Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	-41: COC indicates 2 containers. Only 1 container rec'd.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

The following is a summary of the review performed by Tetra Tech for the Contract Laboratory Program and Regional Laboratory analytical data packages created for samples collected from June 18 to June 21, 2018, at National Fireworks site. This review was performed on the following field quality control (QC) samples: field blank samples, equipment rinsate blanks samples, and field duplicate samples. This review was performed because the U.S. Environmental Protection Agency, Region 4, Science and Ecosystem Support Division, Office of Quality Assurance does not review these types of field QC samples as part of their validation effort. This policy was stated during a data validation webinar held on February 17, 2011. The webinar was attended by personnel from all 10 EPA Regions as well as personnel from various agencies that utilize the EPA CLP and Regional Laboratories for analytical support.

Field Blank, Equipment Rinsate Blank, and Trip Blank Samples: Field blank collection frequencies were met for all analytical parameters. One field blank sample was collected and analyzed for mercury and volatile organic compounds (VOC). No mercury or VOCs were detected at or above the minimum reporting limits (MRL) in the field blank sample. Equipment rinsate blank collection frequencies were met for all analytical parameters. One equipment rinsate blank was collected and analyzed for mercury and VOCs. No mercury for VOCs were detected at or above the MRLs in the equipment rinsate blank samples. Trip blank collection frequencies (one per sample shipment) were met for all analytical parameters. Two trip blank soil samples and one trip blank water sample were collected and analyzed for volatile organic compounds (VOC). No VOCs were detected at or above the minimum reporting limits (MRL) in the trip blank samples.

Field Duplicate Samples: Field duplicate collection frequencies (one per twenty samples per matrix) were met for all parameters and matrices. Two groundwater duplicate samples were collected for 22 ground water field samples collected and two soil duplicate samples were collected for 40 field soil samples collected. All duplicate samples were analyzed for mercury and VOCs.

Analytical results for each analyte in field duplicate soil sample pairs must fall within less than or equal to 50 percent (%) relative percent difference (RPD). However, if one of the two results of the pair is below its MRL, then the absolute difference between the two results must be less than or equal to the MRL. If both results of the pair are below the MRLs, then no control limit applies. When results for a field duplicate sample pair fall outside the control limit for a particular analyte, the results for that analyte are qualified as estimated (flagged “UJ or “J”) with an undetermined bias in both the parent sample and its field duplicate sample.

For the two field duplicate sample pairs analyzed for VOCs, only one pair had results that fell outside the control limits. For field duplicate sample pair NF17-SS-01 and NF17-SS-01-DUP, RPD values for cis-1,2-dichloroethene and trichloroethene were greater than 50 percent. The results for these analytes in both samples were qualified as estimated (J).

The attached laboratory sample result forms have been hand-annotated in blue ink, where appropriate, to indicate any additional qualifications that were required due to the exceedances discussed above.

Overall Qualifications:

See results summary pages attached for changes to the laboratory qualifiers based upon this validation. The following is a list of qualifiers and definitions that may be used for the validation of this data package:

J	The analyte was positively identified; the associated value is the approximate concentration of the analyte in the sample.
J+	The analyte was positively identified; the associated value is the approximate concentration of the analyte in the sample and may be biased high.
J-	The analyte was positively identified; the associated value is the approximate concentration of the analyte in the sample and may be biased low.
NJ	The analysis indicates the presence of an analyte that has been “tentatively identified” and the associated value is the approximate concentration of the analyte in the sample.
R	The sample result is rejected as unusable due to serious deficiencies in one or more quality control criteria. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was not detected at or above the associated value (reporting limit).
UJ	The analyte was analyzed for, but was not detected at or above the associated value (reporting limit), which is considered approximate due to deficiencies in one or more quality control criteria.
