

Table 1 shows all soil sample results throughout the Main Yard with BaP impacts above the CMI action level of 10 milligrams per kilogram (mg/kg). Table 2 shows all soil sample results with lead impacts above the CMI action level of 800 mg/kg. Tables 1 and 2 also show the area that each impacted soil sample is associated with, the associated report, and the date the report was submitted to the United States Environmental Protection Agency (USEPA) and New Jersey Department of Environmental Protection (NJDEP).

As shown on Table 1, most of the BaP impacts in soil have been addressed by CMs in other SWMUs, AOCs, and PAOCs. Three soil samples with BaP concentrations above the CMI action level have not been addressed. These include one soil sample collected in soil boring S0837 associated with AOC 16A and two soil samples collected in soil borings S2576 and S2578 associated with SWMU 51. As shown on Table 2, lead was detected above the CMI action level in three soil samples collected in soil borings S4333, S4334, and S4337 within PAOC 46 and PAOC 73. These remaining impacts within the Main Yard are discussed below.

2.0 AOC 16A

AOC 16A consists of the Facility's underground Oily Water Sewer System (OWSS) in the Main Yard. Chevron received a RCRA HSWA Permit for the Facility on June 1, 1994. Following issue of the permit, Chevron performed a RCRA Facility Investigation (RFI) (Chevron 2003) and Corrective Measures Study (CMS) (Chevron 2008) to evaluate the environmental impacts throughout the Facility. Chevron received a RCRA HSWA Permit Renewal for the Facility from the USEPA with an effective date of September 3, 2013. The 2013 HSWA Permit Renewal identified the following CMs to be implemented in AOC 16A:

1. Excavation, ESS, and disposal in the Facility's Corrective Action Management Unit (CAMU) for BaP concentrations greater than 10 mg/kg in soil;
2. ISS for lead in soil and subsequent filing of a deed notice;
3. Containment consisting of a cap and subsequent filing a deed notice for arsenic concentrations greater than 20 mg/kg in surface soil;
4. In-situ chemical oxidation (ISCO) treatment for organic contaminants in soil and benzene concentrations greater than 100 microgram(s) per liter (µg/L) in groundwater, supplemented by enhanced bioremediation, if required; and
5. Monitored natural attenuation (MNA) and filing of a Classification Exception Area (CEA) for groundwater.

The lead and BaP impacts in soil within AOC 16A are addressed below. A NFA Report for Arsenic in Surface Soil: Main Yard was submitted to the USEPA and NJDEP on February 26, 2019 and included an NFA determination for arsenic in surface soil within AOC 16A. The NFA for arsenic in surface soil in the Main Yard was approved by the USEPA and NJDEP in a letter dated July 30, 2019. Benzene impacts in soil and groundwater within AOC 16A will be addressed during CMI in other SWMUs and AOCs throughout the Main Yard.

2.1 Summary of Investigations

AOC 16A consists of the OWSS that is located throughout the Facility's Main Yard, as shown on Figures 1 and 2. The OWSS conveys process water and stormwater runoff from tank basins and process areas to the Effluent Treatment Plant (ETP) located in the northern portion of the Main Yard. Three investigations have been completed to evaluate the Main Yard OWSS (AOC 16A): the 1st Phase OWSS investigation (Chevron 1997), the 2nd Phase OWSS investigation (Chevron 2002), and the Full RFI (Chevron 2003). The other SWMUs, AOCs, and PAOCs located within the Facility's Main Yard have also been investigated as part of the ongoing environmental investigations at the Facility. The location of soil borings advanced as part of the AOC 16A investigations are shown on Figure 1.

2.1.1 1st Phase OWSS Investigation

The 1st Phase OWSS investigation, completed in 1996 and 1997, focused on the western portion of the Main Yard. Fourteen soil borings (SB-0252 through SB-0257, SB-0264, SB-0265, SB-0267 through SB-0269, SB-0277 through SB-0279) were advanced, and

samples were collected for Skinner's List analyses for volatile organic compounds (VOCs), semi volatile organic compounds (SVOCs), and metals (Tables 3 through 5). Soil samples were collected based on visual observation of environmental impacts (such as staining, discoloration, or elevated photoionization detector [PID] readings) and the depth interval corresponding to the depth of the OWSS lines. BaP was detected above the Non-Residential Direct Contact Soil Cleanup Criteria (NRDCSCC) of 0.66 mg/kg, but below the CMI action level of 10 mg/kg in only one soil sample collected from boring SB-0267 at 2 to 4 feet below ground surface (bgs) (Table 2). BaP results for the remaining soil samples were below the NRDCSCC. Lead was detected below the CMI action level and NRDCSCC of 800 mg/kg.

2.1.2 2nd Phase OWSS Investigation

In 1999, five soil borings (S0490 through S0494) were advanced as part of the 2nd Phase OWSS investigation. Soil samples were collected for Skinner's List analyses for VOCs, SVOCs, and metals (Tables 3 through 5). BaP was detected above the NRDCSCC of 0.66 mg/kg, but below the CMI action level of 10 mg/kg in two soil samples collected from boring S0491 and S0492 at 2.5 to 3 feet bgs (Table 4). BaP results for the remaining soil samples were below the NRDCSCC. Lead was detected below the CMI action level.

2.1.3 Full RFI

In 2002, one soil boring (S0844) was advanced in AOC 16A as part of the Full RFI. Three soil samples were collected from this boring for Target Compound List (TCL) VOCs, SVOCs, and Target Analyte List (TAL) metals. BaP and lead were detected below their respective CMI action levels in these soil samples (Table 4 and 5). Multiple other soil borings were advanced in 2002 as part of the Full RFI to investigate other SWMUs and AOCs throughout the Main Yard. Soil boring S0837 was advanced as part of the AOC 19 investigation; however, during the CMS it was identified as part AOC 16A. Soil samples were collected from soil boring S0837 at 1.5 to 2, 5.5 to 6, and 13.5 to 14 feet bgs and analyzed for TCL VOC, TCL SVOCs, and TAL metals. BaP was detected above the CMI action level at 5.5 to 6 feet bgs. As shown on Table 1, this BaP impact in soil boring S0837 has not been addressed as part of a CMI in another SWMU, AOC, or PAOC and will be addressed as part of AOC 16A.

2.1.4 Other Investigations

Since the completion of the Full RFI in 2003, several other investigations were performed throughout the Facility's Main Yard to evaluate identified soil impacts within the various SWMUs, AOCs, and PAOCs. Soil samples collected during these investigations were analyzed for VOCs, SVOCs, and metals. Most of the soil impacts identified throughout the Main Yard are not associated with AOC 16A and have or will be addressed under another SWMU, AOC, or PAOC. Tables 1 and 2 show all soil sample results throughout the Main Yard with, respectively, BaP and lead impacts above the CMI action level.

2.2 AOC 16A Discussion

As shown on Table 1, BaP detected above the CMI action level in soil boring S0837, which is associated with AOC 16A, has not been addressed by implementation of CMs in another AOC, SWMU, or PAOC. Figure 3 shows the soil borings advanced around soil boring S0837 in AOC 16A and the BaP analytical results. Soil sample results for VOCs, SVOCs, and metals for all soil borings shown on Figure 3 are included on Tables 3 through 5. Soil boring logs are provided in Appendix A.

As shown on Figure 3, BaP was detected above the CMI action level of 10 mg/kg in soil boring S0837 at 5.5 to 6 feet bgs. Soil boring S5742 was advanced adjacent to historical soil boring S0837. Soil samples were collected for BaP analysis from 5.0 to 5.5, 5.5 to 6.0, and 6.0 to 6.5 feet bgs. BaP was detected below the NRDCSCC of 0.66 mg/kg and the CMI action level of 10 mg/kg in all three samples. Additional soil borings were advanced around soil boring S0837, and soil samples were collected at various depths based on visual observations (petroleum staining) and the highest PID field screening results. Results showed BaP was not detected above the CMI action level in any of these samples. Although the CMS recommended ESS to address the historical BaP exceedance at soil boring S0837, the recent results demonstrate that BaP is not present in soil above the CMI action level at or around the historical soil boring. The ESS CM is therefore not warranted.

3.0 SWMU 51

SWMU 51 is identified as the Oily Soil Pad. SWMU 51 was constructed in 1990 and consists of an asphalt containment pad underlain by a polyethylene liner. The containment pad is equipped with a valve-accesses catch basin for the collection and control of stormwater. The pad was used for temporary staging of non-hazardous soil excavated during on-site spill responses and oily soil that was encountered during on-site construction and demolition activities. The containment pad in SWMU 51 was not used to manage hazardous wastes. According to Facility spill records, no documented releases have been reported from this unit. According to the 2013 HSWA Permit Renewal, NFA has been granted for groundwater in SWMU 51; however, further evaluation of soil was needed.

3.1 Summary of Investigations

Six soil borings (S2573 through S2578) were advanced in 2007 as part of the SWMU 51 investigation within and around the oily soil containment pad. Two soil samples were collected from each soil boring at depths ranging between 2 and 5 feet bgs and analyzed for TCL VOCs, TCL SVOCs, and TAL metals. Analytical results are summarized in Tables 3 through 5. BaP-impacted soil was detected above the CMI action level of 10 mg/kg in soil borings S2576 at 3.5 to 4 feet bgs and S2578 at 4.5 to 5.0 feet bgs. Borings S2576 and S2578 are located, respectively, north and west of the oily soil containment pad. In 2012, soil borings S2900 and S2899 were advanced adjacent to soil borings S2576 and S2578, respectively, to investigate data gaps in the 0 to 2 feet bgs interval (Figure 4). Soil samples were collected at each boring from 1.5 to 2 feet bgs for BaP analysis. BaP was not detected in either sample at concentrations above the CMI action level of 10 mg/kg or the NRDCSCC of 0.66 mg/kg.

3.2 SWMU 51 Discussion

During historical investigations performed in 2007, BaP-impacted soil was identified in soil borings S2576 and S2578 at depths of 3.5 to 4.0 and 4.5 to 5.0 feet bgs, respectively. Surface soil samples collected from soil borings S2900 and S2899, advanced adjacent to S2576 and S2578, show BaP was not detected in surface soil at concentrations above the CMI action level or the NRDCSCC.

The oily soil containment pad in SWMU 51 was constructed in 1990 and was used to stage nonhazardous and oily soil generated from construction and spill response performed at the Facility. The containment pad is an above-ground structure consisting of an asphalt pad underlain by a polyethylene liner. It is surrounded by berms and has a valve system to collect stormwater runoff. It operated as temporary storage for excavated soil for waste characterization prior to off-site disposal. Given the use of the containment pad, impacts associated with the operation of the unit would likely be inadvertent surface discharges associated with the placement of oily soil on the asphalt pad or from stormwater runoff. As discussed above, soil investigations performed in SWMU 51 did not identify impacts from potential constituents of concern (PCOCs) in surface soil. Sampling results show the only PCOC identified in SWMU 51 soil was BaP impacting subsurface soils. Since BaP

impacts were not identified in surface soil in SWMU 51, the BaP impacts identified in subsurface soil are not attributed to the operation of the oily soil containment pad.

Soil in SWMU 51 consists of fill material overlying red to brownish red native clay/silt layer. Information presented on soil boring logs was used to determine that fill material across SWMU 51 ranges from approximately 5 to 7 feet thick. The fill material is described as brown fine to coarse sand with some silt and gravel, with varying amounts of brick fragments. Some boring logs also noted the presence of fly ash, coal, and wood in the fill material. Review of SWMU 51 boring logs did not reveal the presence of catalyst beads, sludge, or layers of asphalt or tar that would typically be associated with refinery-derived wastes. The description of fill material encountered in SWMU 51 is consistent with the NJDEP description and definition of historic fill material (NJDEP 2013).

PAOC 86 is located directly south of SWMU 51. The PAOC Remedial Investigation Report (RIR) (Chevron 2014) characterized the fill material in PAOC 86 as historic fill material. The 2014 PAOC RIR concluded that the presence of polycyclic aromatic hydrocarbons (PAHs) and metals in PAOC 86 soil are associated with historic fill material and no further soil investigation is warranted. In the NJDEP July 2014 Soil comments on Chevron's PAOC RIR (NJDEP 2014), NJDEP concurred with the no further soil investigation proposal.

Since BaP was not identified in surficial soil and there are no documented releases associated with the operation of the oily soil containment pad, no further investigation is proposed for BaP impacts in SWMU 51 soil. Based on the description of the fill material present in SWMU 51, the BaP impacts identified in subsurface soil (i.e., below 2 feet bgs) are attributed to historic fill material and are not associated with the operation of the oily soil containment pad. The BaP impacts in SWMU 51 subsurface soil will be addressed with a Facility-wide deed notice that will be submitted to NJDEP along with all other contaminants present in soil above the Residential Direct Contact Soil Remediation Standard (RDCSRS).

4.0 PAOCs 46 AND 73

Lead was detected above the CMI action level in three soil borings (S4333, S4334, and S4337) between 0.5 and 1.5 feet bgs. The borings were sampled as part of the NF3 light non-aqueous phase liquid (LNAPL) investigation in 2015. As shown on Figure 5, these borings were advanced within PAOCs 46 and 73 but after the PAOC RIR (Chevron 2014). As stated in the PAOC RIR and shown on Tables 2 and 5, lead was detected above the NRDCSCC of 800 mg/kg in soil borings S2726 at 1 to 1.5 feet bgs and S2905 at 1.5 to 2 feet bgs. The soil impacts in PAOCs 46 and 73 were attributed to historic fill. NJDEP approved no further soil investigation in PAOCs 46 and 73 in its approval of Chevron's response to comments on the PAOC RIR (NJDEP 2014, 2016). The historic fill material in PAOCs 46 and 73 will be included in the new NJDEP AOC for Site-Wide Historic Fill Material – Soils.

PAOC 73 is located within Tank Basin 330, and PAOC 46 is located south of PAOC 73 within Tank Basin 75 D-1. The stratigraphy in PAOCs 46 and 73 was compared to soil identified within soil borings S4333, S4334, and S4337. As stated in the PAOC RIR, fill material extends to 8 feet bgs in PAOCs 46 and 73 and is underlain by a gray, organic rich clay layer. Multiple soil borings within PAOCs 46 and 73 also note a dark brown peat layer between 7 and 8 feet bgs. The fill consists of brown, poorly sorted sand with gravel from approximately 0 to 4 feet bgs, and black, poorly sorted sand or gray silt with gravel from approximately 4 to 8 feet bgs. Soil boring logs for boring S4333, S4334, and S4337 also note brown poorly sorted sand with gravel and silt from 0 to between 5.5 and 7 feet bgs. The layer underlying the fill was described as dark brown peat. Although lead was detected above the CMI action level in soil borings S4333, S4334, and S4337 during the NF3 LNAPL investigation, information presented in the PAOC RIR and soil boring logs show that the stratigraphy identified in soil borings S4333, S4334, and S4337 is consistent with PAOCs 46 and 73 subsurface stratigraphy and is therefore associated with historical fill. These impacts will be included in the new NJDEP AOC for Site-Wide Fill Materials – Soils and addressed on a site-wide basis.

5.0 SUMMARY

The 2013 HSWA Permit Renewal identified AOC 16A as requiring ESS and disposal in the Facility's CAMU for BaP concentrations greater than 10 mg/kg and ISS for lead concentrations greater than 800 mg/kg throughout the Facility's Main Yard. BaP was detected at concentrations above the CMI action level (10 mg/kg) in 68 soil samples throughout the Main Yard. As shown on Table 1, most of these BaP impacts have been addressed by CMs in other SWMUs, AOCs, and PAOCs. One soil sample collected from soil boring S0837 had BaP concentrations above the CMI level and is associated with AOC 16A. Since soil samples collected adjacent to and around soil boring S0837 did not confirm BaP impacts in soil, the ESS CM is not warranted. BaP concentrations in two subsurface soil samples collected from soil borings S2576 and S2578 in SWMU 51 were detected above the CMI action level. The surficial soil in SWMU 51 has not been impacted, there have been no releases from the oily pad, and the soil is consistent with the description of historical fill material as defined by NJDEP.

Lead was detected at concentrations above the CMI action level (800 mg/kg) in 294 soil samples throughout the Main Yard. As shown on Table 2, most of these lead impacts have been addressed by CMs conducted in other SWMUs, AOCs, and PAOCs. In June 2015, three soil samples collected in soil borings S4333, S4334, and S4337 in PAOCs 46 and 73 had lead concentrations above the CMI action level. However, these samples were collected after the PAOC RIR was submitted in May 2014. NJDEP approved no further soil investigation in PAOCs 46 and PAOC 73 in its approval of Chevron's response to comments on the PAOC RIR. The soil impacts and the subsurface stratigraphy within PAOCs 46 and 73 is consistent with the impacts and soil described in boring logs for S4333, S4334, and S4337. These impacts are therefore associated with historical fill in PAOC 46/73. These impacts will be included in the Site-Wide Fill Materials – Soils AOC and addressed on a site-wide basis. This new ISRA[1] AOC will be addressed in a single Remedial Action Work Plan for remediation (e.g., institutional and engineering controls) to mitigate risk and to seek a Response Action Outcome for the entire Facility after the Facility CMI is complete.

Since the BaP soil impact in S0837 could not be confirmed and the BaP and lead soil impacts in SWMU 51 and PAOCs 46 and 73 will be addressed as part of the new Site-Wide Fill Materials – Soils AOC, remediation of BaP and lead in soil within these soil borings is not warranted. Chevron therefore requests review and approval by USEPA and NJDEP of this request for an NFA determination for BaP and lead in AOC 16A and SWMU 51 and the soil impacts identified after the PAOC RIR in PAOCs 46 and 73. In accordance with the HSWA Permit, BaP impacts at concentrations greater than 0.66 mg/kg and less than 10 mg/kg will be addressed with a Facility-wide deed notice.

Notes:
Highlighted indicates exceedance to CMI action level
NS - No action level limit available for this parameter
U - Analyte not detected at that concentration
J - Analyte concentration estimated
-- indicates the parameter was not analyzed

Notes:
Highlighted indicates exceedance to CMI action level
NS - No action level limit available for this parameter
U - Analyte not detected at that concentration
J - Analyte concentration estimated
-- indicates the parameter was not analyzed

Notes:
Highlighted indicates exceedance to CMI action level
NS - No action level limit available for this parameter
U - Analyte not detected at that concentration
J - Analyte concentration estimated
-- indicates the parameter was not analyzed

Notes:
Highlighted indicates exceedance to CMI action level
NS - No action level limit available for this parameter
U - Analyte not detected at that concentration
J - Analyte concentration estimated
-- indicates the parameter was not analyzed

Table 3
SUMMARY OF VOLATILE ORGANIC COMPOUND RESULTS IN SOIL
Justification for NFA Main Yard
Former Chevron Perth Amboy Facility

Notes:
Highlighted indicates exceedance to CMI action level
NS - No action level limit available for this parameter
U - Analyte not detected at that concentration
J - Analyte concentration estimated
-- indicates the parameter was not analyzed

Notes:
Highlighted indicates exceedance to CMI action level
NS - No action level limit available for this parameter
U - Analyte not detected at that concentration
J - Analyte concentration estimated
-- indicates the parameter was not analyzed

Table 4
SUMMARY OF SEMI-VOLATILE ORGANIC COMPOUND RESULTS IN SOIL
Justification for NFA Main Yard
Former Chevron Perth Amboy Facility

Notes:
Highlighted indicates exceedance to CMI action level
NS - No action level limit available for this parameter
U - Analyte not detected at that concentration
J - Analyte concentration estimated
-- indicates the parameter was not analyzed

Notes:
Highlighted indicates exceedance to CMI action level
NS - No action level limit available for this parameter
U - Analyte not detected at that concentration
J - Analyte concentration estimated
-- indicates the parameter was not analyzed

Notes:
Highlighted indicates exceedance to CMI action level
NS - No action level limit available for this parameter
U - Analyte not detected at that concentration
J - Analyte concentration estimated
-- indicates the parameter was not analyzed

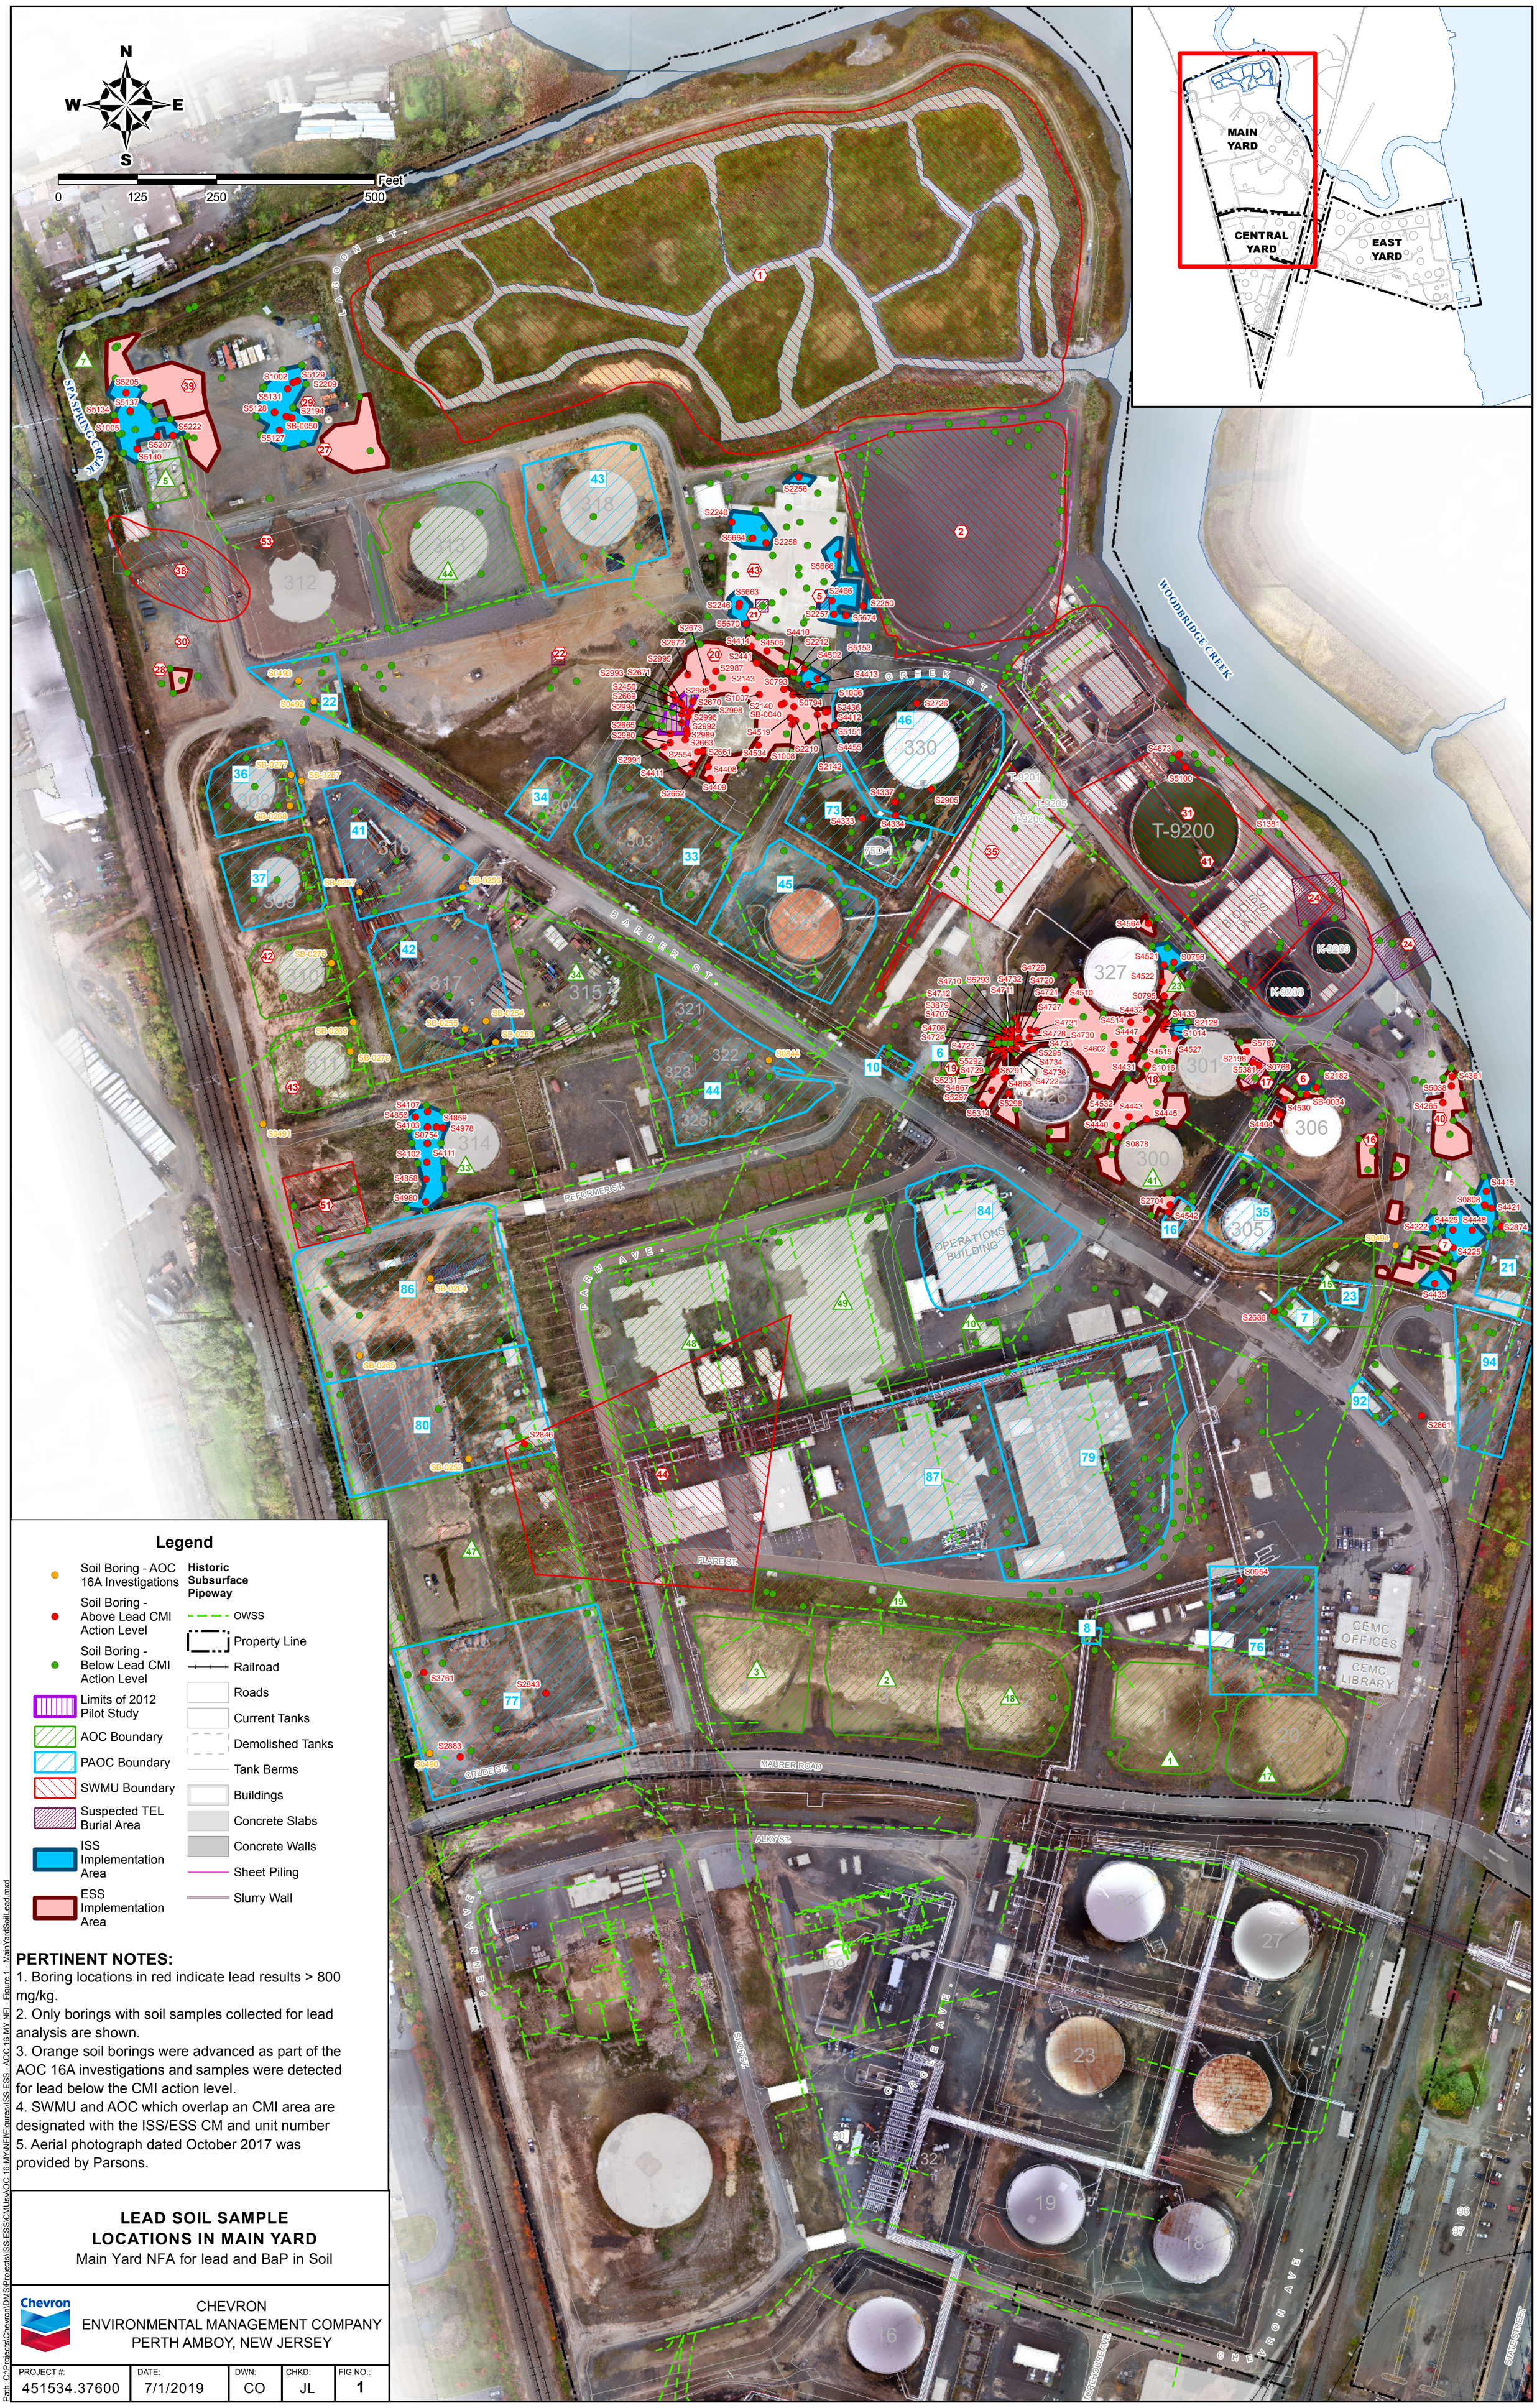
FIGURES



PERTINENT NOTES:

1. Boring locations in red indicate lead results > 800 mg/kg.
2. Only borings with soil samples collected for lead analysis are shown.
3. Orange soil borings were advanced as part of the AOC 16A investigations and samples were detected for lead below the CMI action level.
4. SWMU and AOC which overlap an CMI area are designated with the ISS/ESS CM and unit number
5. Aerial photograph dated October 2017 was provided by Parsons.
